RFI Responses[1]

Response 1

Perspectives on the postdoc roles and responsibilities

Responsibilities: Produce papers, forge and maintain collaborations, attend scientific conferences, present my work in posters and talks, develop scientific independence, write grants and obtain funding, mentor junior scientists in the lab, promote the scientific mission of the PI, and prepare for faculty job interviews.

Fundamental issues and challenges

Main issues: Lack of appropriate compensation for education/work, uncertainty with respect to grant funding and academic job market, Relative inflexibility of K99/R00 timeline.

Existing NIH policies, programs, or resources

RAISE MINIMUM NIH STIPENDS FOR POSTDOCS. Allow for more flexibility on K99/R00 grants such that if individuals obtain faculty positions early they can still take their grant funding with them (and choose a new mentor at new institution). The required 1-2 years on the K99 funding does NOT adequately account for the slow pace of funding decisions and announcements from NIH and can hamper the timely progression to independent faculty positions.

Proven or promising external resources or approaches

No Response

Response 2

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions allow for extra time to develop your own independent research agenda, curate expertize in methods and analyses, gain experience in lab management and budgeting. Finally, at the end of a postdoc you should be set to enter a faculty position and be successful, with pilot data and anticipated publications.

Fundamental issues and challenges

Academic culture is toxic. Women, non-binary folks, non-white individuals, anyone who is not an American citizen are taken advantage of. Through visa instability, inabilities to apply for competitive training awards for foreign nationals (e.g. a Ph.D. And postdoc in the US, with full intention to get an academic job in the US are penalized compared to American peers due to visa status), non-competitive salaries, lack of postdoc support. Moving for short term positions. The temporary nature of postdocs makes it impossible to create a life somewhere, and lack of compensation makes that even harder. A salary of $54k for an individual with a PhD when undergraduates are taking entry level positions with starting salaries of $80k with annual raises just is not appealing for many, especially when adding in toxic culture.

Existing NIH policies, programs, or resources

Childcare supplements

Support for foreign nationals—even making eligible for an F32 in addition to K99 would make a big difference.

Increase postdoc minimum salaries

Relocation assistance for postdoc fellows

Proven or promising external resources or approaches

No Response

[1] Information has been redacted to maintain privacy and remove inappropriate language.

Response 3

Perspectives on the postdoc roles and responsibilities

The postdoc position should be a bridge role to accumulate the leadership, mentorship, and lab management skills necessary to conduct independent research.

Fundamental issues and challenges

There is minimal potential for vertical career growth from postdoc to faculty at most institutions. This is problematic because many postdocs are at a stage in life when they desire to start a family and settle in a physical location. Putting off family planning for several additional years (after 5-7 years of PhD and possible additional years before entering PhD programs) in order to complete a postdoc and then searching for an academic faculty position in a completely different part of the country (and then likely having to move again several years later to pursue the next promotion) is largely unappealing to most individuals. Moreover, many graduating PhDs are able to identify psotdoc positions at institutions located in places that are appealing to them, and would often welcome the opportunity to continue their career at the institution where they do their postdoc.

Elevated pay scales would alleviate much of the financial stress and improve the mental health of postdocs but is unlikely to significantly alleviate the root problem of too few faculty positions available in too few appealing locations.

Academic research has very little appeal to the majority of PhD trainees, as evidenced by the noted trends in biomedical research. Nepotism, favoritism, and privilege are rampant in academia and thus work ethic and intellectual rigor are rarely proportionally rewarded.

Existing NIH policies, programs, or resources

There are no objective measures of performance; although publication record can be purported as a semi objective measure, the publication process is rife with inequalities and proper attribution of credit is almost impossible to determine from a publication record.

Expanding resources to encourage non-academic jobs would be greatly beneficial to many postdocs. Many postdocs will leave academia with very little exposure to non-academic jobs and so will be at an initial disadvantage. There is likely very little that can be done to retain larger numbers of postdocs in academia but presenting non-academic jobs as an equal opportunity will foster better long term relationships across the biomedical research community.

Proven or promising external resources or approaches

Establishing postdoctoral programs aimed at non-academic careers are likely to be very popular; e.g. science policy and regulatory affairs, clinical diagnostic labs, biotech business development, etc.

Response 4

Perspectives on the postdoc roles and responsibilities

A Postdoc is a researcher with a higher degree of independence and responsibility than a graduate student, who may or may not receive some degree of training. In my field (plant biology), this position needs to last 2-5 years in order for the postdoc to publish a sufficiently high quality paper at the end of their research program. Though they have temporary positions, Postdocs contribute tremendous expertise, labor, and teaching/mentorship to the labs that they are part of, and should be compensated as experts rather than trainees.

Fundamental issues and challenges

Postdocs are experts in their fields, and industry positions that they are qualified for tend to pay 2-4x what the typical Postdoc fellowship pays and so we hemorrhage Postdocs to these positions, often long before they have completed the work they were hired to do in the lab. This is a huge waste of time and money. A person who wants to perform research that is not directly tied to corporate profit should not have to choose a life of poverty. Additionally, Postdocs are often at a stage of life where they are interested in having children, and the lack of childcare benefits that universities offer causes many Postdocs, especially women, to leave. Many other types of jobs provide free childcare; universities could do the same, if they were provided with funds to do so.

Existing NIH policies, programs, or resources

The NIH salary scale for Postdocs should be set to $70,000 minimum starting salary, with steps increasing at the current percentages. Though this salary does not approach the pay provided by industry positions, it would allow postdocs to live more comfortably and be able to focus on their research, rather than constantly looking for a next position. Childcare stipends would prevent Postdocs from choosing between their careers and starting a family.

Proven or promising external resources or approaches

No Response

Response 5

Perspectives on the postdoc roles and responsibilities

Interim/unstable position before an actual job either in academia or industry. If you can prove yourself with higher impact journal publication and/or fellowship, it will increase your chance to get a job in academia. However, there is no guarantee.

Fundamental issues and challenges

1. Salary and benefits: Salary is very low compared to an actual cost of living. Bare minimum of benefits provided by institutes, and once you accept NIH-funded fellowship or awards awardees will not br able for getting these benefits. No childcare guaranteed for pregnant women postdocs is extra.
2. No job stability or security: Getting a tenured track job in academia is not guaranteed no matter with your academic performance.
3. Visa issue for international postsocs: hard to obtain a visa as an internationl postdoc. Also, due to that reason and visa restriction, international postdocs are forced to endure with toxic PI and lab environment, as they cannot switch the lab freely.

In Summary, both #1 and #2 reasons are the main reasons for most of postdocs. However I would like to urge more these two reasons are not just boosting postdocs to leave the academia, but also ultimately these are the reasons hurting science integrity and DEI at the end.

Existing NIH policies, programs, or resources

Offer better health insurance, child care, and 401K to postdocs who are funded by NIH. And mandate the minimum salary with benefits for ALL institutes who are funded by NIH.

Proven or promising external resources or approaches

For annual NIH report, add the confidential report for their job satisfaxtion and mentoring.

Also for R01, emphasize their mentoring plan for their trainees. Counting numbers of trainnees who became an academic PIs should NOT be considered as a “strength” for PIs.

Response 6

Perspectives on the postdoc roles and responsibilities

Academic postdocs are a wonderful opportunity for a new scientist to gain additional skills and resources (e.g., connections, awards, grants, etc.) to further their careers in academia or otherwise after they are awarded with their PhD.

Fundamental issues and challenges

Pay. Solely pay. If you made it even close to competitive with a typical salary of an industry job, you would be flooded with postdocs. No graduate student after 6.5 years of study is going to work for 50% of the pay, when they can make a living wage anywhere in an industry or government job.

Existing NIH policies, programs, or resources

Just pay them more. You don’t need to do anything else.

Proven or promising external resources or approaches

Just pay them more. You don't need to do anything else.

Response 7

Perspectives on the postdoc roles and responsibilities

A postdoc in my field is generally gaining additional research experience and training and working towards (or within) a K or an R research grant. I think sometimes postodc responsibilities can prevent that key goal if a postdoc ends up doing a job that is more like a research staff position, like being a coordinator for the PIs study. In that case postodcs are at a professional disadvantage because they're spending all their time on admin tasks and not research analysis and dissemination, and grant writing.

Fundamental issues and challenges

In clinical psychology, there is a complete "donut" of support for trainees interested in pursuing a primarily research-focused career that makes it very hard to move through to the K or R stage. Specifically, there are no federal funding mechanisms to support trainees during the postdoc internship year, which is also woefully underpaid compared to basically every other postdoctoral or residency-based trainee in the health sciences across the board. I think it is asking a lot of trainees to literally live on poverty thresholds while also potentially writing a K and finding a postdoc or faculty job. As a result, It is my sense that only the most well-resourced individuals are able to navigate that period, and I would imagine that lower resourced students would struggle a great deal more than those from backgrounds of higher SES. I think the NIH has a lot of power to help the internship situation for clinical psychology to change, better supporting research during the internship year, and to support trainees from diverse or under-resourced backgrounds, and NIH does not seem to be involved in this issue at all despite the fact that Clinician-Scientists do a lot of great work later in their careers with NIH.

Existing NIH policies, programs, or resources

There should be a funding mechanism for the clinical psychology internship year to help bridge to postdoc or career. it could look like an F to K or K to R mechanism, and could incentivize internship sites to protect research-focused trainees' research time but partially contributing to the cost of training for those trainees.

Proven or promising external resources or approaches

NIH already has very cool programming to support trainees to move from the F to the K, but not for clinical psychologists who have the "Donut" year of internship training. I think the existing programs could be tailored to this specific training circumstance for clinical psych PhDs. Alternately, maybe clinical psychologists on internship could be partially funded by T grants like med students on residency.

Response 8

Perspectives on the postdoc roles and responsibilities

Academic postdoc has long been viewed as cheap labor for investigators to advance their career in research. For most postdocs, that path has been a dead end with many years spent working long hours for low wages.

Fundamental issues and challenges

The fundamental issue is that the prospect of earning a reasonable income (for someone with a PhD) is grim when taking the academic postdoc route.

Existing NIH policies, programs, or resources

Postdocs need to be considered as professionals and not trainees! Investigators need to consider them as employees with rights and reasonable work hours.

Proven or promising external resources or approaches

It all comes down to work hours and compensation. Postdocs should not be expected to accept subpar working conditions for low pay in the name of science. They are well educated individuals with advanced degrees and NIH needs to take the lead in changing the culture so other academic institutions follow suit.

Response 9

Perspectives on the postdoc roles and responsibilities

The academic postdoc is an essential stage of career development for an academic researcher, and I am grateful to be in a good situation for my postdoc currently. Most individuals are not sufficiently established to compete for funding as a professor immediately out of graduate school, and the additional time spent in an established lab to build your reputation, publish papers, and secure funding is invaluable to position early-career faculty for long-term success.

Fundamental issues and challenges

I think this has been covered sufficiently everywhere. An extremely demanding job that pays highly trained and independent individuals a very low wage with bare-minimum benefits is always going to face recruitment, retention, and overall quality of life issues. The solution is to pay more and provide better benefits.

Existing NIH policies, programs, or resources

The payback agreement on NRSA fellowships is nonsensical and inhumane. It is cruel for no reason and is not based in any way on the realities of postdoctoral work. Think of the realities in question. Think of a person who has

1. chosen to pursue research as a postdoc despite the low pay,
2. has put in the enormous effort to complete an NRSA application, and
3. has done this at a sufficiently high level to receive funding for this competitive grant.

This person is always, 100% of the time, intending to pursue a career in academic research. They are not trying to scam the government into giving them money. As you are certainly aware, postdocs are not paid very well. Thus, despite this person's sincerest intentions, the realities of life may often force this person to exit the disadvantageous situation of a postdoc sooner than expected. Perhaps they welcome a child with special needs into their family and one of the parents needs to stay home. Given the low income of postdocs, the postdoc partner will likely be the one making this sacrifice. Or perhaps a medical emergency in the family brings financial distress, forcing the postdoc to take a high-paying job outside science to cover the expenses. These are the situations that would drive a hard-working postdoc who is proud to have received an F32 to stop the work early, and they are distressing, financially-straining situations in themselves. The threat of having to pay thousands of dollars to the government in order to make the right choice for your family is unthinkable. The payback agreement forces otherwise qualified applicants to look elsewhere for funding to avoid indentured servitude to the federal government in the event that something in life goes wrong. It needs to be ended immediately.

Response 10

Perspectives on the postdoc roles and responsibilities

No Response

Fundamental issues and challenges

I firmly believe increasing compensation for post-doctoral trainees would improve recruitment. After years and years of schooling, the compensation trainees receive while being a valuable part of the NIH community is meager and borderline disrespectful for the knowledge and skills they have. I believe the lack of compensation also discourages people from pursuing doctoral degrees at all because the amount of time and money invested in attaining the degree is seldom worth the compensation received by the end of it. Without higher pay, I highly doubt the NIH would see an increase of post-doctoral fellows in upcoming years.

Existing NIH policies, programs, or resources

The answer is to increase compensation.

Proven or promising external resources or approaches

No Response

Response 11

Perspectives on the postdoc roles and responsibilities

Postdoc positions have changed over time into an extended period between PhD and faculty where many institutions simply wait to see who is left standing. I don't think postdocs should be like this—we have the opportunity to provide additional professional training that can be useful to the individual (not the lab or the institution) and then move people along to the next stage. The fundamental problem is that we provide too few next opportunities within academia and so the postdoc is now a long period of anxiety and modest productivity for most, especially those outside of Ivy league university and/or those who hit lucky with a given project.

Fundamental issues and challenges

We underpay our postdoc workers badly—not by 5 or 10% but something more like 50%. We have to rectify this problem as a matter of utmost urgency and we have to stop complaining about funding—most institutions have more than enough and need to cut administrative burdens rather than complaining about the poorest paid. It would also be helpful to have formal vacation and parental leave (both parents including same sex partnerships) that are paid for and enforced.

Existing NIH policies, programs, or resources

We don't need policies—we need to pay a competitive salary to qualified workers and make sure they have time outside of work. We also need to have more than one academic pathway and actually value those—we should have an immediate doubling of all staff scientist positions and also value training, community engagement and other important roles instead of keep pretending these are 'less' than PI roles.

Proven or promising external resources or approaches

No Response

Response 12

Perspectives on the postdoc roles and responsibilities

The postdocs are the soul of lab running the lab, producing the the preliminary data for the grants.

Fundamental issues and challenges

The salary is the main problem of reducing number of postdocs in academia. They are treated really bad.

Existing NIH policies, programs, or resources

The strong supportive system for the postdocs is the critical

Proven or promising external resources or approaches

The NIH should monitor the PIs whether they give good salary to postdoc

Response 13

Perspectives on the postdoc roles and responsibilities

It is equivalent to involuntary modern slavery.

Fundamental issues and challenges

Respect, Fair-compensation, job security, and professional development opportunity are all lacking.

Existing NIH policies, programs, or resources

PLEASE RAISE the postdoc salary guidance!!! It is not FAIR!!!

Proven or promising external resources or approaches

NIH OITE and individual IC offices are the only good things happening to postdocs.

Response 14

Perspectives on the postdoc roles and responsibilities

Protected time to further develop research interests with limited mentorship.

Fundamental issues and challenges

Prioritise 1st time applicants when awarding stand-alone postdoc grants, and training programs with postdoctoral training components.

Existing NIH policies, programs, or resources

Incorporate border or open research agendas to allow institutions to research on their own priorities.

Proven or promising external resources or approaches

Option to progress to US postdoctoral positions

Response 15

Perspectives on the postdoc roles and responsibilities

My postdoc was valuable and impressionable on my career development. I viewed my postdoc as a stepping stone in my career that was necessary to expand my scientific knowledge and skill set. My PhD dissertation had a very narrow focus, and so I was able to seek a postdoc that was in a related field to build my knowledge base. It also provided an opportunity to increase understanding of translational sciences, and really accelerated my ability to move ideas at the bench to affect the community (whether it is patients, medicine, devices, etc.). Importantly, the postdoc is meant to instill independence and confidence as individuals progress in their careers.

Fundamental issues and challenges

Expectation from universities to retain postdoc in an academic career. This is problematic for a few reasons. Many postdoc programs and resources assume that postdocs will only seek academic careers, and therefore offer a very limited scope of training in grant writing, teaching, etc. when instead they should support and encourage postdocs to explore career tracks without feeling like they are 'cheating' on their program. Bottom line is that academic openings can be geographically limited and the academic ecosystem of publish/parish for tenure is unattractive. Rather, there are significant needs in biomedical career tracks that are overlooked or frowned upon by Mentors. This mindset needs to shift.

Inadequate salaries. Of all the federal postdoc programs, NIH offers the most realistic salary but still falls short to meet basic living needs. Many postdocs are located in urban areas with rising cost of living. Based on the age group of postdocs, they are either relocating and entertaining a long-distance relationship or starting families. Many postdocs rely on their spouse income for support while they complete training which creates feelings of desperation or inadequacy, and certainly does not support family planning. Due to poor compensation, it creates an environment where postdocs want to train quickly and move onto a career after 2-3 years.

Research programs of a Mentor often rely on the productivity of their postdoc. Postdocs can be extremely productive given their level of training and motivation. While mentors and trainees must have a symbiotic relationship, when a postdoc lands a permanent position, it is often seen as a disadvantage on the Mentor's record rather than an accomplishment. It is important to reframe Mentor and Trainee success, or consider reframing success metrics for Mentor so that movement of postdocs does not compromise their future grant applications.

Existing NIH policies, programs, or resources

Increase programming related to non-academic tracks—including drug discovery and pharmacology. Some postdoc offices at universities offer career exploration and development. Most postdoc mentors do not have the experience advising their trainees in applying or interviewing for non-academic jobs. This is understandable since it is out of their expertise; however, a culture shift for mentors to support and

encourage postdocs to participate in career development opportunities would enhance the training ecosystem. Ultimately if a postdoc is seeking a non-academic career track and lands a job in another career field, this should also be viewed as a success by the Mentor and when the Mentor's performance is reviewed. By diversifying training and experiences of postdocs, this can also benefit the basic research of their mentors by bringing back new ideas, increasing the relevance, or challenging the translatability of their work.

Leadership and team science approaches should be prioritized for postdoc training—these soft skills will benefit in any career, academic or non-academic.

Proven or promising external resources or approaches

No Response

Response 16

Perspectives on the postdoc roles and responsibilities

Further training in specific research area, carrying much of a specific study (design, data analysis, data acquisition, writing papers) and mentoring PhD students, a stepping stone to a faculty position

Fundamental issues and challenges

Salary. No academic jobs to step into once you finish your post-doc.

Existing NIH policies, programs, or resources

higher salary; more funding for research; more academic positions; conference travel funding

Proven or promising external resources or approaches

No Response

Response 17

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellowships are meant for providing additional training to lead to independent researcher positions or to lead to staff scientist like positions.

Fundamental issues and challenges

The salary for postdoctoral fellowships (and predoctoral, for the matter) aren't sustainable for paying bills. Most postdoctoral fellows are of childbearing years and need to make the decision between having a family and leaving or not paying their daycare. Even without children, with the increase in housing, the under paid postdoc no longer makes sense.

Existing NIH policies, programs, or resources

There should be a policy put in place that when a fellow is on parental leave they should not be contacted/harassed by their supervisor requiring work or when they will be returning to work. Education should also be provided to all supervisors that there is 12 weeks of parental leave, because most are unaware.

Proven or promising external resources or approaches

No Response

Response 18

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as one in which brings new expertise to a laboratory and learns a new system to set that academic up for the future. For this, I mean that the training in the postdoctoral labs PI will enable their post doc to combine expertise learned during the PhD with what is going on in the current PIs lab to continue future academic studies. This means that postdoctoral faculty mentors will give up portions of their planned programs to enable future success. While this is a position of partial training, it

also is not. The main issue is that coming in with a PhD means you have substantial background in navigating experimental design, application, and evaluation. Post docs should be compensated for that expertise. That means salary equitable to industry which now range 75k to 100k a year.

Fundamental issues and challenges

Equity in salary is a huge challenge. The inequities in pay across cities in the US are not currently keeping up with housing, living costs, and starting a family across the country. This is why many PhD scientists are leaving academia into industry. The disparity and ability for students from low income families, (ie don't have generational wealth) to rely upon, means they are unable to stay in academia. This does not make sense if we want to understand scientific problems from multiple angles-you have to have diversity in all facets to do this. Money is a great way to make things more equitable and keep scientists in academia. If as a post doc you can only afford to literally pay rent and eat, why would you do this?

Existing NIH policies, programs, or resources

1. Pay for childcare within all grants for parents
2. PAY POST DOCS MORE
3. Enable free healthcare when on fellowships and training grants
4. Give PIs more money so they can support the above three

Proven or promising external resources or approaches

No Response

Response 19

Perspectives on the postdoc roles and responsibilities

No Response

Fundamental issues and challenges

No Response

Existing NIH policies, programs, or resources

Nothing will be fixed without providing more money to a broader pool of NIH-funded labs to allow them to support postdocs and staff scientists with salaries appropriate for their expertise and experience level i.e. higher than the current NIH minimum. The NIH R01 mechanism no longer provides enough money to support postdocs at the level they need to be supported at to make it a viable option for more people, especially individuals from underrepresented backgrounds. The NIH needs to bring back and enact the earlier proposal to cap funding amounts to individual investigators (through both grants and contracts) and commit the recovered money into increasing the budget of the modular R01 grant. This will allow a larger share of NIH-funded investigators to commit to stably funding postdocs and staff scientists at the levels they deserve.

Proven or promising external resources or approaches

No Response

Response 20

Perspectives on the postdoc roles and responsibilities

Postdocs are trainees who are learning to be independent scientists. Their roles/responsibilities include: doing original research and publishing this work under the guidance of a mentor, understanding and implementing responsible conduct in research, learning how to mentor, learning how to communicate their science through oral and written formats.

Fundamental issues and challenges

Issues include low salary, lack of benefits, lack of discrete tracks for postdoctoral training, lack of formal mentorship beyond a single PI.

Existing NIH policies, programs, or resources

NIH could increase postdoc salaries and include benefits, could institute a requirement for mentoring committees of at least 2 other faculty besides the PI and could formalize postdoc tracks on NIH grants which would require a mentoring plan. For example, many postdocs are interested in industry positions after academic postdocs and could take part in workshops to enhance skills sets for industry.

Proven or promising external resources or approaches

I think key focus should be salary and benefits and mandatory mentoring committees that are part of annual renewals for R01s and other grants with non-compliance leading to withholding the next years budget.

Response 21

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should be a short-term training position that provides an academic with the tools necessary to begin to build their own independent lab and career.

Fundamental issues and challenges

The major (and sole) issue at the moment for me is the incredibly low salary/stipend guidelines that NIH provides. This is not a feasibly or enticing salary for any postdoc living in a high cost-of-living city. But given that these guidelines are so influential, many institutions will use that guideline as a good way to suppress salaries and stop individual labs from trying to renumerate their postdoctoral trainees appropriately. There needs to be a major restructuring of payscales for postdocs AND a raising of the >$500K funding threshold for R01s. These two limits are causing a litany of issues; given the $500K bar, people do not want to pay postdocs more (in order to keep costs below the threshold) and because the postdoc salaries are low, many postdocs struggle to survive, thrive and build families at a critical time when they should feel free to do so. This is particularly true at some of the leading institutions that are located in high-cost cities.

Existing NIH policies, programs, or resources

Increasing payscales for postdocs AND a raising of the >$500K funding threshold for R01s (to at least >$800K)

Proven or promising external resources or approaches

No Response

Response 22

Perspectives on the postdoc roles and responsibilities

The postdoc, for me, was somewhat useful as a way to buy myself time to figure out what came next. I did not believe it was a viable path for a long-term academic career. I did have some capacity to further develop skills that would better serve me in industry. I developed both technical and interpersonal skills, e.g. coding and "managing up", both of which made me more valuable in my next job. The research I did was interesting, but developed far too slowly for it to be useful to the rest of my career development. Overall, it was slightly helpful but could not have been worth my time invested for more than 1-2 years.

Fundamental issues and challenges

The bottom line for me and so many more is that we are not paid enough. I needed at least 70k-80k in salary to feel that I was not wasting my time. If the minimum pay from the NIH was lifted to this level, I know that a great plurality of postdocs would be lifted up, and encouraged that they are not just wasting their time in a dead-end job that does not directly prepare them for the next career step. The NIH should also mandate career development for postdocs that fosters *non-academic* paths. There are far too few sustainable academic paths, and we need to give postdocs the tools it takes to build a viable long-term career.

Existing NIH policies, programs, or resources

The minimum pay for postdocs on a NIH grant should be lifted to at least 75k. The only way to significantly move the bar on a national level is paying people more, from the main source of funding that everybody applies to. At the same time, this needs to not cut into other resources on grants that are meant to fund research laboratories. There needs to be a real increase in funding, specifically to provide a sustainable income for postdocs in the US.

Proven or promising external resources or approaches

Industry postdocs last for a promised period of *only* 3 years, explicitly tie into career development at a company that can *actually* promise them a job at the next level, and are paid much better than academic postdocs despite not being as high as other full-fledged industry scientist positions. Personally, I feel this is the best model for the NIH to emulate for the next generation of doctorates who will emerge from graduate training and consider an academic postdoc to be an increasingly untenable position in the current environment for professional research in the US.

Response 23

Perspectives on the postdoc roles and responsibilities

No Response

Fundamental issues and challenges

Clear understanding by the NIH reviewers on the differences between MD's and PhD's views, and pathway involving research when involved in a post-doctoral research fellowship program. PhD's definitely will understand and be motivated about research. MD's might be or may be more interested in that residency spot. Also MD's path may take a lot longer specific to research funding (i.e., 6+ years for a surgeon versus 3+ years for a PhD)

Existing NIH policies, programs, or resources

Ecosystem could be improved by providing at least 5% salary coverage for the main mentoring faculty.

Proven or promising external resources or approaches

No Response

Response 24

Perspectives on the postdoc roles and responsibilities

An indulgence for the wealthy. A financially disastrous decision for everyone else. We are hyperqualified, exploited workers, coming with a bachelor's and a master's degrees, and a with a PhD, we are NOT trainees after all those years and qualifications.

Fundamental issues and challenges

Salary. It's disgracefully low, and it should be at least 200-300% higher. Also, no retirement benefits: You're actively taking from our present and our future.

Existing NIH policies, programs, or resources

No Response

Proven or promising external resources or approaches

No Response

Response 25

Perspectives on the postdoc roles and responsibilities

It's an opportunity to gain extra skills, and enhance skills such as writing, grant preparation, to pave way for a future research career; or to find out whether a research career is a good fit before faculty job applicaiton.

Fundamental issues and challenges

I've been blessed with good postdoc positions that meet my expectation: gain a new skill, learn a new neuroimaging technique, network, writing, publish.

I know others are not so lucky that they spent too much time in data collection, and no time to write and publish.

Overall quality of life: Most of us are over-worked, some weeks I work > 80 hours/week.

Definitely low pay given the qualifications and education.

Existing NIH policies, programs, or resources

Raise salary

More paid holidays, as some institutes don't even have federal holidays off.

Proven or promising external resources or approaches

Improve career paths/options for doctoral/postdocs. Encourage other fields such as industry to recognize the value of doing a postdoc, so to ease the pressure of getting into academia.

Response 26

Perspectives on the postdoc roles and responsibilities

As an incoming postdoc in June 2023, I view postdoctoral position as a transitional stage in my career from being a student to run your own lab. I do though see it as an employment based work, not fully training phase as I will be relying a lot of my prior training to implement in the new lab. Yes, I would strengthen some of the skills however lots of them would be just continuation of my work in another lab until I am deemed independent enough to start my own lab.

Fundamental issues and challenges

Even though I am choosing a path to do academic postdoc, the quality of life of my family will decrease. While I am at the institution that provides subsidized housing and childcare, moving to the next position without help with rent or childcare cost will immensely impact our personal life. I think the biggest issue is low pay for the fact that postdocs are highly skilled employees who hold highest possible educational degree and are being compensated almost at the same levels as researchers without a lot of research experience.

Existing NIH policies, programs, or resources

I suggest that childcare supplements are extended to all available fellows including programs like NCI F99/K00 Fellowship. It is a huge disadvantage that neither F99 nor K00 fellows are not eligible for the supplement: https://grants.nih.gov/grants/guide/notice-files/NOT-OD-21-074.html

The amount of supplement given also could be increased

The other solution could be setting the minimum postdoc salary based on cost of living in certain places. As someone who lived in Virginia where minimum NIH postdoc salary gives enough financial support, it is not enough in places such New York, Boston or San Francisco. I think we should not make people choose where to do postdoc based on the fact where they can afford living, but where they can do exiting science and have a good training.

Proven or promising external resources or approaches

No Response

Response 27

Perspectives on the postdoc roles and responsibilities

No Response

Fundamental issues and challenges

Biggest challenge is relatively low salaries in science, especially academic research, and the "pyramidal" structure that makes it so difficult to succeed. Our trainees look at us and say no thanks.

Existing NIH policies, programs, or resources

We have had several postdoctoral fellows decline T32 positions in the last couple of years due to the insurance issues. At my current (and last) institution fellows who went on a T32 essentially were no longer university employees, and lost a lot of insurance/disability benefits. Some of these the institution could make "whole", but many they could not restore. For example, insurance companies don't sell individual disability. This category switch also affects eligibility for university child care. When I was a fellow >20 years ago, I was going to have to turn down a T32 because I would have lost my childcare and family insurance would have been reduced. My university found ways to make exceptions, but it required a lot of paperwork on my part. Things have not improved for fellows today.

Proven or promising external resources or approaches

No Response

Response 28

Perspectives on the postdoc roles and responsibilities

The Postdoctoral position should embrace further research experience after the Ph.D., with additional training in grant writing, mentoring of undergraduate and graduate researchers, and presentation skills.

Fundamental issues and challenges

The current situation traps people in the Postdoctoral position for too long.

Existing NIH policies, programs, or resources

The number of Postdoctoral positions should be reduced. This initiative is looking to solve a problem that does not exist. With fewer persons in the Postdoctoral programs, salaries can be increased and time of service reduced. To repeat, the current decline in numbers is a good thing.

Proven or promising external resources or approaches

See above

Response 29

Perspectives on the postdoc roles and responsibilities

No Response

Fundamental issues and challenges

No Response

Existing NIH policies, programs, or resources

Make NRSA grants open to non-citizens. There are lots of talented candidates out there.and if we bring them here, they strengthen our scientific infrastructure (since they often want to stay).

Proven or promising external resources or approaches

No Response

Response 30

Perspectives on the postdoc roles and responsibilities

Postdocs are generally the main idea makers in the lab. They are also the workhorses are they are vastly underpaid. 55k for 50-60 hours of work is horrible compared to industry.

Fundamental issues and challenges

Postdocs are generally abused. This is especially true for foreign postdocs. See above as well. The pay is absurd.

Existing NIH policies, programs, or resources

Increase base salary for postdocs and increase the amount for an R01

Proven or promising external resources or approaches

See the industry. Also, dont vote republican.

Response 31

Perspectives on the postdoc roles and responsibilities

A time to build a foundation for research before having more responsibilities added such as teaching

Fundamental issues and challenges

Timing during reproductive years for child bearing people.

Under a T32 if a person has a child and needs to take leave their spot/funding is not paused for them. This is a barrier for people who want to have a family as a post doc because these programs often overlap with reproductive years.

Having to move

If it is not likely the post doc will lead to a job it is difficult to move for a 2 year position especially if you have a spouse and a family.

Existing NIH policies, programs, or resources

Pausing funding clock for maternity leave

Pausing funding clock for medical leave especially for disabled fundees

Proven or promising external resources or approaches

No Response

Response 32

Perspectives on the postdoc roles and responsibilities

A temporary job that helps with the transition to an independent position. Additional training period after PhD to learn new skills and decide a research direction.

Fundamental issues and challenges

Much lower salary compared to industry. Long work hours and high stress due to the competitive academic job market. Extra pressure for non-US citizens due to many NIH grants limitations.

Existing NIH policies, programs, or resources

Remove the requirements of US citizenship or permanent residency of NIH training grants. Increase the minimum salary for postdocs to be comparable with industry.

Proven or promising external resources or approaches

Incorporate individual development plan (IDP) into postdoc training. Postdoc salary should not all come from a lab but more from an independent organization (e.g. funding agency, university) to make sure enough autonomy for postdocs for career development rather than being used as staff by PIs.

Response 33

Perspectives on the postdoc roles and responsibilities

This should be a period of training to gain new skills and experience beyond a graduate degree (Ph.D.). This training should prepare a researcher for positions in academia or industry, as well as other pursuits.

Fundamental issues and challenges

I am at the [redacted for anonymity], where the postdocs and graduate students unionized and went on strike in November and December of 2022. It is difficult or impossible for these trainees to afford to work in places like California, New York or Boston, where the cost of living has become prohibitively expensive. This may be why many current Ph.D. program graduates are seeking scientist positions in industry. This will affect the ability of academic institutions to recruit faculty to train the next generation of scientists. Other countries, e.g. Germany, China and Switzerland have solved this problem by increasing stipends for both graduate students and postdocs. Some private postdoctoral fellowship agencies have increased their stipends and the NIH should do the same.

Existing NIH policies, programs, or resources

Increase stipends depending on geographic economics. Look at the UAW agreement that the [redacted for anonymity] made in December 2022.

Proven or promising external resources or approaches

Our institution have made significant improvements for postdoctoral mentoring. However, this will not help recruitment without increased stipends.

Response 34

Perspectives on the postdoc roles and responsibilities

I'm writing as a recent postdoc (2015-2017), ESI faculty, and also now member of leadership for two different T32 programs. A T32 postdoc is a particularly fortunate one, as your job is to figure out your own research program not inherently work to further the agenda of the R01 PI (for example). I was fortunate enough to benefit from several T32s (predoc and postdoc), and now that I've been recruited to lead them as an early Associate Professor faculty member, I'm realizing how leading them are acts of altruism because leadership is unfunded or underfunded.

Fundamental issues and challenges

Granted, this issue is exacerbated in the Bay Area, but postdocs via NIH are reimbursed at $50-60k/year, but if you have a kid or two the poverty line for a family of 4 is around $120k. Childcare costs $3000k/month per infant/toddler at the university-affiliated daycares. Living far enough away to find affordable housing and childcare means long commutes to take advantage of in-person training opportunities. Choosing to do a postdoc if you have or want a family is no longer a rational choice, and often only available to the most-privileged applicants. Groups may aim to supplement funding, but this not universally available.

Existing NIH policies, programs, or resources

More money is needed. Please raise NIH postdoc salaries, adjust for cost-of-living, and match childcare, transportation, etc. costs to those in the community (e.g. current postdoc allowances for childcare only cover 0.5-1 month of childcare out of 12 months of the year). Additionally, add childcare costs to allowable expenses for travel to attend conferences.

In addition, please add financial support for fellowship leadership and staff—its hard/impossible to administer good fellowship programs in soft money environments without funding! It's literally an illogical choice without funding, because it becomes time stolen from other places (like R01s) or family.

Proven or promising external resources or approaches

None of the rest of this is relevant without adequate funding of postdocs and administrative staff.

Response 35

Perspectives on the postdoc roles and responsibilities

Post doctoral training is meant to be a time when researchers are most productive. This is the time during which academic track researchers transition from being trainees to primarily mentors, as they often work closely with techs and mentor grad students. It is also a great time for people to explore a new field/new direction after their graduate training.

Fundamental issues and challenges

Academic postdocs are some of the most highly trained and undervalued workers in my opinion. Non-academic postdoc postions pay 2-3 times what an academic postdoc pays, and often feature shorter hours and higher benefits. Also, postdocs at most positions have little support through maternity leave etc, which is critical at this time in most birthing people's careers since this is a natural time for having kids in most careers. If these things were addressed, I think retention would be higher.

Existing NIH policies, programs, or resources

Increased postdoc salary.

Proven or promising external resources or approaches

Talk with unions like the [redacted for anonymity] union that represents postdocs.

Response 36

Perspectives on the postdoc roles and responsibilities

This used to be the necessary step prior to the faculty position.

Fundamental issues and challenges

I am overworked and underpaid. This career track does not make any sense anymore, compared to going to industry. It is time to check the reality.

Existing NIH policies, programs, or resources

Funding! What would one expect with the decreasing resources? Again, please check the reality. My opinion doesn't matter, the fact matters.

Proven or promising external resources or approaches

Check the average US salary and working hours (degree adjusted). You will get all your answers.

Response 37

Perspectives on the postdoc roles and responsibilities

essential job that is a stepping stone to an academic position.

Fundamental issues and challenges

Salaries are no longer competitive with industry and government positions. Its very difficult to offer to write a postdoc with someone and have them say they simply cannot live on the allocated NIH stipend. My lab often runs on a shoestring and I rarely have adequate funding to top off the salary.

While the allocated child care supplement was a wonderful addition, the allocated amount does not even approach the actual cost of child care which often is $1000/month.

Existing NIH policies, programs, or resources

If child care costs were expanded, that might be enough to make up for the low salary.

Proven or promising external resources or approaches

No Response

Response 38

Perspectives on the postdoc roles and responsibilities

A post doc is a time to work with a new mentor, patch holes in your knowledge, learn to manage your own time and scientific projects, and grow towards thinking about lines of inquiry rather than paper-level questions.

Fundamental issues and challenges

Post-docs make less money than a masters-level staff member. Because of NIH funding guidelines, it is really hard to get your university to allow you to pay them more. Post-docs are often at an age where they are starting families, and the post-doc salary is simply insufficient for this. The current state of funding for faculty, where there is a soft money environment and no guarantees, and the difficulty in transitioning between industry and academia, means that it is not necessarily worth it to try for an academic position, even if someone is competitive for a tenure-track position.

Recognize that the system is set up to be reasonable for the goal of being the "breadwinner male scientist with a stay-at-home wife working under the assumption of 30% paylines" and not the reality of "dual career families forced to train where childcare is super-expensive and that are far from relatives who could help, for the hope of competing for grants under [sentence incomplete].

Existing NIH policies, programs, or resources

Pay them more. Commit to funding people, not projects? Don't allow universities to train more Master's students as money-making endeavors. Increase the size of NIH grants so that success isn't dependent on the use of unpaid student labor or underpaid postdoc labor?

Proven or promising external resources or approaches

Pay them more. Commit to funding people, not projects? Don't allow universities to train more Master's students as money-making endeavors. Increase the size of NIH grants so that success isn't dependent on the use of unpaid student labor or underpaid postdoc labor?

Response 39

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral trainees as an essential part of our scientific and academic community, now and in the future.

Fundamental issues and challenges

There are many challenges facing postdoctoral researchers including rising housing costs, realities of dual income households with or without children, family leave policies and challenges within long term academic careers(funding, position availability, low salaries in high-cost environments). Trainees are unfortunately also facing high levels of student debt as well.

Existing NIH policies, programs, or resources

Expand flexibility with family leave policies for men and women. Continue to increase salary and benefits such as child care stipends, travel, or other funding categories. Expand housing options or programs (if possible). Continue to grow and develop support systems for women and underrepresented communities in science.

Proven or promising external resources or approaches

Sponsor programs geared towards engaging high school students to join scientific communities (and eventually move into postdoc positions). Continue to grow and develop support systems for women and underrepresented communities in science.

Response 40

Perspectives on the postdoc roles and responsibilities

Postdocs are often the main source of expertise in a lab and offer mentorship to grad students and technicians. In addition, the scientific expectation is that they will be independent and produce significant output that will put them on track to a PI position (typically).

Fundamental issues and challenges

Postdocs have effectively no recourse in cases of poor or abusive mentorship. There is no option of "quiet quitting" as it will only hurt the postdoc themselves. In addition the stipends are completely out of touch with basic cost of living as well as a reasonable expectation of quality of life. Postdocs are often making

not much more than technicians in a lab while having vastly more experience and expertise. The NIH needs to update its support system for postdocs by first adopting the same salary scale it uses for all other positions that accounts for geographic location; it's absurd that postdocs across the US receive the exact same amount from an F32. Additionally, there needs to be greater support of postdocs in toxic environments. Support for shifting labs without penalizing that time lost when considering early investigator status would go a long way towards helping postdocs. Grants overall need to be larger as well. Even supportive PIs may feel financially unable to increase postdoc pay without cutting lab sizes.

Existing NIH policies, programs, or resources

See above for suggestions on increasing grant and fellowship amounts.

Proven or promising external resources or approaches

Any resource that connects postdocs with mentors beyond their PI would be super useful. Currently, postdocs may be forced into labs that have poor training environments that could leave them out of the loop when it comes to planning for the next steps.

Response 41

Perspectives on the postdoc roles and responsibilities

Postdoc position is a training position that will lead either to a tenure-track faculty position or a higher level industry job. If it's the second it should be limited in time. A postdoc has many roles and responsibilities from designing and executing experiments independently, writing papers and grants, mentoring students.

Fundamental issues and challenges

Postdoc salaries are very low compared to industry jobs. It's ok to be lower since they are a training position but postdocs already have a PhD and the current NIH cap for their salaries is extremely low and I can see why PhDs don't want to do a postdoc. The NIH also puts a lot of limitation like how many years after PhD to apply for fellowships or they are not allowed to be PIs in grants in some institutions. Basically they do most of the work but they are the most dispensable in academia and their future is very uncertain.

Existing NIH policies, programs, or resources

K99 or other awards that have time limitation should be lifted. Salary restrictions especially if you receive a fellowship should be restricted. Most importantly the $250k modular budget for R01 is not enough to support both highly qualified postdocs and reagents/supplies. Without increasing the budget we will have to do less research either because we will not be able to pay for salaries (if postdoc salaries increase) or we won't be able to find good postdocs (if salaries remain so low nobody will stay in academia for a postdoc).

Proven or promising external resources or approaches

Postdocs are usually at an age that they start having families and children. NIH and universities should do something to support postdocs for housing and for daycare costs like other developed countries do.

Response 42

Perspectives on the postdoc roles and responsibilities

I view the academic postdoc as a potentially valuable, enjoyable, and transformative phase of a scientific career. It is a time to learn new skills and make new connections that are important for becoming a professor or industry researcher.

Postdoctoral scholars also make huge contributions that benefit everyone else in the academic system, including the PIs and younger mentees. **Research would not function without them!** We need people who are well trained and can devote nearly 100% of their time to research (and the training and mentoring that research involves) without other administrative duties.

But postdocs are also underpaid and often taken advantage of.

Fundamental issues and challenges

No Response

Existing NIH policies, programs, or resources

For NRSA felllowships:

- Higher base salaries
- Salary adjustments for local cost of living
- Wider eligibility

Proven or promising external resources or approaches

No Response

Response 43

Perspectives on the postdoc roles and responsibilities

I believe in what I think is the classic view of doing a postdoc. It is to receive more training (preferably in a new field/research topic or majorly different research approaches to a similar problem) and to show real ability to become independent, to gain more experience as a mentor and nowadays to also obtain some real teaching experience

Fundamental issues and challenges

I am a NIH T32 director (for 15 years). For us, postdoc applications have been going down even before COVID. Some of it is salary and some of it is—kids see faculty struggle for funding and don't want to go there. I think life balance has become a bigger deal—which is balanced with what is perceived as a low salary and too much time focused on career success. I also think they view postdoc outcomes as being a faculty member. If there was a way to create NIH funded postdocs that were one some sort of track to industry, government or other non-academic careers that might attract more applicants.

Existing NIH policies, programs, or resources

For T32s—you should let them have at least some of their postdocs be NON-citizens. There is a large talented workforce there—and frankly many are willing to work harder to US postdocs.

Proven or promising external resources or approaches

Some people here are trying higher salaries. We tell the university that broader efforts are needed—but here the focus is (too much) on graduate students.

Response 44

Perspectives on the postdoc roles and responsibilities

The academic postdoc is position to expand my network and develop a research program that will empower me to progress towards an independent career. That's of course not guaranteed. If I hit the end of the line without securing an independent academic position, I will have considered this time a great waste of my time with respect to my peak earning years.

Fundamental issues and challenges

Sexual harassment and the inability or unwillingness of universities to take action against PIs who garner millions in grant funding. Relying on institutional enforcement of title IX just doesn't cut it. Academic institutions protect their PIs, not their students. In line with this, the need for letters of reference for virtually everything.from PIs who have engaged in sexual harassment against trainees needs to stop.

Financial incentives. I had to take out 12K in student loans while I was a graduate student to pay income taxes on health insurance. This was on top of 46K for undergraduate. My rent at the time was $1250 for a room in a house with 8 other people with no access to a kitchen. Why doesn't training qualify for student loan forgiveness, except through special programs? Since we are typically paid from non-profits we should quality. But our status as "contractors" prevents this. Similarly, if we become disabled tomorrow we wouldn't qualify for disability because we aren't paying into social safety programs. Nor are most of us

getting retirement benefits. As trainees we already make far less than we would on the fair market, and the lost income is money we will never recover in our lifetimes, placing us a decade or more behind peers who skip the slog to an academic position. At the same time, places like Temple are financially punishing students for speaking out for their own best interests. Either we are students on fellowships and get money to study. Or, we are employees who get paid to work. Refusing to pay fellowship money because students refuse to work is criminal, given we're not employees. If we are employees, pay into the social safety net and give us retirement benefits. Put policies in place that let us break even, financially.

Existing NIH policies, programs, or resources

Find a way to protect the trainee. Having a PI who has all the power is not the way to retain scientists. Sexual harassment is a serious problem. The mental trauma that sexual harassment causes aside, it's likely I will never be able to circumnavigate the PI who fired me "if you don't like it, leave" for asking them to stop flirting with me. PIs have way too much power over the fate of their trainees. The NIH can't just put the onus for managing bad PI behavior on the institutions because the interests of the university aren't tied to the interests of the student.

Proven or promising external resources or approaches

Stop funding of PIs whose students are driven out of science altogether. During my tenure in one such lab, it received two MAJOR grants from the NIH, including one R01 and one larger grant. Yet the papers reported on NIHReporter for those grants, which have now ended, had nothing remotely to do with the grant's specific aims. Essentially, all output from the lab was cross-posted to all grants that had been secured. The NIH MUST enforce completion of proposed work. There should be a general alignment with the proposed research and the output accepted on NIHReporter. Where there is not, stop funding the PI! Otherwise, the PIs who are good at securing funding run projects that never get finished. That work never gets published, and if it does, it doesn't get published on the timeline trainees need to advance their careers. These labs are where careers go to die, and the NIH needs to find a way to stop funding them.

Some PIs expect their trainees to write ENTIRE grants for them. The NIH should require that the PIs write their own grants (or through paid science writers), rather than relying on their trainees for these functions. It is never in the student's best interest to write an NIH grant for the PI, not even segments of them. Writing fellowships in which the trainee is the PI is the only acceptable way students should be permitted to gain experience with grantsmanship. In other words, the NIH must do something to protect the student's best interests because many PIs will not.

Response 45

Perspectives on the postdoc roles and responsibilities

The postdoc position is (should represent) an opportunity to explore an entirely new research area while (as part of) developing a future independent research program. The postdoc position (to me, with some exceptions) should be for individuals who wish to remain in academic science as future principal investigators (or senior scientists that the NIH needs to increase mechanisms for funding). In addition, the dearth of postdoc trainees presently is largely a function of insufficient salary support, research support options, and reasonable assurances of future career progression.

Fundamental issues and challenges

Money. To think that someone with an advanced degree proving/supporting they are a singular expert in a particular field (represented by their dissertation) is only worth $45-60K per year is absurd. Union laborers at general contractor/construction firms make $25+/hr starting in middle American markets (this equals $50K/year at 40 hours per week. To be sure, those individuals aren't staying up to read the latest issues of engineering publications (in contrast to the sometimes all consuming rigor of many postdocs reading their literature, writing papers, writing grants, analyzing data, etc). The postdoc experience is an absurd joke and that the NIH sets the minimum (but by proxy standard) salary at a wage provided to unskilled labor is an additional absurdity. [Union labor deserves this wage and perhaps more which is not to defray from the mockery of pay for skilled labor at the postdoc level.]

Existing NIH policies, programs, or resources

More money, more F and K funding opportunities (expand eligibility to >5 years experience for K99/K22). In addition, the NIH (and therefore US Congress) needs to increase the standard R01 budget to probably

$500K-$1M per year while incentivizing older PI's to retire and/or institutions to expand the number of faculty positions offered per year. Paylines also need to be increased to 25-33%-ile while standardizing scoring criteria across study sections and reviewers (need to decrease score compression!!!). NIH needs to expand the R50 mechanism to all IC's.

Proven or promising external resources or approaches

Decrease emphasis on F and K proposals on mentor experience. Expand F99/K00 program and increase/expand availability/rates of K99/R00 and DP2/5 opportunities. You know what the answer is, giving postdocs more money to live and more money to do their work. This is easy to understand. Now lobby congress to expand NIH and NSF budget not by percent but by fold-change.

Response 46

Perspectives on the postdoc roles and responsibilities

Post-doctoral training should serve two goals:

1. To provide advanced training post-PhD, preparing the trainee for a future professional career, in either academia OR industry. There is no reason to assume that a post-doc must lead to a position in one or the other.
2. To provide an opportunity for the trainee to observe what it is like to be a PI, without having to carry the responsibilities of being one, and be able to make an informed decision on whether they aspire to such a role or not.

Unfortunately, these goals are not served in the current post-doctoral environment--the vast majority of PI's use post-docs as cheap labor, and provide little to no career development opportunity.

Fundamental issues and challenges

Post-doc salaries need to be competitive. The antiquated notion that post-docs can be paid minimum wage because they will work for nothing in the quest for a faculty position, is silly. If post-doc salaries are not competitive with industry salaries for fresh Ph.D.'s, the best and brightest will begin gravitating away from academic positions at an early stage, perhaps as early as college. Post-docs also need to be seen as role models for younger students. If they dont have positions that students see as aspirational goals, the result will be a degradation of post-doctoral quality and eventually faculty quality. NIH can easily fix all this by simply making the minimum post-doc salary today $100k, and adjust it for inflation every year, with a 5-year level-set review.

Existing NIH policies, programs, or resources

Make the post-doc position serve more than just academia. Provide opportunities for post-doc programs in collaboration with the industry, and with government/regulatory organizations.

Proven or promising external resources or approaches

Honestly, the NIH need look no further than Faculty recruitment, training, mentoring and job satisfaction profiles at tier-1 schools, and apply them objectively to post-docs. As a faculty member I am shocked at how disparate these programs are. Schools know that their best faculty will leave if they dont treat them fairly. They need to apply the same principle to post-docs. NIH can make them do so.

Response 47

Perspectives on the postdoc roles and responsibilities

I am tired of being considered a "trainee" I am a professional research scientist, all be it of a junior position, but I am not a student, I am not a trainee. Postdocing is an entry level position in academia and it should be considered as such. It feels a little insulting that we're considered trainees when in reality we are; doing research, writing grants, training undergraduates and grad students, teaching, outreach, and fundraising under the supervision of a boss.

Fundamental issues and challenges

The knowledge that an international postdoc does not have the same level of access to career development as a US citizen is disheartening, despite knowing international postdocs make up the majority of postdocs in the USA, and therefore the bulk of the work. The NIH is happy to take us as cheap labour and unwilling to allow us to develop our careers to the same extent. We literally CANT stay in academia here!

Existing NIH policies, programs, or resources

All postdocs should be treated the same, end the second class nature of postdocs on J visas. Very few countries in the world have these restrictions, the UK, Canada, Australia, Japan, New Zealand. The restriction on non-permanent residents applying for F, K and R awards puts US science in a less sure footing than other nations. A system that embraces the best in awards rather than bias passport or residency produces better science and better value for money in that science.

Proven or promising external resources or approaches

I find this question hard to answer when the reality of the situation is I can't really tell people to come to the US and train as a postdoc knowing I'm bringing them into an unequal system where they will not have the same chances in their careers because of the passport they own. All of that overrides job satisfaction, mentoring, working environment etc. You can't mentor your way out of visa restrictions.

Response 48

Perspectives on the postdoc roles and responsibilities

The academic postdoc provides an early career investigator the opportunity for continued mentorship, access to data and opportunities to grow one's research program and portfolio deeper and/or broader, and more time to publish and submit grants, on the path toward independence in research.

Fundamental issues and challenges

The financial pressures faced by early career investigators have reached a tipping point; given the phase in life that many postdocs find themselves in, they are coming off of several years of living off of miniscule graduate school stipends, negotiating several moves to relocate for research opportunities, while simultaneously making family planning and other personal life decisions. No longer are people willing to sacrifice financial and living stability to pursue these training options, particularly when there are so many other avenues that can be pursued in private industry. Put another way, the ability to sacrifice financial and personal/living stability in pursuit of these underpaid research opportunities is a privilege that only some have, and most cannot absorb this risk. Pressures from covid, remote work arrangements, and inflation all contribute to the problems related to quality of life for postdocs. We have seen a noticeable decline in postdoc applicants over the past several years, and I have heard the same from colleagues at comparable institutions.

Existing NIH policies, programs, or resources

Put simply, the stipend levels set by NIH must increase at a substantive rate. These are doctoral level individuals with talents and expertise who are paid at the same rate as the bachelor's level research assistants we hire. It's not acceptable, but even for non-NIH funded fellowships, the NIH stipend levels set the amount for all of the fellowships in our training program. Also to add that grant budgets must therefore be increased to accommodate the increased salary/stipend for fellows. It remains a mystery why budgets for any of the R-level grants have not changed at all in the 20 years that I have been an independently funded investigation. Setting the stipend level is one thing, but also providing the funding to support the infrastructure to pay postdocs at that level is another.

Proven or promising external resources or approaches

Funding.

Response 49

Perspectives on the postdoc roles and responsibilities

I enjoy very much my work as a neuroscientist and postdoc, but have several concerns with my role and career, and these concerns are widely shared by other postdocs I interact with. Most importantly

1. the narrowness of the academic career trajectory and its competitiveness and
2. the various ways my university avoids recognizing my value by treating me as a trainee rather than an employee

Fundamental issues and challenges

As far as I understand, the career trajectory of all academic researchers is intended to be PhD student > postdoc > lab head. I'm told that even if you do want to run your own lab, this path is very competitive. So what are the alternatives that would give postdocs a safe backup career option while remaining in academic research? This uncertainty and dread of making the next career stage weighs heavily on myself and other postdocs. It would be nice if I could imagine a future where if getting a faculty position doesn't work, I could just work as a competent lab professional. I'm told that the lack of these positions is dictated by the NIH requirements for labs' budgets when giving grant money. I'd love to learn more about this and why it's the case.

Universities routinely treat postdocs (and graduate students) as trainees, allowing them to devalue my labor, since I'm lucky to be working here at all and getting this training. While I don't find my compensation to be unfair, our benefits aren't very good, and my status as a trainee prevents my employer (the university) from really recognizing my work (or that postdocs run this place). This lack of recognition affects morale, and many postdocs do in fact consider our compensation to be inadequate, and are trying to organize a union as a result.

Existing NIH policies, programs, or resources

Particularly for my first concern, I would love to understand whether it's true and in what ways the NIH discourages labs from hiring / paying staff scientists outside of the traditional student > postdoc > PI route through control of budgets. If this is the case, I'd appreciate this hugely impactful policy decision being explained in some way. I can't stress enough how much it weighs on postdocs and what a common topic of conversation it is that I hear.

Proven or promising external resources or approaches

No Response

Response 50

Perspectives on the postdoc roles and responsibilities

Postdocs are essential to keep the lab running and to accomplish research goals. After cutting of training grants for graduate students we have very few students for many labs in our graduate program, plus graduate students take a lot of training before they are able to contribute. So we have to rely on postdocs. Postdocs are already experienced in basic lab techniques and lab planning, and get much more done than the students. They are in a phase to gain more independence and to start thinking about their own interests and directions and thus bring the necessary discussion to the lab. Because they come from different backgrounds they also bring different viewpoints which again is essential for a fruitful discussion and a viable research program. Without postdocs a lab becomes a nice teaching enterprise, but it would be really hard to get research done.

Fundamental issues and challenges

The perspectives for postdocs are not wonderful in terms of the number of faculty positions. Good postdocs go to large, established labs to increase their chances to be competitive. For young labs it is almost impossible to get US postdocs, and we have to rely on postdocs from India, China, etc. As far as I know there are no NIH programs for non-US postdocs, and very few of the private fellowships are available for non-US postdocs so we have to pay all of them from R01 type grants. This leads to the young labs who already have difficulty recruiting postdocs also having to rely more heavily on grants to be able to afford them, while the large labs have the good postdocs who can bring their own funding.

Childcare is an ongoing problem. Especially for international students, PhDs have gotten longer (and are typically started after a Master's) and postdocs have gotten longer (in order to be competitive), and many will want to start families while still at a postdoc position. Childcare in the US is so expensive that I have seen several of my fellow postdocs at the time quit because childcare for 2 children was more than a postdoc stipend.

Existing NIH policies, programs, or resources

Include foreign postdocs for consideration for F32s.

Make smaller postdoc grants for meetings and small independent projects so they can gain some independence even if they don't get a full fellowship.

Make R01-addon grants that postdocs can apply for to propose their own research that touches on/synergies with the main research project.

Proven or promising external resources or approaches

No Response

Response 51

Perspectives on the postdoc roles and responsibilities

Postdocs are the major workforce in my federal funded projects.

Fundamental issues and challenges

Low salary stipend comparing to industries, fewer faculty positions available in the market, job security, NIH grant with a modular budget (R01) is insufficient to support a postdoc to complete a project.

Existing NIH policies, programs, or resources

Increase budge, or additional support for postdocs for funded project.

Proven or promising external resources or approaches

No Response

Response 52

Perspectives on the postdoc roles and responsibilities

The postdoc is a term of learning new scientific skills and demonstrating mastery of the scientific method and the business of science (experimental question selection, paper writing, funding acquisition, networking/communicating work). Once optional, a postdoc of 5-10 years is all but required for a successful tenure track faculty application. At any time, factors completely out of the postdoc's control can derail an academic career (negative result, unfashionable question, personal illness, family finances, PI's funding, PI's support). It is a highly uncertain undertaking that is being challenged by a growing biotech industry where increased personal agency in building a career is becoming more attractive.

Fundamental issues and challenges

As an F32 and K99 recipient in a high cost of living area ([redacted for anonymity]), the finances of a postdoc and junior faculty member (who is expected to hire and train graduate students and postdocs) just doesn't make sense. The F32 increased my tax liability (health insurance costs became taxable), and the K99 improved my salary without increasing my tax burden, but not enough. I had a child during my K99 period, and I was grateful for the opportunity to have an administrative supplement for a technician, but the increased costs of childcare ($3000/month at [redacted for anonymity]) and a mentor who was not supportive of extra flexibility after childbirth, and who actively sought to keep me as a postdoc to work on his grants instead of supporting my move to an academic or industry position, was demoralizing and harmful. I ended up taking a medical leave for mental health reasons. There are few checks and balances to the 'trapped' feeling of being tied to a poor mentor for an entire academic career.

Furthermore, the lack of support from NIH for junior investigators also contributed to my decision to seek employment in industry. The modular R01 hasn't changed in decades, yet postdoc and grad student

salaries are (rightfully) increasing. The 'publishable unit' for papers has also substantially increased, and experimental supplies are also vastly more expensive than they were in the '90s when the modular R01 was last changed. These strains and barriers to probable success made me decide not to pursue a tenure track job despite my K99/R00. I see this as avoiding a huge amount of stress that would also require a move, likely away from my support network of family and friends.

Existing NIH policies, programs, or resources

Change the F32 to be administratively like the K99/R00, so that postdocs do not either lose healthcare or have to pay tax on healthcare expenditures. Get rid of the payback clause in the F32—life circumstances can change drastically for anyone, and forcing someone who may be financially unable to pay back up to a year of salary to stay in a job far from family or in spite of personal circumstance is nonsensical.

Increase grad student, postdoc and junior faculty stipends/salaries. This has to be a financially viable career choice to make it more appealing than industry. This also means the modular R01 must be substantially increased to accommodate the true personnel and supplies costs of doing high-quality scientific research.

Encourage postdoc-to-PI pathways at the same institution. Postdocs often have young families, and moving to different cities away from support networks at each career stage is a huge disincentive to staying in academic science.

Encourage or reward publications (in study section, hiring panels) that are smaller in scope (faster time to end of postdoc) or are multi-first author. The idea that a single postdoc spearheads often huge papers depending of the field encourages postdocs to stay 6+ years in a lab, which is too long at too low of a salary to comfortably bear. PIs often do not support postdocs going on the job market before a work is published, further delaying job seeking that requires this letter of support.

Proven or promising external resources or approaches

Postdoc-to-PI pathways that encourage retention at the postdoc institution. The postdoc will have some hope of stability at an earlier stage in an academic career.

Response 53

Perspectives on the postdoc roles and responsibilities

A post doc is protected time to continue to establish your program of research before beginning a tenure track position. This time should be hyper focused on developing/ refining needed skills, getting out publications, and highly mentored grant writing experiences. I think when working with a mentor whose program of research is closely aligned with the post doc leads to the best development opportunities

Fundamental issues and challenges

Timelines for applications vary substantially for institutions. Requiring applications too early can be difficult for applicants to know if they will actually be ready to start the post doc (ex: asking for applications in the fall for a post doc start the following fall—will the applicant finish their PhD in that time?).

Inconsistency in institutional post doc offerings—post docs often tied to grant funding so institution has a post doc position for this year and next, but not the following year. Investigators and PhD students cannot make long term plans

Lack of information about available post-docs—I rarely found post doc positions listed on institutional websites

Existing NIH policies, programs, or resources

Unacceptably long application timelines for k awards. K awards should be on the same timelines as F awards. Post docs are far too short for the k application timeline. Applicants wait 4 months just to know if the application is discussed, and then another 2-3 to know if it will be funded. That can be half of someone's postdoc time. Resubmissions are incredibly difficult timelines to complete during the relatively short post doc period. NIH timelines in general seem quite long with nearly a year transpiring between application submission and funding hitting (if a grant is even funded the first time) that slows the progress of science.

Proven or promising external resources or approaches

No response

Response 54

Perspectives on the postdoc roles and responsibilities

A postdoctoral position basically feels like a temporary position to obtain either a tenure-track research position or a holding place to find a role outside of academia. The role is to contact high-quality, trained research under little guidance for low pay.

Fundamental issues and challenges

Low pay, bad benefits

1-year contracts that lead to job instability

A postdoc position is not needed for transition into industry roles and is really only required for obtaining a tenure track position, of which the openings of those are low.

Culture of overwork with little reward and only for the promise of publications

Existing NIH policies, programs, or resources

Increase post-doc pay line for the national average and reflect the cost of living areas. There are many post-docs in high-cost-of-living areas due to the uneven distribution of NIH funding and this is not reflected in the NIH pay guidelines.

Proven or promising external resources or approaches

Genenetech's post-doc program

Response 55

Perspectives on the postdoc roles and responsibilities

Postdoc means a protective position to get more involved in research. It also serves as a transition period towards future independent research position.

Fundamental issues and challenges

One major issue is the compensation. The current salary, though much better than many years ago, still does not reflecting the US market value. Person with similar experiences in industry has much better pay than postdoc, including better benefits and retirement packages, and yet they are functioning pretty much similar to a postdoc in academia with a better working environment (9-5 protected working time for example or overtime pay).

In addition, the lack of faculty position is another challenge for postdoc. More and more postdocs are stuck in positions like research associate that is basically another "forever" postdoc position.

A third issue is about the mentorship. In academic, postdoc is especially vulnerable to the idea of mentorship. In my own experiences, postdoc is essentially treated as a better functioned or more productive graduate student. And most postdoc rely on the mentor to have good paper published and to secure funding. Also, postdoc will need the mentor to provide recommendation letter to get promoted in academia. However, this mentorship idea can be dangerous and really works for the mentor. After all, if mentor is not satisfied with the progress of a postdoc. It is very likely that the postdoc will suffer and not end up well in academia.

I think the issues are there, and that's why postdoc are fleeing away from the academia. People should admit that postdoc is not merely a training, but a job. Overall, I think the issues are low compensation, job security, and unclear career promotion.

Existing NIH policies, programs, or resources

To address the above issues, one thing that NIH can do is to boost the NRSA recommend salary. Second, NIH can set up more diverse positions that suit postdoc scientist. I understand the fact that not everyone/

postdoc can be an independent researcher or open a lab after postdoc. But opening other permanent positions with much better pay should be considered.

Proven or promising external resources or approaches

Improving working environment and the processing of mentoring can be considered.

Response 56

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

The payback agreement is truly horrific and should be removed (I can't imagine this being legal in any other industry). It treats postdocs as indentured servants. Requiring a postdoc to pay back the money they earned if they don't stay for two years is just wrong. It's not as if the data collected or the code they wrote just gets thrown away if they don't stay two years. The PI still benefits from the work they did during the first year, and they earned and deserve the money they were paid during that time. Most people unfortunately don't know about this until after they have agreed to join a postdoc lab and have begun their F32 or T32 funding. Postdocs should not be in fear of financial ruin should they decide to leave academia before their two years are up.

Proven or promising external resources or approaches

No response

Response 57

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as an opportunity to gain additional training, experience, publications, and possibly funding, in preparation for a faculty job.

Fundamental issues and challenges

1. The postdoc positions are inherently temporary, while people with PhDs and usually in their 30s would often want something more stable
2. The salary is relatively low considering the qualifications required
3. The chances of getting a faculty job are relatively small, so one might wonder, is it worth putting up with years of low pay and lack of stability for a slim prospect of landing a faculty job (which is not stable either due to the tenure process)

Existing NIH policies, programs, or resources

I think that most postdocs should be 'self-funded' through individual fellowships, where the postdoc will have a chance to develop a new research direction under the mentorship of a PI and be able to take it with them, and the number of these positions should be consistent with the number of available faculty jobs. Labs shouldn't rely on postdoc labor and use them as skilled technicians, specific already funded projects should employ staff scientists.

Proven or promising external resources or approaches

If postdoctoral training is coupled to a clear path to a faculty position (not guaranteed but with a good chance), this could possibly make these positions more desirable.

Response 58

Perspectives on the postdoc roles and responsibilities

the postdoc is an advanced training, term-limited position for researchers to gain more experience and develop additional scientific independence.

Fundamental issues and challenges

fundamental challenges include the desire of candidate to move to big cities on the coasts and work in large labs, even though they may not be the best training environment for everyone and even though there are outstanding resources and scientific opportunities in other geographic areas.

retaining qualified postdocs is a real challenge—the best ones often leave early!

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 59

Perspectives on the postdoc roles and responsibilities

I view this position as a way to build more connections and do more science to position me for a faculty position.

Fundamental issues and challenges

Money! As a postdoc, I am making less than half of what I would be if I were to leave academia (my salary: ~$65K. Computational biology starting salaries: ~$130K). I am in my second year as a postdoc and have effectively forfeited $65K x 2 to have a small chance at a faculty job. I enjoy the science, but I would also enjoy being able to afford a house. I don't have children to support, but it would be much harder if I needed to also spend money of child care.

Additionally, I moved to Boston from LA to do a postdoc because the opportunity was better for me. Since a postdoc is a temporary position, it did not make sense for my partner to move with me. Many postdocs have to face this decision and either way it is not easy. Coupled with the higher pay, remote jobs in industry are much more attractive than postdocs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 60

Perspectives on the postdoc roles and responsibilities

I did one year in an NIH-funded postdoc program. I received valuable mentorship, hands on research experience, as well as time and support to accomplish other professional goals: publish two dissertation chapters, apply for jobs and attend a conference. My postdoc program was very flexible, in that I could design and execute my own research project, with guidance from two mentors (and others in my institution, as needed). This was an ideal arrangement for me. Lastly, although it's hard to know how others perceive this, I believe that having this postdoc training from a well-respected program strengthens my CV and will help in the future.

Fundamental issues and challenges

My situation was somewhat unusual and shaped heavily by the pandemic. I was accepted into a postdoc program in spring of 2021, and I was told at that time that while the program normally requires that

postdocs relocate, they were going to make an exception for my cohort because of the ongoing COVID-19 pandemic and allow postdocs to work remotely from another city or state. This represented a unique opportunity for me. Doing that postdoc in person would have required moving across the country. To be honest, it's unlikely I would have been able to move across the country with my partner and kids, regardless of the pandemic. Uprooting my partner from their job and uprooting my kids from their schools would have been quite disruptive, regardless of the pandemic. The fact that the postdoc was offered remotely made it possible for me to do it.

This dynamic is of course intertwined with postdoc salary. I earned just under $54,000 annually as a postdoc. As a 36 year old with a PhD, substantial professional experience and a family to support, $54,000 is very low pay. That needs to be emphasized. However, because I could do the postdoc remotely, my partner could keep their job, and I could have the benefits of working from home, I decided that the postdoc was worth it. It was a great year. Ultimately, after one year, I received an offer for an excellent researcher position and decided to leave the postdoc early and take that position. The low postdoc salary made it easier to leave, even though the professional development and flexibility of the postdoc were advantageous.

Existing NIH policies, programs, or resources

The reimbursement for childcare expenses was helpful. I would encourage increasing this to cover more of the actual cost of childcare. (I spend $2000 per month on childcare for two children.)

Also, I will note below that I think it would be advantageous for NIH to accommodate more remote postdoc positions.

Proven or promising external resources or approaches

I would strongly encourage that, for fields of study where it is feasible, NIH support opportunities for postdocs to work remotely so that they do not have to move across the country. Remote work could be coupled with regular (e.g., monthly or bimonthly) visits to the host institution for in-person interaction, which I recognize is still very valuable. For me, as a mother of two children, it would not have been feasible to move across the country to do a postdoc, particularly for the stipend that I was being offered. However, the opportunity to do it remotely made it possible. And, I still had an excellent postdoc training experience. I met regularly with my mentor and postdoc cohort over zoom, I attended presentations, and I visited the institution in person. I am not alone among new PhD graduates who do not want to relocate for a postdoc. There were 5 of us in my PhD cohort; every single one of us were completely or somewhat "geographically bound," either because of our children, our spouses, or other financial needs. I believe that accommodating remote postdoc scholars would open these postdoc positions to a more diverse group of PhD graduates, particularly those who are parents and/or those with lower to middle income backgrounds.

Response 61

Perspectives on the postdoc roles and responsibilities

The typical career paths after a postdoc are: academic career at a research institution, academic career at a predominantly teaching college/university, or industry. The postdocs already planning to go to industry have the option to go to an industry postdoc, or skip the postdoc experience altogether. Thus, they are not as much of a concern. The main issue is to support highly qualified postdocs, who want to follow one of the other two paths, but may give up due to financial or other considerations.

Fundamental issues and challenges

The number of qualified postdoctoral candidates has been plummeting, not only in my own experience, but also according to anyone I know. When everyone is seeing it, odds are that it is statistically correct. The crisis is exacerbated by the recent reduced influx of scientists from foreign countries.

The main issue is financial: salary and benefits. There are two ways to look at it. One is, how the postdoctoral salary/stipend in academia compares to what a PhD makes in industry. The comparison is of course not at all favorable. Unfortunately, we cannot expect that the NIH can raise postdoctoral stipend levels that much. Right now, a postdoc in academia is paid less that even someone with a BS working in industry. Those candidates, who go for the higher salary, will go to industry.

The other way to look at it is affordability/cost of living. What must be done is raise the stipends/salaries and benefits of academic postdocs enough that those, who want an academic career can survive. The typical postdoc is in their late 20s and 30s. They need to be able to support not only themselves, but also have a family. That is not feasible on a 55K salary, especially in large cities. Thus, the salary levels have to be increased to meet the cost of living, and adequate health care and dependent benefits must become standard. The universities may have to be required to participate in covering the increased costs.

The alternative is bleak. We will miss out on highly skilled scientists, and try to do high end work with untrained recent college graduates. And even worse, many bright scientists will choose an alternative career path and not pursue an academic research career, to the detriment of future scientific progress.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increased salaries/stipends; benefits, including family benefits; training and mentoring tailored to the different needs of the different future career paths.

Response 62

Perspectives on the postdoc roles and responsibilities

Finishing school for research training. Expand the research toolbox. Gain publications prior to writing the first independent grant and entering the job market.

Fundamental issues and challenges

The need to move themselves to another location prior to taking a faculty position (yet another move usually), particularly if there are a spouse and or dependents involved.

Pay compared to taking a faculty position immediately.

Lack of local institutional funding for post-doc positions.

The difficulty for doctoral candidates to write a F32 with a doctoral mentor who is not co-located with them at the same time that they are finishing their dissertation and possibly job searching as a backup plan to the postdoc.

Using the F32 mechanism for those with a professional doctorate (e.g., an AuD) who are pursuing a PhD sends the message that they don’t need postdoctoral training post PhD

In our field, post-docs are identified through networking rather than advertisements, which can be opaque to some candidates.

Existing NIH policies, programs, or resources

Use the F31 designation for all people pursuing a PhD and F32 only for post-PhD training.

Create a short-term funding mechanism (e.g. 1 year) that is a relatively simple application (like a diversity supplement) that would provide a PhD candidate the means to move to a post-doctoral lab where they could write a F32 within that 1st year.

Proven or promising external resources or approaches

In my field, job satisfaction for a post-doc is generally higher than for a new faculty position. It is one of the main benefits of going the post-doc route.

Response 63

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is marketed as a training position, yet for the vast majority of the postdoc we are not given the space to pursue training. I am expected to produce constantly and consistently and manage the lab, at that. I am not given the space to try new ideas and to fail, unless I do so without my PI’s explicit approval. I am constantly being told that my experiments are too expensive.

Fundamental issues and challenges

The largest challenge is compensation and benefits. I cannot be expected to operate at full productivity of an employee who would be paid at least 1.5 times my salary, yet be paid as though I am a trainee. I have explored other career opportunities and with my skillset I can be making at least double my current salary, with performance based bonuses and retirement matching, which are not provided by the university. I am also constantly expected to work more than 40 hours a week, nights and weekends, and manage the lab in addition to my research work.

In addition, there is no defined method for me to provide feedback on my mentoring situation. If I am having trouble, there is no way to hold my mentor accountable for the mistakes/problems they cause to me. Mentors should be answerable to someone at the NIH, perhaps the program officer or such.

Existing NIH policies, programs, or resources

The payscale that institutions use to set their minimum salary needs to be raised by a substantial amount. In addition, there needs to be guarantees that postdocs will get a full set of benefits. Make it a requirement that if a university takes NIH funding, they MUST match retirement contributions for their postdocs, provide good healthcare plans, maternity leave, and reasonable options for daycare for children. Moreover, put extra funding or develop a 401K type program into F32 and other similar fellowships so that the fellows do not have to take a hit on their tax-free retirement contributions during the course of the fellowships. One major problem is that F32 fellows cannot contribute the 20500 that workers paid through R01's or other grants can, they can only do the 5000 in an IRA.

Postdocs are the workforce of extramural research programs at research universities, yet they are not compensated as such. I understand that there will be some pay cut taken by participating in the academic enterprise, whose goals are not to make money. However, the pay cut cannot continue to be 50% or greater of your expected pay in industry, or the academy will keep losing trained workers.

Proven or promising external resources or approaches

No response

Response 64

Perspectives on the postdoc roles and responsibilities

I view my postdoctoral position as an opportunity to expand upon and diversify my training after honing my interests in graduate school. It allows for time and resources to learn new methods, broaden my network of collaborators, and decide precisely what I would like my career to look at in 2 years. However, at the end of the day, this is also simply a job like any other, just paid at a much lower rate than someone with my training would get in a comparable position.

Fundamental issues and challenges

Increasing stipends (as Veteran's Administrations have recently done for postdoctoral fellows by 12%) would be the primary way to immediately increase recruitment, retention, and quality of life for postdocs. Many organizations follow the example NIH sets as minimum salary for all postdoctoral fellows. Increasing this rate to be competitive with positions these skilled workers would make these positions more appealing to talented individuals who might otherwise leave academia. Graduates of doctoral programs are looking for positions after 5-7 years of low pay that often requires individuals to take out loans or rely on outside help (e.g., familial loans), which create further barriers to entry for individuals of marginalized backgrounds. Academic workers, graduate students, and faculty around the world are striking for living wages and benefits. NIH has a responsibility as a leader in scientific training programs to increase equity by raising stipends.

Existing NIH policies, programs, or resources

Expanding of diversity-related funding such as diversity supplements and individual training grants designed for diverse applicants. Further, the F99/K00 D-SPAN grant should be opened to clinical psychology PhDs, with the opportunity to pause funding during the clinical internship year.

Proven or promising external resources or approaches

No response

Response 65

Perspectives on the postdoc roles and responsibilities

A postdoctoral position means having freedom to do research that excites me. However, low pay takes out all the exciting parts of research because I have to worry about covering my grocery bill rather than my science.

Fundamental issues and challenges

Low pay.

Existing NIH policies, programs, or resources

Stipends, defined maternity leave, increase childcare alimony.

Proven or promising external resources or approaches

I have a very good postdoc which makes me very happy. However, this is not the case for everyone.

Response 66

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are the basic science equivalent of medical residents. They are well trained already but they need further training to be fully independent specialists. A postdoctoral fellow needs to be able to semi-independently conduct research and mentoring graduate students under the PI's guidance. And a significant growth in independence is expected.

Fundamental issues and challenges

The scarcity of faculty positions is probably the most fundamental problem. which severely diminish the career growth for postdoctoral fellows. The level of compensation for postdoctoral fellows is an issue but is not the root of the problem. Residents are paid low wages too, but that has never been an issue because there is the prospect of well compensated career ahead of them after the residency. There is no such of hope at the end of the tunnel for academic postdoctoral fellows.

Existing NIH policies, programs, or resources

There may be a balkanization of the post-doctoral fellowship programs. Each NIH Institute seems to be very enthusiastic to seek unique programs of their own. It becomes more confusing for both sponsors and applicants.

Proven or promising external resources or approaches

Response 68

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The NIH salary scale for post-docs no longer provides a livable wage in many US cities and hasn't been adjusted based on competition in the biotech industry and other related fields. Because of NIH pressure to do so, there is current competition amongst universities to recruit "diverse" post-docs without regard to their qualifications or likelihood of success. There is no mechanism to retain trainees from disadvantaged backgrounds for longer training periods in order to bring their skills up to par with others who have had more experience. Mentors need to be allowed to be budgeted for in NIH training grants—the days of PIs having multiple R01s enabling them to mentor for free are over. Mentorship is the critical predictor of success, and we can't budget for it.

Existing NIH policies, programs, or resources

Ideally there would be a bridge award to help the divide between completing a T32 before submitting a K award. There is a total mismatch between how T32 positions are used, and the expectations for a K. Nearly all T32 trainees are expected to work on their mentor's projects, yet a K requires them to move to independence. Rarely can a T trainee publish enough to be competitive for a K, and even more rarely can they develop their own research ideas or program. Most T-level trainees are essentially cheap labor, they are not encouraged toward their own programs of research. So promising T trainees need intermediary funded—with an adequate research budget—to collect preliminary data or otherwise pursue their research programs. The TRE in T32 programs is grossly inadequate for trainees to do much of anything—even their tuition costs aren't covered. Let's be real about the expectations—how can a trainee be expected to succeed when

1. their mentor isn't paid to mentor them,
2. their can't work on their own interests,
3. their training budget is inadequate,
4. it is nearly impossible to develop any independence to be competitive for a K, and 5. the salary doesn't even meet their basic needs?

Proven or promising external resources or approaches

The whole approach needs to be modernize. It's sorely outdated.

Response 69

Perspectives on the postdoc roles and responsibilities

A position to embark on scientific discovery in an effort to eventually become an independent researcher.

Fundamental issues and challenges

Salaries are far below what is competitive for the level of training required for the postdoc position, despite the recent adjustment in NIH salary minimums. This does not scale to the cost of living at various locations in the US. In a high cost of living area, I don't understand how someone in their late 20s—30s (without a domestic partner/spouse that has a higher paying job) can expect to afford housing (rent/mortgage/down payment), childcare (can be over $2k/month/child in some areas), and have savings at the end of each month after taxes/insurance are taken out of the postdoc salary. There is no financial incentive to become a postdoc and the bottom line is that financial resources improve quality of life. This severely burdens those with student loans, dependents, and disabilities. There is no tangible way to diversify faculty at research institutions when these burdens disproportionately affect certain groups of people. It becomes much more attractive to find jobs in non-academic sectors when the pressures and commitments of work are equivalent, but the salary is at least 3x higher and more amenable to those who want to strengthen their personal finances after completing a PhD.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Higher salaries, unionization, longer parental leave standards.

Response 70

Perspectives on the postdoc roles and responsibilities

As someone who recruits postdoctoral fellows to my laboratory, I perceive this as a training position. This is someone who is entering my lab, with a high level of skill from their PhD training, who is now going to learn how to direct and develop their own independent training program. I believe that postdoctoral fellows should be the primary intellectual drivers of their Science, while being overseen by a scientific mentor. They should initially contribute to the scientific and funded goals of the laboratory (first 2 years of training) but then ultimately transition to developing their own projects and ideas that they can then take with them when they leave the laboratory (last 2-3 years of training).

Fundamental issues and challenges

The funding of postdoctoral salaries via award mechanisms at NIH (eg. F32) are not keeping up with the real cost of living for postdoctoral fellows, especially those with families to support. Although this is a training position, these are adults, often in their late 20s and early 30s, who have already been in training for a long period of time. My own institution recently raised the minimum salary of new postdoctoral fellows to $80,000/year (first year postdoc) to address this problem and I am seeing it having a positive effect on my ability to recruit and retain postdoctoral fellows.

Existing NIH policies, programs, or resources

Increase the salary of postdoctoral fellows via the F32 mechanism to $80,000+/year. This would be a level much more commiserate with their education level and stage of life.

Proven or promising external resources or approaches

No response

Response 71

Perspectives on the postdoc roles and responsibilities

I viewed it as an opportunity to expand my skill set to something more desired in an industry setting after having realized my Ph.D. was limited in scope beyond an academic lab.

Fundamental issues and challenges

Money. If you think it is anything else then you are purposefully ignoring the main issue. Why stay as a postdoc any longer than a few years when I can increase my salary by 50-100% in other settings. The math for staying doesn’t work out.

Existing NIH policies, programs, or resources

Money. Salaries. See above.

Proven or promising external resources or approaches

Better pay. And scale the pay to cost of living in a given area of the country. Mandate time off to match federal holidays and vacation time.

Response 72

Perspectives on the postdoc roles and responsibilities

Postdoc: a transition stage to independence when still is needed training to warrantee high-quality performance in the specific field.

Fundamental issues and challenges

Unfortunately postdocs are seen by many institutions/PIs as only technicians (cheap high-quality work), and are not really defining a training plan or guiding the postdoc for independence.

Postdoc is a vulnerable momentum, as there is no a faculty position and the individual is not anymore student. This often leads to a lack of identity feeling.

Existing NIH policies, programs, or resources

Eligibility for KR00. currently their is a cap of 5 years. If the postdoc was unfortunate to do not be well trained on the culture of writing a grant (common problem), then when realizes that there is a time sensitive grant application, that could be too late. At this stage the postdoc can bi highly skilled, however the options are gone to move to independence.

I suggest to open these specific cases to discussion.

Proven or promising external resources or approaches

NIH could offer certification to institutions based on their programs to support career development for postdocs.

Some institutions do not have a strategic plan to support postdocs for transition, and this becomes an issue when applying to NIH transition grants that request evidence of institutional support.

Response 73

Perspectives on the postdoc roles and responsibilities

I think a postdoc is a critical step for me to learn new skills and advanced my training and prepare myself to be a PI in the future. As a postdoc, not only I will conduct experiments and write manuscripts, but I also routinely help to train new students and help PI with proposals and grant writings. Meanwhile, I have to prepare myself for independence later.

Fundamental issues and challenges

I think two things are bothering me a lot. First of all, postdoc outside NIH institutes has low pay. Secondly, the funding opportunity for non-citizen and non-permanent resident scholars is so limited. I guess only K99 is available, which is very competitive. Nowadays, without a K or other funding, it's very hard to find a faculty position even with some good publications. Or even if I found a place, with only startup funding from the university, it is very stressful and challenging to do sustained research and secure the tenure promotion later.

Existing NIH policies, programs, or resources

I think it's hard. May be good for retaining domestic scholars but it's definitely not attractive for international ones.

Proven or promising external resources or approaches

I think NIH should increase the pay bar for extramural postdocs and open more grant application opportunities to international scholars.

Response 74

Perspectives on the postdoc roles and responsibilities

I view the postdoc position as an opportunity to expand research skill sets, help graduate students, gain further training & experience with lectures, gain more experience with grant writing, and as a way to become more prepared for a permanent position.

Fundamental issues and challenges

Postdocs don't get paid enough, some appointments are too short, relocation expenses are rare, PIs are abusive & overwork their postdocs, postdocs are often expected to do the work of a PI for them without receiving any training along the way

Existing NIH policies, programs, or resources

Response 76

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is a bridging step in attaining research independence and taking alone a project with scientific acumen, grant writing skills and publications between graduation and independent faculty post.

Fundamental issues and challenges

Lack of proper mentoring, cohesive environment and lack of appreciation and motivation both financially and psychologically.

Existing NIH policies, programs, or resources

Better management skill development and writing motivation for postdoc to establish through potent publications in respective domains.

Proven or promising external resources or approaches

Job satisfaction and mentoring are the two biggest factors according to my opinion.

Response 77

Perspectives on the postdoc roles and responsibilities

It is meant as an advanced training beyond a PhD in skills needing further development after the doctorate.

Fundamental issues and challenges

The post-doc is being considered as experience before faculty positions. That is not the intended purpose behind it. In many cases, the position is used to "wait" till the right position becomes available—also not the intended purpose.

Existing NIH policies, programs, or resources

Limit post-doc support and increase graduate student support. Higher stipends. Require detailed post-doc mentoring and training plans.

Proven or promising external resources or approaches

Pathways to non-academic jobs should be acceptable as an outcome.

Response 78

Proven or promising external resources or approaches

Increase postdoc salary

Response 79

Perspectives on the postdoc roles and responsibilities

An academic postdoc sets up a researcher for a job in either academia or industry. It's an incredibly important position, and has been absolutely instrumental in my evolution from a PhD that thought I knew everything, into a 3rd year postdoc that also runs a startup, and has national funding through the NSF (the NIH keeps rejecting me, what gives?). It's extremely disappointing that so many are deciding to skip this step in favor of more money.

Fundamental issues and challenges

Apparently, money. I had no idea people thought they'd be rich after getting a PhD, so perhaps the issue is we're bringing people in that are getting a doctorate for the wrong reason. Quality of life for postdocs is fine, we make more than double what a grad student does. Anyone complaining about quality of life needs to get a grip, this is the best job you could ask for.

In my opinion, those that bail out because of quality of life, or money, or because it's hard, just aren't up to snuff. Don't get soft on us now, the system, as currently designed, separates the wheat from the chaff—isn't that the point?

Existing NIH policies, programs, or resources

The only thing that the NIH could probably do better is eliminate the across-the-board base pay for postdocs. Pay needs to be adjusted to the region—$45,000 in Podunk, MS is in no way shape or form equivalent to that same amount of money in, say, Los Angeles, CA (or Chicago, or NYC, or even DC).

However—I don't think we need more money. The job pays fine, an—this is the crucial part—if you do well and write grants like you're supposed to, you supplement your income handsomely. It's not a difficult concept. Otherwise, a postdoc is a crucial step in becoming a real scientist that's hired for their brain, not some set of hands on an assembly line at Lonza.

Proven or promising external resources or approaches

No. Iron sharpens Iron, the program works. If you adjust the postdoc program to cater to the vocal minority that constantly complains, you will assuredly be lowering the bar of what it means to be a true, effective scientist. The NIH is the gold standard for high quality science—don't change now—the US is the destination for up and coming scientists for a reason—we have the best programs. The fact that we educate the academics of the world should be a constant reminder that quality of our scientific systems will always be more important than quantity of people involved.

The world, today, has more scientists than have ever lived. This is inherently the problem—there are too many people who want to be Bill Nye getting into science, who clearly don't have what it takes. Please don't change this program—while it has been as difficult as anything I've ever done, I wouldn't have wanted my experience to be any different, as it led me to where I am. If you maintain the program as it is, this will continue to be the case, and we will continue to lead the world in scientific discovery.

Response 80

Perspectives on the postdoc roles and responsibilities

A postdoctoral position to me means a chance to continue education and technical training under a timed contract and is necessary if you wish to pursue a career in academia.

Fundamental issues and challenges

Postdoctoral trainees are severely underpaid and undervalued. Its hard to justify moving your life to another state where you may only be there for 1-2 years and are underpaid and treated poorly by administration.

Existing NIH policies, programs, or resources

Overall there just needs to be more funding and support for postdocs.

Proven or promising external resources or approaches

Postdocs need to be better financially compensated.

Response 81

Perspectives on the postdoc roles and responsibilities

Post-docs should be generally self-sufficient and provide about 25% of their time to mentorship of other trainees, 10% of their time towards lab management tasks, and the remainder of time to research and proposal writing. I view academic postdocs as a bridge between performing supervised research and preparing for a faculty role, which includes project and employee management, grant writing, and budgeting skills.

Fundamental issues and challenges

Both recruitment and retention suffer due to postdoc salaries and benefits. Most post-docs are between the ages of 28-35, when they are trying to make crucial financial investments in their future, such as purchasing real estate and contributing to retirement funds. This is also the prime age to start families. However, post-doc salaries and benefits rarely provide the financial stability and security to pursue these time-sensitive milestones. Importantly, there is no guarantee that after 1-2 post-doc positions, researchers will obtain a faculty or tenure track position. Therefore, the financial risks of a post-doc rarely outweigh the potential benefits.

Existing NIH policies, programs, or resources

By the time graduate students graduate with a PhD, they have been living a low quality of life for 5-7 years, are experiencing burnout, and likely have unattended health issues. Improving retention and

recruitment in post-doctorate positions begins with improving the national standard of stipends and health benefits for PhD graduate research assistants. NSRA stipends for pre-doctoral trainees should be further raised to 35,000 and should include an option for health insurance subsidies through the ACA. Additionally, a national standard for post-doctoral NSRA retirement benefits should be established.

Fundamental issues and challenges

Lack of funding

Age-limiting funding opportunities for researchers that have not followed a straight academic pathway

Existing NIH policies, programs, or resources

K99/R00

Proven or promising external resources or approaches

No response

Response 83

Perspectives on the postdoc roles and responsibilities

My postdoc was a fantastic experience. It was a very valuable training period for me which helped me develop my grant writing skills and land a R1 tenure-track faculty position.

Fundamental issues and challenges

I don’t think the pay in general is the problem, but it should be adjusted for cost of living. For instance, postdoc salary in Boston, MA would need to be double the postdoc salary in Birmingham, AL to achieve the same standard of living.

Largest issue is that faculty don’t have enough resources to cover personnel (including postdocs) and research costs with the existing NIH grant budget limitations and lack of support from institutions.

Existing NIH policies, programs, or resources

All R-level awards need to increase the budget so that faculty can afford to pay postdocs.

Higher fringe benefits should be allowed so that postdocs can be enrolled in their institution’s retirement match/contribution program.

Institutions should be required to pay faculty salaries so faculty can use grant $ better

Proven or promising external resources or approaches

No response

Response 84

Perspectives on the postdoc roles and responsibilities

I see the postdoc as an opportunity to help launch an independent academic career. However, too often, postdocs are relegated to grunt work for the PI. There is no room for creativity or developing one’s own program of research. For example, even T32s are highly specific (e.g. “training the next generation of suicide researchers in machine learning methods”). If your research doesn’t fit into a particular funding opportunity, you are forced to shoehorn your interests.

Fundamental issues and challenges

A big issue for me was relocation and expenses therein. I had to turn down postdocs that were a better research fit because I could not uproot my entire family again for a 2 yr position. Another issue of course is salary. The cap for NIH salary is far far far too low and should be adjustable instead of automatically starting at year 1. I was fortunate in that I have a working spouse who was willing to support me through the postdoc, otherwise, I wouldnt have been able to afford it and would have gone straight into a job. Along with postdoc training, more opportunities to stay at the institution and apply for grants across all mechanisms would be helpful. Some universitys restricted the grants postdocs could apply for.

Existing NIH policies, programs, or resources

NIH stipends must increase especially for year 1 to be viable and competitive with other industries. In addition, there should be variable salaries based on cost of living in thee area. Moreover, granting the postdoc more freedom to carve out their own path instead of a narrow and highly specified T32 would be a great improvement. It seems like T32s are awarded just like any other grant--”show how niche and specific your program is”. That is a huge downside in my opinion as funding opps are limited and it has pushed my career in a direction I’m not sure I want to go and that I’m not sure whether there will be jobs in. But it’s what pays the bills and so I have to persist.

Proven or promising external resources or approaches

Pay us more. Period.

Response 85

Perspectives on the postdoc roles and responsibilities

Postdocs are an important part of the academic research enterprise. They do important research, gain new skills to prepare them for their next career while balancing formal and informal mentorship of junior trainees ranging from undergraduates to graduate students.

Fundamental issues and challenges

Postdocs deal with a number of stressors which are plainly obvious to graduate students and prevent some graduate students from wanting to pursue a postdoctoral fellowship. Postdocs are on one year contracts typically, so the lack of job security can be a source of stress. While the pay is certainly better than it used to be, the salary for postdocs in most institutions is still not exciting, especially in the face of cost of living expenses in many locations. The other main source of stress is that the average length of postdoctoral fellowships seems to be significantly longer than they once were. After a PhD which takes about 6 years, it can be seen as a tough ask to become a postdoc for another 6 years before finding a job.

Existing NIH policies, programs, or resources

NIH mandated minimum postdoc salaries could be improved and enforced for all postdocs regardless of whether they are on fellowship. The NRSA program also should be adjusted so that it doesn’t cause postdocs to change employment status as happens at many institutions. For example, at Northwestern, a postdoc I worked with lost access to some benefits such as tuition benefits when she was awarded an F32. It seems awful to penalize someone for winning a competitive fellowship. I’ve even heard of some postdocs declining their NRSA awards to retain their standard employment benefits.

Proven or promising external resources or approaches

St. Jude’s and at least one other institution (Van Andel Institute, if memory serves) have announced that they will start paying postdocs at levels above the NIH minimum mandate. They may have other initiatives for postdoc recruitment and retention. It could be worth looking at these strategies and seeing how they can be adopted nationwide.

Response 86

Perspectives on the postdoc roles and responsibilities

I have been a faculty member for over 27 years, and built a thriving research program (with 25 consecutive years of NIH funding) primarily on post-docs. Over this time, there has been a shift in the goals of post-docs from desiring to be in my shoes at the end of the training period to now desiring

something else (industry, science writing, teaching, anything other than primary research). This is alarming in and of itself. On top of that, over the last five years the market for recruiting post-docs has dried up. I see this in the precipitous drop in applications to my own lab, as well as co-director of an NIH training grant when we advise students near the end of their PhD; it used to be that over half were headed for an academic post-doc, but now it's less than 10%. I fear for the future of academic science if these trends continue.

Fundamental issues and challenges

1. Pay—Post-docs are not paid enough. And the modular NIH R01 budget hasn't changed in over 20 years, meaning that it is impossible to pay people what they are worth from an R01. This leads to students and early post-docs choosing to leave to get decent pay. For example, I had a post-doc leave after a year because she would get twice the salary at a job as a science writer (even though she would have been competitive for a faculty position had she stayed).
2. Being a post-doc is hard. You have to work your butt off and give up many of the pleasures of life. An end is not in sight, because this continues through the period as a junior faculty member.
3. Job prospects at the moment for a faculty position are poor. Competition is tough and the number of job openings is low.
4. In some places, post-docs are abused. Post-doc training compacts and mentorship compacts are not universal, and offices of post-doctoral training are not universal.

Existing NIH policies, programs, or resources

1. Increase pay for post-docs.
2. Increase the typical R01. Caveat to these two: fewer R01s.
3. Programs to convince hiring institutions to consider hiring faculty who don't have papers in the CNS journals—push for smaller papers in society journals.
4. Put an age limit on an R01—a colleague of mine is submitting an R01 at 86. This should not be allowed.
5. Enforce adherence to training and mentorship compacts to provide more even training experiences, and punish faculty who abuse trainees.
6. Provide support for offices of post-doctoral training to support existing post-docs.

Proven or promising external resources or approaches

Mentoring compacts—there are many at institutions across the country. We are developing resources at the [redacted for anonymity] for mentor training and mentorship compacts, and some of the training is based on those at other institutions.

Publishing practices—partner with DORA.

Response 87

Perspectives on the postdoc roles and responsibilities

To me, the postdoctoral position is an opportunity to build focused career skills, with the intent of pursuing academic research. It is a liminal state which can provide extra protected time to focus on career development without yet having all of the responsibilities and roles of a PI—but it should also be in preparation to build the skills (and relationship building) necessary for success as a PI. For postdocs who are unsure or change their mind about pursuing an academic career, training opportunities should also be presented for postdocs to transition to non-academic roles.

Fundamental issues and challenges

I think most people pursue postdoc positions and research careers because they love what they do, rather than for economic gain, but PLEASE increase the NIH salary for postdocs. The salary guidelines have not kept up with inflation and cost of living, ESPECIALLY in large/expensive cities. It's frustrating to be highly skilled / trained and be living in bad housing or with tons of roommates and still have 70%+ of my income go towards rent with what's left over to go towards groceries, gas, etc. It makes a huge difference in

quality of life. Low pay plus long hours makes a postdoc position unappealing even if the passion for the work is there. It also affects recruitment and retention and biases towards people who have familial wealth—why would a talented young person choose a postdoc position that they may be in for 4+ years when they need to support their family (or start a family), have debt, etc? The wage gap is causing a brain drain in government/academic science and will impair US scientific innovation and progress if it is not addressed now.

While I think salary is the #1 problem facing postdocs, there are also really important issues to be addressed, including proper mentorship. If NIH is giving PIs money to support salaried postdocs, it seems only fair that postdocs should be able to provide feedback on their experience as a trainee/employee directly to the NIH. I think there needs to be more collection of feedback from current trainees and accountability for quality of life/lab culture/etc. issues.

Existing NIH policies, programs, or resources

Increase postdoc salaries.

Proven or promising external resources or approaches

A mechanism for NIH trainees / NIH-funded postdocs to provide feedback to the NIH on the quality of the mentorship, training, etc that they are receiving under their PI.

Response 88

Perspectives on the postdoc roles and responsibilities

Early career researcher, rapidly growing into an independent researcher, mentor, professor

Fundamental issues and challenges

$$$

Post-covid rents have reached stratospheric levels. Here in [redacted for anonymity], a 2 bedroom appartement is $3,200+. Daycare at [redacted for anonymity] $2,200 per kid.

It is now officially impossible to sustain a family as an academic postdoc.

Of note, ability to sustain a family is a requirement for J1 visa, and partners under J2 visa do not necessarily have authorization to work. Even worse for H1-B, for which dependent cannot even apply for work authorization.

Fundamental issues and challenges

Postdocs are not paid a fair and living wage.

Existing NIH policies, programs, or resources

NIH policies, programs, and resources prevent postdocs from earning a living wage.

Proven or promising external resources or approaches

No response

Response 90

Perspectives on the postdoc roles and responsibilities

We are primarily employees, not trainees. There is literally no industry in the world that would ever label someone with a PhD as trainees. However, we get labeled as trainees because it conveniently allows the system to keep exploiting us as cheap labor and justifying paying us 1/3 of what we could get paid in industry.

Fundamental issues and challenges

We don't get paid enough. We are trained PhDs with an enormous skillset, not trainees to be exploited as cheap labor. Pay us entry level industry salaries (100K+).

We get penalized for getting fellowships by our universities.

The outlook for getting faculty positions is grim.

There are little to no mechanisms in place to get a faculty job at the same institution you are already at--forcing people to constantly have to move around from place to place. This is extremely unfriendly to anyone who has a family or partner.

Not enough guaranteed maternity/paternity leave.

Not enough benefits for parents (childcare, grant extensions)

We can't even pay ourselves more when we get extra grants. I got an F32 and a NARSAD BBRF award, and the university would not let me pay myself more. If PIs get to pay themselves more when they get grants, why can't postdocs???

Existing NIH policies, programs, or resources

Paying us more, giving us more parental leave, giving us resources for childcare on their own would be a HUGE help. The next thing is to have more faculty jobs open for us, otherwise this entire career path is a futile effort for the majority who will not get faculty jobs. I realize the number of jobs is outside NIH control, but it's something for everyone to be thinking about.

There are also many of us who would be happy to stay long term as staff scientists in academia. However, there are very few such positions in large part because PIs do not have the funding to pay staff scientists a salary that they could typically find in industry. Maybe the NIH could think about funding mechanisms specifically designed to fund permanent staff scientist positions.

Proven or promising external resources or approaches

No response

Response 91

Perspectives on the postdoc roles and responsibilities

Academic postdocs are one step away from becoming junior faculty and should be treated and paid as such. Their responsibilities are to continue training, develop their own independent programs, and start applying for funding. The institutions MUST treat them at a higher academic level than grad students and perhaps on the same level as faculty, but certainly not volunteers who have to constantly fight for adequate benefits.

Fundamental issues and challenges

Postdocs aren't paid enough, and I say this as someone who employs them and as the PI of a T32 training grant. Institutions (maybe just ours, but I doubt it) do not respect their advanced degrees and treat them as nuisance employees. Non-TGE postdocs have few opportunities for extramural funding which hurts their trajectory. There are few programs to train postdocs how to become faculty.not just career development seminars.training on how to run a lab, how to hire personnel, how to budget, etc. That needs to start before they become faculty.

Existing NIH policies, programs, or resources

Non-TGE postdocs need access to extramural funding. It is not fair that these individuals are biased out of extramural funding which could enhance their careers. There are more non-TGE postdocs than TGE postdocs available, which leads to these budgets being cut (which might be good for NIH but is bad for institutions and their postdocs). NIH should demand that any institution with a T32 have an office of postdoctoral affairs dedicated to the welfare of postdocs and that it be active and inclusive. NIH should also demand that institutions treat their postdoctoral positions like faculty positions (better benefits, access to retirement plans, etc.). This may vary from state to state but it really shouldn't.

Proven or promising external resources or approaches

Look at the T32 grants that scored highest in the last few rounds of review. Those probably have excellent approaches that the NIH can draw from.

Response 92

Perspectives on the postdoc roles and responsibilities

Postdoc positions are temporary training positions that are akin to apprenticeships. They allow PhDs to further develop their research expertise and gain/refine skills related to scientific communication (through talks, preprints and papers), teaching, mentoring, time management, and funding discovery. Many faculty positions in the biological sciences require postdoc experience, but in other fields it is not common (i.e. computer science and bioinformatics). Postdoc positions can stretch longer than a 5 year period due to many reasons, or folks may find themselves needing to do more than one postdoc. These experiences are burdensome and can reduce the scientists chances for success in academia because it often means they age out of award eligibility, have lapses in research continuity, and may have to incur additional living expenses as they are in temporary jobs. Ten (or 20) years ago a PD was a 2-3 year role that was needed before landing a tenure-track job. While they are still required for faculty jobs nowadays they seem to be longer and more uncertain.

Fundamental issues and challenges

A postdoc job is not family friendly and lacks key benefits (like retirement) for a significant time frame of ones career. A PD's success can hinge on their mentor. It is difficulty to recruit postdocs to more rural areas (like central Iowa) over more urban areas (like Berkeley or Boston) even when the salary is equivalent (NIH scale) and the cost of living is lower. I think many PD suffer from a lack of opportunities—there are few jobs and the market is competitive. Many PD are highly skilled and trained and would be perfect fits for secure staff scientist type jobs (with benefits!) but these are nearly impossible to fund with sufficient job security to recruit anyone.

Existing NIH policies, programs, or resources

Define "early career" (like for a ESI MIRA) as time from when they secured their independent position, not from time of their earned terminal degree. Add more seed grants or small funding opportunities to support postdocs independent of their PI—but not a K99/R00 which is select for those only destined for academic careers. Establish NIH wide guidelines for policies related to benefits and paid time off (for life events such as birth/adoption, family death or care of an elderly parent). Offer cross-training or internship type opportunities to allow PD to develop skills beyond the academic bench. Provide a mentoring workshop/training series that aligns with NIH mission and goals. Offer annual travel awards for PD to attend conferences.

Proven or promising external resources or approaches

The HHMI "Entering Mentoring" resource is an excellent training guide, but this could be updated and modernized. Implementation of published policies to improve gender equity and support scientists of color during grant review process and post-award support would be beneficial.

Response 93

Perspectives on the postdoc roles and responsibilities

A short-term training period after the PhD to gain new research skills and prepare for a professional position

Fundamental issues and challenges

1. Postdocs are financially exploitative, and they only work for people who can afford to be exploited and not consider their long-term financial security. I have the credentials to earn 6 figures, but I am doing a poorly paid job that is securing my mentor's future, not my own. Fellowships are even more exploitative, because you lose annual pay increases, pretax health insurance, and retirement benefits.
2. My graduate training environment was harassing (ex. being called a bitch by a lab member), and the stress of that (6 years) was horrible for my health. After grad school, I was diagnosed with clinical depression. These experiences make it really hard for me to function in an academic environment, and doing a postdoc often feels like a punishment and a pointless extension of grad school.
3. I discovered during the pandemic that I like working from home, which has diminished my enthusiasm for bench work. As soon as I find something else, I will almost certainly quit.

Existing NIH policies, programs, or resources

Postdocs need guaranteed retirement benefits, pretax health insurance, and annual increases regardless of funding source. Fellowships should pay better, and universities should not be allowed to pay a 6th year postdoc the 0-year minimum!

Basic sciences programs are rife with abusive behavior, and administrators largely ignore it. This should be considered research misconduct, and universities should face penalties for failing to resolve it. Their funding should be tied to their ability to provide a training environment free from bias and harassment. Otherwise, they will never fix this.

I really think postdocs should be rare. Most people do postdocs because they think they might want an academic job or because they need skills that they didn't gain in grad school. Grad school should provide a greater diversity of skills so that people don't feel the need to get another PhD's worth of training after spending 5 or 6 years as grad students. The work done by postdocs should be performed by fewer, better paid, long-term staff scientists. This would be far more efficient.

Proven or promising external resources or approaches

No response

Response 94

Perspectives on the postdoc roles and responsibilities

I did an academic postdoc at a university in the bay area before switching to industry. It was a valuable period to switch fields from in vivo to in vitro research and the skillset I built up during my postdoc helped me switch careers. I view the postdoc position as an opportunity to expand skillsets and learn techniques whilst at the same time contributing to research outputs

Fundamental issues and challenges

Low salary in the bay area. With university subsidized housing, I spent 60% of my stipend on rent. The market rate for rent was more than 100% of my stipend. J1 visa status makes it complicated to find employment after the postdoc. Another challenge was facing a toxic environment on a J1 visa. There are no consequences for bullying/ creating toxic work environments at the well known US universities and lack of funding promotes a hypercompetitive environment where only people willing to do whatever it takes makes it. My US postdoc experience ended my career in academia but I am thriving in industry outside of the US. My PI used my visa status to control me and other immigrants in the lab and used deportation as a threat. I reported this to the university and she received a verbal warning with no record the complaint kept and no mechanism to warn future postdocs coming to the lab.

Existing NIH policies, programs, or resources

The NIH payscale forms the basis for stipends at most universities. That needs to be increased to keep up with cost of living increases.

Stricter deterrents for academic bullying coming with the grant.

Mandated record keeping of PIs with bullying complaints against them.

Proven or promising external resources or approaches

Prestigious science at a brand name university was the reason I came to the US and that would still be a valid reason to come

Support for H1B/ O1 visa instead of J1

Response 95

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary and availability of tenure-track job opportunities.

Existing NIH policies, programs, or resources

Increase minimum salary. Increase overall dollar amount for grants.

Proven or promising external resources or approaches

More money.

Response 96

Perspectives on the postdoc roles and responsibilities

Post doctoral position is meant for gaining additional research experience and preparing oneself for the academic setting

Fundamental issues and challenges

The lack of good pay. It's very difficult to survive in big US cities with such less payscale. It's sad that even after getting the highest possible degree of PhD, postdocs still suffer so much

Existing NIH policies, programs, or resources

Increase the pay—make it respectable for a PhD holder.

Have defined vacation days—be treated as a full time employee

Have defined maternity leave

Proven or promising external resources or approaches

Job satisfaction

Response 97

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a place of uncertainty. From interaction with current Post docs, it is where your career in academia is discouraged. Because most times the end goal of engaging in a post doc position is for most people not gotten. Students need to do more grueling years in order to get to the goal of becoming independent. Some have called it a glorified graduate school, some have called it cheap labor for the professors. Either way that doesn't sound appealing to any graduate student interested in academia.

Fundamental issues and challenges

The pay and a way to transition to independence is the most critical issue in my opinion. There's a problem or low payment. Most prospective post doctoral scholars are in their late 20's and 30's. Some have families that they need to take care of so the low pay combined with the financial burden from dependents makes it impossible. M most post docs I know have to get a side job in order to make ends meet.

Apart from the pay, there's no defined pathway to independence, because of this most scholars end up in the post docs cycle. Doing 5-15 years of multiple positions without the independence that they seek.

Existing NIH policies, programs, or resources

The grant system has to be modified to accommodate post doc independence transition. This could be in form of more start up grants or pathways to independence. Akin to what is obtained in the MD track. Where you do your residency and in some cases subspecialties and then being to practice. There could also be a pathway for research, teaching, enterprises/entrepreneurship independence.

Proven or promising external resources or approaches

No response

Response 98

Perspectives on the postdoc roles and responsibilities

A necessary training step needed to progress from more closely mentored graduate training, on the way to an independent research career. It is less needed for individuals more interested in industry research, where postdoctoral training is needed. In many instances postdoc fellows are necessary for academic research labs to function, obtain data for grants and publications.

Fundamental issues and challenges

The largest current issue is salary. In many locations, the NIH minimum is no where near the amount necessary to live. Additionally, many citizen's and permanent residents leave academic training because of the low pay lines. It is additionally burdensome on faculty, as even if institutions raise pay levels, their grants cannot cover higher salaries in addition to rising costs of materials. I believe many individuals will leave postdoc training because of the inherent sacrifices necessary to live on a postdoc salary. Coming from a low income family, who I cannot rely on for financial support, this has been particularly true. Without better pay and more equity between institutions, many individuals from low income or other under-represented groups may not continue within academic research

Existing NIH policies, programs, or resources

Increase NIH minimum pay lines to be in step with what is necessary for cost of living in many large US cities.

Increase grant funding to cover additional salary costs.

More funding opportunities for postdocs would also be helpful.

Proven or promising external resources or approaches

Establishing more training grants for postdoctoral fellows could help institutions have better working environments, clear mentoring expectations, and potentially help increase postdoc pay.

Response 99

Perspectives on the postdoc roles and responsibilities

Postdoc play an essential role for completing research projects on limited time.

Fundamental issues and challenges

It becomes extremely challenging for recruiting and retain high-qualify postdoc these days. I heard the same issues over and over again from faculty across multiple institution.

Among many factors, here are tow of them may have important impact:

1. Fewer postdoc candidates, particularly from china. China has been one of countries that delivers a good portion of well-trained postdoc candidate before, but many stop going aboard starting from last a few years.
2. increased competition for funding and less faculty positions. increased pay in industry.

Existing NIH policies, programs, or resources

1. provide more training grants in number and amount, more NIH funded resources.
2. Increase the amount of modular R01. the $250/y standard of the modular R01 has not been changed since 1998. If considering the inflation, it should be 400$/y now. Nowadays, one R01 is barely cover the personnel required for high quality projects, plus it lasts shorter. As a result, too many investigators are in full time for "writing grant proposals" rather than "doing science". This has been a fundamental issue for 20+ years.

Proven or promising external resources or approaches

No response

Response 100

Perspectives on the postdoc roles and responsibilities

My main roles as an academic post-doc include designing and executing experiments independently, training graduate and undergraduates in the lab, and writing research fellowships and also publications. My roles are similar to an academic PI with the main difference being a large portion of my time still goes into performing my own laboratory experiments. I feel there is nothing wrong with my roles and responsibilities. Although I work long hours and most weekends, I am not too bothered since I do enjoy my work and being a part of academic research.

Fundamental issues and challenges

The main reason for challenges with post-doc recruitment and retention is the pay scale. It is incredibly low. At this point in our lives we have spent likely 10+ years in upper-education training and have all achieved the title of "Doctor." However, our pay is still

Existing NIH policies, programs, or resources

Increase the post-doc starting salary to at least >60,000

Implement regional pay scale based on cost of living (ex. cost of living in California or Massachusetts is not the same as Minnesota, therefore, it would help account for this in the minimum post-doc salary)

Proven or promising external resources or approaches

No response

Response 101

Perspectives on the postdoc roles and responsibilities

I am a university staff member, not an academic, but I often describe postdocs to the outside world as "apprenticeships" under university faculty. So, in my mind there is an implication that the apprentice will eventually get a tenure-track R1 research job. Seventy-percent of my postdocs want TT R1 faculty jobs. Less than 10% will achieve that, which equates to failure for many of the rest. That is a problem. I also have concerns about doing an apprenticeship after already doing 5 years in PhD study, although I do see the difference in PhD study as becoming an expert in a discipline, and a postdoc as becoming an expert at the role of being a university faculty member. Both are trainee positions, and thus the lower salary is part of the deal, with the payoff being tenure and eternal job security. For the majority of postdocs who want TT R1 faculty positions but will not get them, it's a bit of a bait-and-switch to hire them as postdocs. I do think they are being exploited to some degree, in particular the international postdocs, which make up over half the postdoc population at most universities. My university has a low number of postdocs compared to the amount of research expenditures, and I don't think that is a bad thing. Unless that means the PhD students are doing the bulk of the work, which is probably the case, and probably not any better.

Fundamental issues and challenges

We haven't really seen to much of a problem filling postdoc positions, but we are a large university in a warm climate. Our numbers have remained steady. Overall quality of life is not great. Cost of living/rent has increased dramatically, while wages have not. Retention seems to be ok, as postdocs will typically stay

if their contract is renewed, but that is likely due to a lack of options. It is quite disheartening to speak with a 3rd or 4th year postdoc, in their early 30's, who are facing the realization that their are few jobs available that they want, and are having to re-evaluate their goals and kind of start from ground-zero. They lament with comments like, "I guess I'll have to go into industry." Humanities scholars seem to have even fewer options.

Existing NIH policies, programs, or resources

I do not have a lot of familiarity with existing policies. However, I would not be opposed to limits on the number of postdocs and students that could be funded on projects, and requirements to hire key personnel under Research Scientist or Research Faculty titles with salaries competitive with industry. I also think indirect costs/overhead at many of these universities have become egregious. There is a lot of waste in administration.

Proven or promising external resources or approaches

I have tried to build programs with industry, but it has been difficult to make those connections. Industry does not seem to have a lot of interest in building pipelines with postdoc offices. I suspect most of those partnerships are with schools and colleges directly. Mentoring programs with industry professionals have also been difficult to launch. Like many postdoc programs, my office lies within the Graduate College at my university, and I have suggested that we need to start a conversation with graduate faculty about being realistic with their students about the job opportunities available within academia, and my leadership has zero interest in this.

Response 102

Perspectives on the postdoc roles and responsibilities

They are trainees who are interested in further his/her knowledge and learn to a more critical thinker. During this training they learn to be able to come up with hypothesis and projects to answers their question. They should learn how to troubleshot independently. In regards to their professional development, they continue to network and learn how to formulate grant application, participate or write their own fellowship grant or small grants.

Fundamental issues and challenges

Not enough graduate students, which is a pipeline issue. The pay is an issue and family support is another. [redacted for anonymity] has agreed to increase the pay, paid vacation and child support by a very large percentage. Such large increase without the increase grant support will hurt the hiring of postdocs. I foresee that the postdoc hiring will greatly decrease until the NEI budget has increased accordingly to match the cost of hiring of postdoc.

Existing NIH policies, programs, or resources

see above. the salary and budget should be increased to meet the current postdoc salary. In addition, there should be more F grants for postdocs and funding to forester the professional development.

Proven or promising external resources or approaches

you might want to track the career path of previous postdocs.

Response 103

Perspectives on the postdoc roles and responsibilities

I did a postdoc abroad, and for me it was a great experience where I learned a ton of new research skills as well as soft skills -—I was able to give talks at conferences, teach a few classes, mentor students in the lab, and organize conferences. However, it must be said that I was paid very well for my postdoc in Switzerland, an equivalent of $100,000/year plus matching retirement savings support.

I think an ideal postdoc gives the trainee sufficient autonomy to develop a robust research project while nurturing soft skills that are important in a research career, whether in academia or industry. It's important that any postdoc training program be transparent about the long-term prospects of a career in academia and adequately prepare postdocs for alternate career paths.

Fundamental issues and challenges

1. The lack of transparency about long-term prospects for a career in academia, given the lack of sufficient faculty positions opening up for postdocs to transition into, is terrible. Career planning and development should be intimately integrated into postdoctoral training programs.
2. The low earning potential for most US-based postdoc positions is a travesty. PhD-trained researchers should be paid a healthy salary that includes basic benefits like healthcare and retirement savings. It's no wonder that so many are choosing to work in industry, where they are paid much better for their expertise.

Existing NIH policies, programs, or resources

1. The salary cap for NIH-funded postdoc positions needs to be raised considerably.
2. There should be a minimum postdoc salary guideline, in order to force academic institutions to pay their postdocs adequately.
3. Postdoc salaries should rise annually with inflation, and should ideally be further adjusted to compensate for local costs of living.
4. Any NIH funded postdoc training programs should be required to include career development programs.

Proven or promising external resources or approaches

Look at the postdoctoral training salaries and policies in some European countries for inspiration, for example in Switzerland:

https://ethz.ch/en/the-eth-zurich/working-teaching-and-research/welcome-center/employment-contract-and-salary/salary.html

Response 104

Perspectives on the postdoc roles and responsibilities

I see it as a stepping stone to my career goal in becoming faculty, but I also see it as a job.

Fundamental issues and challenges

Extremely low wages for effort and education. Postdocs should be paid at higher wages (but not at the detriment of PI grants which do not currently support pay increases). NIH minimums should be adjusted for cost-of living. Additionally, many people lose benefits when on fellowships. NIH should work with institutions to fix this ongoing problem.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 105

Perspectives on the postdoc roles and responsibilities

As a graduate student, my perspective on the role of a postdoc is to lead their own project with input from the PI, as well as receive mentorship from the PI in how to pursue a career in academia, including mentorship on how to be a PI, lead a lab, grant applications, running a lab, etc. In addition, postdocs should be a leader in the lab and mentor graduate students as well as undergraduate students.

Fundamental issues and challenges

LOW PAY. OVERWORK. TOXIC WORK PLACE. I cannot stress enough the incredible impact low pay has on my decision to NOT pursue a postdoc. It is terrifying that post docs will start out with such low pay and few making anything more over the years. In addition there seems to be little upward mobility after becoming a post doc, especially if the only option is to become a PI. Many researchers would love to stay

in academia, but not be a PI, unfortunately the pay is so incredibly low, it is impossible. Post docs are overworked, it does not matter the amount of recognition received. Working over 40 hours a week is insane, when no other business requires that without extra pay. Additionally, there is no vetting process to becoming a PI. This results in the most underqualified "bosses" in any industry. PI's have no requirements to being good mentors, good leaders, or a good employer. This results in many opportunities for toxic and bad work environments. Lastly, the continuous pressure to "publish" and in "high impact journals" in order to be considered successful or to succeed needs to change. Many postdocs are incredibly smart and hardworking but you cannot change scientific fact. If experiments simply result in null findings, that should not be punished. So the pressure that you can only succeed if you publish positive results leads to increased toxicity and overworking of postdocs.

Existing NIH policies, programs, or resources

NECESSARY MENTORSHIP AND PI TRAINING. All PIs should have to undergo training to run a lab and become a PI if they receive NIH money. Postdocs should have a MINIMUM 15 days off + federal holidays. Post docs should get a raise, and there should be cost of living adjustments required.

Proven or promising external resources or approaches

No response

Response 106

Perspectives on the postdoc roles and responsibilities

A post doc should be about half and half split between applying the knowledge and skills you already have and training on new knowledge and skills. More than just a student, but less than an independent investigator.

Fundamental issues and challenges

In my own experience, the two big barriers to going into a post doc are money and immigration status. When I was an NIH NRSA post doc in 1989 the pay was miserable and I had to rely on my wife's better income and benefits. It seems like people are saying the same thing today.

Many of my graduate students are offered good post docs, but because of their immigration status they end up going into industry. This seems like a sad waste of talent and training, when they could be contributing to science in the larger public interest instead of proprietary, narrow corporate interest. We should open up the NRSAs to non-citizens who have received PhDs in the US.

Existing NIH policies, programs, or resources

Two suggestions: open up NRSA fellowships to anyone who graduated with a PhD from a US school, regardless of nationality, and extend the student visa terms for an additional four years to anyone with an NRSA or who is paid as a post doc on an NIH supported grant.

Proven or promising external resources or approaches

Perhaps the NIH could foster a sense of community among all post docs who are supported by NIH through one or another mechanism by hosting conferences where the post docs present their work. In a sense, create a scientific society made up only of NIH post docs. Bring them together, celebrate their work, let them get to know their peers.

Response 107

Perspectives on the postdoc roles and responsibilities

Step to a faculty position

Fundamental issues and challenges

There is no career path outside of few faculty positions in academia after postdoc. Your success heavily depends on one PI and his grant project. The strict, closed-minded traditionally defined job descriptions for faculty positions do not consider outside of the box candidates thus after maximum of five years in a lab as a post doc science world closes its doors on you. Industry doesn't always want you because you

aged and overqualified and your basic research skills are not well-defined, scaled, or cutting edge. So other than big labs and big PIs many other labs are no outlet streets after a postdoc there. Preparing a postdoc application may take days if not weeks applying to an industry job on LinkedIn easy apply with only a CV takes seconds. At industry most of the time after 5pm or during weekends/ holidays you are not expected to work and if you do you are compensated. A postdoc at [redacted for anonymity] had to pay parking lot money for after hour while not getting paid for extra hours as if they have so much money. Lots of postdocs are subjected to all sorts of discriminations and bad treatments especially from their PIs and international ones especially can't say anything or take any action because of Visa issues or their career's dependency on PIs rec letter and network. Science is cool but science world is like a jungle with limited money)and there are no real protection for postdocs. Postdocs are there because they love science but they are disposable, cheap labor and replaced with new ones easily. I saw biology postdocs who became realtors, business analysts, credentialing analysts, makeup sellers, etc. How sad to lose that experience and talent in science and how can those people find a way to go back.

Existing NIH policies, programs, or resources

Programs, policies, recourses are all on paper and not implemented in real life unfortunately and they don't cover every single postdoc.

Proven or promising external resources or approaches

Hiring faculty from industry can help. Setting up advisory boards with industry background for departments can help. Getting postdocs out of academia for internships etc can help.

Response 108

Perspectives on the postdoc roles and responsibilities

I had two years of postdoctoral training funded by a T32. It was a wonderful opportunity, particularly having protected time for research and the opportunity to interact with a cohort of other postdocs at a similar career stage as well as supportive mentors. I learned an enormous amount and was able to take some risks in my research that I might not have been able to otherwise.

Fundamental issues and challenges

We simply do not pay postdocs enough. The perception that postdocs are essentially overgrown children, rather than autonomous adults who often have families, is harmful. Postdoc pay should reflect the level of expertise they bring to the table: these are highly trained scientists who could certainly command higher salaries in industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 109

Perspectives on the postdoc roles and responsibilities

Further scientific training, skills, and expertise. This includes hands on skills, writing/ communication, mentoring and laboratory leadership, and implementation and design of experiments and publications.

Fundamental issues and challenges

Inadequate compensation

Depending on the institution—does not guarantee retirement, subsidized health benefits, employee status (this limits qualifications for certain programs like PSLF and LRP)

Wellness resources and changing "publish or perish" mentality

Not enough good quality mentors

Lack of diversity (gender, sex, race, etc)

Lack of support for trainees at the institution at large

Existing NIH policies, programs, or resources

T32 stipend make into an employee status and aid recipients on how to navigate how to pay taxes for it

LRP program is very attractive for trainees that have large debt

Guidance on grant writing, IC support

Proven or promising external resources or approaches

Require mentoring / leadership classes for both mentors and mentees (including older mentors not just the new upcoming scientists)

Increase diversity

Increase funding

Response 110

Perspectives on the postdoc roles and responsibilities

I have supervised over ~50 postdocs in my career ~25 of whom now have independent positions with professorial or European group leader ranks. Non-academic postdocs have gone to established companies large and small, and several have started their own companies. To me, having postdoctoral trainees is a core mission and central to the identifty of my lab. Postdocs in my group can take all aspects of their projects with them when they leave, providing them with a boost at an early career stage. However, this puts an enormous strain on my ability to fund my lab—particularly as Federal, corporate, and Foundation grants become more and more milestone driven. It is far more difficult today to balance training requirements with the production oriented standards of contemporary research—particularly in my field of cancer systems biology. It would be far better were postdocs to be self-funded to the greatest extent possible, with my grants providing experimental and computational resources. As it stands, I perceive little correlation between postdoctoral performance, subsequent success in faculty positions, and funding through the NIH/NSF or private foundations. Instead, the more conservative the project, the better the chances of success and I think this is the opposite of what we should encourage. Postdocs are not meant to be cheap labor on highly scripted faculty -led projects, they are meant to be independent thinkers with maximal autonomy and the ability to make breakthrough discoveries. Every recent trend in American science is trending the other way.

Fundamental issues and challenges

I preferentially recruit American postdocs to my group but find that they are strongly attracted to industry positions in large part because they find salaries too low and career options too limited in Academe. The cost of living has increased dramatically in cities such as Boston (where I am based), largely due to the large influx of pharma companies. Even committed postdocs cannot afford to live on the stipends that are offered—and these are commonly well above what is budgetted in an NIH R01 style grant. A dearth of postdoctoral funding mechanisms is very discouraging to US postdocs. Even among Americans who evnetually secure faculty positions out of my lab, fewer than half secure any fellowship despite multiple tries. In contrast, almost all of my European postdocs have their own fellowships and they are generally much more optimistic than their American counterparts. This situation could be mitigated by providing more and better paying postoctoral fellowships. More complex is addressing challenges with publication. The average time from sumission to acceptance of manuscripts from my group is well over a year, and this causes enormous stress when people are in the process of leaving the lab. It also leaves a lot of good science unfinished. Unfortunately I am not sure how to mitigate this—athough some journals are trying to reign in excessive and open-ended "reviewer 3" demands, which are the primary cause of publication delays.

Existing NIH policies, programs, or resources

First and foremost we should try to stop sending the message that there are too many people trained in science and that interested students should look elsewhere for a career. Unemployment among biomedical PhDs is very low and industry demand exceeds supply—at least in my area of biomedical research. The most important change NIH could make is to expand fellowship activities and make NRSAs less bureaucratic and dependent on preliminary data. We should encourage postdocs to get NRSAs at the start

of their post graduate careers, not three years in when they have a few papers under their belts. In my (admittedly somewhat limited experience of n=3), fellowships geared at underrepresented minority groups are even more discouraging. Review is glacially slow and involves a lot of complex procedural hoops. I discourage postdocs of color in my group from even applying.

Proven or promising external resources or approaches

As described above, we should do everything possible to encourage a spirit of independence in postdocs combined with mentoring opportunities. The current funding systems has turned them into low-paid workers in a milestone/RPPR-driven scientific environment in which incrementalism is the name of the game. We need to make it possible for people who do not come from wealthy families to afford their first apartment or move across the country. I personally beleive that this is the responsibility of academic institutions but have little or know hope that most medical schools or hospitals have any interest or plans to make the necessary investments in their trainees.

Response 111

Perspectives on the postdoc roles and responsibilities

The postdoc has the same responsibilities as the graduate student—to conduct an independent research project under the supervision and funding of a lab head. Both positions are temporary, typically 4-7 years. The only real difference between graduate students and postdocs is the level of experience doing research.

Fundamental issues and challenges

1. postdocs are underpaid. It is very difficult to support a family on a postdoc salary, especially in expensive cities where most postdocs live.
2. postdocs have no job security. It is expected that postdocs leave after 4-7 years for a different position. This is difficult because postdocs' spouses and kids often must find another job and school.
3. the biggest benefit of doing a postodoc is the slim possibility of getting hired by an academic institution to be a lab head. Doing a postdoc is not necessary for most industry jobs. Therefore, doing a postdoc is a huge gamble and often a waste of time.

Existing NIH policies, programs, or resources

1. pay postdocs more. Supply more grant money for postdoc salaries
2. alternatively, make postdoc funding more stable. If most postdocs are 4-7 years, make the grants that pay them 4-7 years. This would encourage postdocs to join smaller labs in more affordable locations without worrying that their lab will run out of funding.
3. create funding mechanisms for postdocs to stay in their postdoc lab as permanent employees. Allow these permanent employees to apply for grants that fund their research and fund them at acceptable success rates. The K99 is not good for postdocs. It encourages them to peruse projects already established in their postdoc labs. When they get a job, they are offered lower startup and they end up competing with their PI or trying to start something new with zero momentum. A better solution to help postdocs land faculty jobs would be to fund more new investigators and reduce the funding to huge labs.

Proven or promising external resources or approaches

I suppose the nih could invest in funding facilities/services for postdocs. For example, day care and parental leave. These benefits are common in other large companies.

Response 112

Perspectives on the postdoc roles and responsibilities

A postdoc is meant to carry an independent idea/project in the lab of a principal investigator.

Fundamental issues and challenges

With the average age of the defending graduate student getting older and older, the idea of being a early-mid 30's adult earning $56K with no retirement benefits if we get a fellowship is offensive. Postdoc lengths have also been increasing to 6-7 years. Coming from an already wealthy background or choosing to live in an extremely low COL area seems to be the only way to accept a post-doc. I think the challenges are quite obvious at this point. There are better positions with much higher pay now.

Existing NIH policies, programs, or resources

Funding for 1-2 year mini post-docs focusing on learning a particular scientific technique. Push for bigger R01 budgets that haven't changed in the past 2 decades.

Proven or promising external resources or approaches

Response 113

Perspectives on the postdoc roles and responsibilities

In my position, I have wide ranging responsibilities including:

1. Training grad students, and undergrads;
2. Study design and set up;
3. Data collection;
4. Data processing, curation, and analysis;
5. Hypothesis generation and analysis design;
6. Data analysis and communication;
7. Publishing
8. Funding acquisition. I'm encouraged to be a mini PI while still doing all the the same tasks as a grad student.

I do think that part of why folks have conflicting experiences is that no two postdoc positions are alike. In some, you may be treated as more of a trainee, others a staff scientist, and others as a secondary PI. Often, it's a combination of the 3, resulting in feeling like you are always behind and not paid enough for what you do for the lab.

In my view, there should be fewer postdoc positions. These positions should be limited to individuals seeking specific training and get paid as a graduate degree and 5 years of experience in the field (basically an advanced grad student, so more than a stipend but less than a data scientist). If someone is operating as an expert (e.g., designing studies or training students), however, and is not primarily receiving instruction, I think they should have a higher position that is appropriate for their role (e.g., staff scientist or data scientist if they are responsible for data curation and analysis, clinician if they are administering treatment, junior professor if they are training or teaching, etc). I think academic institutions and funding agencies should make more of these expert opportunities available and encourage them as the default path after PhD/MD/etc.

Fundamental issues and challenges

Lack of standardization in benefits **and responsibilities**, low pay, high risk. By high risk, I mean that postdocs are generally short-term opportunities with an expectation of moving to work with someone you don't know well. Since there isn't the added protection of a specific training program, postdocs are often exploited and have less power than a grad student to do anything about a toxic or abusive situation. That, combined with the fact that postdocs are more likely to be older and with familial responsibilities, a stable, higher paying, non-academic job becomes much more attractive.

Existing NIH policies, programs, or resources

1. More funding opportunities for non-postdoc positions (like data scientists, clinicians, junior faculty, etc.) and
2. Stricter requirements on what institutions must provide postdocs.

Proven or promising external resources or approaches

That's a tough one because I'm not sure of comparable positions in other industries. I think having a clear separation between trainee roles (which should come with trainee benefits such as tuition, structured mentorship, etc.) and professional roles (which should come with industry standard pay, responsibilities, and benefits) would go a long way. If there is literature on how to reduce workplace harassment and exploitation, incorporating those suggestions would be good, too.

Response 114

Perspectives on the postdoc roles and responsibilities

The role of an academic postdoc should be to carry out independent research and prepare for what comes next —postdocs are not permanent positions and so career development (from figuring out what the next career stage will be to holistic development and preparation for that phase) is critical. Postdocs should be allowed dedicated, protected time for career development. Additionally, mentors of postdocs should be evaluated for their ability to truly mentor and develop postdocs (and this should not be measured in the number of postdocs that move on to faculty positions). This also means that postdocs should have the financial support necessary during this phase of their career. Postdocs are highly trained, capable scientists who should be rewarded with salaries above the minimum living wage.

Fundamental issues and challenges

Postdoc salaries need to increase. NIH NRSA scales are a good place to start, but the NIH *must* start mandating that universities that get NIH funding (or labs that have individual grants such as R01s) pay ALL of their postdocs at least NRSA scale. Too many universities fail to set a postdoc salary floor that is in line with the actual cost of living or worth of postdocs. While I realize that the NRSA scale is meant to apply to those with NRSA fellowships, it is factual that many more postdocs are worthy and qualified of NRSA awards than the number of NRSA awards provided. Therefore, not holding universities to a rigorous salary scale only ensures that postdoc pay in general lags woefully behind.

The NIH must work with universities to ensure that postdoc benefits do not change when postdocs receive NIH funding. I was awarded a T32 spot after being a postdoc associate (non-fellow) for a year and it cost me hundreds of dollars because my postdoc associate health insurance and benefits plans ended, and I was forced to go onto graduate health insurance (without benefits such as HSA etc) as this was the only plan available for postdoc fellows (such as those on T32s/F32s). Countless postdocs across the US have similar horror stories, from losing medical providers and falling behind on medication availability because of forced insurance changes that universities say is the mandate of NIH (schools blame these insurance/benefits policies on NIH).

Postdocs need higher salaries and better benefits (including retirement). Most postdocs are in their 20s and 30s and it's unacceptable that a prestigious position (such as a postdoc) at this stage of life does not come with job benefits such as retirement or child care.

Existing NIH policies, programs, or resources

No reponse

Proven or promising external resources or approaches

Higher salaries lead to higher employee satisfaction.

Response 115

Perspectives on the postdoc roles and responsibilities

I would love to do a post-doc because, in my view, the role is a great way to continue doing the work that I love. However, I also view it as a role that I cannot afford to do. For example, I live in CA, and getting paid $55k/year is not even close enough to a middle-class income for 2 people (without kids!). Not to mention that I have over 50k in student loan debt to pay for.

Fundamental issues and challenges

The issue is pay. It's literally just pay. The incoming post-doc generation is composed of millennials who are strapped with student loan debt and will be forced out of science because post-docs just simply don't pay enough. It's really straightforward.

Existing NIH policies, programs, or resources

Increase the salaries. It will mean that fewer opportunities are available for post-docs, but I think that is probably just fine.

Proven or promising external resources or approaches

Increase the salaries.

Response 116

Perspectives on the postdoc roles and responsibilities

It should involve training in research, and training in independent thought. It should no be conceived as a source of cheap labor for the PI.

Fundamental issues and challenges

My PhD graduate students in statistics and biostatistics can land jobs straight out of graduate school that pay from $100,000 to $300,000, plus bonus, stock options and stock grants. It's always been true over my 30 year career that my students make more than I do, if not immediately upon graduation, then after a few years in industry. To ask them to take a postdoc position paying perhaps 60,000 (it used to be even less) is just plain insulting. They'd rather go back and live with parents for a month until they can land a good quality job in the biotech/pharmaceutical industry or in Silicon Valley. At the moment, one postdoc salary doesn't remotely come close to paying for room and board and transportation in Los Angeles. There are a lot of cities in the United States now where faculty can't afford to buy a house on even a faculty salary. Postdocs need to eat and ideally to thrive. Increase postdoc salaries, immediately! Please!

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 117

Perspectives on the postdoc roles and responsibilities

A stage in the academic career where you develop independence, have a chance to use the skills acquired during your PhD to do exciting research, and to prepare your own research profile for faculty applications.

In Europe postdocs frequently have supervisory roles towards master students and PhDs, which helps them develop critical mentoring skills for later PI jobs.

Fundamental issues and challenges

The low salary, barely enough to have a decent life in Boston. Less than many earn with just a Bachelors degree. Certainly not enough to start a family. It does not seem to have increased adequately with inflation.

Ridiculous structure of penalising postdocs with a fellowship: they should get more benefits for bringing money and prestige to the university, not less.

Precarious visa situation, very limited support from HR before moving to the US/the institute.

Uninviting and volatile political climate, expensive healthcare, low number of vacation days, horror stories about mass shootings all disincentivise international scholars.

2-body problems: all of the above but navigated twice.

Response 118

Perspectives on the postdoc roles and responsibilities

Postdoc training to me should be preparing the individual to run their own research program while balancing managing people and administrative work. This means more thinking big picture and managing graduate students, undergrads etc, with less emphasis on working at the bench. There should be more transparency on how to budget for grants and people.

Fundamental issues and challenges

I had a horribly abusive Ph.D. experience and every time I reached out for help, I was gaslit and blamed for the negativity. The problem is that there is even less support as you reach a post-doc position and a PI position. Having to work through all this negativity on top of barely being paid and stressing about finances, is a beautiful recipe for burnout. If you really want to improve the postdoc experience, it starts with comprobable pay and support at every level. By support, I mean mentorship, actionable responses to abuse and less pressure to publish Nature, Cell, Science.

Response 119

Perspectives on the postdoc roles and responsibilities

The postdoc is a period where I get to spread my wings, scientifically. It's an opportunity to prove that my past success is an indicator of future outcomes, and to identify a unique and pressing question that interests me.

Fundamental issues and challenges

Funding, funding, funding. Any other answer is silly and just a distraction of this main issue. I mean this not only from a postdoctoral salary/fellowship perspective, but the fact that R01 funds haven't increased in over a decade doesn't match the reality of science nowadays. On one hand, many postdocs feel stress to obtain funding, or they may never be able to pursue an independent scientific question outside of their supervisor's existing grant programs. On the other hand, many postdocs looking ahead to having their own labs are highly discouraged by funding prospects, both the success rate and dollar amounts. Graduate student and postdoc salaries are constantly increasing, to the point where having one R01 is not sufficient to sustain a lab. Given the average amount of time it takes for an ESI to obtain their first R01, the thought of needing more than one to support multiple students/postdocs is daunting.

Existing NIH policies, programs, or resources

Funding at the postdoctoral and investigator levels need to be expanded/increased. Any other policy adjustments are misplaced bandaids that do little to fix anything.

Proven or promising external resources or approaches

None of those other things matter if funding stays as limiting as it currently is. There is no job satisfaction if constant worrying about funding is attached to the job. It's not surprising that retention rates are dipping when better funded scientific opportunities exist outside of academia.

Response 120

Perspectives on the postdoc roles and responsibilities

I view the post-doctoral position as a transition position from graduate school to faculty. For me, the goal has been to get the training in how to run a lab, how to mentor, how to chose and conduct my own research directions. My responsibilities are to be a good lab citizen, do my research, contribute to public knowledge about the world, and do science that can help people.

But it is also a job that I do to pay the bills, feed my children, and have safe housing.

Fundamental issues and challenges

The fundamental need for me as a woman who had a child in graduate school and in my first postdoc is social support to make it possible for me to do my work. I did a postdoc in Europe, and there the social support is so much better—insurance, salary, housing, parental leave. I was on an F31 in the US when my first child was born and almost went broke, left academia for a while, and only returned to academia because of the post-doctoral benefits I was offered in Europe. Having the second child during postdoc abroad was much, much easier because I had the possibility to take a long leave (8 months paid) and was able to hire a research assistant to continue my experiments while I was in late pregnancy and on leave. Then, I received a fellowship to support extra childcare costs and to hire household help (house cleaner) during COVID. These have also contributed to my retention. Now I am a postdoc in the US on a T32, and I am back to paying huge amounts of money for childcare with high demands on my time and low social support. The contrast is stark.

Existing NIH policies, programs, or resources

Childcare costs policy: This is a fantastic policy and I have taken advantage of it. Ideally, the maximum would be more than $2500, as this covers around 1-2 months of childcare in most places. Additionally, it would be great to have this allowance allowed through more funding mechanisms (i.e. R01s) as graduate students and post-docs are also paid through those funding mechanisms.

Pandemic accommodations: the NIH should allow people to "double up" on eligibility extensions for K awards. The pandemic affected my productivity during a critical period in my post-doc. I had no childcare for several months, and was unable to work. I also had a child during my post-doc. When I add up the amount of time I was on leave or unable to work, it is more than 1 year. K99 is becoming almost required in my subfield for getting a faculty position, and the eligibility limits are restrictive for mothers who tend to have less time to work than those without children or (data suggest) fathers. Being able to get a longer extension is both fair and will improve the representation of any people who have had more caregiving demands during their early career that overlapped with the pandemic.

Parent leave accommodations are too short. 8 weeks is not enough time to bond with a child and recover, especially for graduate students who cannot afford high quality childcare.

Proven or promising external resources or approaches

While in a European country, I received a privately funded fellowship that was a monthly allowance for me to use freely "to support compatibility of science and motherhood". I used it to buy a washing machine, hire biweekly house cleaning, pay for a babysitter to pick my kids up from daycare, and to get some babysitting during the pandemic when the childcare facilities were closed or closing early. This money made a huge difference. Anything that the NIH can do to improve the quality of life of mothers in science is going to life everyone up. Now that I am on the cusp of having a faculty position and seeing many women dropping out of academia because they just want enough money to pay for housing and childcare, I see that this is the single most important thing for the retention of mothers in science.

Response 121

Perspectives on the postdoc roles and responsibilities

In most cases, a postdoc should be training explicitly for a professor position. In some cases, postdocs may just want to learn a new system or technique before going to industry.

Fundamental issues and challenges

The minimum stipend set by the NIH has failed to keep up with inflation and NIH recommendations for decades, especially in high COL areas.

The "training" structure set by the NIH devalues the abilities and contributions of postdocs, who hold terminal degrees in their fields and can easily earn more respect in industry.

Existing NIH policies, programs, or resources

MORE INDEPENDENT FELLOWSHIPS FOR POSTDOCS.

Obviously, increase postdoc minimum stipend.

Don’t let faculty pay postdocs off of R01 grants. That is paid labor, not a training opportunity.

Pressure universities to create more permanent jobs for people with PhDs, in lieu of the bloated and exploited postdoc labor force.

Proven or promising external resources or approaches

No response

Response 122

Perspectives on the postdoc roles and responsibilities

This is the most underrated position I know. The most important lab member (besides PI) with many responsibilities, yet the salary amd benefits does not refelect it. Expected to work as much possible for as low as possible salary, with no PTO, no employer 401k contribution, no dental issurance (changed in 2023), no parental leave benefits. Salary cap is too low when living in big cities with high rental prices, affecting work life balance—meaning no life with such a low salary

Fundamental issues and challenges

Low salary

Low salary and high expectations

Benefits not equal to other staff members

No paid time off

Even for people who love research, it is difficult to plan future with low savings.

No support for women, especially young mother in science

No child care support

Existing NIH policies, programs, or resources

Everything needs to be updated to reflect 2023 year, current cost of living and lifestyle.

Specific development plan from postdoc position to independent scientist.

Specific programs offered to mothers/fathers that want to do research and not only be present but take active part in their children life.

Proven or promising external resources or approaches

Higher salary!!!!!!!!!!

Response 123

Perspectives on the postdoc roles and responsibilities

It is a time to learn a new technique, skill, perspective before opening a lab of your own. A time to expand mentor and professional network. It is also a valuable time to learn about basic lab operations.

Fundamental issues and challenges

Biggest fundamental issue is financial. Cost of moving is significant given the role’s temporary nature. Salary is also low. For those seeking academic jobs, it feels like the options are

1. postdoc, low salary, with potentially low chance of getting hired at faculty level or
2. non-academic job, higher paying salary, more stability in 5 year term.

I am also at a UC school where the university requires that I get paid above NIH scale. This becomes challenging because my advisor has limited funds to cover the difference.

Existing NIH policies, programs, or resources

NRSA childcare supplements should be expanded. The resource existing is great, but not enough to make significant impact on parents' lives.

Proven or promising external resources or approaches

No response

Response 124

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1. You want to know why people aren't becoming postdocs? It's because postdoctoral pay is unconscionably low because of NIH policies. Your guidelines or requirements for postdoctoral salaries are immoral. Not only are postdocs in general paid well below what equivalently trained people are paid outside of academia, NIH postdoc pay is shockingly low even compared to postdocs funded by other federal agencies. I was an NSF and EPA-funded postdoc back in the late 00's, and I made almost 2x what my wife in an NIH-funded postdoc made, and my pay was 30% below the private sector offers I was receiving. These disparities certainly remain, and I would guess no federally-funded postdoctoral salary has kept up with inflation since them, especially cost of living inflation in the kinds of cities where most universities are sited. The pay is so bad that I ACTIVELY DISCOURAGE students and mentees from applying for (much less accepting) NIH-scale postdocs. Moreover, in my own grant proposals I never ask for funding for postdocs because it would be cruel of me to hire someone on NIH scale salary. If I want someone with that level of expertise, I hire them under a job title that allows me to pay them half-decently, something comparable to an NSF postdoc in the physical sciences.
2. The $500,000/yr cap on modular R01s has also not kept up with inflation, so even if I were willing to hire a postdoc at NIH scale (which I wouldn't because I'm not a terrible person) I would probably have to hire a graduate student instead.

Existing NIH policies, programs, or resources

1. All the problems of bullying, abusive advisors that plague PhD programs are only magnified in postdoctoral positions. NIH should change its funding scheme so that funding for postdocs and graduate students is not tied to an individual project or advisor but is applied for separately via a department-wide grant. At least then the trainee wouldn't be at the mercy of one possibly sociopathic individual. Plenty of research organizations use models like that. NIH should learn from them. This would have the ancillary benefit of introducing many postdocs earlier to collaborative team science, experience that they need more than "independence".
2. NIH should stop issuing K-awards to postdocs. Expecting people at that level of experience to start applying for grants is absolute insanity, and is a big part of why people don't want to stay in the academic research pipeline at that career state. The grant writing expectation should only arrive once a person in a faculty position.
3. A postdoctoral fellows should have minimum 90 days of paid parental leave for birth of a child and NIH should withhold funding for employers/advisors who don't obey those minimums. Plenty of people in the late 20s and early 30s want to have families, and the structure of postdoctoral positions makes postdocs uniquely vulnerable when they decide to have children. This is another big reason people, especially women like my wife, leave the research pipeline at that career stage, and it goes hand-in-hand with the need to disentangle postdocs from a single project or advisor.

Proven or promising external resources or approaches

Pay people what they're worth and ensure decent benefits and a decent work environment and they'll take the jobs. It's not that complicated.

Response 125

Perspectives on the postdoc roles and responsibilities

Postdoc is training cum independent research capability development opportunity in an exciting and resourceful environment. It offers many opportunities for helpful resources, and co-work with independent leaders to further training in academic and administrative development so as to prepare for a future independent position.

Fundamental issues and challenges

The basic drawback of a postdoc position is very low pay and limited to no benefits. Here is my own example of why I left academia for industry: I worked as PI of a [redacted for anonymity] (130000.0 USD for 2 years) which paid me 52500.0 USD per year. I had a very stimulating research and mentoring environment and envisioned myself leading a research group after 3-4 years of post-PhD training. However, as an international student with a family of 3 in [redacted for anonymity] could not survive on that salary. Therefore, I could not even complete my fellowship period and was terminated after 1year for an industry that is paying me 132000.0 USD/per year with full benefits for at least financial peace in my family.

Existing NIH policies, programs, or resources

To retain postdocs, NIH MUST have, at least, a similar payscale and benefits with other Federal like FDA, EPA, NIST, or Government Labs.

Proven or promising external resources or approaches

Providing a similar payscale and benefits with other Federal like FDA, EPA, NIST, or Government Labs would eventually enhance the postdoctoral training ecosystem.

Response 126

Perspectives on the postdoc roles and responsibilities

Postdocs are vital to advancement of research programs. They are often the workers that bring in new technology and approaches to subject areas and they are the guarantors of future inquiry. Their leadership at the ground level of research labs has a profound effect on other trainees and staff.

Fundamental issues and challenges

Postdocs are faced with unfair economic choices. The must forgo a living wage to pursue an academic career. Thus, we lose the best talent to the private sector. Their choice should be based on chosen career path, not survival. Thus is a fundamental component of Institutional racism, because only those with outside resources can easily make the choice to pursue a postdoc or an academic career. Those that do choose a postdoc often find it economically untenable and leave. Postdocs also face unrealistic work expectations that do not meet minimum standards of employment in the private sector, including parental leave, paid time off, and hourly work standards. Finally, career development training is non existent at most institutions, so they are often unprepared for the job market and lag behind peers.

It is time to bring Postdoctoral training out of the scholastic tradition of mendicant monks and into the modern era.

Existing NIH policies, programs, or resources

Living wage competitive with the private sector with benefits, sick and parental leave, and paid time off. Required mentor training to host postdocs. Required institutional career development training. 5 year eligibility for NIH training funding. Training grant funding for program directors and program managers to oversee training and career development. Recognition that postdoc transition to the private sector is a success.

Proven or promising external resources or approaches

UC President’s Postdoctoral Fellowship Program. NSF INCLUDES funded programs. UC San Diego EPIC training curriculum for postdocs.

Response 127

Perspectives on the postdoc roles and responsibilities

The main purpose of a post-doc is to gain additional research training. This may be used to increase qualifications for industry positions or as the basis of an independent academic lab. Post-docs assume many responsibilities, including mentorship, data collection, publishing, logistical aspects of the lab, etc. To me, the most important aspect of a post-doc is the opportunity to learn a new skillset that can be incorporated with previous training (graduate school, etc.) for a successful independent research lab.

Fundamental issues and challenges

The number one problem with post-doc positions is the outrageously low compensation for someone with an advanced, terminal degree (Ph.D. or M.D.). I know many very passionate scientists who had to make the difficult choice not to pursue a post-doc because they could not support their family on a post-doc salary. Academic research looses many passionate, talented scientists due to our failure to properly compensate post-docs. Anything other than a substantial increase in post-doc pay set by the NIH will be viewed as lip service.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Mount Sinai pays their post-docs a competitive wage (about 70K) and housing assistance. This would be a great program for the NIH to model.

Response 128

Perspectives on the postdoc roles and responsibilities

A preparatory stage to become a Principal Investigator at Universities or National Labs

Fundamental issues and challenges

- Salary range is very much not comparable to industry positions. Another problem is that universities follow the "NIH minimum salary", so the NIH should be willing to change such policies
- Visa processing is absurdly complicated for PhD-holders in general. Contracts are short (often with yearly renewal) and visas are only granted for a 1 year period, forcing researchers to thousands of dollars and time to travel to renew their visas.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 129

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The biggest issue for me is the salary. My postdoc is in a high cost-of-living city and it would be impossible to have an acceptable quality of life (e.g.,

Existing NIH policies, programs, or resources

If the budget cap on grants contributes to the low postdoc salary, increasing the budget cap for grants would alleviate that.

Proven or promising external resources or approaches

No response

Response 130

Perspectives on the postdoc roles and responsibilities

The postdoctoral role is additional training post-PhD.

Fundamental issues and challenges

I was a T32 postdoctoral fellow 2021-2022 who left the position early because I could barely afford rent in boston on my salary. My quality of life was extremely difficult. My T32 salary did not even meet the NIH minimum recommended salary. I left my position for an industry scientist position and tripled my salary and my quality of life has drastically improved. I wanted to stay in academia but being able to afford childcare and starting a family was more important. Also the lack of health insurance as a postdoc was very troublesome.

Existing NIH policies, programs, or resources

Postdocs need to be paid more and have guaranteed health insurance. As a T32 postdoc 2021-2022 I was not even making the NIH minimum salary recommendation while living in a high cost city (boston).

Proven or promising external resources or approaches

Pay Postdocs more and guarantee health insurance.

Response 131

Perspectives on the postdoc roles and responsibilities

Research scientist. Should learn new fields and/or techniques while also learning to be a mentor to graduate and undergraduate students. Should be building ideas to build a lab around while contributing to the postdoctoral lab OR the techniques needed to succeed outside academia. Continue to expand on the professional network and scientific communication skills developed in graduate school. If continuing in academia, should also be focused on developing skills necessary as a professor—grant writing, peer reviewing, lab building, teaching, etc.

Fundamental issues and challenges

1. Salary and benefits. Most postdoc salaries are set to the NRSA minimum with limited benefits under the justification that a postdoc is a temporary training position. However, a postdoc is a PhD-level research scientist and works in a lab for typically 3-5 years or more while doing difficult, skilled labor. If you want people to stay in academia, you need to increase the salary to at least 1.5x the current amount and include benefits for grant recipients (at least health/dental/vision, retirement, paid leave, parental leave). This is still less than industry, but will be enough to stop driving people away.
2. Penalized for staying local. Currently, it is discouraged to do a postdoc at the same university you did you graduate studies in. This makes it very difficult to put down roots. Just drop this entirely. Let people like and work where they’re comfortable.
3. Penalized for longer graduate studies and for undergraduate grades. Judge a scientist by the science they’ve produced when they produced it. Don’t ask for a justification for a long time in graduate school or poor undergraduate performance. It feels awful to explain how years of trauma or life events added time to your studies and then still have that justification ignored by reviewers. Just judge based on the the quality of the work at hand instead of the length of time it took to get there.
4. Sexism, racism, and power abuse in academia. The power dynamics in academia are such that if a PI is successful (defined by grant/papers), they can get away with hurting trainees. I don’t know a solution, but this needs to be addressed.

Existing NIH policies, programs, or resources

1. Require that grant funds cover salary and benefits for the awardee, including training grant funds. Raise the salary to at least 1.5x the current amounts, add benefits (at least health/dental/vision, retirement, paid leave, parental leave). If grants cannot be raised to this amount while giving the same amount of grants, give fewer larger grants.
2. Raise lab grant sizes. R01's and R21's are too small to sustain modern labs while also providing graduate students and postdocs with the quality of life they deserve. If grants cannot be raised to accommodate the needs while giving the same amount of grants, give fewer larger grants.
3. Remove the limit on the number of years as a postdoc. This was intended to keep people from becoming forever postdocs as it is a "temporary" "training" position. However, in most fields 3-5 years (a typical length for a successful postdoc) is not temporary and every type of position has training involved. Additionally, professorships are few and far between. Make postdocs a viable long-term position akin to a research scientist.
4. Don't penalize people for staying in their graduate field. Science certainly benefits from cross training ideas, but it also benefits from some people becoming very knowledgable in their field. If some people don't want to change fields after graduate school, they shouldn't have to. There's still a lot to learn from a postdoc even if they're in the same field and model system.

Proven or promising external resources or approaches

Pay. Benefits. Equity.

Not new trainings.

Not new resources.

Increase our pay. Give us benefits. Address power imbalances in academia.

Response 132

Perspectives on the postdoc roles and responsibilities

Develop new skills that will benefit you as an you transition towards becoming an independent PI in the next phase of your career

Fundamental issues and challenges

Please raise salaries to make postdoctoral positions more attractive to potential trainees who may come from underrepresented backgrounds or who may be navigating decisions around supporting new/young families, individuals who may otherwise be tempted by higher-paying full-time jobs right out of their graduate programs for fiscal reasons.

Existing NIH policies, programs, or resources

Higher pay for T32 fellows, etc.

Proven or promising external resources or approaches

Promoting work-life balance with potential for implementing 4-day work weeks or flexible scheduling

Response 133

Perspectives on the postdoc roles and responsibilities

I believe a postdoc have already gone through training and developed a special area of expertise during grad school; thus, they are no longer a trainee, and are instead scientists who bring their skills and knowledge to a new lab to help the PI in developing a research direction that the PI otherwise could not be able to do so himself/herself.

Fundamental issues and challenges

Postdocs are compensated as trainees when they are actually expert scientists already. Specifically, the stipend for postdocs is way too low--it is very difficult for a postdoc to sustain an acceptable quality of life if he/she wishes to have a family and children, not to how demoralizing it is to see the industry is paying

at least two or threes times more for the same qualification, with better work-life balance and job security. On top of that, there are also lots of restrictions on eligibility for fellowships and grants (e.g., most are for US citizens/ permanent residents only), making it difficult for qualified postdocs from a diverse background to stay in academia.

Existing NIH policies, programs, or resources

Increase the minimum compensation for a postdoc (starting at 75k per year), set a ceiling for the amount of time that it takes for a postdoc to transition into research scientists positions (maximum 3 years), increase the availability and funding for research scientist positions, expand the eligibility of fellowship and grants applications

Proven or promising external resources or approaches

No response

Response 134

Perspectives on the postdoc roles and responsibilities

Postdocs today essentially function as staff scientists but with precarious positions and low pay. An ideal postdoc is able to do independent but related work to the host lab/PI, getting guidance and resources to become more independent and a better scientist. However, most do not function this way, and many are just used as research labor that is often cheaper than grad students due to the lack of tuition, and requiring less effort in training for the PI. I don't think it is necessarily bad that Postdocs fill this role in labs and departments, but they should be compensated and treated commensurate with their level of education.

Fundamental issues and challenges

Postdoc positions are only rational to take if one is interested in a career in academia, and there seems to be a viable route to getting a permanent position. As the job market becomes more precarious, it is rational that fewer PhDs would choose to go into a postdoc. Absent a major change to university hiring practices and trajectories, the only way to increase postdoc retention of recruitment is to provide more money and more stable positions. This would obviously also improve quality of life. As a current postdoc, I would worry less about whether I should continue in my position if I was paid adequately and didn't know I had a clock on how long I could work in my lab. Similarly, if pay raises and adjustments to postdoc salary year to year reflected economic trends and provided a financial boost that didn't seem like a joke, I would be more inclined to stay. It was demoralizing to see the salary adjustment, after more than a year of record inflation, was nowhere near high enough to cover the increase cost of living. I now make much, much less in adjusted salary than I did when I started. This is ridiculous.

Essentially, if you paid postdocs anything near what they were worth, and gave them more stability, more people would want to do postdocs.

Also, quit calling postdocs trainees. We have 8+ years of education and training. Every new job requires learning and training no matter what level you are at, this is not unique to postdocs. Calling us trainees gives cover for universities to deny us resources afforded to employees when it suits them.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

One approach would be to let postdocs remain working in labs as staff scientists. Most postdocs will not get a faculty position, and many do not want to. A lot of good researchers are lost to academia because they either don't want to run a whole lab/teach/essentially do paperwork, can't afford it, or need more stability. A more stable staff scientist position in an existing lab would retain a lot of these people.

Response 135

Perspectives on the postdoc roles and responsibilities

Graduate school 2.0. More pressure, more stress, and much less appreciation.

Fundamental issues and challenges

One main issue is the pressure to publish and get funding. Depending on the lab you might be stuck as a post doc with little opportunity to advance. Lastly, the pay for the amount of work is so low. I can make twice the money in industry as I can a post doc which would give me a better quality of life. That's very important given the increased costs for basic necessities.

Existing NIH policies, programs, or resources

It's really the whole academic system that needs to be modified. Older faculty need to retire, funding rates need to be increased

Proven or promising external resources or approaches

No response

Response 136

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should be a transitional role to gain a new skill set by completing an independent research project.

Fundamental issues and challenges

Fundamentally, the postdoctoral position (unlike predoctoral studies) offers very little value for any person who does not go on to pursue an academic tenure track or equivalent. Meanwhile, the compensation is very low for a highly educated American adult. Problematically, most postdocs who want tenure track position at a research university do not obtain one due to market conditions. Further, the norm, encouraged by NIH policies, dictates that most postdocs pursuing an academic position hold a postdoc position for about five years.

Existing NIH policies, programs, or resources

Personally, I believe the NIH will only consider incremental changes in the postdoctoral position, but the following structural change should be enacted:

Make the maximum postdoctoral training period two years.

Doing this would force candidates to attain faculty or staff scientist positions in academia or pursue a job outside of the academy. Likewise, institutions looking to hire tenure track faculty could not expect ~5 years of postdoctoral training.

Proven or promising external resources or approaches

No response

Response 137

Perspectives on the postdoc roles and responsibilities

Post-doc is an intermittent position to gain insights into expanding your knowledge from grad school and applying it to real-world scenario. It is a key role that is a part of decision making process in your career to move into an independent scientist or industry player or startup one of your own

Fundamental issues and challenges

Challenges—Navigating the US institutional research environment; Limited funding opportunities for non-residents, lack of sufficient training sessions that help in transition to specific roles

Issue—Insufficient pay to support dependents and kids; visa issues creating panic and unnecessary administrative hardships, lack of proper guidance in matters of taxation

Existing NIH policies, programs, or resources

Institutions in which Postdoc's work do not provide any awareness regarding the policies, programs or resources. So NIH should proactively establish compulsory training ecosystem to promote Career transition of Postdocs

Proven or promising external resources or approaches

Create a Nation wide ecosystem of all Postdocs ensuring implementation of a uniform code

Response 138

Perspectives on the postdoc roles and responsibilities

A transitional role for someone to further develop their research horizons and capabilities in preparation for a permanent position in industry or a tenure track role in academia

Fundamental issues and challenges

Salary and benefits

Existing NIH policies, programs, or resources

Increase postdoc salary and funding so that labs can afford more and better paid postdocs

Proven or promising external resources or approaches

Increase postdoc salary and funding so that labs can afford more and better paid postdocs

Response 139

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

As a graduate student I have already decided against doing a Postdoc. It is 98% due to pay. The increasing lengths of PhDs in Biology/Neuroscience mean that I have gained more expertise in my PhD training than predecessors from decades ago. I refuse to give more of my life to academia with little to show for it outside of my name on publications. I have already put off so much else in my life that I cannot imagine putting anything else on hold to make the money I could've made with a bachelors in industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 140

Perspectives on the postdoc roles and responsibilities

The post-doc just seems like an extension of a PhD. I don't feel like it is anything special nor are you treated any better in my opinion.

Fundamental issues and challenges

Payment. To be honest, as a doctoral student the post-doc position is not appealing in the slightest. I went through rigorous training and hours devoted to my research projects to get paid just a tiny bit more. The PhD is supposed to symbolize you becoming an expert in an area and it doesn't seem like that at all in academia. Plus I find it common with post-docs not getting offered faculty positions at the institutions they are at. Meaning after two-years of being somewhere you must move yet again. I'd rather be a job where I am paid accordingly for my degree and not having to move.

Existing NIH policies, programs, or resources

increase payment and have set institutions where post-docs leads to faculty positions. I'm finding it more common that institutions will not hire unless you are coming in with a K-grant aka you are self-funded.

Proven or promising external resources or approaches

No response

Response 141

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The publish or perish culture has fostered toxic learning environments that scares people away.

Existing NIH policies, programs, or resources

There are limited options for students to defend themselves if they are abused by their PI.

Proven or promising external resources or approaches

No response

Response 142

Perspectives on the postdoc roles and responsibilities

Postdoctoral roles would allow me to continue expanding on my dissertation findings, while developing further research programs that would further extend the impact of my work. It would afford me the space to breathe while I figure out a K award.

Fundamental issues and challenges

Money. Simply put, I would need funding that is commensurate with my doctoral-level skills. It's not feasible to live in a US city and make less than 80k.

Existing NIH policies, programs, or resources

Long-term funding from PhD through first R. Less racist review process. Include international students.

Proven or promising external resources or approaches

No response

Response 143

Perspectives on the postdoc roles and responsibilities

As a former postdoc, to me, a postdoctoral fellowship represented an extended period of training where I could gain new skills and hone current skills. I viewed it as training for my future profession (I am now faculty) and I learned many of the skills needed to be a successful PI. But importantly, a postdoc is a job, just like any other job. One of the first pieces of advice I got as a postdoc was "your job as a postdoc is to get a job", and that's how I viewed my postdoc. Training to get me a job.

Fundamental issues and challenges

There are several fundamental issues.

1. Pay. Many prestigious labs are located in extremely expensive cities (San Francisco, Los Angeles, San Diego, NYC, Boston, etc) where the postdoc stipend barely keeps up with rent. As a single, childless, postdoc in [redacted for anonymity], I spent half of my paycheck on rent (and I was paid above NIH scale). My friends with children had to make immense sacrifices to pay for childcare, food, and housing. I had to ask my parents for financial support. I am fortunate my parents could help me and understood the nature of my position, but this is not sustainable for anyone who does not come from wealthy parents. Childcare costs as much if not more than rent, and many universities provide zero support for childcare. This means that prospective postdocs have to make a choice, and many choose to do what is best for their families.
2. Bullying. I was EXTREMELY fortunate to have a really fantastic postdoctoral mentor and informal mentors who encouraged me and provided me with support. For other postdocs this is rarely the case. Many postdocs are bullied, abused, and stories about visas being threatened if postdocs do not work insane hours have circulated for decades. As recent events have shown, many prestigious labs at big research institutions that receive millions in NIH funding are incredibly toxic environments.
3. Job security. A postdoc is at most a 1-3 yr contract dependent on funds the PI has available and postdoctoral fellowships. This is incredibly unstable and many postdocs with families to support cannot constantly move around. It's also been historically thought that moving around (institutions/location) show a diversity of experiences, and this is extremely expensive and difficult for families, especially when moving for a postdoc means leaving support networks of friends and family.

Existing NIH policies, programs, or resources

Some ways the NIH can improve the experience is to

1. increase the postdoc salary scale. Many institutions use this to set their funding levels for postdocs, so the NIH has strong influence here. Allow PIs to ask for increased salary support. Postdocs are unionizing and getting better pay. I strongly support this effort, as postdocs have a PhD and are highly skilled workers, but if I don't have the funds to support my postdocs I have to let them go or hire fewer postdocs, giving fewer opportunities to those who need them the most.
2. Expand mentoring resources and programs. Things like the K99/R00 MOSAIC and NIGMS K12 programs that include development of postdoc cohorts and professional development opportunities are invaluable. My time as a K12 trainee gave me opportunities I would have never gotten otherwise. Incorporating aspects of this into F32 and T32 would be excellent as well as strengthening existing programs.
3. Increased opportunities for support for childcare. Some NIH grant mechanisms allow for funding childcare support but expanding this to all postdoc (and even grad student) funding mechanisms would be transformative.
4. NIH has a grant conference for ESI's I attended, but expanding this to target postdocs could be really great. Most postdocs don't know how to write grants or even where to find resources like reporter or matchmaker so having workshops on this could be invaluable (if these workshops do not already exist).

Proven or promising external resources or approaches

UC San Diego has a very good postdoctoral affairs office that works well. Providing mechanisms for institutions to apply for funding to improve these offices or develop these offices would be beneficial.

Response 144

Perspectives on the postdoc roles and responsibilities

Leasing /training less senior students. Research and training to become an independent investigator.

Fundamental issues and challenges

Salary, no respect, even PhD students overrule even on GLP. Overworking.

Existing NIH policies, programs, or resources

You should enforce what you have to everyone you fund and then we can talk about increases. Most PI use loopholes to avoid following your minimum wage guidelines. No money for training or conferences. Just work as a slave. And the moment you even ask for at least the official policy to be upheld. You are gotten rid off—All of a sudden funding dries up. And of course all university resources available to Postdocs work for the PIs. Just another measure of control after wasting everyone's time.

Proven or promising external resources or approaches

Postdocs should have same benefits as staff researchers such as tuition forgiveness etc. an actual contract and not this clown show we have now. Where they are doing whatever they want without any consequences.

Response 145

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should be a time to expand research and critical thinking skills while you prepare for the next career stage. This should be short term and used as a time to enhance your resume and solidify your primary research/career goals.

Fundamental issues and challenges

There are many challenges here as postdocs are not well supported in many institutions. Currently, students come out of PhD with very little savings and then have limited capability or desire to accept a postdoc position where they will also make little money and work long hours. There is no parental leave or support for childcare in most institutions and this is horribly unsupportive, especially since the PhD + postdoc journey is so long it is typical for people to have children during this time. The quality of life of postdocs is poor because they undergo so much training, only to continue to work long hours for little pay with little vacation time or support for work life balance. It is no wonder so many people want to go to industry after PhD where they get these benefits. I am a US citizen but I know for international postdocs the pathway to citizenship can be difficult and also poses a challenge. Lastly, the postdoc experience has become so long in recent years. It used to only be a few years but now it takes 5-7 years to publish good papers and move on—this is not appealing to anyone who has just finished a 5-8 years PhD.

Existing NIH policies, programs, or resources

Anything that would support higher pay, more vacation time, paid parental leave, childcare, and support for international postdocs. Furthermore, a more structured program to help postdocs move through their time at a quicker pace.

Proven or promising external resources or approaches

No response

Response 146

Perspectives on the postdoc roles and responsibilities

A postdoc position is for those who wish to stay in academia or acquire more specialized training. I think for those who want to stay in academia, it is a necessary step to gain more experience, make connections, and perform highly impactful research that would make one competitive for academic positions. For myself, I do not wish to become a PI and to me, doing a postdoc is more about gaining new sets of skills and working in a related, but new field. It is also a place where I can continue to explore research and determine if there is really a long term place for academics like myself who want to continue to do research at public institutions without necessarily becoming a PI. I do think that a postdoc also is giving me the time and space to explore whether I can continue in academia or whether I should in fact leave like most of my peers into industry.

Fundamental issues and challenges

I think compensation plays a huge role in retention. Here, it is just not possible to continue to live on a postdoc salary and also have things like a family or be someone's caretaker (I personally know a postdoc who has two children, so her cost in childcare is $2500/month per child, which is as much as she makes a

month). The university and academia in general prides themselves on being an inclusive place, but it really is not. Institutional support for first generation scientists, those with families, or internationals is highly lacking and causes us to lose tremendous amounts of talent as these workers leave for industry or completely change fields altogether. I have fellow postdocs as friends who have had to tell their children they cannot join the soccer team or go on a trip to meet their grandparents because they are literally living paycheck to paycheck. If we want to foster academic research and attract (+retain) top talent, we need to increase compensation to living wages.

For me, I like the academic environment, but don't know if there is a long-term place for someone like me that does not possess the aspirations of becoming a PI. The traditional model seems to be that there is a literal pyramid scheme leading to the top, which is the PI position and there is a huge bottleneck for positions past postdoc. Additionally, toleration of systemic abuse is another reason I would also consider leaving academia. I have witnessed terrible things that have gotten swept under the rug and have had multiple colleagues leave academia because they have been so terribly abused.

Existing NIH policies, programs, or resources

I think the T32 model for postdocs is actually horribly regressive and a form of indentured servitude. I was actually awarded a departmental T32 here at my institution and I had to turn it down once I read the language. I think the "other forms of commitment" while offering some flexibility, is really just unnecessary and seems like a means of holding recipients hostage in the field. If you want people to stay in academia after you fund them, there should be rewards for staying, not punishment for leaving. I care for my elderly parents and if I were to have accepted the T32 and for some reason, need to leave the field and the workforce completely to become a full time caretaker, the last thing I want to (nor should) do is have to bargain with the NIH for a repayment of the fellowship or some other form of "service".

I also think the application process for fellowships should not take undergraduate GPA into consideration for the applications. It is asinine to think that someone who has already been productive publishing, who has a PhD from a competitive institution, has good letters of reference, and is highly skilled, would then be judged by how they performed in an introductory chemistry course. As someone who had to work throughout college and care for elderly and ill family members, it is shocking to think that anyone would still care about a grade I got in a course 16 years ago when I have demonstrated my ability to publish impactful work and my research has helped my PIs secure multiple R01s.

Proven or promising external resources or approaches

Stop funding abusers. Stop creating an environment that allows PIs to abuse their trainees. This includes sexual harassment, discrimination, threats, and overworking/underpaying their trainees. Academia is quite toxic and the NIH does not seem to bother itself with these issues. However, if it were to actually punish programs, departments, PIs, and institutions that tolerates abuse of the trainees, their hands would be forced to deal with these issues. I think the NIH could also focus more on promoting ways to keep postdocs in academia by creating funding sources and programs for just that. I am not thinking K99s or career transitional funding into faculty positions. I am thinking more about creating more funding opportunities and programs that could structurally change the model. While more little labs as opposed to large labs is a good approach, I also think working on funding career academic researchers. that are not necessarily faculty or PIs and giving them the funding and space to continue to do research and live well so that their talent is not effectively lost from the pool as they leave for industry.

Response 147

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are often valued positions by the hiring PI but often disregarded as dispensable by an institution. Institutions maintain stringent barriers between faculty positions and postdoctoral positions. The former is treated as a valued, career prospect employee while the latter is viewed more similar to that of a student. Institutions do not want to be responsible for retaining postdoctorates and along with this is active prevention of postdoctoral researchers from receiving institutional support as a PI to submit R level funding which could allow promotion.

A postdoctoral position should be treated similar to the trades. A trainee such as a journeyman will, in a predefined timeline, be given the opportunity to advance into master's level position given certain competencies are met. Institutions should employ postdoctoral trainees with the intention of their success

being rewarded with a faculty position within the institution. Conversely, if an institution trains far more postdoctoral researchers than it is willing to promote into faculty positions, it is effectively showing it cannot successfully train postdoctorates to the standards the institutions themselves set.

Fundamental issues and challenges

Postdoctoral positions maintain a fundamental lack of long term job security or prospects. It is rare that postdoctoral positions can guarantee secured funding for more than 2 years once started. Even if it is extended to longer (4-5+ years), this is almost always done in single year increments affording no stability to the position.

Many of the entities with the most postdoctoral positions (research intensive medical schools) refuse to implement standard procedures to promote postdoctorate personnel into long term, faculty positions.

The use of the 'fellowship' loophole to treat Doctors of Philosophy as students (as to keep from offering proper job benefits) is ludicrous. No postdoctoral positions, NIH fellow or otherwise, should be treated differently than the faculty member he/she works with as it pertains the HR-related benefits and processes. All postdoctoral positions, even those supported by the NIH should be salaried, full time employee with benefits positions.

Existing NIH policies, programs, or resources

The use of the 'fellowship' loophole to treat Doctors of Philosophy as students (as to keep from offering proper job benefits) is ludicrous. No postdoctoral positions, NIH fellow or otherwise, should be treated differently than the faculty member he/she works with as it pertains the HR-related benefits and processes. All postdoctoral positions, even those supported by the NIH should be salaried, full time employee with benefits positions.

The NIH should heavily incentivize retention of postdoctoral researchers through promotion into faculty positions (preferably tenure track). This could be done through modifications to existing T32, F32 and K type awards by including options to maintain or increase funds awarded to an individual if promoted into a faculty role. This would also give the benefit of allowing T32, F32 and K recipients to have PI or co-I status on R level proposals.

Proven or promising external resources or approaches

No response

Response 148

Perspectives on the postdoc roles and responsibilities

I view it as extra training before gaining independence but I also see it as a waste of time because it now takes years to complete a postdoc before being "competitive" enough to apply for a position in academia. it feels like doing a second phd with less help

Fundamental issues and challenges

Money. If you want postdocs in your lab because we are highly skilled and advanced then pay us a living wage.

Change the whole [redacted] system. Requiring a big paper before applying for a job means years as a postdoc. and it's harder and harder to get big papers because they now require so much data. Panels a-z in a figure? That's a whole paper! But institutions wouldn't even pick a candidate with a j neuro paper from their postdoc. What ami training for? I got the training I can do the science, it's not like you're reaching me how to manage or budget or do any admin business—just ridiculous. I could switch to industry tomorrow and make over 2x my salary. And have a more balanced life.

Existing NIH policies, programs, or resources

System wide changes

Proven or promising external resources or approaches

No response

Response 149

Perspectives on the postdoc roles and responsibilities

I see postdoc position as a training opportunity to learn additional skills to prepare for an independent research career. While it is a training opportunity, postdoc contribute significantly on driving and leading the research program. They are leaders in doing actual experiments while mentoring graduate students and communicating with PIs.

Fundamental issues and challenges

I see two major challenges:

1. low salary and
2. lack of job security.

The salary of postdoc need to be adjusted so that postdoc can have a survival life to support a family. A $55000 salary cannot support family. Postdoc are highly skilled workers and need to be compensated accordingly. NIH postdoc pay should be competitive to industry scale. Often, postdoc position contract are for 1 year which does not offer job security. Although NIH grants are usually 4-5 years, postdoc are not offered long-term contract.

Existing NIH policies, programs, or resources

Postdoc should be treated as scientist. In the name of training, postdoc has become a way to recruit cheap labor to do highly skilled critical thinking work. Postdoc position should not extend more than 3 years. Labs should hire Phd with more than 3 years experience as "Scientist" position and they should be paid competitively. NIH should have grants funding mechanism to allow this kind of hierarchy. Not all postdoc can be PI. there should be other academic positions between postdoc and PI.

Proven or promising external resources or approaches

No response

Response 150

Perspectives on the postdoc roles and responsibilities

I am applying to postdocs right now. There are so many exciting ones out there. I see these postdocs as a chance to learn new skills, focus on my research and teaching, and develop new connections in the field.

Fundamental issues and challenges

One of the most pressing issues I'm facing is financial, and related specifically to student loan debt. By the time we get to postdocs, some of us are no longer eligible to defer our student loans. And we're no longer students, so we're not able to defer as we were in grad school. But we simply are not paid enough to make payments on our loans.

Existing NIH policies, programs, or resources

Take the average annual rent for a one bedroom apartment in each location, multiply it by 3, and make that the starting annual salary for postdocs.

Proven or promising external resources or approaches

No response

Response 151

Perspectives on the postdoc roles and responsibilities

The postdoc seems like an excellent time to develop independent research skills and gather preliminary data to start a new research program as a PI.

Fundamental issues and challenges

To me, the postdocs seems like it can be a valuable opportunity with the right mentor fit and with some time-bound planning (ie lasting a few but not 5+ years). Beyond that, the biggest barrier I see to pursuing a postdoc is salary; at the time in my life I would be pursuing a postdoc, I would like to be getting married and starting a family, which is hard to envision on a postdoc salary in most metro areas today. After not being able to save much money during grad school due to low wages, I am not sure it will be financially feasible for me to pursue a postdoc.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 152

Perspectives on the postdoc roles and responsibilities

A post-doctoral position should be a time when an individual can consolidate and extend the training they received as PhD or other graduate field. It should be a time of opportunity to just do science, and publish, and learn how to write grants, and to begin to craft their own academic/scientific trajectory. The post-doc should be the last tine that they are free from administrative and departmental political burden and they can take advantage of this sheltered time to do a lot of science!

Fundamental issues and challenges

1. Salaries are ridiculously low--for everyone, but especially for MD, PhDs.
2. Can't compete with industry salaries and the ability to "leave work at work". The persistent expectation that post-docs need to work night and day turns many people away from an academic career.
3. The pressure to do job talks, submit multiple grants, "get a K or get out" detracts from what should be a wonderful experience doing science.
4. For those with clinical skills, the lure of having a private practice and setting your own schedule is much more attractive to parents (in my team mostly mothers) who have abandoned academic careers and sometimes even left grants behind because it felt incompatible with being a good mother.
5. Everything in academe feels like too much of a "crap shoot" and the "luck of the draw" from getting papers published to grants funded, to support from department leadership--all of this leads to a sense of uncertainty, unpredictability, and unfairness that turns many people off. Individuals from minoritized groups are often so sought after in faculty positions that they can't afford to take the opportunity to do a post-doc which in the long run could really benefit their career. They come fresh out of their PhD and are overrun with committee work (even more than typical because of their backgrounds). So much is broken.

Existing NIH policies, programs, or resources

1. Faster turnaround for F awards. Trainees often graduate before they get results from a second round of grant reviews. It is demoralizing.
2. Institutions vary in how much help they give post-docs transitioning to faculty and K awardees to R-level funding. The transition points are where we lose people (at least at my institution). Specific programs for becoming a career scientist, developing your own trajectory, how to be a scientist and have a life would all be so helpful. We had a senior scientist enter a room of PhDs to give a career lecture and he started it out by saying "If you are in the audience and you want to have a life, you should just leave now and find another job." It is that kind of ridiculousness that turns people off. Having role models of all genders who do not brag about how little sleep they get, what drugs they take to write grants, and how they don't have life outside of the lab is essential. This has become even more pressing after covid as so many of us have realized how quickly life can be taken away or drastically curtailed. Funding for mentorship should be prioritized. Those of us who are good at it do it as volunteer work. The amount of uncompensated work that goes into mentorship disproportionately "burdens" those who are dedicated to training the next generation of scientists. It's fine if some people don't want to be mentors, but we shouldn't be punished for taking that part of our jobs seriously. For example, funds should be available for T32 directors and mentors.

Proven or promising external resources or approaches

Post-docs should unionize. Individual universities should invest more in transitioning people from post-docs to faculty. More post-docs in partnership between academe and industry would build a more nimble scientific workforce, would improve academic-industry collaborations, may make it easier to give higher salaries, and would make it less of an "either-or" decision to take an academic or industry track.

Response 153

Perspectives on the postdoc roles and responsibilities

I view it as a potental stepping stone to a faculty position, time to gain additional training outside the focus of my graduate studies, and an opportunity to connect more with faculty and consider different career options (e.g., decide whether to stay in academia).

Fundamental issues and challenges

At my institution [redacted for anonymity] postdocs receive only 6 weeks of paid parental leave (and all available vacation is forfeited towards that leave), sub-par health insurance, no subsidies for dental or vision insurance whatsoever, and very limited vacation time. This combination of conditions may be tenable for brief periods for young, single people with no dependents, family obligations, or plans to start a family, but for people predominantly in their upper-20s to 40s, poor benefits can make for harmful delays in healthcare and delays of major life events (such as parenthood). When even at the end of a long training period, stipend and benefits remain so inferior to those available in other sectors, it can feel irresponsible to remain in academic research.

Existing NIH policies, programs, or resources

Higher stipends, larger number of K99 awards or other awards to facilitate transition into a faculty position, allowing non-MDs to propose K99/R00s with trials across all NIH institutes, more training/resources on how to identify relevant funding mechanisms.

Proven or promising external resources or approaches

No response

Response 154

Perspectives on the postdoc roles and responsibilities

Further training on applicable aspects of ultimate career goal. For example, if goal is tenure track professorship, training in research, teaching, mentorship; if goal is industry scientist, training in research techniques and application; etc.

Fundamental issues and challenges

Low compensation relative to other positions requiring the same experience; lack of consistent health insurance, retirement, and family (e.g., maternity/paternity leave) benefits; inconsistent training/expectations; high likelihood of poor/toxic working environment; persistent inequities and poor diversity/representation in positions of power; low stability; and low likelihood of achieving the designed outcome (i.e., tenure track faculty position). In sum, the benefits of doing an academic postdoc are not worth living and working on these conditions for an unknown period of time while trying to hold out for a tenure track faculty position (since probability of getting they position is very low), when positions with better pay/benefits and better quality of life exist outside of academia.

Existing NIH policies, programs, or resources

Providing health insurance and benefits universally across funding mechanisms, increasing mandated salary minimum there

Proven or promising external resources or approaches

There are many peer-reviewed sources highlighting issues relating to quality of life, job dissatisfaction, low mental health, and inequality that directly stem from the low pay, lack of clear benefits, and persistent inequities that postdocs face in the current academic environment.

Response 155

Perspectives on the postdoc roles and responsibilities

The role of an academic postdoc is two-fold. First is to obtain additional experience and training beyond the PhD that will help the postdoc obtain a permanent position. The second is to conduct high-quality scientific research within an academic laboratory.

Fundamental issues and challenges

- Pressure to move to a new institution (which often means a new geographical area)
- Low pay
- Toxic laboratory environments
- Temporary nature of the position
- Lack of opportunities after completing a postdoc (especially in academia)

In general, postdocs are often at a stage in their lives when they want to find long-term stability. Many people start families in their late 20s and early 30s. Moving to a new city away from your community for a low-paying job that will only last a few years at most with uncertain job prospects in the future is not appealing to many people. Personally speaking, doing a postdoc has caused me to delay starting a family.

Existing NIH policies, programs, or resources

A big issue is that fellowships strongly favor applicants who changed institutions between their PhD and their postdoc. This hurts people who have family and/or community obligations that prevent them from changing geographical areas (which is disproportionately women and URMs). I know multiple people who chose not to apply for F32s or other NIH fellowships because they had stayed at the same institution due to family obligations and didn't believe they would be competitive for these awards.

The base level of NIH pay for postdocs is very low given that they are already highly-trained workers and could earn much more in non-academic positions.

Proven or promising external resources or approaches

Improving the work environment and the mentoring postdocs receive could always be improved.

Postdoctoral training is rarely formalized and often focuses exclusively on research. More formalized training for people interested in alternative careers would be helpful (e.g. science writing, teaching, mentoring, etc.).

In general, it would help if there were more PhD-level career options in academia beyond traditional PI roles. For example, if there were more job openings for senior scientists, facilities managers, teaching professors, etc. in academia I think more people would do postdocs to prepare for these roles.

Response 156

Perspectives on the postdoc roles and responsibilities

I view my postdoctoral studies as an opportunity to pursue challenging questions in science, establish a niche that is independent from my mentors.

Fundamental issues and challenges

One of the challenges comes from that PI have no incentive to care about postdoctoral fellows' career. In fact, the system reward bad PIs who sabotage their postdoctoral trainees. Here is my story: There are challenges along the postdoctoral career path since we are dealing with many unknown variables. One of the biggest issues is the uncertainty related to the scientific project outcome. However, with proper conceptual ability and critical thinking, good scientists can come with a variety of novel ideas which can move the science forward. The actual challenge that I faced came from lack of commitment of mentors. Despite having a written career agreement on an institutional email, my main supervisor, once I was able to carve a niche for my future independent career and 90% finish a project which I came up with, he terminated my appointment a month before my first Faculty interview (which he was aware of). In many previous discussions right before his decision, he mentioned that NIH don't track success of postdoctoral

trainees in any PI's lab and that he will not gain anything if I become a PI myself. He mentioned that he would gain more if he took my project and submitted as "his own". He took my whole project as started submitting as his own second R01 with other PIs who never contributed to the project. He faced no consequences in what he did. I had to start over in another lab and it took me two more years to be able to establish a new project. However, in my new situation I have lost all legibility for NIH path to independence grants.

Existing NIH policies, programs, or resources

1. Creating preventive measures to discourage PIs and/or faculty from sabotaging their postdoctoral fellows.
2. Establishing Incentive system for PIs who help their postdoctoral fellows to pursue academic career and becoming new PIs themselves.

Proven or promising external resources or approaches

Providing retirement, child support.

Response 157

Perspectives on the postdoc roles and responsibilities

additional research experiences to transition to an academic career

Fundamental issues and challenges

Money, post docs are not paid nearly as much as they are worth and the salaries allow institutions to exploit students. unsure why we are even asking the question—the issues and challenges should be obvious but nothing is being done about it.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 158

Perspectives on the postdoc roles and responsibilities

The role of the academic postdoc is to help mentor graduate students, lead projects and write grants. For these reasons, they are truly integral parts of the lab.

Fundamental issues and challenges

Money. I just started my postdoc a few months ago and could possibly leave soon if I can't find a way to make extra money. I am in my 30's, I am a doctor, yet I don't have a way to start saving money for retirement and am afraid to start a family with my current level of income. However, I am going to be too old to have kids soon, so I may need to choose between having a family and staying in academia.

Next would be increasing benefits, similar to a job in industry. This would include employer-matched retirement benefits and maternity leave as well as an emphasis on work life balance.

Existing NIH policies, programs, or resources

The NIH sets the minimum amount that postdocs get paid and most university's follow that. Even if a PI wants to pay their postdocs more, it is very difficult to waver from the university's pay structure. NIH raising the minimum wage would fix this.

Proven or promising external resources or approaches

There is no need to improve recruitment, training, working environment, or mentoring. All these things are fine the way they are.

Advertise competitive salaries and adjust for cost of living in the area and pay postdocs better so they may have a better quality of life.

Response 159

Perspectives on the postdoc roles and responsibilities

A postdoc should help a PhD researcher develop into an independent researcher. It should provide opportunities for the researcher to develop leadership and management skills. It should not just be focused on applying a pre-existing skill set to a PI's project.

Fundamental issues and challenges

Low salaries that don't match cost of living. I was offered triple the salary for an industry job, but I still remain in academia, because I have no family requirements for the moment.

Existing NIH policies, programs, or resources

Salaires need to be drastically increased. And if anything they should reflect location costs of living. It makes no sense for an NIH postdoc in Boston to be paid the same as a postdoc in rural Kentucky.

Proven or promising external resources or approaches

No response

Response 160

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Pay. The fundamental issue and challenge keeping PhDs from pursuing postdocs is the pay offered by a postdoc relative to the cost of living in major areas where many research institutions operate. Postdoc salaries in nearly every field have not kept pace with industry jobs that offer compensation to reflect the skills and talent that people with PhDs will bring to the field. Please, please pay postdocs more!! Set a standard that other agencies and private funding institutions can match! All we hear about from professors is how great academia is, but the cost of living is rising and our stipends just do not reflect that reality.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 161

Perspectives on the postdoc roles and responsibilities

It feels like a necessity to be even possibly competitive for a faculty position. If I could get a faculty position without doing a postdoc I would not do a postdoc. I feel ready to lead a lab, but am not viewed as a competitive applicant.

Fundamental issues and challenges

The pay is far too low and if the only reason to do a postdoc is the chance at finding a faculty position then it is probably not worth it or viable for most people. I am only able to take a postdoc because my partner has a reasonable salary from a a career outside of academia. That is a privilege. And after all the sacrifice, I still might never reach a faculty position. I am lucky to be in a position to take such a risk but it is no surprise that many people are not or do not wish to.

Existing NIH policies, programs, or resources

Increasing pay, parental leave and child care support.

Proven or promising external resources or approaches

More encouragement for postdoc positions that turn into faculty positions. More support for staying at the same university. Less need to complete postdocs to be competitive or at minimum better pay to make it less of a risk to spend time in a postdoc wishing for a faculty position.

Response 162

Perspectives on the postdoc roles and responsibilities

I think of it as training period that will help me blossom based on what I learn and implement and possibly be able to do this on my own without the help of my trainer later on.

Fundamental issues and challenges

There's no money. Most trainees don't know why they're doing a postdoc. Most are unlikely to land a respectable job in Industry but they hope to be directors some day. For immigrants, you're tied to institute and project based on your visa and everything is left on your understanding of the foreign system. Most don't know why NIH route is different from Instructor route and whether tenure could be had either way. Immigrants are atleast 5 years behind the natives despite being just as competent if not more.

Existing NIH policies, programs, or resources

Every postdoctoral fellow should receive a standard training to explain grant options and routes to Professorship. They should also receive training on Sort of hot topics that are primarily funded by the NIH to plan their careers if they're not committed to a subject. They should also understand what it means to join Tier 1/2/3 institute.

Proven or promising external resources or approaches

None there's not an inclusive system for any trainee from abroad.

Response 163

Perspectives on the postdoc roles and responsibilities

The worst layer in the pyramid scheme that is academic research careers.

Fundamental issues and challenges

Disgustingly low salary + lack of full benefits, and for what? An academic career that has the same salary issue (relative to industry). And if you happen to get that prof appointment, guess what. Sorry, no more science. Become a grant writing machine. Life-long underpayment for the privilege of begging the NIH for a piece of the ever-dwindling (due to inflation and inadequate increases) funding pie. No thank you.

Existing NIH policies, programs, or resources

Increase the minimum postdoc salary by a LOT. Mandate full benefits (including retirement plan matching). More funding for the NIH.

Proven or promising external resources or approaches

Irrelevant. Money talks. Otherwise, postdocs walk.

Response 164

Perspectives on the postdoc roles and responsibilities

More independent training before pursuit of a position leading a group in an academic, industry, government, or institute setting.

Fundamental issues and challenges

Low pay is the biggest factor by far. Cities with the highest cost of living (Boston, Los Angeles, San Francisco) are home to the schools faculty recruiters tend to favor applicants from and have the most

resources to carry out the most fundable, most cross disciplinary, and highest impact science. Postdocs have already suffered from poor income through graduate school, it's unsustainable to keep getting paid too little to have any savings at all by late 20s-30s in these locations. I want to stay as a postdoc, but I just can't afford it anymore. I can't go on vacation. I can't visit family. I can't buy anything that isn't essential. With no prospects of that changing, I cannot stay even though want to.

Existing NIH policies, programs, or resources

Higher pay.

Proven or promising external resources or approaches

No response

Response 165

Perspectives on the postdoc roles and responsibilities

Postdocs should expand training and knowledge, produce quality research and publications, and move forward lab projects. Greater training and mentorship of junior students would help prepare postdocs for industry and academia.

Fundamental issues and challenges

Stipends not enough for major cities; postdocs deserve benefits+retirement; temporary status an impediment to focus and quality work. Longer term positions with benefits would create a more stable workforce and higher skill in scientific labs. The postdoc to faculty pipeline has such high attrition, it is difficult to justify a postdoc. Stability of funding (5 years) would help keep skilled labor in the lab.

Existing NIH policies, programs, or resources

The time limit on years of postdoctoral work needs reconsideration. The practice of limiting many postdoc fellowships to 2 years harms the ability to train in high quality science. The instability of positions creates anxiety that is widespread and detracts from scientific focus. A longer term training scheme is common in Europe where group leaders can gain responsibility for training and mentorship prior to full faculty. That model might be implemented in the US to stabilize the postdoc to senior scientist transition. It is difficult to justify salary for long term staff on grants (based on review). Longer term staff would help productivity tremendously. Forcing postdocs to move institutions or else face career consequences is a massive social cost that is unfair and disproportionately harms URMS/women. It is one of the single worst practices in academia to move adults 3-5 times in their 20s-30s.

Proven or promising external resources or approaches

Look at the group leader model in Europe. Senior postdocs are given small labs of 3-5 trainees and some funding for independent projects. It seems a better transition than what we have in the US.

Retirement benefits should be standard. It is inexcusable to undermine financial stability in young adults.

Response 166

Perspectives on the postdoc roles and responsibilities

I believe that a postdoc position is a critical step to develop and expand research endeavors. Although, challenges at my institution ([redacted for anonymity]), financial stress and other challenges associated with being viewed as a temporary staff has dampened my enthusiasm reflecting on my experience.

Fundamental issues and challenges

Some challenges may include salary recommendations and staff/employment status at academic institutions.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 167

Perspectives on the postdoc roles and responsibilities

Please realize that the shortage in funds to provide research training to postdoctoral candidates also includes MDs. Healthcare systems are in deficit spending, and the NIH has been a cornerstone for MDs receiving subspecialty training to get quality experiences in research.

Fundamental issues and challenges

The projected supply for pediatric subspecialists, especially in academic institutions, falls far short of needs. We need a healthy supply of physician scientists.

Existing NIH policies, programs, or resources

Expand support of postdoctoral training, which has steadily waned in recent years.

Proven or promising external resources or approaches

Fund increased T32 and F awards

Response 168

Perspectives on the postdoc roles and responsibilities

It is a temporary position to gain additional skills before landing on a permanent job.

Fundamental issues and challenges

Salary and the lack of benefits is the main issue. Postdoctoral fellows are young professionals with families. The current NIH salary structure and the grant budgets are not suitable to pay the postdocs what they deserve. Furthermore, many institutes do not provide benefits (such as maternity leave, retirement accounts and healthcare) that these individuals should be entitled to as working professionals.

Existing NIH policies, programs, or resources

NIH should modify the postdoc salary scale that many institutions follow and adjust the salary based on the living cost of a particular region. Without reducing the number of issued grants, NIH should increase the budgets of R grants to match the inflation rate. NIH can further enforce the institutes to pay a minimum living wage to graduate students/postdocs and cover their benefits from overheads. This could be a requirement for institute's eligibility to compete for NIH grants. Stipend on the training grants should be adjusted proportionally and additional funding mechanisms should be created for international postdocs. Policies should be implemented such that postdocs on training grants do not lose their benefits.

Proven or promising external resources or approaches

The trainings offered for intramural postdocs should be accessible by the extramural postdocs. Policies can be established to make trainee experience as a component of the tenure criteria and investigators who fail to comply can be banned from competing for NIH grants.

Response 169

Perspectives on the postdoc roles and responsibilities

Based on my experiences and people I have worked with, the post doctoral position is often treated as a full time researcher working independently on a project under the supervision of a principle investigator. While it is often called a training position, it very rarely functions as such and is most often actually treated as a semi independent researcher pushing the lab goal forward.

Fundamental issues and challenges

The biggest issues preventing me from considering a post doctoral position are the low salary and benefits when compared to other

PhD scientific positions. While it is of course difficult to match industry level compensation, it is not feasible to expect highly trained workers to take a position with such a low relative pay and lack of health insurance

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 170

Perspectives on the postdoc roles and responsibilities

It is a stepping point to an individual faculty job where you have more freedom than a graduate student but still need training/mentorship.

Fundamental issues and challenges

The pay is way too low. I can't afford to send my child to daycare 5 days a week and pay all my bills.

Existing NIH policies, programs, or resources

Simply finding announcements and explicitly state the documents needed for each K award separately. It was very difficult to figure out which documents were required specifically for K22 compared to other grant mechanisms. A better walk through of the documents required since my PI didn't know anything about the funding mechanism and felt like I was on my own.

Proven or promising external resources or approaches

Improving job satisfaction. Better pay, help with child care, etc. The NIH LRP program is amazing and helped keep me in academia. More programs like that will help with retention.

Response 171

Perspectives on the postdoc roles and responsibilities

The postdoctoral associate or fellow is the main producer of publishable insights in the academic lab. They are expected to learn during their tenure, but their main responsibility is to be productive according to the PI's research vision.

Fundamental issues and challenges

Postdoctoral trainee pay is not competitive with industry, and it is well understood that the only reason to do a postdoc is to eventually get into academia. In reality, there are far more postdocs than academic positions, so it is immediately not apparent why someone would choose to make less money when they won't get an academic positions anyway.

Existing NIH policies, programs, or resources

Increase in postdoc pay and tax benefits associated with being paid by the government. For example, the institutional allowance in a nih postdoctoral fellowship can be used to cover healthcare, but that is counted as taxable income in our taxes. Increased pay will have a massive impact.

Proven or promising external resources or approaches

No response

Response 172

Perspectives on the postdoc roles and responsibilities

I am grateful to have had a chance to do a postdoc. I learned a tremendous amount of new skills, and I was set up perfectly to move into a faculty position. I think postdocs are essential.

Fundamental issues and challenges

Postdoc salaries are very low and require sacrifice to live on especially in big cities and for those of us with children at home. I was lucky enough to be at an institution for my postdoc that had supplemental funding for moving costs and conference travel. Without those things it would have been even more financially difficult.

Existing NIH policies, programs, or resources

A consolidated, indexed website with postdoc opportunities would save a lot of duplicated effort in searching—NIH reporter is not the best tool for this. And per my previous response increases in stipends and other funding would be vital.

Proven or promising external resources or approaches

No response

Response 173

Perspectives on the postdoc roles and responsibilities

It's basically training, but in my experience, the postdoc tends to do most of the leg work for a lot of research projects. They tend to be underpaid for the functions they provide, especially given that many companies would pay triple their stipend for the same work and time commitment.

Fundamental issues and challenges

The pay structure. I chose not to pursue a postdoc because of the pay. I went straight into a teaching institution because it paid more, and I still got the needed experience that I need. While the long-term reward may be better for those with postdoc experience, the existing and very current/urgent need to be able to support yourself or your family is a lot more important than the promise of a budding career that may or may not come true.

Existing NIH policies, programs, or resources

Not sure how to change it, but again, it's the funding and pay structure.

Proven or promising external resources or approaches

None of these listed "training ecosystem" address the problem that is more fundamental in Maslow's Hierarchy of needs—the ability to support oneself and one's family. This need supersedes any form of recruitment efforts because in today's climate, you're going to be hard pressed to find people willing to subject themselves to lower standards of pay for the same amount of work, especially as the cost of living keeps increasing.

Response 174

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

While I, personally, decided to become a postdoc, the majority of people I know from graduate school and elsewhere did not, and the decision came down to financial reasons (and sometimes benefits) 100% of the time. People don't feel incentivized to become a postdoc when they can just as easily find a job in industry that will pay nearly double the starting salary, generally comes with better benefits, and very often means working fewer hours.

The fact that many don't feel that there's a clear path from a postdoc to something other than a PI job is also part of it—everyone recognizes that they can't all become PIs, and many don't find themselves cut out personality-wise for the competitive nature of the current ecosystem (as there's an impression that you have to dedicate a huge part of your life to becoming a PI to remain successful, minimizing time with family and other activities outside of work).

But ultimately, it really comes down to money. If a postdoc position meant proper benefits—contributions to retirement, guaranteed leave, etc., or especially if it paid even 80% of what many industry jobs open to

the same new PhD graduates are paying, rather than 50-60%, I think far more people would make the choice to stay in academia. Most people want to remain in academia from a scientific purity perspective, it just becomes hard to justify doing that while also wanting to start a family, purchase a home, etc., when an easy option to make substantially more money is available.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Raising pay. Guaranteeing benefits. More non-PI opportunities in academia/that benefit from postdoctoral training. No other approaches are going to fix the problem or impact the retention of more than a tiny fraction of people.

Response 175

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The main issue that I see is pay. So many grad students choose industry/other careers over doing a postdoc because of the huge disparity in pay. Postdocs are not paid what they are worth.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 176

Perspectives on the postdoc roles and responsibilities

Postdocs are currently treated as highly specialized labor for cheap. Postdocs design and run experiments, train the next generation of scientists, write papers and grant proposals, basically function as mini PIs while getting insultingly low pay. “The love of science” and “prestige for working at X institution” do not pay rent.

Fundamental issues and challenges

Postdocs are not paid a living wage, especially in high cost-of-living cities. Lack of consistent support for parental leave and childcare disproportionately women scientists. Again, you can’t pay rent or buy a house with “love for science” and “prestige”.

Existing NIH policies, programs, or resources

Implement a cost-of-living adjustment to postdoc salaries. Increase postdoc salaries to match inflation. Compel universities, especially private universities, with certain amount of assets/endowments to step up and pay the cost-of-living adjustments. Have robust parental leave policies. Have consistent minimum standards for healthcare and childcare coverage.

Proven or promising external resources or approaches

If you must means-test, NIH could do a pilot where the postdocs get a pay bump and track/measure the immediate delta in quality of life and postdocs’ outlooks and inclinations to stay/leave academia, and also see this over time. This isn’t rocket science. Go talk to labor economists.

Response 177

Perspectives on the postdoc roles and responsibilities

I'm the Postdoctoral Officer at [redacted for anonymity] and also a full-time tenured faculty member at the medical school. During my 25+ years as a PI, I've seen little change in the roles that postdocs fill. They are, and have long been, the ones doing the lion's share of the actual lab work. They train graduate students, design experiments and often write the first drafts of papers. In recent years, the number of domestic postdocs has dropped significantly, and the postdocs we get now are mostly from overseas. Though their responsibilities have not changed, their ability to carry out these responsibilities has, as many do not speak and write English well enough.

Fundamental issues and challenges

At the monthly postdoc coffee hours I attend, salary is often a major topic of discussion. Minimum postdoc salaries at [redacted for anonymity] are pegged to the NRSA 0-year level, and this has not kept pace with inflation, particularly in the Boston area. Overall, my sense is that most of our postdocs are not unhappy with their work or work conditions. The pay, however, definitely makes life challenging, particularly for those with families.

Existing NIH policies, programs, or resources

I was pleased to see the NRSA increase released recently. I think raising this farther would have a significant impact on postdoc satisfaction rates across the country. There are a wealth of career development resources available to postdocs. For our postdocs these include those offered by the individual schools within [redacted for anonymity], those sponsored by the postdoc office that I lead, those organized by the Boston area postdoc association, those offered by our neighboring institutions (including the NIH sponsored programs at [redacted for anonymity] and those offered by [redacted for anonymity]) and those offered by the National Postdoc Association. Despite this, few postdocs make use of these resources. Moreover, attendance even at recreational activities (i.e. Christmas parties or kayaking on the Charles River events) is quite limited. What is needed, in my opinion, is not new or increased programming. What's needed are sufficient funds so that we can run postdoc retreats and other community-building activities.

Proven or promising external resources or approaches

The [redacted for anonymity] IRACDA program (sponsored by the NIH) has been extremely successful in placing postdocs in faculty positions, with about 85% landing faculty jobs. In part this is because they are able to be selective, but it's also because postdocs in that program are required to do significant teaching. This allows them to build skills that universities find attractive.

Response 178

Perspectives on the postdoc roles and responsibilities

A post doc seems like grad school 2.0 with slightly more pay. A post-doc in academia ultimately would not be worth it for me because it severely would impact my earning potential.

Fundamental issues and challenges

The pay is honestly the biggest issue. I love research, but a postdoc would not be sustainable for my future goals.

Existing NIH policies, programs, or resources

More pay.

Proven or promising external resources or approaches

More pay would aid with job satisfaction.

Response 179

Perspectives on the postdoc roles and responsibilities

Postdocs perform an essential role in US biomedical research. They perform most of the day-to-day research and represent the future of US biomedical science. Without postdocs, our research efforts would be crippled.

Fundamental issues and challenges

In recent years there has been a pronounced decline in the numbers of qualified graduates wanting to take a postdoc position. In my personal case, I have gone from a situation where I received 10-20 unsolicited postdoc applications per year from qualified individuals, to a situation where I receive only 2 or 3 applications from unqualified foreign graduates. For the first time in my long career, I have been forced to advertise for postdocs, generally with limited success. All of the applicants are foreign and most are under qualified for the positions advertised. Retention is another serious problem, with postdocs departing at short notice for jobs in biotech, leaving research projects incomplete.

Existing NIH policies, programs, or resources

Postdocs deserve to be better paid for the essential function they perform in the academic research endeavor. Certain states, e.g. California, and certain university systems have mandated minimum salaries for postdocs that better recognize their essential role in research and offer them a better standard of living. However, these minimum salaries are far in excess of the NIH postdoc salary scale and grantees struggle to meet the increased salary cost. Since NIH grant budgets are never increased to reflect increased salary costs, better treatment of postdocs comes at the cost of research productivity since group sizes must be cut to meet a fixed budget. This in turn makes grantees in high cost states less competitive. More resources need to be made available to grantees to cover the costs of paying postdocs state or university mandated salaries. The salary scale for postdoc fellowships should also be revised to better reward them for their efforts and make postdoc training more attractive.

Proven or promising external resources or approaches

No response

Response 180

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions at the moment are temporary stepping stones to academia or industry that hamper actual science productivity due to qualified applicants constantly having to move and acclimate to new positions every year or two. Instead, there should be staff scientist positions for researchers with Ph.D.s that provide more stable and long-lasting employment so we do not constantly lose progress from hiring and rehiring or having to re-invent progress every time a postdoc has to move on.

Fundamental issues and challenges

Salary is not commensurate with

1. Expertise,
2. Duties, or
3. Cost of living and is not even slightly competitive with other fields in which that expertise is desired.

It’s frankly ridiculous that postdoctoral researchers are still treated as students and not employees when they are often the main research staff contributing to grant work and other science. Moreover, most PIs are not given the support or training to properly manage a lab, much less senior staff like a postdoc. The burden is placed on postdocs to self-manage or co-manage their work environment with the PI rather than focus on science itself. Lastly, the lack of adequate funding for postdoc’s own research means they are unable to launch their own programs of research and contribute to the creation of innovative research beyond that already imagined by existing PIs, stagnating the process of science as a whole and filtering out many good scientists from continuing in academia.

Existing NIH policies, programs, or resources

Provide more grant funding opportunities aimed at helping postdocs develop their own programs of research and giving them more freedom to innovate rather than only work on specific grants. Provide support for grant applications for postdocs. Modify existing grant criteria so that postdocs hired to work on grants also have time allocated to producing innovation within the grant itself rather than just producing what was already promised.

Proven or promising external resources or approaches

There are not very many, and I'm not aware of any that I've actually found useful.

Response 181

Perspectives on the postdoc roles and responsibilities

A place to learn an optimize things, Doing science for community, Wanted to be an independent researcher so translate this culture to new coming scientist

Fundamental issues and challenges

The wage is so underpaid respect with amount of input (physical, mental) that even a three member family can't maintain a respectful life. Which is so frustrating

Existing NIH policies, programs, or resources

Letter of recommendation for transition

And wage/ salary

Proven or promising external resources or approaches

Check not only with the University as well as with the postdocs, review their opinion and suggestions at time of making policies. Cross check actual salary and overtime done by postdoc. Apply rule for overtime payment strictly.

Response 182

Perspectives on the postdoc roles and responsibilities

I did 5 years post doctoral fellowship before transition to industry

The mentor plays crucial role in post doc positioning. Unfortunately most mentors in US are not supportive for academic transition of mentees.

Fundamental issues and challenges

The MENTORS, they are afraid of competition

They do not want their mentees to have their own lab. they are no suportive. They are bringing scince to a the valley of death

Existing NIH policies, programs, or resources

Additional committees needed to mentor the post doc and direct him to the right path. They should be independent of the mentors

Proven or promising external resources or approaches

No response

Response 183

Perspectives on the postdoc roles and responsibilities

The purpose of graduate school is to train students how to think like a scientist and how to do science. The role of a postdoc is no longer a trainee—but rather an opportunity to enact science as trained in graduate school in a new environment and at a new scale. The scale is larger than graduate school. Postdoctoral

researchers should aim to carve a niche for themselves from the foundation of their host laboratory. This niche should have the capability to sustain many years of research in an independent laboratory.

Fundamental issues and challenges

First, postdoctoral researchers are not trainees. Second, money. Most research universities are in high cost of living areas. The NIH minimum salary for a postdoctoral research is abused by university administrators to squeeze cheap labor out of their employees. The metric of an NIH minimum salary should be abolished. The current state of the postdoctoral job market permits jobs in the Bay Area to have the same minimum salary as a job in small town Connecticut. A single-family home can be had in West Haven for $350,000, whereas that amount could only buy a basement studio apartment an hour away from San Francisco. Pretending there is parity in living costs is a mistake, the consequence is a huge push of recent PhDs towards biotech (recent PhDs are making around $120,000 from my surveying of past-cohort). Third, opportunity cost. The salary disparity is so vast that prospective postdoctoral researchers will instead choose to make six-figures in biotech rather than the NIH minimum salary for five or six years. The benefit of doing a postdoc, with the exception of those who seek to start their own lab, is zero. There needs to be a pipeline between from postdoc to biotech with tangible benefits.

Existing NIH policies, programs, or resources

Increase the F32 salary to $85,000 per year.

Proven or promising external resources or approaches

No response

Response 184

Perspectives on the postdoc roles and responsibilities

The postdoc position is an advanced career position where freshly graduate PhD student get training on needed skills to transition to their permanent position.

Fundamental issues and challenges

- lack of structure in the training, it is up to the PI to mentor or no.
- PI are not hold accountable as some use the visa renewal argument to put pressure and harass their international postdocs.
- postdoc salaries are very low especially postdocs are at the stage of their life where they start their own family
- lack of retirement benefits.
- health insurance to cover family members is a hole in the budget.
- international postdoc suffer a lot as many rules prevent them from being competitive. When a postdoc is affiliated with a USA institution they should be eligible for all grants applications and have some sort of visa allowing them to travel to all conferences regardless of their citizenship. Each time I prepare for a conference, I need to prepare my presentation and select the talks I will be attending but unlike my lab-mates I need to go to the embassy of the organizing country and pray I will get a visa on time for the conference. This is unfair!
- lack of promotion or perspective for promotion
- The academia culture of figured out yourself is counterproductive at all stages, specifically at postdoc levels with the high level of international trainees that never had a chance to get the exposure to USA system prior to their postdoc.
- NIH needs to take into account mentees feedback when they evaluate a mentor or a progress on a project. This ideally should be anonymous.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

- I think I touch based on that already, a postdoc in industry setting is worth 130k a year at starting levels in addition to all the benefits including health and retirement.
- NIH needs to work hand in hand with Congress and policy and advocacy folks in academia, to make conferences accessible regardless of citizenship
- An efficient training can be possible only by holding principal investigators accountable. As of now such metrics is not in place. Asking to provide a list of former mentees and their actual positions does not tell much on the contribution of the PI towards the successful transition.

Response 185

Perspectives on the postdoc roles and responsibilities

The temporariness of a 1 year position is extremely challenging. The low pay is also difficult. NIH should consider increasing their pay scale.

Fundamental issues and challenges

Pay and temporary position (putting life on hold).

Existing NIH policies, programs, or resources

Postdoc trainee mentorship through NIH and connections with other postdocs would be helpful. More postdoctoral funding possibilities for pathways to independence would be meaningful.

Proven or promising external resources or approaches

No response

Response 186

Perspectives on the postdoc roles and responsibilities

I view it as wasted time for most because the salary is terrible and most will not progress to PIs due to restrictive funding opportunities or choosing postdocs that do not enhance their CV. In some cases I feel it is an exploitative position.

Fundamental issues and challenges

Salary. NIH minimum salary is appalling. There is literally no other issue worth talking about that even comes to close to the magnitude of the salary issue. There will not be a future generation of scientists if postdocs cannot afford rent and food.

Existing NIH policies, programs, or resources

Salary. Increase NIH minimum salary.

Restrictive grant applications for those from abroad—why is the K99 my only path to NIH funding? This massively affects postdoc retention too.

Proven or promising external resources or approaches

Salary.

Response 187

Perspectives on the postdoc roles and responsibilities

A temporary position to grow and develop as a scientist. NOT a training, NOT cheap labour for PIs to continue neglecting their mentoring responsibilities.

Fundamental issues and challenges

The pay? The short term contracts? The lack of immigration support during/after said postdoc? The lack of opportunities to be kept on, as an academic, of that's the career choice? The lack of actual training for said academic job OR any other job for that matter.

Existing NIH policies, programs, or resources

Just have more flexibility, ESPECIALLY for foreign students who haven't trained in the US. More importantly pay a living wage and give proper support for relocation.

Proven or promising external resources or approaches

Improvement recruitment by not picking from the same 5 favourite schools. Accountability for PIs to actually mentor people. Pay a living wage and give relocation support. Have direct opportunities for postdoc to transition into permanent staff positions for research and/or teaching roles. If you train them, why not keep them??

Response 188

Perspectives on the postdoc roles and responsibilities

As a postdoc in academia, I made this choice as it is a mandatory training to acquire all the skills (scientific or not) to finally prospect a career as a fully independant PI. It is a crucial period career speaking as we are supposed to be the most productive during this time.

Fundamental issues and challenges

1. Salary. We are PhD owners paid half what the industry pays us—this is not encouraging
2. NIH grants elegibily criteria requiring US citizenship. This is absolutely Unfair to still have poly this as you know with your statistics that most postdocs are international people.
3. Maternity leave

Existing NIH policies, programs, or resources

Us citizenship criteria for the grants, we need to be as competitive as anyone else so it can be faire

Salary once again—if you want us to stay and not to go away

Reinforce equality also for women who are still too few to reach the Assistant Prof stage.

Proven or promising external resources or approaches

If you listen to all the people who are raising their voice on social media you will understand that academia is no longer attractive to a lot due to the reasons explained before. Just read.

Response 189

Perspectives on the postdoc roles and responsibilities

Getting training and technical knowledge to think and work independently about biological problems to ensure new future directions.

Fundamental issues and challenges

1. Overall life: satisfactory
2. Much lower salary than industry
3. 90% of postdoc Mentor(s) does not like a postdoc to leave his/her laboratory in fear of losing a trained slave.
4. A postdoc is used to generate data for his/her mentor's Extramural Funding, but is not allowed to take a part of it as his/ her future independent work.
5. 90% of mentors provide bad recommendation letters when a postdoc tries to join other lab or independent careers (that's why industry jobs do not ask for reference from postdoc's direct supervisor)

Existing NIH policies, programs, or resources

NIH always helps to introduce new policies and programs, but in most cases, the beneficiary of that program is the supervisor of the postdoctoral fellows. Because,

1. The donot need to pay salary for that postdoc
2. Most likely the postdoc will do a part of his/ her supervisors grant from which the PI will make data for a RO1 grant.
3. The postdoc will never be able to use that work to continue his independent work.

Therefore, it seems that the existing method of NIH is not effective to prevent the decreasing number of postdocs in academia as the benefits were grabbed by middleman and not to a ppstdoc properly.

Proven or promising external resources or approaches

Several measures can be considered to improve the situation.

1. At the end of the postdoc training period, a little fund for a year of research (around 100k) to see how he/ she was trained to carry out research independent of his postdoc Mentor confirming that the PI can not use that data to his/her grant application.
2. After completion of postdoc period the PI should make the postdoc as Multiple PD/PI to apply grant if the mentors uses the data of the postdoc.
3. There should be 3 mentors for a postdoctrsining. The postdoc can provide his data thar was generated from NIH support to any one of them to apply for a grant.

Response 190

Perspectives on the postdoc roles and responsibilities

When I sought this position, I saw it as a chance to develop independence as a scientist. This meant confidence in following through with my own ideas; I was already technically skilled and ready to no longer view myself as a trainee. I also wanted opportunities to hone my mentoring and teaching skills, to get a sense of what I wanted the rest of my career to focus on. Having watched early&mid-career PIs I am now certain that that is not a career I want. My PI says it’s a shame because I’d be good at it, and I agree. I’d be good, but I would not be happy.

Fundamental issues and challenges

Job insecurity (present and future), pay not adjusted to regional cost of living, teaching not supported (PI wants you in the lab full-time because they pay your salary and teaching doesn’t directly benefit them). Constantly being referred to as “trainees” in academia (see this prompt) while industry views our skillset as that of a highly trained professional. In Boston, living in a below-median-rent one-bedroom 45min (train) outside the city I was still paying 70% of my salary on rent, following a raise I now “only” spend 55% on rent, at this rate it is mathematically impossible to save towards big goals like retirement. We are not expecting to become 1%ers doing this work but say if the starting salary was 70k it would lift a giant weight off of many of our shoulders and enable us to be more creative and better scientists.

Existing NIH policies, programs, or resources

Non-citizen postdocs are eligible for so few grants it barely feels worth trying. There should also be financial support systems in place for postdocs who don’t want to pursue the TT (K99 grants), ie support for teaching/DEI/policy work.

Proven or promising external resources or approaches

Make it clear to universities that the pay scales are MINIMUMS, not caps like the universities choose to interpret them. This may also be more of a university-level thing, but hire future faculty from your existing pool of postdocs rather than forcing us to uproot our lives every few years for next to no improvements in quality of life.

Response 191

Perspectives on the postdoc roles and responsibilities

As someone who runs a large lab, postdocs are critical for advancing biomedical research into new, impactful areas. They do not need to take classes, are well-trained to conduct research and make use of the latest technologies and approaches, and are not encumbered with the need to seek funding. they can focus their effort 100% on the science, and make big ideas that PIs have happen. The postdoc period is also a time of personal discovery. Often grad students leave a lab feeling cocky, think they know everything, and could start their own lab. the postdoc period humbles them, as they then realize that doing cutting edge science requires a massive amount of luck and grit--as the "softball" projects they are often tasked with as grad students are not so well-flushed out in postdoc period--postdocs are expected to make the seemingly impossible possible.

Fundamental issues and challenges

There are two:

1) people who are considering a postdoc are not stupid. They are some of the brightest people in the world. As such, they look ahead at what lies beyond the postdoc, before they even start. And what they see is grim--they see how most postdocs

a) never get faculty positions and

b) those that do go on to become PIs wind up stressed out beyond belief, trying to get NIH grants when the payline is depressingly low. So as a country, we lose a large number of smart people even before they start a postdoc. One needs to be somewhat foolish to do a postdoc when job prospects are so much better outside of academia. The best way to fix this issue is to fundamentally change how NIH grants are awarded to PIs, so PIs can spend more time doing science and mentoring, and less time stressing out constantly about grants. I recall when I was a postdoc, we would all sit around and ask ourselves why we were doing this, when our peers were in industry or other jobs making literally 10-100x more than us. Makes one then question how "smart" one really is, to dedicate ones life to eternal stress and subpar salary. That gets me to item

2) Salaries of postdocs need to be increased; and obviously that isn't going to happen w/o increasing the amount of $ PIs get on grants. Need more $ in the system, or fewer bodies. this is basic economics. and unfortunately, w/o more $ in the system, the biomedical enterprise will slow, if not decay.

Existing NIH policies, programs, or resources

NIH training grants and R00 type grants are helpful. But as someone who runs a large unit at a large medical center, these grants are largely meaningless when it comes to recruiting faculty. Sure it's nice to see candidates with funding in hand. But we hire to fill a need or missing area. The NIH is sadly great at funding incremental research. So most of the R00 type awardees are doing incremental research. We seek people from HHMI/Harvard/Stanford type labs, who are doing cutting edge research.

So I suppose the NIH needs to find better ways of funding non-incremental research. It is really sad to see what does well at a typical study section--safe, incremental science. I know how to write grants that do well at study sections--they are boring, but the odds of getting a boring grant funded is much higher than a grant that seeks to break truly new ground.

So in a sense, the NIH funding model is probably also sapping the creativity out of talented, ambitious trainees and postdocs. They enter passionate about science, then see the realities, and get disillusioned.

Proven or promising external resources or approaches

Stop funding incremental science. People become scientists because the process of discovery is exciting. Discovery entails taking massive risks. follow HHMI model, fund people, not projects. Great people will do great science, and remain excited.

If NIH continues along this same path, people will continue to play the same "game" (write incremental boring grants), stress constantly about funding, and have the excitement and passion that drove them to become scientists, sucked out of them.

And regarding satisfaction--postdocs also see how the NIH is constantly increasing the administrative burden on PIs. This needs to stop. Other support docs where every single foreign contribution needs to be scrutinized and disclosed, data sharing plans, revisions to biosketch format every few years. Really??? We are scientists, stop asking us to waste our time on things that have absolutely nothing to do with actually doing science.

It is thus no surprise people are leaving the biomedical enterprise in droves. Death by one thousand cuts, all while getting paid well below what your truly "smart" friends are getting paid (in non-academic jobs).

Response 192

Perspectives on the postdoc roles and responsibilities

The postdoc is a position that artificially suppresses wages of the most intelligent and technically skilled labor force in the country.

The only people who should do postdocs are those who

1. Didn't adequately plan for what to do after their doctoral training or
2. Want to secure an academic job.

Fundamental issues and challenges

The postdoc salary is too low.

Existing NIH policies, programs, or resources

Move money from fellowships and training grants to create a special class of research grants restricted to applicants between 0-3 years after their terminal doctoral degree that allow budgets for higher salary and pilot funds for starting an independent research program (honestly the K99/R00 is perfect with a higher salary—get rid of the Fs and make them all K99/R00s—need to give way more of them). Restrict to only PhD holders (not MDs—they have plenty of opportunities already).

Ts need to pay higher salaries.

Proven or promising external resources or approaches

Not really a resource—but mentors who provide space and time for doctoral students to develop ones ideas should be celebrated and emulated. These are sadly fewer than there should be, and rarely recognized.

Response 193

Perspectives on the postdoc roles and responsibilities

A post doc is a highly trained expert practitioner of academic science. They are the workhorses of the field, and are only in "training" in that they are practitioners rather than managers.

Fundamental issues and challenges

The career pipeline is broken; most won't get PI positions, yet there is no other way to advance their career. Doing a post doc is rolling the dice and the odds just aren't very good. Furthermore, having a family while doing a post doc is particularly hard. There's not enough money for childcare, and you have to work beyond the normal hours to be competitive. If I do a post doc, I'll end up in my late 30s before I maybe could have a job that would pay me enough to start a family in a city, but most likely I'd end up leaving the academy anyway and going to industry,.which k could have done without a post doc.

Existing NIH policies, programs, or resources

The NIH needs to find more family support (or higher wages, though this would be more expensive), and career tracks that are not exclusively pushing towards being a PI (since there just aren't enough PI positions to give 2-3 postdocs per lab a job). Terminal staff scientist positions that pay >$80k would make science better, and would make doing a post doc less of a dice roll. This is, to me, a no brainier; there's a reason that firms don't like staff turnover, and the academic model of mandatory turnover every ~5 years is just not good for anyone.

Proven or promising external resources or approaches

I don’t know.

Response 194

Perspectives on the postdoc roles and responsibilities

Publishing, writing grants, collecting and analyzing data, training students, all the things professors with phds engage in

Fundamental issues and challenges

The pay is too low for the degree and skill set phds have, there is really no meaningful location adjustments, the benefits are poor, it’s a lot to ask for a temporary job of an adult who is trying to start a family

Existing NIH policies, programs, or resources

Provide more money to postdocs

Proven or promising external resources or approaches

No response

Response 195

Perspectives on the postdoc roles and responsibilities

postdocs should be considered researchers who devote their time to generating the results and data that drive the lab, since PIs for the most part don’t do experiments and students are learning. A postdoc should be temporary position that involves learning to manage other people like students to progress your research.

Fundamental issues and challenges

- Insultingly low wages that do not scale with cost of living and do not reflect the amount of education required to be a postdoc. It is absolutely ridiculous to expect people to become postdocs if they will be paid $50k, when they could get a job with benefits, twice the pay, and respect in industry
- No guarantee of a good faculty position after working for little reward for years, and putting off having a family and ever having the opportunity to buy a house
- Being treated as a “trainee” when you’re in your 30s and you’ve been doing top research for 10+ years
- Lack of support for parents
- Lack of benefits
- Poor infrastructure for postdoc support from academia
- Often unregulated and unsustainable workloads
- Toxic culture in academia (racism, sexism, expectations of no work life balance)

Existing NIH policies, programs, or resources

increase the minimum salary

Proven or promising external resources or approaches

No response

Response 196

Perspectives on the postdoc roles and responsibilities

Because the academic job market is so competitive, a postdoctoral position is usually necessary for most early career researchers. It is a great opportunity for further learning and to build on our CVs.

Fundamental issues and challenges

The primary issue comes down to salary. Postdoctoral researchers spent at least five years in graduate school living off of a stipend and are expected to continue working in labs for not much more, and with demanding work hours.

Existing NIH policies, programs, or resources

More work towards increasing postdoc salaries and programs and fellowships that recognize the work of postdoctoral researchers, particularly from minorities groups.

Proven or promising external resources or approaches

No response

Response 197

Perspectives on the postdoc roles and responsibilities

The roles **and responsibilities** of a postdoc vary extensively by one's lab. In some laboratories, a postdoc is viewed akin to a junior faculty member; in these environments, the postdoc's independence tends to be respected and their role is to apply the skills they acquired during their PhD to new scientific problems. In others, a postdoc operates as a high-skilled technician who is expected to enact the vision of the laboratory's principal investigator. In my perspective, the role of an academic postdoc should be closer to the former of these two scenarios. Ideally, an academic postdoc should be responsible for performing original research along with related activities like teaching, mentorship, and grant writing, albeit at a pace that is slightly less rigorous than that of an actual professor. The goal would be to produce research that will benefit society, while also learning softer, leadership-type career skills. Presently, however, training environments like these have a tendency to be rare.

Fundamental issues and challenges

I had a single goal that I pursued for the past fifteen years of my life —to become an academic professor. I was always enamored by the prospect of having a career in which I could discover cool stuff, work collectively with a forward-thinking community to tackle an idea that was bigger that any single person, and give back to society's next generation (i.e. our trainees). I worked very hard in pursuit of my goal, routinely putting my research before my own needs. Moreover, I always pursued my best available training opportunities, which brought me to four different academic institutions located on the East Coast, the West Coast, and in the Midwest. For many years, biomedical research was the only thing I envisioned myself doing. Currently, I am conducting the best research of my career while also feeling entirely trapped within an abusive system, to the point where I am now considering leaving science altogether. Being a postdoc today feels like a scam. So, what might be the issues affecting us in academia? They are numerous, but to pinpoint a few: poor treatment of postdocs by senior scientists, mismanagement of funding acquired by postdocs, general neglect of postdocs in the scientific community, a growing academic culture of conformity over innovation, and salary that is not commensurate with one's education level. Many individuals at the pinnacle of US biomedical science earned and deserve their spot, but they typically ascended in a toxic system where enduring poor treatment was accepted as a rite of passage. And yet today, there are simply not enough job opportunities to justify perpetuating that culture. Those at the top of academia represent what their profession values —they must understand that they are delegates for biomedical science. If they want to be followed, they must inspire.

Existing NIH policies, programs, or resources

Honestly, I am unsure if many of the issues affecting today's postdocs can be adequately addressed without major systemic reform. Perhaps postdocs would be better supported if there were fewer of them, and, from the NIH's standpoint that may require providing greater levels of support to a smaller group. The standards for obtaining a PhD in the USA appear to have fallen in recent years, where training programs are currently incentivized to confer PhDs to students who may not deserve them, as graduation rates and time-to-degree are now valued statistics that impact T32 funding. As such, earning a PhD no longer elicits respect from one's superiors by default, as they are wary about the gaps in talent that exist amongst postdocs. Since awarding fewer degrees (or resources) is likely to be politically unpopular, an idea involves the NIH broadly empowering trainees —either at the graduate or postdoctoral level. Just as trainees require a letter of support from their mentor or institution while submitting a grant application or

closing out an award, I propose that, when closing out an award, a trainee should have the opportunity to evaluate the performance of their mentor and institution. Injecting greater transparency about trainee experiences into the funding system may incentivize training programs and mentors to actually advocate for, and support, the people they take on. The NIH could then review this information and use it to decide which institutions and mentors actually deserve F31s, F99/K00s, or even T32s.

Proven or promising external resources or approaches

No repsonse

Response 198

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is multifaceted. While I agree that postdocs are trainees in the beginning, they quickly (years 2-3) can become integral, senior members of their lab with staff-level management responsibilities on top of their research/experimental responsibilities.

Fundamental issues and challenges

The timing of postdoctoral fellowships is such that it often lines up around marriage, family expansion, etc. With little to no guaranteed support structure during or after having kids (e.g. paid maternity leave, child care), it becomes an added burden to also be compensated at a relatively low level.

Existing NIH policies, programs, or resources

The NIAID supplement for family leave is phenomenal and should be a wide-spread opportunity, even for those without current NIH funding.

Proven or promising external resources or approaches

The American Cancer Society has recently included 12 weeks paid maternity leave for postdoctoral fellows, as well as a 3-month expansion. This has been recognized by ACS grantees as being transformational.

Response 199

Perspectives on the postdoc roles and responsibilities

It’s a job.

Fundamental issues and challenges

Low salaries, terrible mentors with no oversight. Poor job outlook. Poor work and life balance.

Existing NIH policies, programs, or resources

Postdoctoral and graduate fellows should just be employees of the NIH and standardize benefits and pay. Remove academic PIs as bosses.

Proven or promising external resources or approaches

Literally any company with functional training programs and HR departments.

Response 200

Perspectives on the postdoc roles and responsibilities

Stepping stone towards assistant professorship or more “senior” position in industry

Fundamental issues and challenges

- Lack of academic job opportunities
- Long timeline impeding the ability to start a family at the desired time
- Low pay

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 201

Perspectives on the postdoc roles and responsibilities

There are fundamentally two forms of postdoc: "learn techniques to get a tenure track job" and "on the way to becoming a staff scientist". Both are viable, both should be supportable. But, there is a real challenge in that most mechanisms are geared towards the former, and specifically look for traits of an independent investigator.

Fundamental issues and challenges

Salary. Salary, salary, salary. When I was a postdoc, life sucked and my wife nearly divorced me because she was sick of being poor. Now it's even worse, because we set a single T32/NRSA scale nationwide, regardless of whether you postdoc in Palo Alto or Kalamazoo. That cannot continue. We have to acknowledge that universities create high costs of living and postdocs need to be paid a living wage. Few people do creative science under financial austerity. I recall a univerisity where I asked how people could afford to train there and was told "marry someone who works for Amazon".

Existing NIH policies, programs, or resources

Index T32, NRSA, and similar to inflation and to local cost of living indices. Just that one change would make a difference.

Proven or promising external resources or approaches

The one thing that some places do well is to ensure that ALL postdocs, regardless of funding source, are treated as employees (not students) and thus have access to health/retirement benefits.

We need to recognize that postdocs are now older people with families. THey are professionals. We need to treat them as such.

Response 202

Perspectives on the postdoc roles and responsibilities

Postdoc positions are training positions designed to help promising research scientists with the following:

1. obtain grant funding,
2. publish more papers, and
3. receive mentorship to assume a research position.

Fundamental issues and challenges

It is really difficult to accept a postdoc salary at 55,000/year with inflation as a single-income single person. Many of the researchers I want to work with are located in cities like San Diego and San Francisco. As a single-income, single person who has no family support in that area of the country, I cannot live off $55,000 in either city.

Additionally, many industry postdocs are paying postdoc fellows $70,000 and not requiring relocation (giving the option of remote work). It is challenging to accept a temporary position (1 year) and relocate with no relocation expenses reimbursed. This is especially challenging when the nature of the work can be done from anywhere.

Existing NIH policies, programs, or resources

Increased salary, more remote working options.

Proven or promising external resources or approaches

No response

Response 203

Perspectives on the postdoc roles and responsibilities

I decided to skip the postdoctoral position altogether since I have spoken to many about their personal responsibilities. As such, I saw this position as a higher level doctoral student. Where they did not have as much say as the PI but they had more influence and understanding of projects than some doctoral students starting out.

Fundamental issues and challenges

- Salary—People cannot have a doctoral salary for years. then make a postdoctoral salary. It is not feasible in this economy.
- Lack of relocation funds
- Lack of independent work

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 204

Perspectives on the postdoc roles and responsibilities

Vital underpaid position that drives the scientific enterprise in the country .

Fundamental issues and challenges

- Extremely bad situation for junior physician scientists .
- No dedicated research time allotted by most institutions without grants .
- Clinical workload leaves no time to write initial grants .

Existing NIH policies, programs, or resources

Intramural program should encourage research in all areas including common health problems like diabetes and obesity instead of focusing on extremely rare diseases of little public health relevance.

Intramural program should focus on admitting more extramural candidates as faculty.

The Pay for junior physician scientists in intramural and extramural programs fall within the bottom decile for market rates . Expecting great applicants to apply for these positions with this pay is wishful thinking at best .

Proven or promising external resources or approaches

Improve pay , work—life balance and encourage the best applicants from all over the world to apply so that USA is the leader in science .

Invest(funding) in promising physician scientist based on past track record for atleast 5 years .

Response 205

Perspectives on the postdoc roles and responsibilities

The reason is obvious. The pay is terrible, the training period is too long for maybe getting a tenure track position and maybe getting funded and maybe getting tenured.

Fundamental issues and challenges

Salary

Existing NIH policies, programs, or resources

Increase salary

Proven or promising external resources or approaches

Increase salary

Response 206

Perspectives on the postdoc roles and responsibilities

I see it as just an internship type of position until I find a job where my competence and effort are appreciated.

Fundamental issues and challenges

The pay is simply embarrassing. I accomplish 5-10x more compared to people with no scientific education straight out of undergrad, and yet their work is appreciated more than mine. Not to mention that last year true inflation (the only categories I have money to spend on—groceries, rent, gas) was 17%, and you guys gave me 2% compensation for it. Just dehumanizing

Existing NIH policies, programs, or resources

The pay. You have 100 billion to waste on unsolicited involvement in every single war possible, but not for us to build this country. It's embarrassing. I care more about building the future of this country than it's own government does.

Proven or promising external resources or approaches

Check out how much same jobs are paid in industry.

Response 207

Perspectives on the postdoc roles and responsibilities

I view a postdoc as job—a research scientist—with the goal of fostering independent research. Like any other job, postdocs learn new skills. However, to call postdocs trainees negates their massive prior experience, earning a PhD in a highly related field. This view leads universities to minimize postdocs as trainees—meaning they have access to fewer benefits and lower salaries.

Fundamental issues and challenges

The fundamental issue is salary. The NIH and universities speak often about DEI work and increasing diversity, equity, and inclusion in science. When you pay a postdoc *at minimum* 54k, when an industry job can be double that out of grad school and triple with a few years of experience, you are precisely excluding those you wish to include in science. All individuals who come from low SEC-over-representing those who come from historically oppressed groups-often lack resources to compete with their privileged peers. Why would any person who is in debt, who had to pay for college, who had to support themselves in grad school, who has a family that relies on them, choose to stay in academia? How do postdocs choose to have families when institutions like [redacted for anonymity] don't even offer affordable childcare? In boston, childcare is $3k a month (with a $1,200 YEARLY allowance from [redacted for anonymity]). That leaves $1500 a month for rent. In Boston, that doesn't even get you a studio, so you better be lucky enough to have your partner live in the same city as you. And then food, insurance, taxes? If you are an NIH fellow—guess what! You now have the honor of paying for your insurance out of pocket and getting reimbursed, but you now have to pay *extra taxes on it* because you are not a [redacted for anonymity] employee. It is fundamentally irresponsible for the NIH to not come up with ways to at least scale the stipend to cost of living. Universities will always pay as little as possible; the NIH sets the bar. Paraphrasing a recent tweet: it is cruel to expect that any scientist could perform at their intellectual best while paying survival wages.

Existing NIH policies, programs, or resources

1. Specify that trainees receiving NIH fellowships may remain classified as employees of their home university. As far as I know, there is no stipulation that fellows must re-classify their employer upon receipt of fellowship (for example, as a student on an NIH fellowship, I am still an employee of my university). Yet postdocs must reclassify as 'external fellows,' no longer considered university employees. I am considering simply not applying for NIH fellowships as a postdoc if this remains the case, as I do not want to have to pay more in taxes on my insurance, lose my guaranteed paid family and medical leave from my state (massive concern!), and lose other benefits as a supposed honor of being selected for a fellowship! That is insane and ignorant on the part of the NIH to not consider the repercussions of the change in employment status. So: if universities just choose this option as an easy out and it is not required: please clearly STATE this in the fellowship award so it can be shown to HR. But ideally, make it even easier—Re-configure how they are paid to match grad fellowships and pay through the university. It is absurd to lose money when you win a fellowship.
2. Raise the minimum postdoc salary. If it cannot be scaled across the whole US, find a way to scale it regionally or state wide. You will lose postdocs, especially the people you say you want to recruit—women, URMs, first generation researchers—if you do not do this.
3. Provide additional funding mechanisms for subsidized child care.

Proven or promising external resources or approaches

No response

Response 208

Perspectives on the postdoc roles and responsibilities

To preface, I completed my Ph.D. in biomedical engineering (optics) in 2021, postdoc in behavioral neuropharmacolgy in 2022. As a postdoc entering a brand new lab, I set clear expectations with my PI that my goal was to build my own research operation focused on building advanced microscopy platforms to study astroglial physiology in murine drug/alcohol use disorder models. I had the optical systems engineering and glial biology expertise. My PI had the behavioral neuroscience expertise and a willingness to let me loose in his lab. The goal of my postdoc was to learn what I needed from my PI and lab mates to build a compelling proposal to fund my own lab within a few years of joining—all while installing what technical expertise I brought in optical engineering and image analysis to streamline their experimental workflows. My PI and I saw our work together as a mutually beneficial collaboration to build each others careers, with the expectation that we would help each other out. Though our time was brief, I felt nothing but full support from my PI and the lab during my time there and leading to my departure.

Fundamental issues and challenges

The School of Arts and Sciences at my institution shot down my negotiated stipend, citing the resulting gender disparities in pay it would have created in the lab. My stipend was pegged to the NIH minimum in a city that has seen double digit home value and rent price growth in the last 4 years.

My family situation left me geographically constrained in the postdoc positions I could pursue. Despite nearly a dozen offers across the US, the most suitable option was staying at my doctoral institution but moving to a new lab in a different college and department. I was advised this may count against me in my grant applications by all mentors except my postdoc PI.

Academia has successfully instilled this idea among trainees and university administrators postdocs cannot make more than the NIH minimum recommended amount. As cost of living grows nationally, the tradeoff between a stable, comfortable career and the noble pursuit of fundamental science no longer makes sense. For me, that was realizing that my earning potential over the next decade was questionable at best in academia. And i needed to provide for my wife and infant daughter. it took 3 months in my postdoc to realize academia was not a financially sustainable career path for me if I intended to provide for my family.

At least for US citizens, there is very little incentive to pursue an academic career outside intellectual curiousity. The same skillset I am using during my postdoc earned me multiple $100k+ job offers in industry. In my current position, i nearly tripled my postdoc salary and relocated to be closer to extended

family. That sort of career move is not possible in academia today—and trying to make it happen is financially unsustainable.

Existing NIH policies, programs, or resources

The NIH needs to mandate cost of living adjustments into their minimum salary guidelines for postdocs based on local rental prices and median home sale values.

The NIH needs to incentivize institutions to support postdoctoral researchers. Currently at my institution, postdocs cannot negotiate compensation levels. Postdocs are not eligible for employer sponsored retirement contributions or tax advantaged savings vehicles.

The NIH needs to instruct institutions to cover fellowship recipients (e.g. F or K awardees) health insurance premiums, retirement contributions, and temporary disability insurance. At my prior institution, fellows made less money than those funded off of research grants because their health insurance was worse coverage, fully unsubsidized by the institution, and there was no retirement savings vehicle made available to them. Despite the career impacts of these awards, the economic effects are palpable at R1 institutions.

The NIH needs to manage expectations of study sections on F and K award applications. The level of scrutiny of these grants that all trainees ultimately see select against any trainees with a family to take care of or any other personal obligations outside their careers. It discourages many trainees (including myself) from even trying to make it happen.

Hold institutions more accountable for taking care of their graduate students and postdoctoral scholars.

Proven or promising external resources or approaches

Just listen to the academic chatter on twitter. through a lot of the noise, there is a LOT of valuable perspective to be had.

Response 209

Perspectives on the postdoc roles and responsibilities

In theory, a postdoc should be a time for a person to begin to gain new research and management skills while generating data to craft a research plan that will allow them to run their own research group. In practice, it is often a way for labs to operate with highly skilled, low paid labor. There are no safeguards to ensure that PIs will help their trainees get academic posts in a timely fashion, or allow them to take research discoveries with them to their next lab. The competitive academic job market compounds this, as postdocs now need 2-4 first author papers which can take 6-8 years in many fields. This is far longer than it takes to learn new skills and learn to mentor. The postdoc, as it exists today, is ripe for abuse.

Fundamental issues and challenges

The primary issue is the massive pay disparity between the postdoc and all other career paths available to a PhD-level scientist. Without a partner or family support, it is very difficult to live comfortably on a postdoc salary, particularly in areas of high cost of living. Even when a scientist would like to complete postdoctoral training it can be impossible to continue when other paths offer financial stability, particularly as the postdoc aligns with a time in life when many people would like to start families/purchase a home. The second hurdle is the lack of anything close to a guarantee that a tenure-track faculty position awaits them at the end. Most postdocs will not end up securing a tenure-track faculty position and will have to switch career paths anyway, so the idea of doing so many years of additional training for low pay when the likelihood is that you will not secure a position at the end anyway is very difficult to swallow. I think an additional factor, particularly for marginalized groups like women, people of color, and LGBTQ people, is the concern that academia has not yet successfully established proper workplace norms to protect these groups. This is especially true when the lab structure and the job application process mean that a handful of people can decide the fate of your career. It puts trainees in a tenuous position, and institutions are still too slow to act. Entering a career track where there are HR departments and professional standards are enforced can feel much safer to a person in these categories.

Existing NIH policies, programs, or resources

Increase postdoc pay scales, and consider a cost-of living adjustment. Postdocs in Boston, San Francisco, and New York cannot survive on their salaries, and a national pay scale does not make sense. But also

make it more feasible for PIs to have career researchers in their labs by including funding for PhD level scientists who don't necessarily want to be PIs but who do want to work in academic science and earn a livable wage. The current system is a pyramid scheme--each PI is training many postdocs in order to put out sufficient research output, but there are not that many job vacancies each year. If labs were not so reliant on postdoc labor, a shortage of postdocs would not be a concern, because we don't actually have a shortage of new PIs. The solution is not luring more PhD trained scientists to do an academic postdoc before being forced out of the academic track because there isn't a job for them, the solution is to diversify talent in the typical academic lab such that postdocs aren't a necessity to get work done. Also eliminate the absurd payback requirement for the F32. Postdocs not supported by government funding would never be expected to pay back their salary for research hours worked simply because they left the field, and its absolutely ridiculous that the "reward" for a competitive government grant is a pay back requirement that often isn't even mentioned or described to recipients until they will accept the award. It benefits no one, and should be a no-brainer to eliminate it. Society benefits from trained scientists in many ways, not just in academia. Postdocs produce the majority of research output each year, pretending that it is only training and not a job is a farce.

Proven or promising external resources or approaches

The NIH should require that institutions offer retirement benefits to postdocs. The academic postdoc is growing in length, and it is unacceptable that many of them do not get any retirement contributions until they are in their late 30s/early 40s and have completed a postdoc. Acknowledge that the postdoc is primarily a source of cheap labor in labs, rather than a bona fide training, because the majority of them will not get a tenure track academic position at the end. Therefore, postdocs should not be "exempt" from benefits that would be considered standard for any other employee.

Response 210

Perspectives on the postdoc roles and responsibilities

Learn to do solid science. Also, to set up your field for a career in science.

Fundamental issues and challenges

In this order of priority:

1. Postdoctoral pay is around 1/2 what it should be;
2. Insufficient support for laboratories;
3. Time required on the job to be competitivve

Existing NIH policies, programs, or resources

the minimal recommended postdoctoral pay must be increased. NRSA award payback clauses should be absorbed by the institution that is benefitting, not the postdoctoral researcher. PIs should be allowed to use federal funds to supplement postdoc pay.

Proven or promising external resources or approaches

Damon Runyon and Jane Coffin Childs award; Fellows programs (ie Whitehead or CSHL).

Response 211

Perspectives on the postdoc roles and responsibilities

Indentured servitude to megalomaniacs

Fundamental issues and challenges

See above, along with horrible pay, unreasonable hours and expectations culminating in a fragment of a chance at a career with no job security.

Existing NIH policies, programs, or resources

Mandatory managerial training for PIs, fix the "rich get richer" system of funding, de-anonymize peer review

Proven or promising external resources or approaches

Good luck saving academia

Response 212

Perspectives on the postdoc roles and responsibilities

Position to grown professionally in, get more experience, more independence and a stepping stone for a career in academia or industry

Fundamental issues and challenges

The biggest challenge is low salary compared to industry positions. Second challenge is the limited number of vacation days and not being able to see family often due to both financial and holiday restrictions

Existing NIH policies, programs, or resources

- Increase the salary of the postdocs and provide better insurance, more
- Vacation days and more support
- For foreign scientists (visa issues, spouses, children etc)

Proven or promising external resources or approaches

Any European institution can serve as a role model when it comes to vacation days, insurance and other benefits.

Response 213

Perspectives on the postdoc roles and responsibilities

Conduct research at high level of independence, publish and present research findings, attempt to secure external funding, establish new research program distinct from mentor to secure academic independent investigator position.

Fundamental issues and challenges

Low pay relative to level of training and experience, high cost of living in cities with 'desirable' institutions, job insecurity as a postdoc, low chance of securing faculty position in academia, unclear path to jobs in industry if outside biotech hub regions.

Existing NIH policies, programs, or resources

higher Mandatory minimum pay scales for nih funded postdocs, career guidance and counseling each year for postdocs

Proven or promising external resources or approaches

No response

Response 214

Perspectives on the postdoc roles and responsibilities

Postdoc position is a job. It should be considered that way, and every postdoc should be getting benefits as that of a job. That includes, incremental salary with every inflation cycle, but not limited to salary.

Fundamental issues and challenges

The major issue is salary. Scientific research per se is a high risk job. It includes lots of sacrifice and mental pain. When a job of this nature with lesser motivation, at least money as a factor which is compatible with industrial postdocs, the retention might increase.

Existing NIH policies, programs, or resources

Not aware

Proven or promising external resources or approaches

EMBO postdoctoral fellowship program is a promising program to get inspired by

Response 215

Perspectives on the postdoc roles and responsibilities

A postdoc is a training period where I perform research, learn new techniques, and explore new ideas/directions in preparation for my future lab.

Fundamental issues and challenges

STEM PhDs make >80k if not 6 digits/year, but postdocs are paid ~50k/year. Thus, if a PI cannot provide 30k+ worth of mentoring & career development (in terms of trainee success and satisfaction), they also should not be hiring postdocs, or at least should not complain it is hard to hire "qualified" ones. On one hand, some PIs do not care about the careers of postdocs—they just want the experiments done. On the other hand, there is a systemic lack of funding which PIs cannot address as individuals. Finally, a majority of STEM PhD graduates deem it is more desirable to land an industry job directly than doing a postdoc, since tenure-track positions are rather competitive.

Existing NIH policies, programs, or resources

1. I have known many postdocs doing "chasing postdocs", doing postdocs after postdocs hoping to get a desirable position. I'm sure something can be done about that both in terms of the PI and the trainee. One or both could be true: the trainee was not informed of alternative career choices that they can pursue and/or the PI has not given sufficient mentoring and career development for the trainee to land a permanent position.
2. NIH should include confidential mentee evaluations of PI for funding decisions. NIH should prioritize funding PIs with a track record of mentee success and well-being and avoid PIs with a reputation of bully, harassment, and/or other toxic behaviors, which are unfortunately not uncommon. PIs with poor mentee outcomes should be banned from hiring postdocs with NIH funding until a improvement in mentee evaluation.

Proven or promising external resources or approaches

Higher mentee salary baseline and more funding from Congress designated for mentee salary (not direct cost) will help for sure.

Response 216

Perspectives on the postdoc roles and responsibilities

It is used to exploit highly skilled and highly trained (>10 years) workers for their labor at virtually no cost, as the pay rate is less than a living wage in almost every market.

Fundamental issues and challenges

When you run the actual numbers for the hours that are worked, the pay is about half minimum wage. In order to be considered for a position in academia, lots of people who weren't born rich have to do 2 or even 3 postdoctoral assignments to even be considered

Existing NIH policies, programs, or resources

Limit hours, increase pay. We've been saying this for YEARS AND IT HAS FALLEN PERPETUALLY ON DEAF EARS

Proven or promising external resources or approaches

PAY RATE YOU FOOLS

DO YOU NOT SEE HOW MUCH RENT HAS INCREASED? I LEFT ACADEMIA BECAUSE I WAS LITERALLY STARVING AND WORKING 90+ hrs/wk

Response 217

Perspectives on the postdoc roles and responsibilities

The post doc for physicians is different than PhDs. Having a T32 training program is essential for medical programs to retain trainees in research but often the PI of the grant has interests that vary widely from that of the clinical fellow. Having flexibility for trainees and broader scope of research options for trainees is important for retention.

Fundamental issues and challenges

Many women physicians want to pursue research training after medical training. However, due to the long medical and residency and fellowship training, women of child bearing years are often faced with the decision to start a family before they finish training. The timing of having children extremely stressful for trainees. Childcare coverage during the infant and toddler years is a nightmare for most academic moms. School age children are more independent and it gets easier after a decade of parenthood. Many of my physician and PhD friends I trained with who left research did so due to the need to stay home with children or need for a stable income. Lack of family support and no grandparents nearby, lack of spousal support to stay home full time, high cost of living, high childcare costs and extremely limited availability of childcare options and often terrible hours (9-4) that hardly cover the typical academic or physician schedule are all to blame. However, mentors and grant cycles that are not forgiving for those with young children are also at fault for forcing women out of the workforce. Lack of reentrant programs or mentored programs for those who took time off to stay home are needed.

Existing NIH policies, programs, or resources

More clarity on the training timeline and how to request additional time for maternity leave.

Proven or promising external resources or approaches

Interdisciplinary women in medicine meetings at each institution should be supported and funded and prioritized. Many women are the only female in their department with a very heavily skewed group of male decision makers at all ranks above them who never knew what it was like to juggle career and breast feeding. Flexibility to work from home is important. I had to pump milk in the car during lunch break of my standardized exams because the advanced notice requirement to request disability accomodations for Prometric happened well before I even told my family I was pregnant and before I even thought I would need to even ask for time to pump. My infant son was only a few weeks old when I took my first board test and 3 months for the 2nd test. Lack of time and lack of private pumping space both at work and during testing is an issue. A women in medicine group is important for supporting trainees and talking openly about these and other barriers and options for leave. Post docs have a particularly hard time taking time off due to no formal leave policies and no one to cover during the absence. Women want to work, be successful and have a family. If you make them choose, you will push them out of academics because family always comes first.

Response 218

Perspectives on the postdoc roles and responsibilities

The postdoc position advertised itself as being a professional training emphasizing experiential professional training as part of the 2 year fellow shop program. So I expected to learn more from practical work experience.

Fundamental issues and challenges

The fellowship was nothing that it was advertised for but instead feels like being enrolled in a grad program that will result in a degree while also working a full time job. The pay is so low for having to live in the most expensive cities in the US. Work hours are ridiculous—working 50-60 hours a week. There is pressure to publish and less focus on conducting good research. I was given 3 months of maternity leave, only to be made to work all evenings, weekends for rest of the year. I don’t even take lunch breaks or other breaks while at work. It’s just so unfair.

Existing NIH policies, programs, or resources

All of it. Whoever is making these policies—ask yourself would you do this fellowship for the workload and pay?

Proven or promising external resources or approaches

Work environment—make it more friendly to postdoc with families, prioritize work-life balance.

Response 219

Perspectives on the postdoc roles and responsibilities

My understanding is the purpose of graduate school is to learn how to do research effectively, while developing somewhat of an expertise in your selected field. A post-doc is the next step in training, in which you will

1. apply what you learned in graduate school to do more research and develop expertise, while
2. learning from a mentor how to be a PI (e.g. grant funding, managing a lab etc.). This makes sense to me, as a post-doc seems to be the next step for those who want to write grants, run their own research, and join an academic environment.

Fundamental issues and challenges

I currently work as a Service Fellow at CDC, a position I obtained in the second year of my PhD. I had been interested in doing a post-doc and joining an academic career, and was especially interested in being able to answer my own research questions (in a way that we are not always able to do in government), but now entering my late 20's, it's difficult to justify leaving a job with a salary of 78k that only required a Master's degree, to make 55k with a PhD. Post-doc salaries are not competitive compared to government, and especially not industry. Additionally, there is a lot of uncertainty about how long a post-doc may be funded for, and thus it is difficult for me to make the decision to move myself and my partner across the country, potentially, just for a one-year position. I'm also deterred by the fact many post-docs seem to include research coordination (which includes duties that do not require a PhD) or student management, which can easily expand and take over what should be protected time for research.

Existing NIH policies, programs, or resources

I think at the very least the post-doc salaries should be adjusted for locality, or match the government stipend for a position similar to the one I have, at a GS-11.

Proven or promising external resources or approaches

I think it would be great to have some kind of post-doc listing so it would be easier for grad students to find positions. For example, I work a lot with the Midlife in the United States cohort, and it would be great to be able to search somewhere for all post-docs related. All post-doc interviews I've gone on so far were due to networking and my advisor, which doesn't seem very equitable. It would also be great if post-docs were more assured of the step following—a common fear to me and my grad student cohort is that academic positions will be scarce by the time we finish a post-doc.

Response 220

Perspectives on the postdoc roles and responsibilities

An opportunity to take on a new project and explore new directions different from grad school. A step towards independence and learning new bench, management, and mentoring skills

Fundamental issues and challenges

Where to start, there are so few incentives. First and foremost, the salaries are insulting and unlivable for the amount of training required. Post docs should be able to live comfortably and save money, as they are highly educated and specially trained professionals. The assumption that you will relocate for a post doc, and then relocate again for a faculty position. High stress and long hours, weekend work. Poor health and retirement benefits. No guaranteed parental leave. The classification of post docs as trainees. Extremely few permanent academic research positions that are not principal investigator positions. And low pay for those positions that do exist. The increasing competition for increasingly less powerful (dollar wise) grants. The lack of repercussions for sexual harassment, abuse, and academic integrity creates a hostile work environment for many and discourages those who are rigorous and stringent in their research practices.

Existing NIH policies, programs, or resources

Higher pay and better benefits, funding for childcare costs (substantial amounts that make a considerable dent in the total amount). Repercussions for those who have sexually, physically, or emotionally abused trainees and colleagues. More serious repercussions for those found guilty of academic dishonesty.

Proven or promising external resources or approaches

No response

Response 221

Perspectives on the postdoc roles and responsibilities

a post-doc is someone with skills that still needs time to learn some new skills to make it to the independent research career.

Fundamental issues and challenges

There is too much competition from industry and too few prospects for tenure track jobs. In my opinion the post-doc talent pool is very shallow right now and I think this is because of the poor compensation and career prospects.

Existing NIH policies, programs, or resources

Post-doc pay needs to be increased if we want good people to stay in academic science. A lot of the best scientists are not even considering staying in academic research.

Proven or promising external resources or approaches

No response

Response 222

Perspectives on the postdoc roles and responsibilities

I view it as an opportunity to gain more skills. You don’t want to be a spin-off of your PhD advisor, so you mesh what you learned there with something that will differentiate you

Fundamental issues and challenges

Unclear timelines (used to be 2 years, now 6 is common). Would be good to have a formal cap. Also, pay is horrible, especially in medium to large cities. Postdocs need to be able to afford to live 20 min or less away from lab to maintain work-life balance. Also, doing more to subsidize childcare costs (both direct and indirect). The way potential postdocs search for jobs is also difficult compared to searching for jobs in any other industry

Existing NIH policies, programs, or resources

NIH childcare supplement is far too low and should be expanded to include more types of childcare (ie those without a license)—many of the cheaper in-home day cares are not licensed, many nannies are not licensed, and au pairs are never licensed. Childcare for an infant in larger cities and surrounding suburbs is approximately 2/3 the salary a postdoc gets after taxes, so without partners making substantially better money or doing 100% of the childcare, it would be impossible to afford full time childcare

Proven or promising external resources or approaches

Funding pipeline conferences and workshops so postdocs can make connections with universities and industries that would use their skills

Response 223

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low pay,

Existing NIH policies, programs, or resources

COVID extension on K99 eligibility is not fair for people who started their postdoc in 2020! They are affected by the shutdown without any data that can be analyzed. However, they are not entitled to get K99 COVID extension since NIH does not provide further extensions beyond people whose eligibility ends in 2022. This is totally not fair. Everyone starting their postdoc while expenceing COVID-19 shutdown should all get 2 cycle extension.

Also, 1 yr of childcare extension for K99 eligibility for fathers should be granted automatically like mothers. Nowadays, both mothers and fathers mostly share the same parenting responsibilities.

Proven or promising external resources or approaches

No response

Response 224

Perspectives on the postdoc roles and responsibilities

I view it as a "traditional" stepping stone for those who want academic positions in America. Our department often penalizes ABD applicants who apply for TT positions for NOT having done a postdoc.

Fundamental issues and challenges

As a doctoral student who has been considering what to do after graduation, my biggest concerns are finances and quality of life. I would like to have children and get married in the next couple years, but the pay level and work/life balance of postdocs in America are huge turn-offs considering the non-academic alternatives. I feel like a postdoc really delays "starting your life".

And given that they're mainly to prepare you for TT jobs, why would I bother if the future of higher ed in our country has made me so pessimistic?

Existing NIH policies, programs, or resources

Increase the minimum pay rate!

Proven or promising external resources or approaches

No response

Response 225

Perspectives on the postdoc roles and responsibilities

- Advance science
- Learn new skills
- Train grad students and techs
- Become a leader in specific topic
- Publish well in order to get a job

Fundamental issues and challenges

- Salary is at least 2x lower than industry and too low to make ends meet.
- Moving across the country is difficult, especially when you are leaving close friends and family or when a spouse or partner must change jobs to come with you.
- Abuse is rampant and quality of life depends too strongly on your PI. Academic protections are weak.
- Postdocs do not feel the NIH or their institutions value them.
- No child care leave protections during peak child bearing years. I have ZERO paid child care leave at my institution.

Existing NIH policies, programs, or resources

As a non-citizen or permanent resident, the NIH does not support me financially through fellowships. Opening fellowships to international scholars would be important for me.

The NIH sets the salary of most postdocs in the nation by setting the NIH minimum. The NIH could make doing a postdoc a viable financial decision for so many more people if they increased the NIH minimums drastically.

Proven or promising external resources or approaches

Increase the NIH salary minimums and I can guarantee there will be more individuals interested in postdocs.

Response 226

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Need to pay higher salaries

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 227

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is an opportunity for advanced scientists to learn new skills, and contribute to science at the highest level by bringing experience and knowledge to the most difficult problems in biomedical research. We are the “hands” who carry out the most difficult NIH-funded projects, and who provide hands-on training for graduate students and technicians. Professors are the ones who lay out the overall research strategy for a laboratory, and who secure funding to carry out such strategy. Postdocs are the academic workers who implement the strategy and turn it into reality.

At the same time, a postdoc position is a mentored training opportunity. Postdocs are not permanent staff scientists, but rather accept low pay for a heavy workload in exchange for mentorship from faculty in new scientific fields distinct from their graduate training, and in the more subtle and challenging aspects of an academic career such as grant writing, peer review, and publication. Ultimately, due to its low pay and ambiguous status in the academic hierarchy (we’re trainees when universities don’t want to pay us more, and employees when universities don’t want to accept more rigorous oversight and training for us), postdoc positions must be temporary. They provide the chance for the postdoc to build the body of published work, and skillsets to move on to independent investigator positions within academia, or advanced and lucrative positions in industry.

Fundamental issues and challenges

- Timelines are absolutely punishing.
- It takes years to produce the minimum 1-2 high-impact first author publications needed to compete for faculty positions. Much more than the 3-5 timelines that guide most NIH policy on postdocs.
- 7-10 years is the norm at my institution for postdocs who successfully compete for faculty positions. It's not that postdocs willingly chose to spend so much time in training, but it simply takes that long to generate data for about two high-level papers.
- Pay is abysmal. $60,000/year in Boston is barely enough to afford an apartment within commuting distance of campus, with no savings.
- The pay gap compounds time pressure. Every year spent in a postdoc feels like an "ante" in a poker game, where you give up sustantial financial security for one more year of work towards independence. By the mid-stages, the timeline feels crushing.
- There are almost no funding opportunities beyond year 4. This puts postdocs in a precarious position as they must be supported by lab grants.
- The extended timelines and financial insecurity especially weigh on parents (especially mothers).
- Postdoctoral advisors have too much influence and control over their postdocs. For example, my advisor delayed editing and my manuscript for over a year, causing me to miss out on multiple grant opportunities.
- Mentorship is variable and usually lacking. Many PIs see postdocs as labor to be used and exploited.

Existing NIH policies, programs, or resources

- The K99 COVID extensions were completely mishandled. I lost eligibility when I passed 4 years in the postdoc this October cycle. If I had started my postdoc a few months earlier, I would have been eligible for a one—or two—cycle extension. My postdoc was severely impacted by COVID (3 months shut out of lab, 1 year with access for just 8 hours a day), but yet I received absolutely zero extension for the K99, the most important training grant a postdoc can apply for. The NIH should have blanket extended eligibility for year 5 for all postdocs in their positions during the pandemic.
- It should be possible to "pause" the 10-year Early Stage Investigator Status (ESI) and 4-year K99 timeline for up to 1-3 years at any point post-PhD. ESI and K99 timelines are huge pressures, and severely discriminate against postdocs in slower fields, who pursue different fields than their PhDs, or with substantial family obligations. Allowing trainees to "take a time out", stopping the clocks, for any reason would be incredibly helpful as it provides greater flexibility to pursue challenging training opportunities and reduce time pressure on postdocs from diverse backgrounds. Postdocs who become faculty without taking the timeouts can still benefit by extending their eligibility for ESI status on 1st R01 applications.
- Postdocs on training grants should be required to have a committee of 2-3 faculty separate from their primary advisor to review their work, provide additional mentorship, and provide a "check" on advisor abuses.
- There should be funding opportunities for more senior postdocs (5-8 years) to compete for fellowships that pay them ~$80-100k as staff scientists/non-tenured faculty. These funding opportunities would be an acknowledgement of the reality that a postdoc takes 7+ years now, and provide additional salary security for the most advanced postdocs.

Proven or promising external resources or approaches

- ESI and K99 timelines should begin as soon as an individual enters a mentored postdoc position, NOT as soon as the PhD is awarded as is current policy.
- This will enable trainees to pursue internships/industry experience before entering into mentored postdocs.
- There are several advantages here.

1. Some postdocs would begin with substantial industry experience and contacts, enriching their research.
2. Many trainees who will end up in industry anyway will chose to stay there, reducing pressure on the "postdoc pipeline".
3. 1-2 years on an industry salary would relieve substantial financial burdens for many postdocs.

- Universities should treat postdocs as staff, not as trainees.
- Universities should not have separate benefit categories for postdocs with external grants and postdocs funded by lab grants. Many postdocs win an F32 and promptly lose their health insurance.

Response 228

Perspectives on the postdoc roles and responsibilities

It means advance my scientific career in more independent way. It is a way in which I can get even more specialized training in a state of the art environment addressing scientific unknowns. Having said that, it increases the responsibilities within the PI's environment

Fundamental issues and challenges

Given the responsibilities and excessive work load, I do believe that if postdoctoral researches are given that workload, they should received better salaries and benefits. Plus, the research intense environment makes extremely hard to handle research and family responsibilities. Then a more friendly schedule for post docs with less pressure will be beneficial.

Existing NIH policies, programs, or resources

Increase salary and benefits

Proven or promising external resources or approaches

No response

Response 229

Perspectives on the postdoc roles and responsibilities

As a T32 associate program director and a laboratory PI, postdoctoral fellowships are critical for providing the needed training and networking to become an independent scientist. This may be in academics or industry or other venues, but it's really teaching the key thinking, problem solving, technical, and communication skills.

Fundamental issues and challenges

There are multiple key issues:

1. The Postdoc salaries are very low, compared to that of equivalent skill levels in industry. We hear a lot about postdocs asking why they are working so hard, for so little pay, when their colleagues may earn 2-3x as much in industry or other equivalent jobs. In addition, union negotiations and contracts means the actual salary of a postdoc is not what the NIH provides —that funding gap needs to come from somewhere, and if the institution doesn't provide support, that postdoc position is not filled.
2. There are fewer and fewer US Citizens wanting to do postdocs, yet we can't fund highly qualified foreign-trained scientists who would be able to fill in the gap and push our science forward.
3. Job transitions are extremely difficult, with the tight funding for junior faculty and general lack of suitable positions; and
4. Postdocs should have lives too, and so basic things like parental leave policies need to be better unified across institutions.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

It would be useful to look at other foundation grants that do not have a citizenship or US Residency requirement—and understanding better about how their fellowship graduates do and how many stay in the united states.

Response 230

Perspectives on the postdoc roles and responsibilities

In my opinion a postdoc is a highly trained individual who following completion of their Ph.D, is very knowledgeable in theory and practice of their particular field. Postdocs are in most cases the driving force of projects in any lab as they are able to think independently and critically. Individuals who seek postdoctoral training targeted towards academic research careers are seeking to establish their names as budding experts in their field through publications and presentations at conferences.

Fundamental issues and challenges

As a new transplant in the U.S and having experienced a previous postdoc in Europe, I can clearly see that postdocs in the U.S are absolutely not valued. They are grossly underpaid for the living costs in US states, with poor benefits which in some cases they are required to contribute towards from the little salary they get. It is near impossible to raise a family on a postdoc salary alone in the US, (more so for international postdocs whose partners are not allowed to work), given the high cost of childcare and other expenses. Additionally, although NIH has the recommended minimum salary guidelines, not all institutions adhere to this and in some cases it is left to the discretion of the P.I. In my opinion the quality and resources available for scientific research is a big draw for International postdocs coming to the US, however, after arriving, it quickly becomes clear that the lack of work-life balance and poor quality of life significantly contribute to the lack of retention or even interest in pursuing academic careers. Many of the fellow postdocs with whom I have discussed about future careers aspects are aiming towards industry careers because they would like to be financially secure. It is clear that a lot of the academic brain-drain related to postdocs has its roots in poor financial stability and the expectations that a lot of academic institutions have of overworking and underpaying postdocs.

Existing NIH policies, programs, or resources

Make more funding/grants available to International postdocs who truly are the majority of the workforce in most academic institutions.

Proven or promising external resources or approaches

No response

Response 231

Perspectives on the postdoc roles and responsibilities

The postdoctoral role is to engage in independent, high-quality research work as a fully-qualified PhD scientist, while also receiving ongoing training and mentorship to prepare for a position as a successful, impactful scientist (whether in industry or academia).

Fundamental issues and challenges

The standard pay for postdoctoral scientists in academia is too low—closer to that of a student than a professional. It should instead made to be lower, but competitive, versus comparable industry positions given similar levels of experience (i.e., postdoctoral scientists in STEM should make ~90-100k, which is still relatively low compared to industry positions but at least it is marginally acceptable). The standard NIH rate of ~55k/year for postdocs is a non-starter for STEM PhD graduates who are weighing the pros and cons of an academic postdoc position versus industry. In a city like Seattle where I live, the industry starting salary might be approximately $150-175k/year or more for a recent PhD grad (anecdotal number based on my classmates/friends), which is nearly 3 times higher than the NIH postdoc rate. Industry "postdoctoral" positions are still around ~100k/year (based on the examples I've seen). Most postdocs like myself are not "in it for the money", and accept a lower salary in exchange for intellectual reward, valuable experience in academia leading to hopefully a tenure-track or R01-supported research position, and to further their important research topics. However, when the stark reality of living expenses forces a choice between, for example, sharing a small apartment with roommates and forgoing the ability to contribute to a retirement account, versus a nice salary working for Microsoft Research, Google, Meta, or one of the many biotech companies around, most people choose the latter. This is especially true for PhDs in computer science, artificial intelligence, and other areas that currently command very high industry salaries. The phenomenon contributes to a brain drain in these specific areas of research, due to the huge disparity in industry versus postdoctoral salaries.

Existing NIH policies, programs, or resources

The minimum NIH standard salary for postdocs should be adjusted for the cost of living in a particular city, should be adjusted based on the particular field of study in order to remain somewhat competitive, and should also be made at least somewhat comparable to the median starting wage of a PhD industry job (e.g., set the postdoc rate equal to two-thirds of the median industry STEM PhD starting salary). The comparable salaries are industry-specific. Myself and other postdocs are happy to accept a slightly lower pay in exchange for pursuing our important research and the intellectual fulfillment that comes from dedication to our research topics. However, the lower pay should not be so low as to hamper our ability to save for retirement, have a family, etc. A salary that is two-thirds or more of the equivalent industry job might be reasonable, perhaps. However, the current rate of less than half (or less than a third in the AI/computer science fields) is a hard pill to swallow.

Proven or promising external resources or approaches

The NIH should do more research to determine how much to raise postdoc base salaries to be more palatable for those considering academia. However, in addition, many postdocs feel that it is an insurmountable task to achieve eventual research independence, and that following their postdoctoral fellowship, they will have to leave academia anyway due to the difficulty in attaining tenure or a steady academic job. Therefore, it would be helpful to postdocs if the process of transitioning to an independent academic scientist was more obvious, and was easier, and if there were more paths to do so, to encourage new PhD graduates to pursue a postdoctoral fellowship with the knowledge of it leading to a potential career in academia. Therefore, NIH should increase funding to enable a greater number of career transition awards (e.g. K01) and reduce the threshold required to get them. If more postdocs could acquire career transition support, and receive this support earlier (perhaps also with an increased salary), perhaps more PhD graduates would be willing to remain in academics to pursue postdoctoral fellowships, knowing that there would be support to help them transition to a steady career afterwards.

Response 232

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows have some of the highest managerial, mentorship, and experimental responsibilities in the lab. Considering most labs do not have lab managers or staff scientists, postdocs are the key mentors for graduate students, technicians, and undergrads, while also expected to be the most productive in their research. Postdocs on the academic track are also expected to come up with their own funding (K99) and therefore manage every aspect of their own job.

Fundamental issues and challenges

PAY, PAY, PAY, PAY. I would be shocked if the NIH actually needs to hear this. The idea that this is a "training" position is grossly incorrect. Many, if not all, PI's expect postdocs to be able to enter their lab with minimal training and guidance on research techniques. In addition, many PI's may help postdocs submit grants, but that should not be considered training, as the PI mainly discusses overarching ideas and verbiage—something any boss should do with an employee. Postdocs are expected to work extended hours (more than 40 hours per week, often more than 60 hours per week), leading to reduced work life balance and burnout. PI's are not subject to any oversight by NIH and barely are subject to oversight by their university, leading to many dangerous and toxic work environments. Postdocs are also not afforded parental leave, postpartum care, retirement benefits, all of which can be offered to prospective postdocs in industry or other jobs. Pay is barely more than graduate student stipend (top graduate student stipend is approx $45,000 and the NIH minimum for postdocs is approx $56,000). Postdoc salaries in industry start around $90,000, with full benefits, and less working hours. You want to train intelligent scientists during their graduate school, why are you surprised they can do the math and join industry?

Existing NIH policies, programs, or resources

PI's use the NIH minimum as a maximum. You need to raise the NIH minimum to $80,000. In addition, R01 funds need to be increased to allow PI's to accommodate the raise in postdoc salary.

Proven or promising external resources or approaches

Industry is a very promising external resource to inform NIH's efforts to enhance postdoctroal training—salary starting at $90,000, full benefits, paid parental leave, retirement plan, clear goals towards promotion (in academia's case, faculty position or industry), clear expectations for hours worked per week.

Response 233

Perspectives on the postdoc roles and responsibilities

For me: Envisioning, developing, and executing independent projects with the goal of publishing research and formulating a research program to launch my lab

More generally with goals to

1. Gain valuable research expertise
2. Present work
3. Build towards future career pathways

Fundamental issues and challenges

Salary, lack of mentoring from postdoc advisors, and difficult job prospects and federal funding success rates in academic positions

More minor: lack of community and investment from academic departments and institutions

Existing NIH policies, programs, or resources

Raise minimum postdoc salaries; NIH modular budgets should be updated to match the current economic landscape especially for compensation; existing NIH grants should allow PIs to pay postdocs on other funding sources (such as private fellowships) to supplement their income to match salaries adjusted for areas with higher costs of living

Proven or promising external resources or approaches

Requiring all NIH funded PIs to take DEI training (some already available through NIH office of dei). Requiring annual postdoc mentorship plans for each postdoc and provide regular reporting on these plans to NIH (could include this info when PIs provide research progress reports)

Response 234

Perspectives on the postdoc roles and responsibilities

Ideally, I consider a postdoc as a training position to gain further skills to continue on the academic track and eventually obtain a tenure-track position.

Fundamental issues and challenges

The pay is much too low to be competitive with industry positions. Moreover, the general lack of benefits (retirement accounts, sometimes health insurance, etc.) and lack of job stability sets postdocs even further behind their peers, since many of these are also lacking or inadequate during graduate studies. My peers are buying houses and having children, but I would be struggling to pay my bills if my partner had not left his postdoc position for industry.

Existing NIH policies, programs, or resources

$2500 per budget period for childcare costs is laughable when yearly costs for daycare can easily be 10x that amount. Everything helps, but this would only cover childcare for a conference or two.

Proven or promising external resources or approaches

Biotech and pharmaceutical companies do an excellent job of recruiting and retaining employees by paying them what they are worth.

Response 235

Perspectives on the postdoc roles and responsibilities

My postdoctoral fellowship has provided an incredibly valuable opportunity to continue my training and work with expert mentors.

Fundamental issues and challenges

The salary is the main issue in my opinion. It is simply not feasible for many postdocs to live on the current NIH postdoc salary. It has only been feasible for me because I am in a low cost of living state, I am not supporting a family, and my institution supplements my salary. I cannot imagine that it is possible for people to live on this salary in higher cost of living states without supplementary income. This is also the main concern I hear from my peers.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increasing the salary

Response 236

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Average postdoc makes less money than an average clown in the US. Thats a fundamental issue

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 237

Perspectives on the postdoc roles and responsibilities

Transition from doctoral student to independent investigator. Pipeline of future leaders.

Time to launch a line of research at a peak of training, energy and imagination; before other obligations take over (management, teaching, administration).

Fundamental issues and challenges

First, it is a real issue. thanks for the opportunity to comment.

From my perspective, PhD students are not going into post-doctoral positions because they see:

- Other PhD students going into industry after graduation and getting salaries 3x times higher than post-docs (often peers that were not as birth as they are).
- Post-docs looking for academic positions after 3 years and not finding them, or not finding them in the locations they would prefer.
- Faculty working nights and weekends to keep up with writing grants, papers, teaching, correcting, etc. And working over weekends and vacations. New generations do not find this lifestyle appealing.
- The benefits of academic life (flexibility, working from home) are offered by every other job now. No longer a reason for going into academic career.
- Apparent no need to be an expert to publish, teach or communicate to the public. Anybody can write a tweet, do a podcast or write for the NYT. Excellency and deep knowledge that requires time and preparation is not rewarded nowadays.

Wonder also whether the brightest minds have been attracted by AI and technology in the past decade. Maybe right now new generations are driven towards diversity, inclusion and belonging. (?)

Existing NIH policies, programs, or resources

Making academic life more attractive will make post-doc training more attractive. I do not have the magic trick but pay lines in the 8th percentile are exhausting and discourage academic careers. Perhaps we were too many academics submitting grants and lowering the numbers will get to a new balance with easier funding. While maintaining or increasing the quality of research, the significance and the innovation.

Proven or promising external resources or approaches

No response

Response 238

Perspectives on the postdoc roles and responsibilities

Mastering the skills of a research scientist that you learned as a graduate student

Preparing for a future role as a mentor and PI

Fundamental issues and challenges

Postdoctoral salaries are pathetic. Work-life balance is poor. They are sometimes not even treated as “real” employees. The days are treating science as some great life calling are over. It’s a job. People (yes, postdocs are people too) have families, hobbies, and entire lives outside of the lab. That needs to be recognized and accommodated. They are employees of ann organization and should receive the same benefits. The romanticization of the research scientist role needs to be recognized for the antiquated facade over the exploitation that it is.

Existing NIH policies, programs, or resources

Leadership training and opportunities in the form of courses, coaching, and emerging leader programs. Decent salaries. Postdocs shouldn't be paid 20K a year when a PI makes 200K. Support in the form of full employment benefits, even if it's for a contract position.

Proven or promising external resources or approaches

Treat postdocs with respect and give them the benefits and pay they deserve. They are employees just like anyone else. Don't treat them otherwise. Develop them into future scientific leaders with access to leadership trainings and coaching opportunities. Create and enforce a code of conduct that offers all postdocs a safe working environment free of abuse, manipulation, and exploitation.

Response 239

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a transient period of training given to an individual with a Ph.D., with the goal of securing research opportunities primarily in the academia

Fundamental issues and challenges

1. As an international postdoc, I find it difficult to support my dependents because the pay is insufficient. I would appreciate it if there was a way that allowed universities to pay for medical insurance for dependents.
2. Visa issues. Currently, as a J-1 visa holder, there are a lot of difficulties with visa renewal each year. It would be great if the J-1 visa did not need yearly renewal, but was for a "one-time" 5-year period without going through the pain of yearly renewals.
3. Have a smoother visa policy for industries to hire international postdocs

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 240

Perspectives on the postdoc roles and responsibilities

It is a means to advance my scientific career and learn new techniques and tools.

Fundamental issues and challenges

I have heard about postdoc recession, but I have been trying to secure a position but have not been able to. Is there really a recession or PI'shave become more selective?

Existing NIH policies, programs, or resources

Workshops and trainings on transitions from postdoc to obtaining grants are already there but postdocs are less aware.

Proven or promising external resources or approaches

No response

Response 241

Perspectives on the postdoc roles and responsibilities

My postdoc has been the chance to grow into my own as a scientist, now that I have the "license to practice" obtained through my PhD studies. In seeing what professor life has been, it also feels like the last chance to do science that is uniquely *mine* (i.e. done by my hands), before beginning a professorship, where I'm expected to leave the lab but still channel the process of science in training

students. It's also incredibly bittersweet —my social network is extremely well-connected, and there is deep grief at the idea of abandoning it for a job where I have to start over. It is a common assumption that as a K99 fellow I've "succeeded." Yet. why is the prize losing the close access to support networks that I've cultivated for 4-5 years, both inside and outside the institute that I've found success at?

Fundamental issues and challenges

I'm sure plenty of people will talk about financials, so I won't harp on that. *LOCATION*: Postdocs are typically late 20s/early 30s. This age range is when it is no longer easy to build strong social networks (no incoming cohort, etc). We are asked to upend our social network that we developed during graduate school to start another training position, and expected to leave this location again 2-5 years later, usually to start over *again*. Furthermore, assistant professors are often left at arm's lengths by their departments until they get tenure, a further way that these social networks are left unfilled. And yet, assistant professors —30-year-olds with no training in mentorship, with little-to-no social support network, and with the prospects of having to either *succeed* or risk starting over *again*, are expected to train 20-year-old graduate students, who are also often in a completely new place with very little social support network.

Scientific research (heck, NIH-FUNDED research) has shown that social networks are critical for success in the workplace. And also critical in giving these trainees and assistant professors the resources required to navigate the high-stress years of pre-tenure without focusing this stress upon trainees.

Existing NIH policies, programs, or resources

Again, I won't talk about financials, although those are certainly important. E.g. Pathway-to-independence awards (e.g. K99) should get explicit commitments from the sponsoring institution/university to generate space for the R00 portion of the award, if so desired by the applicant. Mechanisms that do not expect postdocs to continuously choose their career over every other aspect of their life are essential to improving postdoc well-being, not only during the postdoc, but also afterwards. Modifying resources so that postdocs can apply for grants/other-funding that would permit them to transition to academic research scientist careers in their sponsoring lab (or another lab) are also critical. Many of us are incredibly good at doing the process of scientific inquiry, it would be wonderful if an alternative option to "leading a lab (where you transition to writing grants and dealing with bureaucracy)" existed that looked like "continue doing what you've spent the last 5+ years BEING TRAINED to do."

Proven or promising external resources or approaches

No response

Response 242

Perspectives on the postdoc roles and responsibilities

Postdoc is a full time job.

Fundamental issues and challenges

Low pay. NIH minimum should be 75k. Postdocs are not "trainees." Any/every job requires training.

Existing NIH policies, programs, or resources

Increase NIH minimum postdoc salary to 75k. Minimum 2 year commitment. If a PI can't afford this then they can't afford a postdoc. The system is unsustainable.

Proven or promising external resources or approaches

Increasing minimum pay is a key DEI issue. the first thing I ask when advising students about an academic career is "do you have student loans?" This is not complicated, and everything else is window dressing in comparison.

Response 243

Perspectives on the postdoc roles and responsibilities

Postdocs are experienced, well-trained scientists who hold doctorate degrees and personally perform experiments in the lab. Their primary role is to design experiments, collect data, and analyze results. Academic scientific progress is largely dependent on the research performed by postdocs.

During this period, postdocs may gain experience in additional skills that may help their future career (eg grant writing, managing, mentoring, and training students and technicians, developing projects). Due to their experience, the managing, mentoring, and training performed by postdocs may be essential for the operation of the lab. However, the quality and degree of training is highly variable between individual labs. This is not the primary focus of the position.

Due to the large discrepancy between the number of academic postdocs and the number of academic professorships, a significant percentage of postdocs will not ultimate receive academic professorship positions. Since academic professorship positions are largely given on the basis of research output during the postdoc, this further reinforces the focus of postdocs on producing research that will result in first author papers in high impact journals. However, some postdocs (ultimately the majority of them) will pursue other career trajectories, each of which has requirements falling outside the range of what postdocs may learn as an academic postdoc.

Fundamental issues and challenges

The largest issue in recruitment, retention, and quality of life is the low salaries offered postdocs. Postdocs all have advanced degrees which would enable them to obtain significantly higher salaries outside academia. Since postdocs spend the early portion of their careers as PhD students, they don't have large savings to support them as their pursue their postdocs. Without the income and savings of similarly aged individuals, it is hard for academic postdocs to maintain the quality of life afforded other similarly aged, similarly trained individuals. In particular, most postdocs are at the age at which many Americans get married, have kids, and buy houses which require significant financial assets. as a result, many postdocs are forced to choose between delaying these life decisions or leaving academia.

The low salaries have additional impact on the diversity of scientists who remain postdocs. Since wages are low, people with independent wealth may be likely to remain in academia and people with less independent wealth may be more likely to leave. Further, parents who need additional income to pay for child care (especially women scientists) are also incentivized to leave academia.

The uniformity of postdoc salaries also incentivizes the most talented (or at least the most marketable) scientists to leave academia. A large majority of institutions offer postdocs a set salary scale at the level suggested by the NIH. R01s are also not large enough to accommodate higher postdoctoral pay. Individuals therefore have limited flexibility to negotiate or offer higher salaries, so postdocs of all qualities end up being paid on the same scale.

The salary issue is especially acute now due to the slowness with which the NIH and academic institutions respond to changing factors. Salaries and R01 budgets are not tied to inflation and have not increased to keep pace with inflation.

Existing NIH policies, programs, or resources

Increase NIH suggested salaries.

Provide a range of NIH suggested salaries.

Include performance bonuses in NIH suggested salaries.

Include subsidies for child care in NIH suggested salaries.

Increase salary sizes in R01 modular budgets (and adjust R01 size accordingly).

Extend K99/R00 fellowship eligibility, and early career status for all postdocs who completed PhDs before the Covid19 pandemic.

Extend K99/R00 fellowship eligibility, and early career status for all postdocs who take parental leave (fathers and mothers).

Ask for input from postdocs more often (not just in crisis time)

Require references from past trainees in all evaluations of PIs (research grants, training grants, awards, etc). This may incentivize better mentorship.

Offer workshops or funding for late stage postdocs to learn skills needed as a PI (budgets, leadership, hiring, interviewing, grant writing).

Proven or promising external resources or approaches

No response

Response 244

Perspectives on the postdoc roles and responsibilities

Postdoctoral period is a crucial phase where a scientist gains a bird's eye view of the entire research cycle, from research planning and execution to learning to secure research funds (beyond salary support), networking with other scientists, and gradually becoming autonomous.

Fundamental issues and challenges

Beyond funding and adequate salary to afford to live in major cities, racism and favouritism in the workplace need more attention. Discrimination isolates postdocs and refrains them from pursuing academic careers. It is even worse for international female postdocs whose lives/visas in the U.S. depend on the yearly contract, and they go through this emotionally traumatic experience quietly. I left my postdoctoral studies [redacted for anonymity] after being subjected to racial discrimination and bias by my PI and I am beginning to hate science altogether. I was told several times that there are too many professors of my descent in the U.S. and so I should rather teach at a community college and give away my research dreams. It is not fair to suppress one race to promote another. I lost two precious years of my postdoctoral period, and I am trying so hard to salvage my academic career back in my home country.

Existing NIH policies, programs, or resources

The policies and programs stipulated by NIH are perfect but still are not reachable by most international postdocs. When I applied for funding from external agencies, my application was rejected because of my PI's track record of training postdocs and their funding status. It would be better to have postdoc fellowships that are not evaluated based on their PIs status. Also, NIH should consider recognising and funding the PIs who have an inclusive and diverse team.

Proven or promising external resources or approaches

No response

Response 245

Perspectives on the postdoc roles and responsibilities

I loved my post-doc. And I love training post-docs. It is truly a period of training, but training happens in many professions and the fact that these trainees have advanced degrees must be recognized by higher salaries.

Fundamental issues and challenges

Money. The NIH has not changed the modular budget in many years despite inflation. It's you, hi, you're the problem it's you. You need to increase postdoc stipends and PI grants.

Existing NIH policies, programs, or resources

Get rid of training grants and do more individual postdoc and grad student grants. Training grants have turned into who can create the most ridiculous statements about their programs as opposed to showing you how individual faculty are training individual trainees. It has become a circus.

Proven or promising external resources or approaches

No response

Response 246

Perspectives on the postdoc roles and responsibilities

Academic postdoc means freedom to pursue our own ideas and to square off a topic precisely catering to each and every patient

Fundamental issues and challenges

Fundamental issues are visa issues for international students and the mandatory requirement of experience for the post and lack of opportunities for the students at their home country and us as a leader should open up more opportunities for international students and not only for underrepresented communities it is mandatory that we view each challeng as an opportunity.

Existing NIH policies, programs, or resources

Existing grants for international students should be changed for good

Proven or promising external resources or approaches

No response

Response 247

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

little to no funding available for international postdocs, short apointments, salary not competitive, slim chances of advancing to group leader/professor

Existing NIH policies, programs, or resources

extend current oportunities to non US citizens, fund project scientist positions for those beyond 6 years of postdoc

Proven or promising external resources or approaches

No response

Response 248

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

low salary and low job security has become a serious problem for future Americans. Commonly in academics labs, majoiry of post-docs are hired from overseas and given H1B visas, which do not require lotteries to be granted. The low pay makes US citizens less likely to apply for post-docs, and overseas applicants may have more tenacity in this situation. As a result, the PI might be more willing to hire people from other countries, such as India or China. In addition, these foreign scientists must endure the low rewarding position due to their immigration status, if they resign, they might have to leave the country. Such a slvaory practice is unfair. As a result of these hiring decisions, Americans lost out on opportunities as well. Policy suggestions include increasing the postdoctoral salary annually and requiring at least a certain percentage of Americans to be in a research grant so as to prevent taking advantage of foreign labors and empower opportunities for Americans.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 249

Perspectives on the postdoc roles and responsibilities

My postdoc was intended to provided me a mentored training experience in a laboratory in order to set up for transition to becoming an independent investigator leading my own research program.

Fundamental issues and challenges

I was used as a staff support position and my career development opportunities were frequently delayed to perform support work for my laboratory. There is no adherence to a career development plan leading to a transition to independence, and there is no longer any expectation of a future independent research program.

Existing NIH policies, programs, or resources

Provide very clear expectations for mentors in NIH funded mentored training grants (K awards). My mentor has used every opportunity to delay my K award for productivity on lab projects rather than prioritizing my career development. Find ESI R01s at a level that does not require 3-4 submissions because There are not enough years of ESI remaining after providing years of support toward my "mentored lab experience" .

Proven or promising external resources or approaches

No response

Response 250

Perspectives on the postdoc roles and responsibilities

Academic postdocs were a personal nightmare when I was one many years ago and I do everything I can to make our postdocs have a phenomenal experience at our company

Fundamental issues and challenges

None.

We provide higher pay than every exclusively university postdoc I know of (plus they are paid as regular employees with no [redacted] about fellowship vs grant vs other annoying types pay that make taxes a nightmare). Postdocs also get full benefits including 401k with match, health insurance (with options for a family), and childcare options. And finally we frequently convert postdocs to full time employees within our company.

Existing NIH policies, programs, or resources

Not particularly aware as I am mainly focused on activities within our own company.

Proven or promising external resources or approaches

Look at big pharma postdoc practices.

Require all NIH funded postdocs to get benefits that are standard at large chemical and pharmaceutical companies (BP, Pfizer, Dow etc)

Response 251

Perspectives on the postdoc roles and responsibilities

I'm a former postdoc. I worked in a prestigious lab and was part of a group doing meaningful research (which was great) but as a career it's awful. My experience as a postdoc led me to leave research and pursue a completely different career.

Fundamental issues and challenges

Simple: PAY. No one wants to spend 5 years on a PhD to earn less than $50k / year in a highly focused and demanding postdoc role. I think this pathetic pay is pushing young scientists out of research because it's challenging to make ends meet on a postdoc salary in many situations.

Existing NIH policies, programs, or resources

There are other issues, but fundamentally the pay is laughably bad and undermines the entire NIH approach. People in other careers are SHOCKED when I tell them what postdocs earn.

Proven or promising external resources or approaches

If wages improve it will attract and retain talented people. If not, they'll eventually go elsewhere and any other changes will not be enough to fix it.

Response 252

Perspectives on the postdoc roles and responsibilities

Post docs are increasingly seen as cheap labor without the need to perform additional training

Fundamental issues and challenges

Postdoc programs are unstructured, lack milestones, lack avenues for submitting formal complaints, and the experience is heavily influenced by the lab you are able to join. The pay is abysmal and the expectations are high.

Existing NIH policies, programs, or resources

The only "incentive" to staying in academia is the idea of flexibility and freedom in research which ultimately falls apart when you consider the demands placed on post docs, the lack of resources, and the lack of pay. How can somebody be expected to do their job well when they're living paycheck to paycheck?

Proven or promising external resources or approaches

Competitively pay postdoc for the value they add to academia. If they're the backbone of pushing research to new heights, the NIH should act like it

Response 253

Perspectives on the postdoc roles and responsibilities

An academic post-doc seems like a temporary position that primarily exists because there are too few faculty positions relative to PhD graduates. In most universities, post-doc compensation is inadequate to cover cost of living in nearby area. Coming from a period of financially struggling to survive graduate school, it is infeasible to continue poor financial situation post graduation, especially when other positions offer substantially higher compensation and growth opportunities.

Fundamental issues and challenges

Financial concerns seems to be a foundational problem. In considering my career options immediately after graduating from a PhD, post-doc positions are nowhere near competitive with what compensation alternative positions can offer.

Existing NIH policies, programs, or resources

Limitations on post-doc compensation should be revised to consider cost of living needs of post-doc trainees. Doing so will ensure a post-doc position is a viable option for PhD graduates.

Proven or promising external resources or approaches

NIH can dance around the issue, but more funding and higher postdoc compensation are critical.

Response 254

Perspectives on the postdoc roles and responsibilities

Post doc roles and responsibilities are on par with entry level industry jobs, but pay one half to one third the amount.

Fundamental issues and challenges

Inability to live with dignity or have the option to support a family due to poverty wages in an increasingly harsh economy.

Existing NIH policies, programs, or resources

Simply paying more would go a very long way.

Proven or promising external resources or approaches

Paying more would definitely immediately enhance recruitment, working environment, and job satisfaction.

It would likely also increase the quality of post docs candidates. Smart people with lots of industry options are not going to take a job that pays around the same as Walmart managerial staff to do cutting edge biomedical science.

Response 255

Perspectives on the postdoc roles and responsibilities

To use a plane analogy, I think the PI should be the pilot, and the postdoc should be somewhere between a co-pilot and a flight attendant. These days, I think postdocs are expected to be the pilot, flight attendant, ground crew, gate agent, and baggage handler. I've always viewed the postdoc as a simple and perhaps necessary stepping stone for a newly minted PhD to use towards achieving their academic dreams

Fundamental issues and challenges

I am a first year graduate student who has always considered himself on the track towards being an academic PI; however, I must say that watching some of these postdocs do a 6 to 8 year appointment scares me out of my wits. I really don't know if that is something I would want to do and I think this is probably the same for so many other young trainees across this country. Furthermore, these full-fledged scientists don't make all that much more than a graduate student.

Existing NIH policies, programs, or resources

Maximum appointment limits of five years. PIs need to be held accountable for the fact that they cannot simply hold someone back indefinitely from advancing their personal scientific career.

Proven or promising external resources or approaches

Increase pay!! And benefits!

Response 256

Perspectives on the postdoc roles and responsibilities

A way to deepen your scientific work to launch a career as faculty or advanced industry role by producing a high impact publication (and other output)

Fundamental issues and challenges

Salary–needs to be 3 times rent in the area of institute, and current NIH standards are inadequate for most cities. Also benefits, including healtcare, retirement matching, and paid parental + maternal leave.

Existing NIH policies, programs, or resources

Raise official salary for postdocs to 75k/year and peg annual increase to inflation. Add benefits, and this to ALL calls/programs that involve postdoc funding

Proven or promising external resources or approaches

Salaries and benefits in countries like Switzerland, the Nordic countries, etc. The idea is a large-scale recognition for the need for fair pay for the work.

Response 257

Perspectives on the postdoc roles and responsibilities

The postdoc offers a critical experience in independent research engagement (with some supervision) beyond the PhD training and education. The postdoc should learn the role of being a member of a research team, take initiative in research, and be socialized into the researcher role. The postdoc should not merely be a research assistantship. Aspects of the expected researcher role should be part of the postdoc including conducting research, managing oversight and leadership aspects of working with a research team, writing for publication, presentation at national or international conferences, and writing at least one external grant proposal.

Fundamental issues and challenges

A primary challenge that I understand inhibits recruitment of postdoc fellows is the requirement to uproot and move for the 2-year postdoc position. By the time many trainees reach this point, they are settled in their home. We have learned in general, and especially during the COVID-19 pandemic, that many fields do not require full-time in-person presence. As such, I recommend removing the requirement of presence on campus or on site and permit the particular program to negotiate an arrangement with the postdoc fellow.

Existing NIH policies, programs, or resources

Expand postdoc programs to less research intensive universities to boost their research potential and offer more opportunities.

Proven or promising external resources or approaches

No response

Response 258

Perspectives on the postdoc roles and responsibilities

It is a temporary research position. Not a particularly training position, mainly just a job working on a research problem.

Fundamental issues and challenges

Bad compensation. I decided not to pursue a postdoc after my PhD because doing postdoc will not allow me financial stability. Meanwhile I’m old enough to have family and kids.

Existing NIH policies, programs, or resources

Stop framing it as a “training”. It is just a job. Treat it like one. There should be no cap in salary.

Proven or promising external resources or approaches

NA. Why do highly skilled workers getting paid < $25/hr? Why would people stay when it is so difficult to survive day-to-day life? What an illogical decision to keep the status quo.

Response 259

Perspectives on the postdoc roles and responsibilities

The postdoc is / should be a time to hone skills and pursue career development opportunities to enable success in a future job (academic or otherwise).

Fundamental issues and challenges

The number 1-100 issue is salary. Postdoc salaries are too low in relation to the cost of living near most academic medical centers. NIH must raise the stipend levels AND increase grant budgets accordingly. Doing the first without the second is a doomed experiment.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

$$$

Response 260

Perspectives on the postdoc roles and responsibilities

I really see the role of a postdoc position to be a bridge between the doctorate and an early career independent investigator. The postdoc serves as a junior investigator much like a resident does in medicine, where they are mentored to become the best researcher they can.

Fundamental issues and challenges

I think there are a number of issues that inhibit postdocs. First, there is a lack of standardization. Not all postdocs are created equal and it is very dependent on the PI or Lab in which you are working. I think research could look to residency-type programs as a way to standardize postdocs so that they truly progress in their careers rather than just become glorified PhD Students or research assistants for a PI. Second, there should be more opportunities for funding for all types of postdocs. There is a real bias towards clinicians for K awards, not to mention that the number of awards is limited. If postdocs were a true priority, then there would be more opportunities for them to get experience writing and conducting research grants.

Existing NIH policies, programs, or resources

Exand the number of non-clinician K awards and increase the funding overall for postdoc level investigators. Consider T32 programs that also cater to postdocs as a main target and not just to PhD candidates, and the postdocs are an after thought. Consider creating a funding stream for universities to establish more standardized postdoc training program (like in medicine and pharmacy).

Proven or promising external resources or approaches

Overall, pay lines for postdocs to make it very difficult to choose that as a career pathway, particularly for those with student loans and families. Even an increase in pay lines of at least 10K could really go along way. Provide funding/programs for women, in particular, those with families and children who are trying to make it work and in the end, have to quit because they don’t have the support (mentoring, programming and financially) to stay in postdocs. The Fogarty institutional training programs are a great opportunity for postdocs, but they are limited to one year and are based overseas. Such programs should be extended or have the option to renew, and other institutes could consider doing something similar.

Response 261

Perspectives on the postdoc roles and responsibilities

I love it, it is good for learning and training; except the financial issue that affects every individual.

The financial burden is seen even more in Boston as the city is relative 3 times more expensive than other places but the postdoc salary are not adjusted accordingly.

Fundamental issues and challenges

Quality of life is not good as financial freedom is restricted, when it comes to family, place of living and health insurances

Existing NIH policies, programs, or resources

Certainly the pay grade should be adjusted accordingly with states and place of living.

For example, there are London/ Zurich based adjustments when it comes to paying postdocs

Proven or promising external resources or approaches

I like the training and resources

Response 262

Perspectives on the postdoc roles and responsibilities

Transition to independence, no longer an early stage trainee

Fundamental issues and challenges

1. Low salaries
2. Low salaries
3. Low salaries
4. Low salaries
5. Abysmal job prospects in academia, especially since non-academic positions do not require a postdoc

Existing NIH policies, programs, or resources

Foreign ineligibility for NIH-funded training grants needs to be gone. Most postdocs at top schools are foreigners that stay in US and leave academia because they can't get funding for their positions

Proven or promising external resources or approaches

SALARIES

Response 263

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a professional appointment with allows for continuity in the academic track. The postdoc, while gaining more training, is a qualified individual with highly specific skills who provides research support contributing to the US research enterprise. This enterprise cannot continue to compete without the skills, ideas, research of postdoctoral fellows. They are individuals with doctoral degree who should be provided the equivalent respect, career training, financial stability/support in order to continue to effectively contribute.

Fundamental issues and challenges

The issues ad challenges facing post docs are immense but can be summarized as follow:

1. Compensation is not up par to their skills/and level of education
2. The work conditions in great part are very exploitative. They are expected to work long hours and weekends, with no benefits of time off, adequate vacation times, contributions to retirement, etc.
3. The advancement to independent career is very slim

Existing NIH policies, programs, or resources

The NIH funding system needs to increase to reflect not inflation and to match the skills/levels of education that post docs are bringing to the table. Post docs need to be afforded the resources to live and to not be in financial stress while conducting research. The funding mechanism needs to reflect the areas they are living in and not just everyone gets the same pay no matter where.

There should be programs in place that allows post docs to further their careers if they can't or don't want to become a PI.

Proven or promising external resources or approaches

There are a few institutes who are taking the charge in improving post doc conditions. These institutions (Van Andel Institute, St—Jude's) have increased the pay for post doc and guarantee them benefits of medical, dental, vision, parental leave, contributions to retirement, etc. and provided them with support staff with establish working conditions to avoid and minimize their exploitation.

Response 264

Perspectives on the postdoc roles and responsibilities

Protected time to establish research with enhanced mentorship and training opportunities.

Fundamental issues and challenges

Pay, especially when compared to other opportunities

No clear career trajectory

Not necessary for desired positions

Existing NIH policies, programs, or resources

Increase pay

Proven or promising external resources or approaches

No response

Response 265

Perspectives on the postdoc roles and responsibilities

1. Expanded their scientific/technical knowledge
2. Learn how to drive a project from conception to papers
3. Be technically and scientifically independent
4. Figure out the field in which they would like to start their independent career
5. Became better mentor/manager

Fundamental issues and challenges

1. Very low salary compared to individuals with the same experience in industry position (postdoc salary in the industry start with a base of $90,000.00 a year vs the $54,000.00 at university)
2. Lach of relocation funds. Postdocs are expected to relocate often, to not take postdoc positions in the same institution where they did their Ph.D. training, and then relocated again during the faculty job search. However, no relocation fund has been offered. This is DEI gatekeeping since people who come from low-income situations might not be able to relocate for free.
3. No reasonable parental leave (most institutions offer only 8 weeks for mothers and 0 weeks for fathers)
4. No affordable daycare options. Again how do you want to increase DEI representation if only wealthy households can afford daycare? Woman postdocs have to spend over half of their salary on daycare, how they can be efficient in their training if they are constantly worried about financial ruin?
5. Conflict of interest with PI: Postdocs want to finish their training as soon as they can, be successful, and transition into an independent career. On the other hand, PIs want to try to keep successful postdocs in as long as possible in their labs because they need to produce papers, write grants, and drive the projects.
6. Postdocs are completely dependent on their PIs without any safeguard from institutions.
7. No training on how to be a PI (manage people, admin work, budgeting)

Existing NIH policies, programs, or resources

1. Increase base salary
2. When evaluating grants and funding of PIs, do not rely only on the teaching/DEI statement, but actually, ask them to provide a track record of their postdocs. How long each postdoc was in their lab? Did they transition successfully into academic or industry roles? Did the postdocs get enough paper?
3. If PIs grants are based on papers their postdocs, also postdoc should be co-PI of the grant.
4. Mandate federal parental leave for both parents

Proven or promising external resources or approaches

Postdocs should have a PIs committee to increase their mentoring exposure

Response 266

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions should not be construed as cheap labor performed by mediocre individuals. Only outstanding future scientists should be accepted as postdocs. A significant salary increase together with a reduction in the number of postdocs is the most efficient solution as the total budget will remain essentially the same. Quality over quantity.

Fundamental issues and challenges

Significant salary increase coupled to much higher standards will attract outstanding individuals and filter mediocrity

Existing NIH policies, programs, or resources

Eliminate admission of lesser qualified individuals to postdoctoral positions. Nowadays, a doctoral degree is enough. Standards must be much higher. Doctoral degrees from foreign universities of dubious reputation are considered sufficient for acceptance. This should be eliminated.

Proven or promising external resources or approaches

The main problem is that too many unqualified individuals are accepted as postdocs, thus lowering the standards of the academic and scientific discourse.

Response 267

Perspectives on the postdoc roles and responsibilities

The opportunity to apply your doctoral skills to other disciplines and begin paving your own path in research by combining what you know with other laboratory skills

Fundamental issues and challenges

Absolutely 100% the salary. I will be starting a postdoc at the end of this semester which was a very stressful decision for me. Ultimately, I was not ready to give up the chance to learn certain skills I wanted for my career BUT this came at the cost of knowing I will continue to be living paycheck to paycheck the next 2-3 years on a T32 salary. I have spent the last 5 years stressed about finances on a grad stipend, with the promise that having a PhD would be worth it. At this point, having a postdoc salary will qualify me for income-restricted housing in the city I will be moving to, and that is unimaginable after all the work and training that went into getting a doctorate. Postdocs should be paid what we are worth as research scientists and should not have to make a choice between the post doc we want OR being able to afford an apartment and groceries.

Existing NIH policies, programs, or resources

Double the NRSA pay scale.

Proven or promising external resources or approaches

Pay PhDs the equivalent to industry averages.

Response 268

Perspectives on the postdoc roles and responsibilities

I perceive postdoctoral position as an underpaid position that folks interested in academia have to go through in order to become a principal investigator.

Fundamental issues and challenges

Postdocs are NOT paid enough and they do not receive decent benefits, considering the level of expertise that they have and often their age.

Existing NIH policies, programs, or resources

Increase the pay minimum of postdocs to $80,000 per year and ensure they receive a 401K.

Proven or promising external resources or approaches

Increase the pay minimum of postdocs.

Response 269

Perspectives on the postdoc roles and responsibilities

This is a critical training stage for those who want tenure-track or research-track faculty positions. During this time a postdoctoral trainee develops their own research agenda and receives mentoring to navigate the job search and to succeed as a faculty member. This is no longer a necessary step for industry positions.

Fundamental issues and challenges

Low salaries, lack of mentorship, and lack of work-life balance is discouraging many from pursuing a postdoc. This is especially true for underrepresented groups, which has direct impact on the diversity of the professoriate. As more industry jobs for PhDs no longer require postdoctoral experience, more domestic graduate students are skipping the postdoc. Since this is not a realistic option for international students, the proportion of international postdocs is likely to increase and the reliance on an international workforce at the postdoctoral level and beyond is subject to international politics and could seriously jeopardize the future of academic research. Faculty need to accept their mentoring responsibility and stop hiring postdocs as super technicians. The hiring process is opaque and biased.

Existing NIH policies, programs, or resources

1. Make it clear to institutions that they can use their funds to offer benefits and make postdocs on NIH fellowships employees of the institution.
2. Make PI mentoring track record a factor in awarding ALL grants not just training grants. A measure of quality of mentoring needs to be used as this is not simply about how many people you have trained.
3. Encourage trainees and institutions to report toxic work environments and behavior to the NIH.
4. Advocate for abolishing the use of reference letters to advance in academia.
5. Demand hiring processes modeled after the best practices in faculty hiring: use of rubrics at each step of the process, no reference letters, advertise to underrepresented groups, include a commitment to mentoring and professional development in the ads.

Proven or promising external resources or approaches

The NIH IRCADA program is a great model to prepare faculty. This model should be expanded and promoted as the way to train postdoctoral scholars.

Response 270

Perspectives on the postdoc roles and responsibilities

A postdoc is a transitional period for additional training, learning of lab leadership mentoring in grant writing and management. It can be a time to expand knowledge in a completely new area or to learn a new method or technique to enhance competitiveness.

Fundamental issues and challenges

There are several fundamental issues: postdocs don’t have sufficient benefits and support for individuals with families, health concerns or folks from URM backgrounds. There is a problem with pay but also with how it is structured. Postdocs need to have a base pay rate that is higher or we will continue to lose postdocs to industry. The focus on moving for a postdoc makes it unpalatable for families and URM folks which is a larger and larger percentage of postdocs now especially as we diversify grad education. There are no resources for a “two body” problem with a move and employment. Postdocs need paid health care and family leave policies that are more friendly. Finally, there needs to be an emphasis on limiting the length of postdocs. 2-3 yrs is plenty. Either create levels or make additional resources available for

transitional positions. Recognize that not every postdoc is going to be a traditional faculty member. What about those that lead core facilities? Right now there aren't resources for training or grants for these folks but we need them.

Existing NIH policies, programs, or resources

Make the base pay higher both as the NIH standard and on training grants. A relocation allowance would help with the URM folks. Offer training in lab management and grants management. More career guidance and training for faculty careers and teaching should be incorporated for those who want it.

Proven or promising external resources or approaches

There is a great training course at UC Davis offered by [redacted for anonymity] on laboratory management for postdocs and early career faculty. This came out of the P30 NIEHS environmental health sciences center. and the School of Veterinary Medicine at UC Davis. They have to limit enrollment It would be nice if this course had a broader reach it is excellent.

Response 271

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should be one in which the postdoc assumes the leading role in developing their research. Usually, at least in the beginning, the postdoc does not have their own funding so they use their supervisor's funds and resources to conduct their research. They are expected to contribute intellectually to other projects, provide new ideas, supervise personnel, train other colleagues, contribute to manuscript preparation, and, in general, work towards building an independent career in the near future.

Fundamental issues and challenges

The issues that I think are inhibiting recruitment, retention, and quality of life are:

- Extremely low salary in comparison with peers with similar or even lower work experience. The salaries in the industry usually are 4x higher than in academia. This usually means that only people that have extra economic support can pursue a career in academia, especially if they have a family.
- Job insecurity. In academia, even if you do everything as you are supposed to the chances of landing a PI position are extremely low. This means that if you sacrifice your quality of life by having a lower salary in the hope of getting a PI job the chances of not getting it are very high. In the end, this means that most people end up with a job outside academia having lost a lot of money in the meantime.
- Job/life balance. Usually, you are on your own in terms of bench work. If you are lucky you have one technician that can help you. Since the postdoc work is very diverse it usually comes with a high workload. Moreover, usually, the possibility of getting a PI job depends on having a good publication record. This requires a lot of dedication that usually eats into personal time. This issue is more important when you have a family since the cost of daycare is outrageous. Most of the time the cost of daycare is equal to the whole postdoc salary which makes it really hard to reconcile having a postdoc job and a family.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 272

Perspectives on the postdoc roles and responsibilities

Responsibilities are varied and differ by lab. My role as a postdoc includes a lot of project management and interface with students.

Fundamental issues and challenges

The pay. There needs to be a pay increase. This is a temporary position and we often move for a postdoc. At least covering moving costs/help with signing lease would be a step in the right direction. If you spend 10 years not making wages or contributing to retirement because of a PhD, postdoc salary and benefits should help reprieve some of that lost time.

Existing NIH policies, programs, or resources

Higher wages, help with moving costs, standards about how long students can hold offers (eg don't let t32 programs require a response to offers in less than a week if students are still interviewing)

Proven or promising external resources or approaches

Academia needs to consider that the alternatives to a postdoc pay a lot better and have a lot more benefits. Postdoc should be treated as a job where pay and benefits are transparent and upfront. Postdocs are often "required" to stay for 2-3 years even if their contract is only for one year at a time. This is confusing and prolongs time spent in low paying positions and makes it hard to leave for other opportunities.

Response 273

Perspectives on the postdoc roles and responsibilities

As a postdoc in the lab, my roles **and responsibilities** include overseeing everyday tasks to ensure research is progressing forward for the entire lab and teaching/sharing knowledge with new additions to the lab. As a member of the lab with more experience, I believe it is my responsibility to progress the research program forward and to take more risks in the experiments I am attempting (ie developing new protocols that have not been previously attempted before in the lab for other members to eventually use). I view my postdoc position as a stepping stone in my career in academia—it is a necessary step that I must take before I am qualified to become a professor.

Fundamental issues and challenges

The main issues that postdoc's face are poor salaries. We can easily secure any position within the industry and make twice the salary we do as a postdoc. Being a postdoc, you are required to work around the clock and face constant pressure to publish in high impact journals. We are the leaders of the lab and ensure everything is running smoothly, yet we are not compensated for this work. We are encouraged to remain in these poorly paid positions in the hopes that we can eventually become a professor, but the truth of the matter is that professorships are highly competitive jobs and postdoc terms are running longer and longer. When my PhD supervisors were postdocs, a routine postdoc lasted 2-3 years, but now 7-10 years seems standard. With a salary that is barely able to meet my everyday needs, it becomes harder and harder to justify staying in academia.

Existing NIH policies, programs, or resources

It would be great if the NIH would raise the minimum salary for postdocs. Many institutions abide by NIH guidelines, and it would greatly influence many universities across the country if the NIH were to significantly raise postdoc salaries.

Proven or promising external resources or approaches

I think institutions should not shy away from advertising industry jobs to postdocs, or encouraging us to go in that direction. We are treated better as employees in the industry, and quite frankly, there are not enough professorships for every postdoc. It seems that postdocs are all being trained for an job in academia, while a majority of us will not end up securing those positions. Also, more resources for postdocs dealing with fellowships/taxes on fellowships. I found that as an international postdoc, I was not aware of the hardships that I would encounter after accepting an external fellowship (ie. losing medical insurance from my institute as I am no longer considered a full time employee, not being taxed properly on my fellowship and being left with significant debts and fines during tax season). If the US would like to continue to attract international postdocs, it would be nice if there were resources to help us in these situations. Especially resources pertaining to taxes—my institute always suggests that I see a tax attorney, but given my extremely low salary, this is not a reasonable solution. I also don't think I should be penalized for receiving external funding and have to pay a large lawyer fee.

Response 274

Perspectives on the postdoc roles and responsibilities

I serve as a shadow PI. I run the lab on a day to day basis. I am the primary mentor to graduate and undergrad students working in the lab. I also run my own research program. This process was helpful at first, but after 2 years I am just doing the work of a PI without the title or pay.

Fundamental issues and challenges

Pay. The salary is complete trash for the level of training and skills that I have. I can get paid over twice as much outside of academia.

Also, stability. Having to move every 2 years is exhausting and drains the little savings that I have. Having better funded, longer postdoc positions would solve this.

Existing NIH policies, programs, or resources

Increase the salary.

Proven or promising external resources or approaches

Increase the pay.

Response 275

Perspectives on the postdoc roles and responsibilities

This is a position that allows an early investigator to gather the skills required to obtain an independent research position in the future. It also allows scientists who are indecisive about their next step to think and gather the skills to transition to their next position.

Fundamental issues and challenges

The salary is very low for the training that one has received. This is especially true for postdocs who have families and live in expensive cities. There is no universal parental leave established. Depending on the city, a parent may get 6-12 weeks. Six weeks is not enough for a woman to recover physically and emotionally after giving birth, to find childcare (especially in cities where waiting lists are long), and to be ready to start working full time. Work-life balance can vary tremendously from lab to lab since specific work hours are not established. The number of hours spent in the lab could be significantly affected by an advisor’s expectations. Every institution should have mentoring programs that allow postdocs to receive advise outside of their lab.

Existing NIH policies, programs, or resources

Universal parental leave (minimum of 12 weeks), increased salary or child care subsidy for postdocs with families, affordable health insurance for families, retirement benefits, information and support for careers outside of academia since not everyone will have the chance to become an independent investigator

Proven or promising external resources or approaches

There is external funding that already starts addressing these issues, including NIH fellowships.

Response 276

Perspectives on the postdoc roles and responsibilities

Pursuing an independent research project, or (more often) more than one. Mentoring students, presenting data clearly at meetings and conferences, maintaining collaborations.

Fundamental issues and challenges

Salary (too low for very high expectations). Not being paid by the hour (you depend on your project/projects, no one cares if you have to work more than 8 hours/day or during the weekend).

Existing NIH policies, programs, or resources

More small starting grants for young postdocs, so they can be easier to obtain and boost the cv and help a little the lab economy.

Proven or promising external resources or approaches

Improving job satisfaction and salary.

Response 277

Perspectives on the postdoc roles and responsibilities

The postdoctoral position has been one of the most rewarding positions of my life. I am enjoying the opportunity to fully dedicate myself to conducting research while also developing the professional development skills necessary to become an effective principal investigator in the next stage of my career.

Fundamental issues and challenges

We are currently faced with very few benefits, including a lack of access to travel support for conferences and professional development opportunities.

Existing NIH policies, programs, or resources

The NIH standard salaries are out-of-date. This is problematic as individual labs will look to NIH minimums as guidelines and use this information as a precedent. It is unfortunate because I know many individuals who cannot live off the the current minimum NIH salaries and have instead opted to leave academia in favor of jobs that pay more comfortable salaries.

Proven or promising external resources or approaches

No response

Response 278

Perspectives on the postdoc roles and responsibilities

A postdoc has lost it's purpose in my view. It's a staff scientist without the career stability and a training position where it trains for a role that a minority of postdocs enter into.

Fundamental issues and challenges

The pay sucks, benefits are subpar, the job is demanding, and as there are way too many postdocs compared to tenure track openings it's a dead end job. No other sector other than academic research sees value in postdoc training.

Existing NIH policies, programs, or resources

Fewer postdocs should employed, with higher salaries, and with a clearer pathway to becoming a tenure track investigator.

Proven or promising external resources or approaches

Postdocs are underpaid, overworked, and have bad career opportunities compared to not doing a postdoc. Pay more, it's that simple. I more than doubled my salary moving to industry and the time I spent as a postdoc was wasted. I entered at the same level as a fresh PhD graduate, which is not an uncommon experience.

Response 279

Perspectives on the postdoc roles and responsibilities

What it should be: Further training in your field, preparation for managerial tasks / running a lab, a temporary position that leads to stable employment.

What it is: Underpaid and overworked temporary positions that rarely result in actual benefits to the employee or stable positions in academic science. Consistently ignored by the institutions and insultingly considered "trainees"

Fundamental issues and challenges

Every institution pays the absolute bare minimum claiming it's what the NIH sets forth even though those guidelines are clearly minimums, poor benefits, zero management training or oversight of PIs so many labs are toxic and abusive with no possible course of action to fix it. Positions are always temporary on two-year contracts at best so you can't put down roots because you might have to switch jobs and give up the research you've been doing to find a new position.

Existing NIH policies, programs, or resources

More grants, more accessible grants, and updating the incredibly outdated grant review committee model you use that somehow manages to be less meritocratic than a random lottery. Increase the minimum salary guidelines because every institution treats it as a maximum and pretends they aren't allowed to pay more.

Proven or promising external resources or approaches

I guarantee you 90% of these issues would go away if institutions paid a proper wage and allowed post-docs to transition to stable jobs rather than temporary contracts completely dependent on outside grants.

Managerial training requirements for PIs would also help if I had any faith they'd be implemented properly.

Response 280

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1. Need for strong and supportive mentorship.
2. Abuse and toxic relationships between mentor and postdocs
3. Accommodations for postdocs who have families
4. Postdoc salary, not enough to support families with small children (especially those requiring childcare).

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 281

Perspectives on the postdoc roles and responsibilities

In depth scientific training to get more autonomy in conducting scientific projects. For me who don't want to be a PI, I consider it as gaining experience and increasing my curiosity while I get additional trainings to be able to find a position in industry.

Fundamental issues and challenges

Postdoc salary is very low and the gap with industry is huge making it difficult to stay in academia for a long time even though we like what we are doing.

Postdoc are treated as trainees and not real employees by some institutions such as not having retirement benefits which is difficult when you commit to 5 years of postdoc training

University do not match NIH salary scale years to years creating inequalities between old postdoc that are sometimes less remunerated than freshly graduated phd starting a postdoc.

Existing NIH policies, programs, or resources

More access to training helping postdocs who want to pursue a career in industry.

More fair salary for postdoc

Mandatory retirement contribution included.

Parental support like F32 with child care help.

Proven or promising external resources or approaches

Not sure to understand this question

Response 282

Perspectives on the postdoc roles and responsibilities

I view my academic postdoc as an opportunity to enrich my training beyond the skills I learned while earning my PhD. My institution very clearly views my position as a source of cheap expert labor.

Fundamental issues and challenges

It is hard to reconcile the insultingly low salary/stipend levels paid to postdocs with the years of intellectual and emotional strain sacrificed to earn a PhD. In many ways it is a wonder anyone pursues an academic postdoc at all; current trends in postdoc recruiting reflect this sentiment. In my mind, there is no other single thing which could improve the experience than increasing salary/stipend levels to those commensurate with the expertise and hard work that postdocs provide to laboratories and institutions. In addition to making everyday living a struggle, particularly in high cost of living cities where academic centers tend to be concentrated, I think postdocs are demoralized by being paid a pittance after years of hard work and struggle to earn a PhD.

Existing NIH policies, programs, or resources

Fellowship and training stipend levels must be increased across the board, and must be made more equitable based on the local cost of living. For instance, the current stipend levels may suffice for a postdoc in a relatively rural area, but make basic living a struggle in large metropolitan centers, which is where most of the top institutions postdocs strive to work at are concentrated.

Proven or promising external resources or approaches

Some institutions are waking up to these critical issues. See, for instance: https://postdocs.stanford.edu/funding-rates-and-guidelines; https://www.dailyprincetonian.com/article/2023/02/postdoctoral-researcher-letter-petition-university-increased-salary-demands-nassau-hall-princeton; among others. To be clear, marginal increases will not solve the problem. Institutions will continue to hemorrhage postdocs who realize their worth and leave for other better paying opportunities. In the end, this is a matter of basic respect to people who have sacrificed years of their lives to pursue their passion and simply want to be compensated at a rate which ensures their basic comfort and dignity.

Response 283

Perspectives on the postdoc roles and responsibilities

The Postdoc is an early career scholar who brings a great deal of education and training, but not a lot of experience managing research projects independently. The Postdoc position is an opportunity to gain more experience under supportive mentorship, with more independence than they received in a Doc program. The Postdoc should be capable of managing a research project, including all aspects of the research process.

Fundamental issues and challenges

Very low pay for someone who is highly educated. Postdoc positions at academic institutions are also on contingent contracts, therefore they’re ineligible for retirement benefits. Most people who can find a faculty position or a better paying industry position will take that over a Postdoc.

Existing NIH policies, programs, or resources

More funding and training opportunities to support social and behavioral scientists.

Proven or promising external resources or approaches

No response

Response 284

Perspectives on the postdoc roles and responsibilities

It means everything to me

Fundamental issues and challenges

Insuficient salary

Existing NIH policies, programs, or resources

Establish minimum salary for poatdocs nih funded that increases with the years of experience

Proven or promising external resources or approaches

Salary is the main issue

Response 285

Perspectives on the postdoc roles and responsibilities

Postdocs should be learning positions to launch PhDs to their next positions, either in academia or industry depending on the postdoc's preference.

Fundamental issues and challenges

I see faculty everyday, including senior leadership in my own department, who view postdocs solely as cheap labor. There is zero incentive for a PI to launch an outstanding postdoc to the next level. In fact, there is disincentive to do so, since the productivity of the lab takes a hit when an experienced member leaves. Furthermore, many institutions get around the time limits placed on postdocs by simply calling them a different name (eg, in my institution, after 3 years, every postdoc is automatically transitioned to the title of "senior scientist". But in practice, that person is still treated as a postdoc with salary less than the NRSA stipend level for experience).

Existing NIH policies, programs, or resources

Have a minimum salary for all PhDs listed on grants as the other bookend to the maximum salary. It needs to include all PhDs so that institutions can't get around it by simply giving postdocs a different title. This would prevent institutions from hiring excessive numbers of postdocs as cheap labor, with no intention of supporting their launch into their independent career.

Proven or promising external resources or approaches

The NRSA stipends for PhDs within 6-years of degree should be applied to all NIH-supported postdocs, including those on extramural grants.

Response 286

Perspectives on the postdoc roles and responsibilities

Having been a postdoc for about a year and a half now, I view the position of postdoc as no different in roles and responsibilities than that of a late-stage PhD student. I would describe at least 95% of my position as train students, helping write text for grants, and performing research. These are all activities I did as a senior PhD student in my first lab. The other 5% is preparing for, attending, and participating at scientific conferences. Again, this is no different than might be expected of a senior PhD student. Therefore, my perspective on the roles and responsibilities of a postdoc is that PIs across the nation truly want a longer PhD studies period, but realize it would strongly reduce the attractiveness of PhD programs. Therefore, they decided to require a postdoc for serious consideration of a PhD candidate so as to get a

longer period of (relatively) cheap labor from skilled scientists without having to offer benefits or competitive salaries that would be expected for scientist positions in exchange for the future potential of a tenure-track faculty position and an understanding that you have been "trained", even though this training is almost non-existent.

Fundamental issues and challenges

A postdoc seems like a worthless training position: we are treated as no better than PhD. Further, we have little in the way of benefits (generally only health insurance) and non-competitive salaries (so that we generally live paycheck-to-paycheck). This last is particularly frustrating when public school teachers can make as much as or more than we do with full benefits, including attractive retirement benefits. Further, many of our advisors didn't have to do a postdoc to secure their positions, but seem to require it of current faculty candidates. Finally, our institutions call us "faculty" but often make it very clear in ways both overt and subtle that we are second class citizens of our academic communities. In total then, it feels like a waste of time as we acquire neither financial stability, savings for our future, useful skills, nor respect. Further, the role is by definition temporary, so that all these downsides come with the additional problem of instability. It is simply a position I took to "check a box" so that I could achieve my career goal of a tenure-track faculty position and to acquire a few more high quality letters of recommendation for my faculty application package. Generally, the "box is checked" once we have published, and after that point, we begin looking for a permanent position (what my wife calls a "big boy job"). And that is the problem, with all the downsides, nobody sees the postdoc as a long-term viable career step, but rather a necessary evil to be hurried through as quickly as possible. For those without academic aspirations, the postdoc is meaningless as they can be hired into other career paths right from completion of a PhD, so many simply avoid the postdoc all together since it gives no tangible benefit.

Existing NIH policies, programs, or resources

Honestly, I didn't know any of these **policies, programs, or resources**existed, so part of the problem is getting institutes to support their postdocs and make supports well-known. Would I expect all issue to be simultaneously resolved? No. However, balancing upsides and downsides of this career path could be a way to sustain interest in postdocs, at least in the short term. For instance, quick changes that could be made would include longer-term contracts (most postdocs are on 1 year contracts) with guaranteed funding and annual raises and bonuses. Do not tie bonuses to performance metrics, because postdocs on riskier projects would then suffer. This could at least allow for long-term financial planning. Giving postdocs access to the retirement benefits of regular faculty (e.g. required contributions with employer matching with competitive interest rates) would give a strong sense to postdocs that they are investing in their future through a postdoc, rather than seeing their postdoc as competing with time that could otherwise be used to greater effect. Some might say fellowships or being a co-PI on a grant could resolve these issues, but the vast majority of PIs hire postdocs to work on multiple funded projects, so that postdocs rarely have the time to dedicate to new research projects that would have to be proposed. My PI made clear that if I were to win such an award, I would still be expected to complete the projects he assigns me in addition to the funding award (as he cannot hire new postdocs). This strongly discourages my competition for these resources, as there is simply not enough time and energy to do all this work. Essentially, postdocs are cheap labor for PIs, and PI's have banned together to ensure anyone wanting to be a PI has to suffer through one.

Proven or promising external resources or approaches

I have seen no proven successes in my postdoc, so I have no resources to direct the NIH toward. Training in my postdoc position (aside from new research techniques) is nearly non-existent, as my postdoc supervisor only cares about research output. Participating in training activities outside of research is discouraged (as it competes with time that could be spent on research), so any training I do must be done on my own time. Obviously, as a married postdoc, I value what personal time I have, so I rarely participate in training. Further, many training or internship opportunities require extreme geographic mobility (e.g. the AAAS science policy fellowship requires a year in Washington DC). However, if a postdoc is married and/or has a family, this extreme mobility is difficult (as it also requires your spouse and/or children to move with you) for very temporary positions, which is hugely unattractive to the postdoc and their family. With the advent of remote training, I think many of us would like to see remote opportunities for fellowship and training participation so we don't have to uproot to take advantage of any opportunity. Also, for many of these external resources, postdocs are lumped in with tenure-track faculty positions for job search sites, even though these are two entirely different career stages. Segregating job postings by

career stage would be helpful to those searching for postdoc and faculty positions alike. It would also reduce the idea that such positions are "equivalent", because they are obviously not. However, the inclusion of both types of position as "faculty" in job searches gives the illusion of equivalence and the perception that taking a postdoc is somehow a "failure" to get a tenure-track position.

Response 287

Perspectives on the postdoc roles and responsibilities

It is a transition stage where postdoctoral fellows can learn new skills and explore new research topics to prepare for the next step of careers. It's meant to be 2-3 years long (or 4-5 years long, as some manuscripts may require longer preparation and revision time).

Fundamental issues and challenges

Salary is not competitive. It's hard for postdoc fellows who have families to support. Career-prospect is also not clear—faculty positions in academia are limited. Also, work/life balance is rather poor—In academia, overworking is somewhat encouraged. When you try to maintain a work/life balance, people may think you are lazy. Also, the PI has too much power over the career and development of the postdoc.

Existing NIH policies, programs, or resources

Given that more and more postdoc candidates are international, there should be more funding opportunities for them. To increase postdoc's salary, we will need support from NIH and universities/institutes. As a junior PI, I want to offer better salary to my postdoc, but it is hard because of limited funding. NIH's modular budget also has not changed for many years—it simply has not caught up with inflation at all when everything else is getting more expensive. Also, it is time to consider if the current formats of graduate and postdoctoral programs offer the training and mentorship that graduate students and postdocs need to succeed, considering that most won't pursue a long-term career in academia. In general, the whole academic research enterprise has not changed for 20-30 years when the world is evolving.

Proven or promising external resources or approaches

In the past year, there have been a lot of discussions on why people are leaving academia. If you check social media, you will see people talking about that every day. The biggest issue is money. Postdocs demand higher salary which makes sense. However, NIH and the universities/research institutes do not provide the means to do so. It makes it tough for the PIs, and so begins the vicious cycle. Academia research focuses on publish or perish; however, to pursue a career in industry, consulting, or even academia itself, it requires more than just being able to produce data and writing papers/grants. The current model seems to support the already established PI rather than providing a platform for postdocs and junior faculty to grow and develop. A lot of PIs see their postdocs as data-generators. I personally did an extended postdoc because my former PI knew I was very productive. He was not supportive of me pursuing my independent career until I told him for family and financial reasons, I had to apply for faculty positions or would need to leave academia and find a job in industry instead. I also told him I found out he supported another postdoc to look for another postdoc position but not me. I know I am not alone in situations like this—Sometimes PIs have too much power over the career of a postdoc. If the PIs are not supportive, the PIs could be stuck for a long time with no proper guidance and help.

Response 288

Perspectives on the postdoc roles and responsibilities

I see a postdoc as an "apprenticeship" in which well-trained and talents candidates work on a mentor's research program in the context of a professional development plan. The goals are to learn assays/skills (e.g. bioinformatics, biochemistry.); some didactic training; RCR training; publish data papers and reviews; and develop their grantsmanship.

Fundamental issues and challenges

COVID hurt things a great deal.

Student loans. PhD graduates can more support and loan relief in industry sometimes

Industry can have more focused goals than academics where it is "every man for himself"—figuratively and literally

Academics are often staid and inflexible in their programs. For example, we find it extremely difficult to get administrators to understand why a post doc (MD, DVM etc) would want to be in a graduate program and they can be extremely inflexible at modifying their training program for these candidates.

I think the NIH should require that all post docs receive post doctoral compensation, even when they are in a degree granting program.

Existing NIH policies, programs, or resources

Some post docs are an academic version of indentured servitude. Some minimum standardization in expectations, salaries, benefits could be led by the NIH. Also, we expect trainees to attend RCR but only if funded on training type grants. NIH could require that all trainees complete RCR as well as PIs (say every 5 years). RCR should not be a resented distraction. Postdocs also watch their PIs closely and while specific application of guidelines can be open to interpretation, too many PIs could be considered noncompliant and this creates an ambiguous environment for trainees.

Proven or promising external resources or approaches

T32 budgets should include funds for recruitment.

Equity in salaries and benefits. Too often trainees in the same lab and between institutions have different position descriptions depriving them of equity.

Response 289

Perspectives on the postdoc roles and responsibilities

The academic postdoc position should ideally prepare an individual to become a principal investigator with their own lab.

Fundamental issues and challenges

I personally decided to pursue my graduate studies in Canada instead of the US due to a number of issues with US programs and the US in general including work/life balance, affordable housing and healthcare access. Here in Canada I've found relatively affordable housing, free healthcare and a generous stipend. Furthermore, my rights as a person in the LGBTQ community aren't up for debate here and are guaranteed unlike in the US where there are changes each election cycle.

Existing NIH policies, programs, or resources

Funding for graduate students and post docs and opportunities for new principal investigators and/or tenure track professors. If there's nowhere to go after your postdoc there is no reason to pursue one.

Proven or promising external resources or approaches

Focusing on recruiting, retaining, and promoting diversity at all levels. If women and under-represented minorities don't see a place for themselves in academic research you will continue to see top talent recruited to industry or to academic institutions in other countries.

Response 290

Perspectives on the postdoc roles and responsibilities

As a postdoc, I am a professional who is responsible for independent research. This involves full time work performing highly specialized techniques to generate new knowledge that is essential for human development and progress. It is the cornerstone position driving science. It is NOT training nor are we 'trainees'!

Fundamental issues and challenges

Salary, salary, salary. All of my non-science friends in finance with bachelors or masters degrees with similar amount of experience are making well into 6 figures and in some cases more than 200,000. They

do not do any sort of special work, and it requires much less expertise. For us to get to that pay scale requires being well into a principal investigator position with high productivity.

Meanwhile, postdoc 'housing' at [redacted for anonymity] consists of 100 year old multi floor units that do not have elevators (one person I know had to carry furniture to the 5th floor on the stairs) nor laundry in the building, let alone in unit.

Why would anyone in their right mind live under these conditions? We already put all our energy into the science—or would like to. 'Passion for science' only takes you so far, and I'm afraid the way postdocs are treated in terms of salary and compensation is totally absurd.

Existing NIH policies, programs, or resources

It's very simple. Pay postdocs more.

Proven or promising external resources or approaches

Pay postdocs more.

Response 291

Perspectives on the postdoc roles and responsibilities

Postdocs are transition position which should prepare the fellow for his/her future career. Training in non-quantitative/nonbiologic skills areas should be mandatory. This includes grant writing—which is not typically taught at the doctoral level, career paths such as industry and government, how to find a job and negotiate resources beyond salary, understanding expectations in academics, industry and government jobs and how to build collaborative networks. Research work should be supervised by the advisor but there should mutually agreed upon areas that help to distinguish the post docs work.

Fundamental issues and challenges

Biggest challenges are salary, child care and the requirement for U.S. Citizenship / Permanent resident status. I have had to turn away some truly outstanding international applicants from my training grant.

Existing NIH policies, programs, or resources

The provision of child care support in T32s or F awards should be an allowed expense and added to the budget (i.e. not subtracted from current non-stipend/non-salary administrative costs so that providing child care does not reduce administrative support).

NIH should consider circumstances under which a trainee not yet a citizen can be supported—i.e. if they are a refugee could be an exception, if they come from a low/middle income country or impoverished background could be another. International Fellows could be required to work in the U.S. for a period of time or face a pay back penalty to ensure return on investment. The number of slots for such fellows could be restricted to a percentage such as 33% so as to still encourage citizenship for fellows. The U.S. would be better served to keep talented international fellows here long time.

Proven or promising external resources or approaches

I recommend NIH training grants request data comparing the long term outcomes of all fellows, not just those on T32's. Include information on international fellows. There will need to be additional adminstrative resources to do this but it would not be a huge burden—perhaps limit it to 5 years post graduation from a program. Mandate reporting on all non-research training (grant writing courses, career development programs etc) in specific sections of the RPPR to standardize the reporting. This would help collect the data in a similar format for analysis. This would be needed to understand where investments should be made.

Response 292

Perspectives on the postdoc roles and responsibilities

A postdoc position in my mind is a training position to allow the student to transition into a more independent researcher. They work under a senior advisor and is trained well in not just bench research,

but writing grants, reviewing papers, giving presentations, communicating/networking with peers, and teaching fellow lab members or junior students.

Fundamental issues and challenges

Many training positions in other fields such as Residency in the Medical field, or apprentices in trade professions, usually lead to a full time job in that field and these training positions are expected by employers. Postdocs in academic research have an extremely difficult time finding positions in academic institutions. Many students also view postdocs as something they can do while they figure out what they want to do as a full time profession. If there is a very small chance of getting an academic faculty position, then the need or drive to do a postdoc diminishes drastically. Those that are strong and motivated and know that this is the trajectory they want for their career, do well. This is not an ideal situation for someone who is unsure of what to do. Industry positions now do not require postdoc training and students skip this step. Overall quality of life as a postdoc again, depends on the motivation of the trainee as well as the mentor and lab environment. When either element is suboptimal, the postdoc experience suffers. Finally, although we have seen an increase in postdoc salary provided by the Obama administration, the salary is still lower than what trainees want. If the increase is to happen, there MUST be a mechanism in current grants for PIs to afford postdocs.

Existing NIH policies, programs, or resources

In my mind, the entire postdoctoral training process needs to change. We need to provide training for those that are serious about pursuing academic research. In this light, NIH sponsored postdoc awards should be provided and mandatory to get a spot in a lab. Even of this separate award pays for 50% of the salary which will be matched by the PI's grants, that would improve the quality and motivation of postdocs. PIs need to view postdocs as valuable opportunities to train, and not hire as labor to get research and papers out. There needs to be a COMPLETE overhaul of the postdoc training ecosystem. I would caution NIH to just throw money at this thinking this will improve the current status of the lack of postdocs as this is not just about money. NIH needs to work with faculty to rethink and rebuild the ecosystem with some accountability.

Proven or promising external resources or approaches

No response

Response 293

Perspectives on the postdoc roles and responsibilities

I believe that I am unique with regards to this topic. I have functionally taken over and am running the lab, including ghost writing all of our grants, mentoring, running experiments for my PI. I have taken the mentality of fake it until I make it. This however seems to be burning me since I have applied for a faculty position at my university and part of the feedback was why would they hire me when my PI is already doing the proposed work. The reality is my PI has only a minimal clue what I am doing and why I am doing it.

Fundamental issues and challenges

1. Atrocious pay—I can easily get paid 3x what I am currently getting paid
2. Lack of academic job opportunities
3. Brutal hours—I work 7 days a week
4. Inability to have control over my life, I'm tired of dragging my wife all over the country, we want to settle. We shouldn't have, but we have two kids now, I'm nearly 40. We built a house that we love, but we are either going to have to move or I have to continue doing what I am doing, which is writing all the grants for the lab, running the lab, mentoring all the students, and performing all of the experiments for my PI.
5. There needs to be more support for primate research trainees in the worst of ways. We are facing so many barriers from so many sides, ranging from faculty in our own departments that dont like NHP research, old NHP researchers that was to squash the competition, startup costs, to public perceptions. The only reason I am sticking with this, for the time being, is because I believe that my research will impact human health. I am suffering now in the hopes that I generate the data to spin out a company so that I can get paid back for the sacrifices I, and my family have made on my account.

Existing NIH policies, programs, or resources

The K99/R00 is a joke and does not work the way it's supposed to. On top of that, I have ghost written and received two R01's for my mentor (so far, more are in the pipeline) that I would be taking with me and I cannot get an academic job.

I turned my K99/R00 into an R01 and it's supporting the research, staff, and my own salary–The problem is that I am not getting credit for my work. There should be a way to write grants and find out who has done the work on the grant. I have generated all the preliminary data, I wrote the first ten drafts, I found the collaborators, my PI came in the weekend before it was due and worked on it. Its his name on it, the reason my name is not is because I dont want to lose my EIS when I hopefully get to start my own lab.

Proven or promising external resources or approaches

I am currently on the job market, one of my major frustrations is that there are several individuals that I am competing with that are coming from big name labs. They are clueless in terms of so much of their science, but because they are coming from a big lab, they are getting their foot in the door, which is immensely frustrating. I dont know how to fix this, but its beyond frustrating that students are able to ride the coats of their mentors when there are people like me that have built my own lab, got my own funding, and am running my own program and I cannot get an interview.

One thing that I believe would be immensely beneficial would be to start incubator type labs for people to either sink or swim. This would mitigate some of the risk to the universities by putting a lot more onus on the individual. For example, I work with primates, I know I can get funding if I had the titles. The university definitely has the space to support this type of model where I could share resources with several other groups, as my lab/funding gains traction, I can either renegotiate or having an independent proven track record, use that as leverage to move somewhere else. Conversely, the less funding I have, the more dedicated space/time gets contracted. In this way, startup academic labs can be more like an incubator lab spaces, this proves to the university who is worth keeping and who is not.

Response 294

Perspectives on the postdoc roles and responsibilities

I became a postdoc to develop my career and establish a record of publication and fellowship funding to strengthen a future faculty application package. It has been critical to my ability to network with other PIs, create an independent research project, and develop my own research program. Comparing where I am currently to immediately after my dissertation defense, I am significantly more prepared to lead a research lab.

Fundamental issues and challenges

Financial stability. In graduate school the stipend was $25k. Making $50k in a postdoc or $90k in an industry position was a tough decision and one that required me to sacrifice another 3-5 years of potential higher income to pursue an academic postdoc. There is no dental healthcare included, no protected maternity leave, no retirement benefits, and no real guarantee that my yearly appointment will be renewed. I have been privileged to work for a very supportive and understanding mentor who has allowed me to pursue my own research interests, but I know that is not always the case. Being a postdoc requires a lot of sacrifice, particularly as a woman in her 30s considering family leave.

Existing NIH policies, programs, or resources

An NIH training plan and pathway for the transition from graduate student to postdoc to faculty that is implemented through the office of postdoc affairs would help a lot of postdocs to keep from floundering. It is easy to join a lab and be a worker drone on a PI's project and not develop your own independent project or be able to pursue funding for that project. If the goal is to "train" a postdoc to develop and then move on, there should be a clear pathway with milestones that is standardized and supported by the NIH and the university. Additionally, I recently discovered during my K99/R00 application that despite there being up to $100k in salary support through NHLBI, my university will not approve a raise of more than 6%. If the NIH increases its postdoc pay standards, universities will have to be encouraged to participate in the recruitment and retention of quality postdocs. Intervention from the NIH on behalf of postdoc salaries may be necessary to keep postdocs from being seduced by the financial stability offered in industry positions.

Proven or promising external resources or approaches

SciPhD was an incredibly valuable resource I took advantage of, and even though I plan on remaining in academia, understanding the business of science is critical in postdoc development. There is no formalized grant application training or budget management training, which are critical to faculty success. Increasing postdoc salary and establishing a pathway to faculty other than the incredibly competitive K99/R00 mechanism would improve the entire postdoc training ecosystem.

Response 295

Perspectives on the postdoc roles and responsibilities

Postdocs in my opinion represent a combination of highly skilled labor, and a training position for research in academic or industrial settings. Our academic funding system (NIH, NSF, USDA competitive grants) has positioned postdocs as highly skilled temporary labor. From my view as a PI at an institution where graduate students are very expensive to the PI, postdocs represent the most efficient labor force. I also expect that postdocs will learn (be trained in) the skills necessary to run a lab, write papers and grants, and deal with laboratory administration.

Fundamental issues and challenges

Recruiting—there appears to be a very limited supply of appropriately trained postdocs. For quality of life, the salary scales are limited by limits from funding agencies on the overall sizes of grants.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 296

Perspectives on the postdoc roles and responsibilities

This role should be about doing solid science. Instead it's a constant battle with producing results under the gun, delaying building a family, trying to ensure an academic career after finishing up, pathetic pay that is barely sufficient to pay for housing and food in the vast majority of cities where large universities that support postdocs are stationed. Comically, postdocs are being bombarded with "wellness initiatives", aka total waste of university dollars that could be used to raise their salaries so that their "wellness" truly improves.

Fundamental issues and challenges

The pay is considerably lower than shifting to industry both in the short term and even worse so in the long term. US postdocs are on the order of 5+ years. That time in industry would yield double what current postdoc salaries pay within even a few short years. Meanwhile, NIH and private foundations continue to cut eligible periods for F32, K99, and other similar funding and career transition awards. Why would anyone stay under these circumstances? It reflects poor economic choices in favor for the very low probability of landing an academic research position. In fact, there's no material reason to pursue a postdoc unless one is pursuing a professorship, as no other field requires it. Professorship positions have been shrinking, even while the list of service, productivity, mentorship, committee, . requirements keep piling on. What other industry requires such an absurd workload for impoverished wages? Smart people will choose to go anywhere else, and rightly so.

Existing NIH policies, programs, or resources

NIH MUST raise R01 and other funding to levels that permit paying postdocs competitive wages. It's easy to determine what a competitive wage is, just look at what PhDs who left academia are getting paid. Currently it's approximately $90,000. Where do you get the money from? STOP funding well endowed labs. Nobel, Lasker, . Prize winners, HHMI, 3+ R01 labs don't need anymore money. You're siphoning the minimal funding you have now to give multimillionaire PI's even more money so they can grow their group to 20-40 trainees and provide mentorship to none of them. That's an inane policy and you know it, so why

don’t you do something about it rather than put out these idiotic RFI’s year after year? You don’t need people to tell you this, just do it instead of wasting more money and time on these RFI’s.

Proven or promising external resources or approaches

Provide F32’s and K99’s with no restrictions. Raise salaries to competitive rates, $80,000 now and match it to an index of salaries for PhD’s in industry of equivalent working years. Mark R01 and equivalent pay to LAB SIZE, meaning that PI’s should not have labs larger than 12 people or they simply can’t apply for NIH funds. Stop funding the ultra wealthy labs. Do you want good mentorship and competitive science? I know the answer is NO because your policies are clearly inline with enriching already wealthy labs. Actions speak louder than lip service. I actually don’t even know why I’m filling this form out because you know all this already but refuse to do anything to fix it. I look forward to the next RFI when nothing has been done, the academic workforce has shrunk even further, and you’re still scratching your heads as to why funding wealthy labs and PI’s rather than postdocs and small mentorship teams hasn’t produced any results.

Response 297

Perspectives on the postdoc roles and responsibilities

The postdoctoral position has one of the highest demands in terms of time, stress, scientific ability, and creativity of any post graduate position. However, it is also one of the lowest paid positions with the most uncertain job security. I was entirely trained and mentored by postdoctoral associates in the lab during my PhD. Postdocs are essential for junior faculty to easily train lab members, produce data and secure tenure. As a postdoctoral fellow entering the job market, it is obvious to me that I will be forced to open my lab without postdocs (due to their limited numbers and the high cost of living in most cities). Therefore the lack of postdocs impairs lab productivity, graduate student mentoring, and junior faculty obtaining tenure. Given their pivotal role in academia, postdocs deserve a higher salary and better access to career development opportunities.

Fundamental issues and challenges

High cost of living in major cities coupled with low salary and low job security.

Existing NIH policies, programs, or resources

Make additional K awards that are dedicated to postdocs working with junior faculty. Far too often, K99 awards are selectively distributed to well-established labs, bottlenecking career mobility for successful postdocs in smaller labs.

Incentivize postdoctoral seminars instead of faculty seminars within neuroscience departments.

Remove postdoctoral salary cap. Create more faculty positions. Allow postdocs to be paid what they are worth.

Proven or promising external resources or approaches

Improve postdoctoral training for careers outside academia

Response 298

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdocs have to be paid more. The current pay is far too low to recruit and retain the best talent and is completely not reflective of the workload placed on postdocs nor their key contributions to research. Additionally, the number of senior faculty who are poor mentors either due to having too little time for mentorship or by actively creating a hostile environment is damaging the perception of the postdoc. One bad experience by a postdoc can discourage 3 other people from even pursuing it—especially after they see the low pay relative to other opportunities they have once graduating with a PhD.

Existing NIH policies, programs, or resources

Increasing postdoc pay is the main one. Without that no other solutions will make a meaningful impact. Beyond pay improved mentorship, coaching in careers beyond academia, and increasing diversity within postdoc ranks will all assist in alleviating this issue.

Proven or promising external resources or approaches

No response

Response 299

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are absolute critical driving forces behind most peer-reviewed science and productivity in the US. In fact, I would wager that non-citizen postdoctoral fellows drive the majority of science productivity in the US. If you look at first authors of high profile science published from US labs, the majority are not born in the US. This means that since they cannot get NIH grants directly, they are often wholly funded by their PIs R01 grants. Many postdocs stay in their position longer than the traditional 3-5 yrs, becoming critical lab members that train all incoming staff/students and take on more responsibilities than just performing research. There are very few mechanisms to reward and retain such key lab members.

Fundamental issues and challenges

Parent R01 funding for postdocs limits PI abilities to pay a reasonable and sustained wage. Further, the lack of security/clarity about their employment at many institutions and categories of job title beyond the initial fellowship years have resulted in a near "extinction" of postdocs, as is seen by massive and desperate advertisements by even huge labs that typically draw many applicants. For those of us not in Boston, DC, NYC and San Francisco, it is almost impossible to recruit these days

Existing NIH policies, programs, or resources

Make the R50 a widely adopted, highly funded mechanism for retaining senior postdocs. All institutes should use this mechanism, there should be a wide swath of non-R01 mechanisms to allow labs to co-apply with postdocs for semi-independent funding that gives them ownership and job security in the eyes of the institute. Also, make the budget for R01s have supplements for postdoc raises/funding rather than make us scrimp on supplies just to be able to squeeze in a reasonable postdoc salary. Make citizenship irrelevant, but productivity the only measure.

Proven or promising external resources or approaches

these little training and survey efforts are irrelevant. Competitive salary, security and ownership of projects should be the focus.

Response 300

Perspectives on the postdoc roles and responsibilities

Trainee position, chance for individuals to expand their expertise, get pubs, learn grant writing.

Fundamental issues and challenges

Too many PI's see PDs as "slave labor" to advance the PI's work and enhance PI status. Not enough accountability of PIs.

Grants are SO hard to get these days, that its a rat race to the top, and PI's can't take time or energy to think carefully about training and development.

Existing NIH policies, programs, or resources

K-awards but also changing modular level funding.

Proven or promising external resources or approaches

No response

Response 301

Perspectives on the postdoc roles and responsibilities

You are expected to over see graduate students, conduct your own research, write grants, and do other managerial things.

Fundamental issues and challenges

I think the post-doc position is under paid and over worked. You are taking on this role expected to work 70 hours a week for maybe 50,000. Also for women you are expected to have kids during this time which is literally giving your entire paycheck in childcare. Many of the post-docs I have talked with don't prioritize their health or their family or just simply don't have kids because it's to hard to financially.

Existing NIH policies, programs, or resources

Providing childcare would be a huge help for post-docs wanting to have kids. Increasing pay.

Proven or promising external resources or approaches

I came into grad school thinking I wanted to post-doc now I will not be. The working environment is abusive in some labs so maybe having a reporting mechanism for grad students and post-docs to anonymously report the PI or like at least a way to share feedback regarding the PI. Also a moving stipend would be helpful too and overall increase.

Response 302

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Increasing the tuition benefit for post docs woudl be very benefitical.

Proven or promising external resources or approaches

Providing effort for program directors and mentors on T32s would be very beneficial.

Salaries for post-docs should be higher (physicians who are residents who become fellows on a T32 would take a pay cut, except where institutions can supplement salaries, but there are not stable funding streams to supplement the T32 salaries.

Expansion of loan repayment programs would be beneficial. For example, the two year commitment of doing largely research is challenging when fellows are looking for jobs After busy clinical year, they have to be ready within 2 months to write a loan repayment grant, and the second year of that grant if awarded will be when they presumably have a new job, at a new institution.

Response 303

Perspectives on the postdoc roles and responsibilities

I love my job. I love being able to generate new knowledge, to pursue my curiosity, and to have the fulfillment knowing that the work I do will make an impact on the world by improving the health of people around the world. However, our responsibilities as postdocs are huge relative to the amount of money we are paid. We are expected to simultaneously be experts on current literature, design projects and experiments, generate new data, perform analysis, write manuscripts, maintain normal lab operations, serve as hands-on mentors for junior scientists, provide institutional service, and then somehow have time to explore independent job opportunities for ourselves. This is a lot to handle, and while I enjoy all aspects of this, I know the experience of others differs greatly.

Fundamental issues and challenges

Low pay and dismal prospects for independent investigator positions, coupled with competition from booming high-income industry positions, seem to be the obvious reasons why fewer people are entering postdoc positions. The NIH, as the main funding source for biomedical scientists, simply needs to put more monetary resources toward paying postdocs what they deserve and establish programs that they can expect to count on for funding as their careers progress. The fact that many postdocs are pursuing passions by staying in academia should not be a good reason for paying them far less than what they should be making for their diverse and highly specialized skill sets.

Existing NIH policies, programs, or resources

The NIH postdoctoral payscale needs significant overhaul, particularly in response to inflation in recent years. As someone in his fifth year of his postdoc, I am making less money now, inflation-adjusted, than I did when I first started this position. This is unacceptable. When starting salaries in industry are easily twice that of what a postdoc makes, it seems fairly obvious to me why there has been a decline in the number of postdocs, who have woken up to the reality that many in academia view us as nothing more than cheap labor. Until the NIH is willing to confront and change this reality, I predict that the current trends will continue.

Proven or promising external resources or approaches

One avenue that needs serious consideration by the NIH is the establishment of programs that create more staff-level, post-postdoc scientist positions. Despite the low pay, I love my job and am very good at it, and if the funding environment favored it, I would continue in my capacity as such a scientist. This is one clear solution to retaining high-quality scientists in academia, particularly if there are fewer postdocs entering the academic pipeline.

Response 304

Perspectives on the postdoc roles and responsibilities

The postdoctoral position, while still a career training position, is made up of highly talented and deeply educated individuals who will make up the future of the academic/industry/nonprofit workforce. By continuing to pay them a salary that is not commensurate with their skills and value their existence, the pipeline that is necessary to support this type of talent work is being outsourced to industry positions and start ups that are willing to pay salaries that are higher, but with less career opportunity for these individuals. This process has created a situation where the NIH now lacks power, leverage, or the ability to shape the talent pool that they have created because top talent is leaving the positions in which the NIH has influence over how their skills are deployed. This talent drain, lack of control and sustainability, seems to be an existential issue in building a talented scientific workforce.

Fundamental issues and challenges

Salary. A salary raise that puts the median skilled postdoc at the NIH at 90-100k dollars at year zero, would cause the best talent to be retained amongst academic postdocs. In many ways, money fixes so many problems here, including second order effects such as quality of life, childcare, and other quality of life issues.

Existing NIH policies, programs, or resources

I don’t believe we need to reinvent the wheel here. The K mechanism is effective in generating new early stage investigators from this pool. If increasing salaries also increases competition by increasing the amount of good postdoctoral candidates for jobs and a decrease in the number of positions, then this is a win for NIH. Academic institutions need to pay more salary, create more positions using their endowments, and allow the grant dollars provided to them to support science. But, at the end of the day, the NIH only has soft influence at these institutions. Starting within the intramural program will create industry change, by supporting postdocs and providing pathways towards independence that are competitive and generate the best outcomes for the institution.

Proven or promising external resources or approaches

No response

Response 305

Perspectives on the postdoc roles and responsibilities

An academic postdoc is not a training position, however, that is how it is portrayed. While some postdocs may learn new skills and mentor new students, ultimately postdocs are recruited to labs based on their training and their expertise. Postdocs are not mentored by PIs in a similar fashion as graduate students, rather they are treated as independent scientists from the beginning. Their advanced training is often exploited to serve as small 'cores' for the lab based on their previous training. For instance, I came into my postdoctoral lab with genomics training—a skill not currently established in the lab. As such, I was not just collaborating with others in the lab but taking on massive additional projects to plan, analyze, and interpret genomics data for all members of the lab. Unsurprisingly, this takes away from my postdoctoral projects and ultimately delays my career advancement. Further, a major flaw of the academic system is that postdocs are only guided toward academic jobs. There is an abysmal effort to prepare for alternate careers. It is utterly flawed logic to think that postdocs will publish and land a tenure-track faculty job. The academic market is saturated, there are only a few positions each cycle, with more and more postdocs applying each year. We need to provide incentives to encourage the retirement of PIs to make room for new PIs. We also need to cap the number of postdocs that a PI can take on. Realistically, a PI is not an effective mentor of 10+ postdocs and the same number of graduate students. Postdocs are the ones left on their own in this situation.

Fundamental issues and challenges

Recruitment and retention are impacted by multiple factors. First, job prospects in the academic job market are low, as mentioned above. Second, entry Ph.D.-level industry positions do not require academic postdoctoral experience and the starting salary is often double that of an academic postdoctoral position. Postdocs are often around 30 years old. This is an age that many start families, buy homes, send children to daycare, etc. I cannot stress enough how truly impossible it is becoming to achieve these personal life goals with a postdoctoral salary, especially if both adult partners in the home are postdocs. Universities charge for parking, which is often upwards of $1000 a year, and do not provide ANY support for postdocs. Access to the university daycare at my institution is $1600 a month and has a 2 year wait list. This cost alone is 30% of an entry-level academic postdoctoral salary, and, added to rent/mortgage, results in pennies at the end of the month for postdocs. Beyond this, universities often do not allow postdocs to contribute to a retirement account. Further, securing a coveted NIH postdoctoral fellowship often greatly hurts the postdoc. Many postdocs (myself included) lost university benefits including health insurance, after securing a fellowship, because the university no longer recognized me as an employee. If I had known this would be the case, I would not have applied for the fellowship. This massive financial burden, coupled with low job prospects and more than 40 hour work weeks results in extremely poor job satisfaction, low quality of life and immeasurable stress.

Existing NIH policies, programs, or resources

1. Childcare costs—$2500 is two, or maybe three months of daycare support. This is not sufficient.
2. Family leave—8 weeks of leave is abysmal and causes massive stress on the birth parent. Minimal leave, coupled with trying to express milk for the lactating parent after returning to work is a major strain.
3. Loan repayment—not accessible to most postdoctoral researchers.
4. The NIH should consider allowing institutional allowances to cover parking/transit to the university.

Proven or promising external resources or approaches

Non-NIH programs that provide a higher postdoctoral salary and more community support at their institution are extremely desirable. These programs (such as at Yale) decrease financial burden and will likely increase enthusiasm for the academic job route. You are also guaranteed a mentoring team outside of your home lab. These types of programs are new but are viewed optimistically by current and past academic postdocs.

Response 306

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should be a time limited (2-3 year max) training period that allows for postdocs to broaden experience, gain lifelong mentors, and apply PhD skills to different areas while preparing for their career position.

Fundamental issues and challenges

Admin: the general lack of clear institutional designation and/or staff benefits for postdocs. For instance, as a postdoc in 2016, I did not have clear sick, vacation, or parental leave. My advisor was reasonable and supportive but it is often left entirely to the whim and personality of an advisor. As faculty now, it is difficult to create and track "fair" leave policies in an ad hoc environment. If postdocs were considered staff, they could be managed and tracked just like other employees.

Also, for many female postdocs, the timing intersects with childbearing years. However, many institutions do not grant maternity leave benefits at all, or even in the best case (if an employee is considered staff) for one year following entry. Given the transient nature of a postdoc, this creates a burden. For instance, a pregnant woman may prolong her PhD through the end of a pregnancy knowing that she would not get leave in a postdoc position; or may prolong time in the postdoc for a similar reason; or may leave academia altogether when she realizes how this timing will play out for her life and family.

Culture: the expectation that postdocs change institutions for PhD / postdoc / career is untenable for many with families, especially women or those without substantial family resources. Changing locations several times within a few years carries material and social costs.

Existing NIH policies, programs, or resources

Extend the NRSA parental leave from 60 days to 90 days (even if restricted to a childbearing parent). Vaginal birth recovery is a minimum of 6 weeks and c-section recovery is a minimum of 8 weeks. Among other considerations, postpartum guidance stipulates that mothers should not lift anything heavier than their baby for 8 weeks, and jumping from "no lifting" to the often very physical demands of much science work at exactly 8 weeks isn't good for total recovery. Additionally, infant development allows for much more regular breastfeeding patterns at 90 days compared to 60 days. This is a small amount of career / scientific time but a huge difference for infants and families.

Consider incentives / drivers that encourage institutions to designate postdoctoral trainees as employees, eligible for routine benefits.

Proven or promising external resources or approaches

No response

Response 307

Perspectives on the postdoc roles and responsibilities

I view postdoc position of early scientist position when one can train to independently run a research while still under professional leading.

Fundamental issues and challenges

Overload of work is well known and present—no boundaries for PIs to overload postdocs with work and duties. Pressure to publish and attend career development seminars, often done in free time since no boundaries set up for PIs to give space for training and out-of-research meetings. Non-competitive salaries for the stage of education and knowledge.

Existing NIH policies, programs, or resources

NIH does not support parents and caregivers enough—not enough daycare space/support, no support for outside daycare (that is usually too expensive for postdoc salary), no rules for PI to support family life and excessive expectations for new parents. Lack of support of life/work balance (students do understand this, PIs do not).

NIH does not allow postdoc to become PIs for animal protocol etc = missing opportunity to learn, pressure for lab PIs who can not often deal with extra work.

[redacted for anonymity] courses are too expensive and NIH should have some discounts (the prices are often higher than courses from [redacted for anonymity] etc).

Lack of possibility to learn about other laboratories work/equipment to be able to enhance the research, very bad information and propagation of core facilities, lack of presentation of institutes and their possibilities for co-operation etc.

Proven or promising external resources or approaches

i.e. universities ([redacted for anonymity]) support of postdoc and predoc networking—special websites, email hubs to communicate, help with moving/saling/buying/saving money.

Response 308

Perspectives on the postdoc roles and responsibilities

Learning new technical skills while simultaneously building leadership skills and independence.

Fundamental issues and challenges

Salary and uncertainty of future academic job prospects. It is untenable to be paid below market worth for years, waiting for a job that is highly likely to not exist.

Existing NIH policies, programs, or resources

The institutions I've been at seem to interpret the NIH minimum postdoc pay scale as the standard salary for postdocs. That minimum either needs to be raised or strongly encouraged that pay can exceed that minimum.

Proven or promising external resources or approaches

No response

Response 309

Perspectives on the postdoc roles and responsibilities

It meant a regression in my career

Fundamental issues and challenges

Salaries are terrible

Existing NIH policies, programs, or resources

Not sure, absence of mentoring is difficult to tail

Proven or promising external resources or approaches

No response

Response 310

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The fundamental issue is the underpaying and undervaluing of a highly educated and skilled set of workers. The overall quality of life of postdoctoral trainees would improve if they were offered competitive salaries and benefits and treated as employees not students.

Existing NIH policies, programs, or resources

Postdocs should be treated as employees, not trainees. Changing our status to full-time employees would make us eligible for helpful programs such as public student loan forgiveness, employer-sponsored 401k, subsidized daycare, a salary commensurate with our education and skill level, taxes automatically taken out of our stipend, etc.

Proven or promising external resources or approaches

Offer a better salary and benefits. We already went to school for higher degrees for 9+ years; treating us like students instead of skilled workers will only push away talent into other industries that give us full-time employee positions right away instead of making us "train" more.

The main purpose of the postdoctoral system is to underpay skilled workers for as long as possible, instead of creating more full-time, full-salaried positions.

Response 311

Perspectives on the postdoc roles and responsibilities

A training job to gain a more independent research experience.

Fundamental issues and challenges

Salary is relative low. Particularly in areas with high living cost. No retirement benefits. Usually be treated as a trainee not an employee.

Chance to obtain a tenure track faculty position is very low, and usually concentrates in several highly prestigious institutes (like Harvard, Stanford, Yale, UCSF, Berkeley etc.). Postdocs from average institutes are less competitive in academic job market.

Existing NIH policies, programs, or resources

1. Increase the modular grant funding. It has not change for decades.
2. Increase postdoc salary and benefits.
3. Cut the current K99 awards, establish a new K99 program that only postdocs from institutes with less NIH grant support can apply. I am not saying the current MOSAIC program is not good, but from what I see, many of the MOSAIC awards go to highly prestigious institutes (No.1 Stanford, or Harvard-related institutes, No.2 UCSF, No.3 JHU), thus it is not a real program to promote DEI. Actually many of the K99 awardees from highly prestigious institutes can obtain a TT job just fine without a K99 support. Those who need grant supports in order to land a TT job are often ignored.

Proven or promising external resources or approaches

No response

Response 312

Perspectives on the postdoc roles and responsibilities

A postdoctoral researcher is a fundamental pillar of the foundation of any research program in any given institution. It is a position that requires high level of expertise and commitment, both technical and intellectual. The postdoctoral researcher is not a student, and while receives training and guidance from his/her mentor and the lab, provides highly valuable labor, both physical and intellectual, contributing to move forward the science of the lab and the institution.

Fundamental issues and challenges

Number one: Salary: If we want to incentivize scientific research and recruit highly talented postdoctoral trainees, we should start by recognizing their value by offering a competitive salary that would allow them to focus on their work instead of being distracted by financial problems. That is especially true for American trainees, who end up with pretty high student loans which cannot be afforded, by far, with the current salary of a postdoctoral trainee. In a world that values professions and basically everything by how much money people get paid, scientists, and especially postdoctoral trainees, are in high disadvantage. Youngsters see their peers with bachelor degrees in marketing or admin getting better pay and many feel

deterred to get into the science path because of all the years of training and sacrifice with very little reward other than the intellectual one. Although MD residents are not well paid either at least they know that once they finish their residency their income will change substantially, being partially why they commit to the sacrifice of a residency (beyond their love for their profession). That's another reason why most of the postbac trainees that come to many research labs aim to go to med school, and not many have the intention of becoming a scientist. The financial talking point has been notoriously out of the conversation in science because we are passionate about a job we truly love and we scientists don't think much about money. However, neglecting that topic it's affecting science and we should do something before it's too late. Let's follow the Princeton's example and increase the minimum wage of a postdoctoral trainee to $65,000 nation wide. I think we wont regret it.

Existing NIH policies, programs, or resources

Again, let's start by salaries.

Proven or promising external resources or approaches

Again, let's start by salaries. NIH and academia put enough effort on trainings to provide postdoctoral trainees with the best mentoring possible; minimize as much as possible cases of harassment; enhancing equality of opportunity and inclusion; etc.

Response 313

Perspectives on the postdoc roles and responsibilities

I see this as a requirement to have a continuing research career. My goal is to stay as a staff scientist in academia, and the postdoc is a prerequisite to this. I have increased responsibilities as compared to being a graduate student, such as the implicit expectation that I will be faster to learn and more productive, and more leadership and mentorship roles in my lab and research community.

Fundamental issues and challenges

Being that my goal is to be a staff scientist, I am dissatisfied with the implicit requirement to postdoc for 5 years before I can become permanent staff and earn retirement benefits. For those aiming for a PI position, or who had wanted to do so when entering graduate school, the fact that an 8 year "postdoc" (5-year postdoc and 3 years of staff scientist in the same lab) is becoming increasingly common discourages people from wanting to pursue this track. Add together the fact that if you want to go into industry that it is much more beneficial (in terms of career and salary growth) to go straight into industry, the number of students who want to pursue a postdoc is decreasing. For DEI purposes, this is additionally detrimental — those from underrepresented and underfunded backgrounds are less likely to want or be able to accept another 5-8 years of low salary and no retirement benefits. Finally, living in a place or working in a position that you know is temporary is inherently stressful, so for anyone who wants stability after graduate school, a postdoc is a bad choice.

Existing NIH policies, programs, or resources

Increasing funding levels for grants would better allow labs to pay livable salaries to both graduate students and postdocs. The same goes for providing funding opportunities for staff scientists, which benefits labs by having talented individuals remain in their position for decades, providing important continuity for training new members and continuing research progress. Furthermore, my understanding of childcare supplements provided is that they are quite minimal with regard to actual childcare costs, especially in the high cost of living areas that are considered the best places to do research (and honestly, a requirement to live in if you want to successfully transition from postdoc to PI).

Proven or promising external resources or approaches

I don't have specific resources but I know that more needs to be done about abusive PIs. I was in an abusive lab as a graduate student but managed to leave. This PI went on to abuse many more students and postdocs, and the postdocs most typically had the fewest resources to help them escape. As a graduate student, you have a little more protection–my graduate program directors were able to assist in a lab move. The two postdocs that I know from the lab who left both had to rely solely on the assistance of their graduate advisor and lacked any support at the institution of the abusive PI. I know there are some policies regarding abuse but the only times these apply are when the victims are able to provide

large amounts of evidence and convince higher-ups that there is a problem, which is difficult when the abuser appears as an "excellent researcher" to those same people. The burden to prevent an abusive PI from abusing future students or postdocs should not be placed on the victims, and as of now, it is.

Response 314

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 315

Perspectives on the postdoc roles and responsibilities

Post-doctoral fellows are critical to our national research interests and play key roles in advancing our understanding of science across most disciplines

Fundamental issues and challenges

Salary—To be more competitive with industry, academic salaries for post-docs need to increase however, there needs to be a concomitant increase in NIH grant funding budgets. Additional increases in post-doc salary will greatly hinder funds for research in RO1-type grants, and therefore these budgets also need to be increased accordingly or more training grants provided to post-docs to offset these costs.

Quality of life—The idea that a post-doc needs to move institutions to transition to a faculty member is obsolete and should not be used as review criteria during a study section

Existing NIH policies, programs, or resources

Increased training grants for post-docs

Increased training grants to transition to faculty at the same institution

Increased grants for early faculty such as small RO1, with improved funding lines than a traditional R21.

Proven or promising external resources or approaches

No response

Response 316

Perspectives on the postdoc roles and responsibilities

Advanced grad student. Transition role between grad student and PI where you can learn more skills and leadership roles.

Fundamental issues and challenges

It's very obvious that the pay is probably the main reason. Graduating grad school you are confronted with "I want to stay in acedemia but then I'll be paid 40-50K, but if I go to industry I will be paid 100k-150k". Many people are struggling to buy a home or start a family at this stage in life. Money actually matters for those things. You don't want to have children if you can't provide for them well.

Existing NIH policies, programs, or resources

Pay them more. Give then dental insurance. Make grants easier to apply for (ie not like 50 pages long, more like 10).

Proven or promising external resources or approaches

No response

Response 317

Perspectives on the postdoc roles and responsibilities

It has been explained to me/view it as an extension of your PhD education with more freedom.

Fundamental issues and challenges

PostDoc are treated as they are still students on a lowered salary. By not providing a higher (livable) salary, decent accommodations for people who want to start a family, and addressing toxic culture of academic, people will continue turning to industry. Pay needs to be adjusted.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 318

Perspectives on the postdoc roles and responsibilities

Push forward the boundaries of science by executing high-quality research in respective field; generating scientific papers, perfect own skills for imminent career in a scientific-related field.

Fundamental issues and challenges

From my perspective as an immigrant in the US, I do not think there is an issue of recruitment as many of the US-based institutions are world-class, highly funded and, technologically gifted to other parts of the world. While my benefits are great, I'm not sure if these are the same for all postdocs across the US, or whether I'm lucky because I'm working at a healthcare-affiliated institution. Otherwise, salary would be the main issue to the quality of life. As an immigrant who came to the US with no savings (because I was a PhD student beforehand like the majority of postdocs), this is the first time in my life that I have to worry about money, and that I have literal nightmares about being poor, not being able to pay bills, or provide for my wife (who followed me to the US as a dependent on my visa and is not allowed to work in the US and as such contribute financially). I can't imagine what incoming postdocs with one or multiple children are going through financially. Meanwhile, some technicians in our labs are making more than postdocs, working from 8am-4pm, and we are here working late nights, weekends, which only gets exacerbated during pandemics as I'm in the field of emerging/high consequence infectious diseases. Finally, the 35$-monthly increase between Postdoc 1 and Postdoc 2 is insulting; it's not like we are paid hourly and go just do "more hours" to inflate our salary.

Existing NIH policies, programs, or resources

The only thing that comes to mind would be the Postdoctoral Certificate Program, which at best, feels like a joke by the fact that is a condition of employment, and takes time away from lab work, which can be hard to navigate for individuals with highly-demanding experiments (e.g. animal experiments in high containment laboratories). While I do get the idea behind it, and do support the fact that some classes are mandatory (e.g. ethics), the structure of the program itself is a burden more than anything else. The idea that there are certificates for focused profiles (e.g. teaching, management, clinical research, etc.) is a nice touch, but the fact that as individuals, we need to manually track which classes are needed for the certificate of interest, register to them, and then complete all them is a burden in itself. Now, the fact that even when we DO complete all required classes for a given certificate, the fact that we need to request the certificate, i.e. that is is not automatically awarded to us is ridiculous. I was already hired to do scientific work, I shouldn't have to perform these administrative tasks. What's next? Should we also have to design in Photoshop, print and, get the dean of our faculty to sign the certificate also? Last but not least, I have NEVER heard about an employer asking to see a Postdoctoral Certificate Program and hiring someone with one, over someone who doesn't; its value appears insignificant for the works it requires.

Proven or promising external resources or approaches

I have been in the US, as an immigrant, for over 1 year and I do not waste money in any shape or form but I have yet to save a single dollar as my paycheck gets slashed by retirement stuff, benefits for my wife and I, while 100% of the rest goes to rent, utilities, and food. There has been months where my account was in the red. I need to go in debt every time I need to fly back to my home country for important life events. It's actually hard to focus on generating cutting-edge research in the name of a US institution that will claim it its own, when at the end of the day I can't even provide food for my wife.

Response 319

Perspectives on the postdoc roles and responsibilities

I think postdoc years are about transitioning and figuring out whether we want to do science really, or we should look after other possibilities. However, the perspectives are not good, especially at the academia. The number of available positions are really narrow, and the push on us is really huge. This generates the most problems in science in general. The lot of cheating, improper data presentation are all about the push and fight for every positions. This is toxic. However, I really think, that we have to be clean, and morally strong. This is my intention and how I live my life. I hope it pays back later. The problem is, that is not true for everybody. The other big problem is, that the scientific community does not have the chance to avoid this attitude mainly because of the PC. Science should figure out a internal quality control somehow. These are the most important things to do.

Fundamental issues and challenges

I think, that the biggest problem nowadays in a postdoc's life is the salary, and the continuous feeling that we are really short on money. I think, that it provides a huge frustration day by day. We generally feel, that we are not recognized at all compared what extent and how long we trained ourselves. Especially, the inflation of the recent years had a really bad influence on our life quality. The main importance of this issue is, that I feel it destroys the moral and self confidence a lot. We just can not value ourselves enough. We feel that we are miserable, and we screwed up our life by making the decision in the past to be a scientist.

The improper salary however is not only a problem by the postdocs. I think, that Staff scientist/PI salaries are also far behind the properly acceptable level. The main problem is, that NIH would loose its leading position because of that. Youngsters are willing not to come to NIH, because they don't want to live on water and bread every day. These responses we got from postbags mostly.

I hope NIH is going to join the movements, what started on universities outside about postdoc salaries. Last time [redacted for anonymity] increased minimum postdoc salaries by 20%, with a starting salary of $65k. Right now this number is at around $55k at NIH. Taking together with the living cost in the DMV region, it is a huge difference.

I think this is a major problem, which NIH should solve for the future.

Existing NIH policies, programs, or resources

I feel, that we have to participate on too much trainings regarding ethics, equity, harassment and etc.

Proven or promising external resources or approaches

I think that NIH is still a fantastic place. However, I think that the above mentioned responses about salary and training would help a lot in the life quality and perception of the working environment of the postdocs.

Response 320

Perspectives on the postdoc roles and responsibilities

Traditional definition of a Postdoc: "Gain the ability to do independent research and carry out a project on your own"

Reality: This can happen in graduate school under the mentorship of specific PIs

Additionally, we need to train postdocs in academic institutions to have careers outside the academy. Too much of the training is focused on grant writing and becoming a faculty some where. Need to focus on leadership and training and individual to become a leader.

There's lots of good people wanting to become policy analysts and wanting to become advocates for specific causes. All of this is done in a volunteer scale right now with limited training or training from people who have zero science background. Non-scientist training can be incorporated but if we wish to change these things long term, people need to be paid and receive external motivation to do these things.

Fundamental issues and challenges

Institutions need to actively analyze cost of living in their respective areas. Faculty may not feel the burden of rent increases and other expenses because those making 6 figs income don't feel the same pain.

R01 award sizes need to significantly increase. Many faculty have indirectly complained me saying "science was easier in the 90s when I didn't have to pay grad students health insurance and students fees were low"

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

AAAS fellowship.

Response 321

Perspectives on the postdoc roles and responsibilities

In theory, academic postdocs are useful if a graduate student feels they have something additional to learn to further their desired program of study. Importantly, this should probably not be a necessary stepping stone in the career of every scientist, but rather, something that might potentially be useful. In practice, academic postdocs are jobs that people must take if they want to stay in academia simply due to lack of faculty positions. In addition, people must take postdocs if they did not publish enough as graduate students. I know very few people who do a postdoc for its intended purpose of furthering your own knowledge base.

Fundamental issues and challenges

LOW PAY. Low pay, low pay, low pay. This issue is beginning to affect graduate studies as well, so I strongly urge the NIH to seriously reckon with this. I am at a PhD program at an R1 university and I am about to graduate in one year or so. I don't know a single member of my graduating cohort that intends to pursue a tenure track career, and therefore, that intends to pursue a postdoc. This has been true for the 2 cohorts of students above me, and appears to be largely true for the 1-2 cohorts of students below me. Industry jobs are far too competitive and many of them are scientist positions that allow us to do science without sacrificing salary and being able to choose where we want to live. Academia overworks people and underpays people, and the common path of doing a long PhD with 1-2 postdocs before even beginning the tenure-track process is simply unacceptable. People are in their mid-40s before they can even begin to make a reasonable salary and have a stable career. This must change. Industry is paying people right out of graduate school $100k+. Why would anyone take a $50k postdoc? $50k is a salary that is simply unlivable in most major cities now. Further, people make this sacrifice hoping for a faculty job after this, and then STILL are not able to secure a job.so it's sacrifice for nothing. I came into my grad program wanting to be a PI and fully intending to do a postdoc after grad school, and I am leaving my grad program realizing I can't afford to be a PI, and I am going into industry.

Existing NIH policies, programs, or resources

Set the minimum postdoc pay at a higher salary because most institutions are interpreting the minimum as the salary range postdocs should earn. Postdocs hold advanced degrees and are worth more. I regret to inform you that this won't be solved with a simple policy change. You have to pay people more. Cost of living is rising, and people are sacrificing more than they want to for these careers. You are ensuring that

the people that choose academic paths are only the most privileged among us with generational wealth and spousal financial support.

Proven or promising external resources or approaches

I am truly deeply serious when I tell you that I had a great lab, great mentor, great support, and I am still leaving academia because of money. It's just money. The average clown salary according to salary.com is $63,145. Most postdocs in this country are paid less than clowns. You can go about this trying to make smaller changes, but I promise you, that isn't going to solve the postdoc retention crisis. It will make life better for people choosing to do postdocs, and I think that's great, but until you raise salaries, no one will be making a different choice.

Response 322

Perspectives on the postdoc roles and responsibilities

An academic postdoc has the role to develop their independent line of research and is expected to perform at high-level while trying to learn new techniques and approach a completely different research question—sometimes outside their doctoral field. To me, an academic postdoc is a unique time for you to dedicate time to being independent while pursuing and exploring curiosity. Some of the roles include; writing and reviewing manuscripts, applying to multiple research grants opportunities, developing highly specific skills at the bench and also professionally, mentor and train graduate, undergraduate and technicians, submitting orders, take highly specialized courses amongst others.

Fundamental issues and challenges

The main issue resolves in poor compensation. Academic postdocs get paid very poorly, to the current cost of living surviving with an academic postdoc salary is almost impossible. In a stage of life where you are starting a family, or trying to start a family, living expenses just don't accommodate to the salary. Compared to as a doctoral student, at the end, you receive a certificate and earn a degree—but as a postdoc that doesn't really happen, you are expected to publish a paper in high-impact journal which can take many years, which means that you will have to work more than 40hrs a week with the bare minimum economic and overall support. It is modern explotation, with the hope and idea that you will get an academic position that is not even guaranteed. With the realm of opportunities that you can have once you obtain a PhD saying that you are pursuing an academic postdoc is viewed as a waste of time and money—without bringing into the conversation how toxic academic environments are and can be. Quality of life cannot exist when you are stressed about how you are going to survive with your salary having a whole degree and highly specialized skills in a space that makes you feel undervalued. It's not worth your mental health.

Existing NIH policies, programs, or resources

Compensate academic postdocs appropriately; provide childcare, force institutions to contribute to healthcare benefits, parking etc and develop a way to track and hold accountable toxic academic environments.

Proven or promising external resources or approaches

No response

Response 323

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellowship is a time to take on an independent project with mentorship by a field leader to help a junior investigator get established in their desired field. The postdoctoral fellow should drive the project in the day to day "doing" of the science AND with the guidance of the mentor learn to determine which questions are the critical ones and define which experiments that need to be done to accurately answer those questions. The postdoc should also serve as a mentor and resource for more junior lab members such as undergrad and grad students. The postdoc should also learn how to obtain external funding—ie grant writing workshops and applications for level appropriate funding—this is important to help them determine if the classic academic path is right for them.

Fundamental issues and challenges

1. Salary
2. Substandard benefits—ie no access to retirement, childcare etc types of benefits.
3. Long term job projects after doing a post-doc are daunting since success rates are low.
4. The NIH modular budget limit of 250K per year. This affects postdocs in a roundabout way b/c faculty cannot afford to pay postdocs unless they do a non-modular budget which increases faculty administrative burden.

Existing NIH policies, programs, or resources

Just pay them what they are worth. This isn't complicated. Institutions will go with the NIH minimums, so just raise the NIH minimums.

Proven or promising external resources or approaches

No response

Response 324

Perspectives on the postdoc roles and responsibilities

The postdoc role is intended to support young scientists as they work towards building their own research program, or whatever scientific career they have chosen to pursue.

Fundamental issues and challenges

Salary. I have had a postdoc position open for 5+ months now with only 4 applicants. You can not survive in [redacted for anonymity], on a salary of 54K and there is no-one willing to move here to try. I can't blame them. I am working towards turning this into a remote postdoc position instead.

This becomes even more difficult now that some institutions are starting to pay 70K+ salaries, which is entirely appropriate, but it means the rest of us absolutely can't compete.

Existing NIH policies, programs, or resources

This survey is a little disingenuous. There have been several editorials in the last month in Science and Nature alone detailing proposed solutions to this issue. I find it hard to believe the Admins at NIH have not been following this discourse for the last 10+ years that it has been going on?

Minimum postdoc salaries need to be increased to 70K and NIH needs to set this bar. You have known this information for years.

Proven or promising external resources or approaches

No response

Response 325

Perspectives on the postdoc roles and responsibilities

I view the purpose of academic postdoc positions to primarily fill three roles:

1. To train early career scientists how to advise students and run an academic lab.
2. To refine their current skill set as well as gain new ones.
3. To perform as much research as possible to gain a foothold in the scientific community that they are a part of.

Fundamental issues and challenges

Purely financial. I am starting a family, and I simply cannot afford continuing to be a postdoc at NIH recommended salary ranges. I made slightly over 20k/year as a graduate student for many years, which put me into massive credit card debt. I now have to work several side jobs (DoorDash, tutoring, etc) to be able to afford a decent quality of life and child care, and I am still living off of credit cards. Scientific careers are not 9-5 jobs, but time outside the lab for me is now spent doing other jobs to supplement my

income. That, on top of the stress of being able to afford my bills takes away from that work that I want to be doing. I cannot afford to put the number of years into my postdoc required to get a highly competitive academic professorship position, and I feel forced to go into industry as soon as possible.

Existing NIH policies, programs, or resources

We need increased salary ranges for postdocs. Not 10/15k, but like 25/35k to even come close to being competitive against industry jobs. Also, loan repayment programs that are accessible to basic science researchers would be helpful.

Proven or promising external resources or approaches

Response 326

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is a professional experience where I'm learning to be an independent creative scientist while supported by someone who already knows what that means. I show up every day eager to learn and do great work. My mentor gets lots of productivity out of that, and in turn, is preparing me to go off and continue to do that on my own.

Fundamental issues and challenges

Simply put, I could leave and go to any pharma company right now and my 2.5x my salary. I've been recruited probably a dozen times over the pandemic. The pay is bad, but the greatest challenge is the dismal prospect for a future in academia or government research. So, postdocs get scared because the powers that be have made no future for us. When we get scared and someone is offering us 2.5x our salary and to actually have weekends off, 70% of postdocs will take that offer. At NIH I am a number in a folder somewhere. No one cares about us here, other than our mentor (if we have a good one). All the places trying to recruit us actually pretend to value our insight, perspective and expertise.

Existing NIH policies, programs, or resources

There should not be 100x more postdocs than staff scientists. Fund a future for us or we will just leave. There is very, very little point in doing a postdoc if I want to go to industry. Give me a future so doing a postdoc makes sense again.

Proven or promising external resources or approaches

Honestly, just look at good practices in the public world for support and retention. It seems like NIH has never really enacted any of that. You all just took us for granted, and now we are all leaving.

Response 327

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The main issue with recruitment and retention of postdocs, is that postdoc's salary is too low and in most academic institutions postdoc do not have access to benefits such as a retirement plan. The majority of PhD students I interact with in my institution wants to pursue a career in industry after completing their PhD. Although they value the training and mentoring experience they receive in academia, they are not willing to put up with the low salary and the amount of free work faculty are asked to do in academic institutions to be eligible for promotions later on.

Existing NIH policies, programs, or resources

NIH salaries for postdoc have to increase significantly.

Response 329

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as a period of additional training and time to solidify future research interests for an independent academic or industry group lead position.

Fundamental issues and challenges

One of the most fundamental issues regarding the recruitment, retention, and overall quality of life of postdoctoral trainees is the salary, especially given their Ph.D. credentials. This salary and lack of benefits (lack of contribution to social security, no retirement benefits for workers in their 30's, and no childcare aid) make it hard to stay in these academic or government style postdoctoral positions. This is especially true for women who face a hard choice of deciding if and when to start a family during this career period. If they do have a child they will have a very hard time finding and being able to financially pay for daycare. But on the other hand, if they decide that they are not financially able to support a child then many women have to wait for the next face of their career, for example an assistant research professorship, to have a child. At this point many women are considered to have geriatric pregnancies that pose health risks for themselves and their offspring.

Additionally, because of the "trainee" designation of postdoctoral fellows there seems to be less recourse or access to an HR department if there are large issues with their mentor. This can seriously derail a postdoctoral fellows career and places international trainees in an even more precarious position.

Existing NIH policies, programs, or resources

The NIH offers childcare aid to federal employees, this could be expanded to include trainees.

The NIH could change the status of postdoctoral fellows from the nebulous trainee to employee, this would allow us to pay into social security, access 401k retirement benefits, and pay into unemployment if an unresolvable issue arises with our mentor.

The NIH could increase the minimums of their policy on postdoctoral fellow stipends, and within the NIH make sure that the difference in pay for postdocs across institutes is immediately resolved.

Proven or promising external resources or approaches

Some academic institutes hire postdoctoral fellows as employees so they can access retirement benefits, unemployment benefits, and pay into social security.

Some academic institutes have childcare centers on campus for their trainees and professors to use, and notably is actually accessible by trainees.

Response 330

Perspectives on the postdoc roles and responsibilities

In my opinion a postdoctoral position should be an early investigator stage, a hybrid between a student and a professional. Is the first step after your PhD in which you start working in a field that is different to what you had been working on so far. When you are a Postdoc you have so far the knowledge of how to work in a lab, how to do your experiments and how to analyze data so you are only student in the sense of the new field that you are working on now but not in the sense of learning how to work in a lab because that you got it with the PhD. In this stage a postdoc is also able to give some ideas and help with designing projects, they shouldn't be just a technician that also analyzes date, postdocs can give their own ideas too.

Fundamental issues and challenges

In my experience as a postdoc there are two big issues that affect recruitment. First one is that postdocs are treated as senior techs, their ideas are not being listened, they just do the experiments that PIs tell them to do but they don't really listen to new ideas. Postdocs do the experiments that most techs don't know how to do, they fix the issues that might be happening when performing some experiments and they analyze the data, but they are not treated as researchers or they PhD background is not being taken into account. The other, and major, issue is the salary. Postdocs are paid equal as techs in the academia labs, which is not motivating and doesn't make us feel valued if someone with a lower level of education is equally paid. In addition, pharma companies pay double or even triple to PhDs so is more likely that people are going to choose those positions, only foreigners who don't have postdoc opportunities at their own countries take these jobs in academia but after a while they discover that in companies they can make way more money and have a better life quality while being more valuated at their jobs. In fact, the salary for postdocs is considered underpaid in some States.

Existing NIH policies, programs, or resources

It is not a matter of changing the policies, is a matter of applying them. Most of the research institutions don't have these programs or resources into account, they don't help their postdocs to grow as researchers, they use them as senior technicians.

Proven or promising external resources or approaches

NIH should do an overview of what the salaries of postdocs are compared with jobs outside academia and maybe there they find their answer for this question.

Response 331

Perspectives on the postdoc roles and responsibilities

Postdocs continue researching in a academic setting, publishing papers, mentoring graduate students, and bolstering their resume to prepare for a faculty position.

Fundamental issues and challenges

Postdoc salaries are simply not high enough to live in most cities, have savings, contribute to retirement, and potentially get married and start a family. the salaries have barely kept up with inflation and graduate students are starting to realize their worth. By the time you graduate with your PhD, you are 28-32 years old, have a doctorate, have 6-8 years of research experience, and potentially numerous publications and you are still only told you are worth 50-60k. Postdocs also have no established maternity leave, childcare, limited vacation, and shaky benefits. It is very dependent on what university and mentor you have. If postdocs are so vital to academia then they should be compensated as such.

Existing NIH policies, programs, or resources

Expand how much money PIs can receive from grants and increase the portion that can go to salary

Proven or promising external resources or approaches

Proven or promising external resources or approaches

No response

Response 333

Perspectives on the postdoc roles and responsibilities

I see the postdoc as an opportunity to develop my own research path under the guidance of a skilled PI so that I am competitive on the tenure-track job market. The important aspects for me are learning new skills, finishing projects that I am leading, and strengthening my publication portfolio.

Fundamental issues and challenges

The main factor for lack of retention is salary. The salary is abysmal for someone who has spent years completing their PhD at a low or non-existent salary and now must take on another role that is underpaid. When does an individual get to start a family and save money and care for their family? Once they have a tenure-track position?

For many fields, often more than one postdoc is required to become competitive on the job market, so institutions are essentially asking postdocs to put 5+ years of their life (when they could be having a family and reaching financial stability) to continue working toward a goal that may or may not happen. Moreover, a lot of postdoc insurance plans are very minimal and do not cover essentials like fertility treatment and PPO plans, which are typically available to graduate students and faculty. We also do not get any retirement plan or other benefits available to employees.

Overall, what is inhibiting recruitment and retention is the lack of treating postdocs as essential employees that are integral to the function of an academic institution. We can get paid much better in industry with great benefits and still do research, so why stick around for a postdoc position or two or three?

Response 334

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I will speak from personal experience to the two biggest challenges I have encountered that threatened (and continue to threaten) my own retention as a postdoc:

1. the lack of adequate parental leave policies and more flexible allowances for partially reduced effort on NIH training grants (F32 in my case); and
2. the absence of cost-of-living adjustments to salary and childcare supplements. Expanding on the first point, the classification of F32 recipients as "trainees" means that at many institutions we are not considered employees and thus are not eligible for equal benefits. This is a monumental issue particularly for women who wish to have children. As a concrete example, I had a first child while on my mentor's grant and as an employee, had access to generous institutional leave policy (4.5 months fully paid). I worked hard to get an F32, only to realize that I am now not considered an employee of my institution and not eligible for either the university-based leave or state-based leave. The F32 offers only 3 months paid leave but does not extend the grant timeline, thus imposing a productivity penalty on fellows who do take the leave. The amount of time is also the same whether or not you are the birthing parent, which does not account for medical recovery and penalizes female trainees disproportionately. This leaves trainees, especially women, in the position of choosing whether to pursue a family or pursue their career. Regarding the second point, the NIH salary levels are not enough to sustain a family of even 1 child in high-cost cities. In my personal case, when I do the math for childcare for 2 children as compared to my salary, it just does not make sense for me to continue working despite years of training and investment.

Existing NIH policies, programs, or resources

My suggestions are tailored for the F32 mechanism, as that is the one I am most familiar with:

1. Allowance for 6 months of paid absence for birth + bonding with a child AND/OR mandate that institutions class trainees as employees and ensure eligibility for all institutional leave policies and other benefits (e.g., equivalent medical insurance, time off, etc). Anything else disincentivizes postdocs to pursue an independent grant.
2. Coupled with above, mechanism for the extension of the grant timeline corresponding to the period of absence or other methods to ensure a productivity penalty is not levied against postdoc taking leave.
3. Option for at least a short term reduction in effort (e.g., to 75%) for personal and/or family circumstances. There are many unforeseen life events (illness, caregiving responsibilities) that may require an adjustment of time but for which a full leave of absence is not needed. The reduction of effort ought to come with extension of grant timeline accordingly.
4. The elimination of the payback clause. For all of the reasons above, postdocs often find themselves in difficult situations wherein they have to choose between supporting a family and pursuing a research career. For many, it will be necessary to change course—this should not come with a further financial penalty.
5. Raising of the NIH salary minimum, with adjustments made for cost-of-living. Postdocs are highly skilled scientists with many years of training and salaries ought be at least enough to support a family as part of a dual-income household, which they currently are not. For women in particular, retention will hinge on the economics of salary vs. childcare costs.

Proven or promising external resources or approaches

No response

Response 335

Perspectives on the postdoc roles and responsibilities

Postdoctoral investigators are a key component of any research academic institution. They are critical for small and mid size groups where they could serve as an intermediate figure between the PI and more junior component of the team. Having a good postdoc(s) could profoundly impact the productivity of a group.

On the other side, postdoc are the next generation of PIs. Investing in their training and attracting them to academic institutions is crucial for the survival and solidification of the excellence in research for these institutions.

Fundamental issues and challenges

I am sure the current struggle for PIs finding postdocs has a multifactorial explanation. However, I believe the main factor is that postdoc salaries (and benefits) in most academic institutions is not competitive with the industry standard.

Existing NIH policies, programs, or resources

As academic institutions will start increasing postdoc salaries to try to competed with industry positions, grants would need to account for this increases in a way that an awarded PI could maintain the same number of postdoc without compromising the research goals for financial reasons.

Proven or promising external resources or approaches

No response

Response 336

Perspectives on the postdoc roles and responsibilities

The role of an academic postdoc as I understood it entering into my current position was to manage, facilitate and execute research independently. Aside from performing research independently, the main responsibilities include training other junior lab members, make scientific intellectual contributions, write manuscripts, share, communicate and advocate science performed in the lab, and secure funding through various grant mechanisms.

Personally, I viewed the position as a stepping stone towards becoming an independent scientist by allowing me to perform research within the general guides of the lab.

Fundamental issues and challenges

Postdocs are over-worked (due to explicit and implicit pressure) and underpaid. I believe one of the primary issues that lead to low recruitment are:

1. cost of living where many opportunities exist in comparison to other opportunities in the same regions.
2. Lack of opportunities following a postdoc tenure

Through my personal experience and those shared with me by others, retention is inhibited by both lack of opportunities (4 years to submit a K is not always realistic) and bad mentorship. I find that too often, PIs, even successful ones, are poor managers, poor mentors, and often times have tunnel vision that prevent creativity. This is not a work environment conducive for a scientific exchange of ideas or to conduce science and create a negative work place. In these situations, a better paying job in a similar environment, where expectations are laid out in the beginning, is much more alluring. I have a firm belief that PIs are a major contributors to the problem. Even in the absence of a great pay, a positive experience would help improve retention. As I see it, the NIH would never be able to compete financially with tech and pharma, so it is essential to identify other factors that can be modified, bosses being one of them.

Existing NIH policies, programs, or resources

In my view, a way to improve the postdoctoral training ecosystem and academic research career pathways revolves around improving training environment and relax the time restrictions imposed on path to independence awards.

K awards deadlines should be extended to 5-7 years or match the amount of time the NIH allows for a trainee to be considered a postdoc.

Add a lab retention criteria to grant funding mechanisms to identify PIs with poor track records. That being said, PIs are likely to manipulate and re-write history when asked to do that, perhaps an unbiased way to identify these would be helpful.

Proven or promising external resources or approaches

No response

Response 337

Perspectives on the postdoc roles and responsibilities

I view the academic postdoc position as a staff scientist position where individuals are seeking to expand some skillset and acquire additional research experience. While there are goals to expand training, I do not perceive postdocs to be "trainees", in that they have their PhD and have sufficient training and skills to be a scientist. I see responsibilities including leading research projects, mentoring undergraduate and graduate trainees, conducting analyses, and writing papers and grants.

Fundamental issues and challenges

The biggest issues are financial, including low salary, lack of ability to participate in employee-sponsored retirement programs, inequity across institutions for paid sick leave, paid parental leave, and paid vacation. Compared to what PhD's can earn and have as benefits in industry positions, the NIH payscale is woefully low. The inability to supplement salary funding from other grant sources if funded off an NIH NRSA is also extremely limiting. Additionally, the need to relocate for a temporary position for 1-5 years is difficult for individuals with families.

Existing NIH policies, programs, or resources

NRSA fellowship stipend levels need to be raised significantly. NIH can require institutions to provide NRSA fellows with a minimum number of paid sick days, paid vacation days, and paid parental leave days. As many institutions view the NIH postdoc fellowship pay scales as a *maximum* for paying postdocs, changes to the fellowship structure will likely have an impact across postdocs, even those not funded by NIH fellowships. Additionally, the annual maximum amount awarded for R01 must be increased. The dollar amount has been stagnant since 1999, and prices for equipment, staff, participants, etc have increased exponentially. This severely limits what PI's can pay postdocs and other staff, leading to wage suppression.

Proven or promising external resources or approaches

Providing adequate financial support for postdocs, both at the fellowship level and by increasing award amounts, will substantially improve recruitment, working environment, and job satisfaction of postdoctoral scientists. Many PhD's need to make practical considerations, including how to support their families and/or start families, pay back loans, save for retirement, and build a life now that schooling is complete. Insufficient wages and benefits are a huge detriment to recruiting and retaining postdoctoral scientists, and leads to increased stress, decreased job satisfaction, and decreased job performance when scientists are worrying about how to make ends meet. The NIH can lead by increasing fellowship stipend levels, increasing maximum funding for large grants, and stipulating minimum benefits for postdoctoral fellows.

Response 338

Perspectives on the postdoc roles and responsibilities

Seems very underpaid as a researcher and technical expert. Opportunities for growth minimal.

Fundamental issues and challenges

Short term contracts, required in-person, low stagnant wages, minimal flexibility

Existing NIH policies, programs, or resources

More $

Proven or promising external resources or approaches

No response

Response 339

Perspectives on the postdoc roles and responsibilities

Postdocs are senior research staff responsible for developing/working on a research project to compliment their existing experience and launch their own independent research program as a PI. Postdocs also take on many leadership responsibilities including mentorship of other lab members.

Fundamental issues and challenges

Postdocs are severely underpaid as research professionals. Starting salaries need to be much higher especially in high cost of living cities and areas. The typical biomedical postdoc also needs to be shorter or have a built in option to transition to a different job title (eg staff scientist, instructor) or junior faculty after four years. The goal posts for how long a postdoc takes in order to publish a high impact paper for an academic position is unsustainable especially if wages are not competitive. This also impacts diversity in the postdoc population.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 340

Perspectives on the postdoc roles and responsibilities

The primary role of a postdoc in a lab is to spearhead research projects in a lab without needing constant oversight. Postdocs have been trained to conduct research in a rigorous and thoughtful manner, so they are able to conduct experiments and analyze results mostly independently. They have the skills to search the literature to aid in their project development and direction, and understand their findings into the scope of the field. They are then versed enough to discuss next steps with their PI, providing valuable insight. As has been seen with the current postdoc shortage, postdocs are essential for lab functioning. There are not enough academic research scientists (or they are too expensive) to drive the research that is needed to get papers, grants, etc. Papers, grants, and research from postdocs is as valuable to the PI as it is to the postdoc. Postdocs are essential for a PI just as a PI is essential for a postdoc.

While the goal of some postdocs is to continue to a faculty position, I disagree that they are "trainees". Gaining experience to move to a higher position is not the same as training. In my experience, postdocs are no different than a new employee at many other organizations—there must be guidance at the beginning of the employment because it is a new position at a new company. Other than guiding a project and maybe how to write grants, there is little training for faculty responsibilities, such as independent mentoring skills, budgeting, dealing with internal paperwork or applications (IACUC, etc.), department requirements, and more.

Fundamental issues and challenges

It comes down to two things: salary and environment. Salary is the easiest to address.

Industry positions no longer require post doc experience, which means there is another option for grad students after graduating. While it is unreasonable to expect to be able to keep up with industry salary, starting offers are often double what the current postdoc salary is, and the gap continues to increase with every year of experience. The current salary for postdocs is very low for someone with a graduate level degree, and extremely low for individuals living in large cities (where many institutions are located). I would encourage you to look at postdoc salaries compared with other disciplines like nursing, engineering, law, administration, business, or even those such as retail store workers and food workers. Not only starting salary, but salary after 3 years or 5 years.

Even if PIs would like to increase postdoc salary, many universities do not allow it. Another barrier is that PIs may not get enough funding from a single grant to pay for postdocs at a salary which would be competitive.

Existing NIH policies, programs, or resources

An easy place to start is not allowing universities with NIH funding to put a cap on postdoc salary.

Raising post doc salary "minimum" (which is what the vast majority of postdocs are paid). This would need to be followed up with an increase in project grant support (such as R01) so labs could afford it.

Increasing the funding received from an R01/ project grant. OR include postdoc hire proposal in the funding mechanism, and give additional support when the postdoc is hired. (for example, when proposing the timeline, state that two postdocs will be hired, one will focus on these experiments, the other will focus on these experiments. And then when they are hired, $50,000 more a year to the lab until the postdoc has independent funding)

Creating a funding mechanism for postdoc researchers that promises to increases their salary. This mechanism would need to be realistically achievable by 40-60% of postdocs and is applied for in the first year or two.

You could consider limiting the number of hours postdocs are allowed to work (like 80 hours a week), but I'm not sure how that would work. That may especially help labs funded by the NIH with non-citizen postdocs. However, it might then set a precedent that postdocs SHOULD work 80 hour weeks.

Expand tuition repayment system.

Support universities in expanding benefits to postdocs.

Proven or promising external resources or approaches

I would look at the success of postdoc recruitment at places that pay a greater % of the cost of living with a family of 4.

Response 341

Perspectives on the postdoc roles and responsibilities

The postdoctoral position for me has been about making connections, building "prestige points," and learning new skills. All done independently without meaningful mentorship, scientifically or politically. It's about "putting in your time" and building your reputation, so that you can benefit from the prestige bias in the minds of those who hold power. The ability to get hired as a TT faculty is largely dependent on the papers you produce in your postdoc—but not their quality—it's based on the perceived prestige of the journal along with the prestige of the host lab and institute. After struggling to get my own paper published (because it directly contradicts works produced by), I was told by many more senior academics, that "high school never ended" and that the journal editors want to be liked by the "cool kids" ([redacted for anonymity] etc,—all the institutes that benefit from prestige bias). So if your work contradicts theirs, the gate-keeping editors will be afraid to even consider it. After being desk rejected by an IF:~5 journal, I was fed up & put it on bioarxiv, after which it went viral, and I realized that virtually everyone in the field agreed with my work, and had seen the same issues (including those changing patient care!), but no one had publicly raised them because of the politics behind it. After my BioRxiv post went viral, it was immediately reviewed at Nature Biotech. I've learned so much about the way that science actually operates through this experience, but the most important lesson, is that academic science is mostly politics & truly not reflective of merit, and because of the politics and ring-kissing in science, *cannot* prioritize human health.

Fundamental issues and challenges

Lack of compensation and overwork, especially in comparison to industry. I have personally had to make difficult decisions related to food security because my rent (for a *rent stabilized* studio) was over half of my salary. For the first three years of my postdoc, I was "breaking even" without the ability to save a dime for my future because of the subsidized housing provided by the institute; however, they only give you three years, meaning that when I reached the end of my third year, and moved into my rent stabilized studio, my expenses rose by nearly $450/month. I asked for a raise, but was told my my "mentor" that because I had my K99, my work wasn't critical for theirs because I was doing my own independent work, so they had no real incentive to raise my salary (even though it could have been self funded through the K99). I lost 15 pounds in the first 1.5 months, while I learned how to be able to buy only the very bare essentials, switching my diet to roughly half rice and beans. My friends started asking if I was okay

because I was looking gaunt and unhealthy, but the honest truth is, I was struggling to make ends meet because of the poor pay. In this time, I really learned the privilege that I had growing up without food insecurity—without needing to hustle in any way to feel safe and secure in my ability to survive.

I cannot think of a single reason why I would recommend doing a postdoc to anyone; despite the fact that I am close to securing a TT faculty position. I don't plan to employ any postdocs because it seems truly unethical with current working conditions.

Existing NIH policies, programs, or resources

NIH policies could improve the quality of life through having a dynamic postdoctoral minimum pay based on location. $56k may make sense in Indiana, but it is literally unlivable in NYC; simply tie it to the cost of living. For reference, the federal government defines "rent burdened" as paying >30% of income to rent. However, this will also dramatically increase costs for PIs. The next logical conclusion is that the modular budget of an R01 must also be increased, which will mean giving out fewer awards (in the absence of a substantial increase in funding by congress). This will in turn make it even more challenging (to impossible) for less established PIs to get grants, meaning even fewer available positions for TT faculty in academia. Ultimately, this is a problem that will need to be fixed by congress, or we have to accept that we need to do less science, more ethically.

Aside from pay, the postdoctoral position should be dramatically altered (or ended), if it's purpose is to prepare those of us who wanted to continue in academia, ready to be a PI. If that's the purpose, then it should be a position closer to a non-tenure track assistant professorship, where it is required that you will begin mentoring younger scientists, and actually learning that aspect of of the positions. As it stands now however, it's just a continuation of graduate school, under the guise of "training" to rationalize poor living conditions.

Proven or promising external resources or approaches

https://www.science.org/content/blog-post/time-fix-trainee-salaries

Remove accreditation for institutes whose administration threaten the visas of our immigrant postdocs as retaliation for unionizing. This also happened at my institute and others (with appropriate wording generated by lawyers for plausible deniability).

Support the creation of a nation-wide postdoctoral union. Then listen to them. The last 4 years of my life have left me so crestfallen from the scientific ideals I grew up with. I used to be such a purist, being driven by the pursuit of knowledge, in whatever direction it brings you. But now I know that academic science has such strong structural disincentives to that. These disincentives include peer review requiring the approval by those in positions of power, with something to lose. The requirement for "high impact" papers, that include gate-keeping by editors who have inside friends and favorites (that track with prestige bias). The requirement for having an "in" with the chair of a department to get a TT faculty position, again fuels the anti-merit political nature of science.

Lastly, related to the pay: Can you really expect those from genuinely disadvantaged backgrounds to forgo meaningful wages until they're in their mid to late thirties? Nearly all postdocs that I personally know who are either on visas from countries that allows for 2-3 year tax-free wages, or are being helped by their parents financially. If you want to confront the role of privilege in science, then you have to make this an *actually* viable, thrive-able, career path. Poor pay systematically advantages those who come from financial privilege.

I so, so, so miss the ideals I once had. I thought of doing science as a truly beautiful pursuit, and one worth dedicating a life to. But seeing how the sausage is made has been nauseating. Please help.

Response 342

Perspectives on the postdoc roles and responsibilities

I personally see my postdoc as a temporary, transitional learning opportunity. This is an opportunity to receive further training, to publish and enhance my CV, to teach and mentor students, to be mentored, to take additional classes and workshops, to sharpen my research skills (e.g., learn new methodology, practice use of statistical software, etc). This is an opportunity to see what academia an research would look like full-time, and to decide what industry to enter after the postdoc period.

Fundamental issues and challenges

The following challenges make it very hard to pursue and stay in a postdoc, and they make me think twice about academia after my postdoc period:

1. Salary is very low and creates/ exacerbates financial hardship.
2. Low salary and unspoken perception of postdocs as worker bees makes individuals in these positions vulnerable to exploitation and abuse.
3. The aforementioned dynamics create unhealthy life-work boundaries.

Existing NIH policies, programs, or resources

1. Increase in salary caps for postdocs
2. Provide a more substantial raise for second and third year postdocs. I got a raise, but honestly cannot tell.
3. Provide individuals in NIH-funded postdocs with built-in research funds for postddocs to pursue their own projects. This will make them feel more independent and provide opportunities to publish, enhance CV, etc. It could be a $10,000 supplement on top of salary.
4. It would be a dream is postdocs were prioritized for the Loan Repayment Program, or automatically granted the LRP. I dont know how in the world I am to finish paying my loans on my salary, if loan payments resume. And I am fortunate to only have less than $30k. I cannot imagine for others with more loan debt and living on the low salary of a postdoc.

Proven or promising external resources or approaches

Response 343

Perspectives on the postdoc roles and responsibilities

There are two sides to this—what I view the roles of an academic postdoc SHOULD BE, and what they ARE IN PRACTICE, based on my lived experience and those of my peers. In my view, the responsibilities of an academic postdoc should be centered around the development of an independent research program and the pursuit of basic scientific research. In contrast, the actual responsibilities of the academic postdoc based on my observation are wide-ranging, and include mentorship, lab management, and execution of research projects beyond the scope of an independent researcher (e.g., performing assigned tasks more closely aligned with the goals of the postdoctoral mentor, rather than in service of the postdoctoral trainee's career path).

Fundamental issues and challenges

1. Pay: Stipends for postdoctoral trainees are far lower than salaries for positions in industry that require comparable levels of experience (~$55k for NRSA F32, vs. $90-120k for industry job out of PhD), and also lower than sustainable living wages calculated for most urban areas (~$65k living wage for Boston, New York, Seattle, Los Angeles, etc.).
2. Career Uncertainty: ~65% of life sciences PhD students begin their graduate training with a desire to continue on an academic track (Sauermann and Roach, 2012), but only ~10 to ~20% of postdocs are able to advance to tenure-track faculty positions (Sauermann and Roach, 2016; Kahn and Ginther, 2017) which means that a majority of trainees are faced with exploring career paths other than what they intended.

Existing NIH policies, programs, or resources

1. Stipends for NIH postdoctoral fellowships (NRSA F32, etc.) could be raised to reflect the current cost of living in the US to make postdoctoral training more palatable and sustainable. Many universities set their postdoctoral payscales based on the NIH F32 payscale, so national average postdoctoral stipends are unlikely to change unless the NIH leads the way.
2. Support for alternative academic research career paths, such as staff scientists, could be a potential retention mechanism to keep highly trained and talented researchers in basic life science research—a strategy for this was proposed in Alberts, et al., 2016.

Response 344

Perspectives on the postdoc roles and responsibilities

I think postdocs are the head of the labs, we run orders, we maintain the lab and we still do experiments for our projects. I think that we should be trained more in the transition to another job too

Fundamental issues and challenges

Salary is the biggest problem, if you are hired in your 1st year as a postdoc in a lab and you stay in that lab for years, you continue to receive a first year salary, that shouldn't be allowed

Postdocs only different salaries related to their level of expertise if they change jobs.

Existing NIH policies, programs, or resources

COSTAR is pretty good but it needs to include more and allow postdocs to stay in the program for longer

Proven or promising external resources or approaches

Improving training in career development is what the postdoc really need

Response 345

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is a step closer to a faculty position and the training required in learning scientific rigor, grant writing and reviewing and having more scientific publications as first authors to build a strong foundation as a academic scientist.

Fundamental issues and challenges

No work life balance. Lot of work load. Despite lot of work, sometimes failures ensue coz of lack of expected hypothesis leading to early burn out with 12 hour work shifts. Less appraisal and less money compensation for the hours worked. People with lesser degrees and qualification and less work load making a 3 times more money with a strict 9-5 and job satisfaction with benefits.

Existing NIH policies, programs, or resources

Appraisal given for work done, compensation for extra hours worked, pay raise and extra benefits similar to industry. More paid holidays alloted.

Proven or promising external resources or approaches

Compensation for work not just defined by papers but defined even by results that don't align with hypothesis. Pay raise and benefits.

Response 346

Perspectives on the postdoc roles and responsibilities

The postdoc is a time to become an independent researcher, driving projects and focusing more on mentoring and learning more of the soft skills. We're trained scientists but this is a time to focus on peer review, grant writing (and management) as well as how to run a research lab. I view it as a stepping stone to a position either in academia as a PI or industry, though I think the two have different purposes. For industry, the postdoc is usually to gain a new skillset. While that is also useful for academia it is about springboarding your own career.

Fundamental issues and challenges

The stipends are not comparable to industry jobs. My friends with BA degrees make significantly more money than I do as a post-doc. I spent my 20s and early 30s working as a research tech in an academic

lab and then as a graduate student. I did not receive raises and promotions nor could I jump between jobs to make more money. My retirement account has suffered and the relatively low pay and job prospects does not make it feel like it will ever improve. I generally enjoy being a post-doc as it is nice being able to just focus on research but going on the job market has been incredibly stressful as it feels pointless—there are too few jobs for the supposed dearth of postdocs. Also, my university HR controls my raises and salary despite being paid from an NIH grant. There is no universal "post-docs must receive the appropriate raise on their date of hire anniversary" as would happen for fellows, leading to a disparate experience. There is also nothing forcing PIs/universities to pay the NIH level for non-fellows.

Existing NIH policies, programs, or resources

Increase the limit on the K99. Extensions were given for COVID but the people who were given the longest extension were the ones who had already had 4 years before the pandemic started. As someone who started their post-doc in 2019 it felt like my research was just getting off the ground when the pandemic started yet that was not adequately reflected in the extensions. Additionally, I think expanding the MOSAIC program to include the F32 would be beneficial. My F32 was not funded and it felt like the reviewers did not adequately read my proposal. It was incredibly discouraging to receive excellent scores for me and my advisor and then receive a low score for training potential. As a first generation researcher from a disadvantaged background it's a bit disheartening to feel like I don't belong. There was concern over my advisor's funding, which should have been irrelevant. The entire point of the fellowship is to fund me and my research so if my advisor did not have a grant, wouldn't that be more of a reason to fund me? Given that there are so few post-docs expanding the budget of the F32 to increase the number of people who receive them would make it feel more likely that I had a future in academia.

Proven or promising external resources or approaches

No response

Response 347

Perspectives on the postdoc roles and responsibilities

In the US means do everything: functioning independently, designing, organizing and conducting experiments and procedures and in some cases designing new protocols; summarize findings and publish results in research journals; assuming general responsibility for scientific operations of the laboratory; providing supervision and guidance to junior technicians, students, and researchers, applying for funding. All these, in most cases, with any kind of technical support. It is a person with all the jobs of the lab: mini PI (just for his/her projects), researcher, technician and mentor.

In Europe, postdocs usually have the respect of the PIs. They are really aware of how much they need them and they usually do not treat them as technicians too, they know that it is much more valuable what they can do out of the bench. The US PIs, expect postdocs to spend 10-12h/day doing bench work, and analyzing data, writing papers and grants the other 12 h of the day. It results so unproductive and people wasting time and money doing meaningless experiments because they did not find the time and perspective for finding the right question.

Fundamental issues and challenges

The salaries are too low and not competitive with those in equivalent education-level jobs in other fields, and really close to grad students' salaries. Postdoc salaries should be regulated area-wise, in NY even with housing from our institutions, we spend 50% paying rent, plus groceries and commuting, we barely make it.

We all understand people leaving academia as if they were running for their lives because it is what they are doing. Postdocs do not judge other postdocs for leaving academia anymore. The ones that still stay are even jealous and ask themselves why to keep trying. Considering the demanding conditions of our work: countless hours to keep our research projects going, non-technical support at all (really different in Europe), we all understand that most people ask themselves if they want this for their lives (non-having a life, non-being able to even consider to raise a family for both absence of conciliation at all and economical obvious reasons).

The academic system has to be reviewed, at all points. It is more than old-fashioned for the reality of modern life, it does not fit at all with society and people's needs. In the past, academics were living lives

in their "own world", science was their life. Nowadays, we are all overexposed to what we are missing. The internet and social media over inform us about what life is for others and how you can be much more successful and enjoy life doing a much softer effort. So, on top of postdoctoral conditions, that makes us feel stupid. Academia is going to suffer a huge crisis in the next years if the system is not reviewed and find ways to conciliate science, ambition, and life.

Existing NIH policies, programs, or resources

Improving salaries and conciliation benefits

Response 348

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are an opportunity to expand one's research portfolio, train in new techniques, and establish more professional connections before securing a more permanent position

Fundamental issues and challenges

First would be money. I started last year and making $54,000 after obtaining an advanced degree felt disheartening, particularly as it forced me to have to move in with roommates in order to afford to live in the city where my job is. I think about constantly about quitting my postdoc for a higher paying job that is not related to research because it will allow me to make more money. The second issue is having to move for the job. Although in many areas of research I can understand why someone will need to work in person, for my postdoctoral position in psychology, everything can (and is currently being) done virtually. This is frustrating because one of the biggest deterrents for being a postdoc was the idea of moving to a new place away from my family, friends and partner for a couple of years. To do that for very little money, and then find out that it is not actually needed for the job is frustrating. Finally, once I moved for my postdoc I realized that postdocs are basically separate from the rest of the department, making it a very isolating job.

Existing NIH policies, programs, or resources

First pay more. Everyone uses the NIH stipend levels to determine postdoc pay, and increasing this rate will help postdoc everyone. Additionally, taking seriously the postdoctoral mentoring plan in grants and actually discuss whether the postdoc will need to be in person or could be remote. Other things to evaluate is how the PI will work to help the postdoc establish professional connections and help advance the postdoc's career. Finally, there should be a survey when a postdoc leaves a lab that asks about their experiences and reason for leaving. PIs that are flagged for not creating toxic environments that pushes postdoc to leave should have to show that they have taken steps to correct the issues or not be allowed to have more postdocs.

Proven or promising external resources or approaches

Response 349

Perspectives on the postdoc roles and responsibilities

Postdoc is an excellent opportunity to develop learning, logical thinking, gaining experience to be an independent researcher. Postdoc is a stepping stone for the academic professor position and any other job.

Fundamental issues and challenges

Visa issues for international fellows to attend conferences outside the country. Some limitation in writing grants in particular for immigrants.

Existing NIH policies, programs, or resources

No

Proven or promising external resources or approaches

Satisfaction

Response 350

Perspectives on the postdoc roles and responsibilities

A postdoc should be a fully competent scientist capable of planning and executing experiments in their field of choice with their PI acting as a manager and resource. Postdocs should be well-versed in the literature and methods of their project; if they are shifting fields they should get up to speed as quickly as possible. A postdoc is responsible for training and mentoring junior trainees on their project (ie graduate students, techs, undergraduate students). I believe a postdoc should be treated as a project lead under the PI in the same way that a project lead would be treated by their immediate supervisor in a healthy industry context ie as a peer who can benefit from the leadership, feedback, and experience of the supervisor, but whose expertise and abilities are trusted and valued.

Fundamental issues and challenges

Academic training is long and poorly compensated compared to easily attainable market alternatives. When you are already 5-6 years behind your peers in income and retirement savings due to PhD training, it is unappealing to continue in a low-paying postdoc position for several more years when you could get a research job that pays 2-3 times more in industry. The academic postdoc is viewed by many as a prerequisite for tenure-track academic jobs only, and for a variety of reasons (negative academic environment experiences, work/life balance, compensation, geographic stability) many trainees are no longer interested in pursuing tenure-track academic jobs. Also, some people get burned out by moving, and the prospect of moving again for a

Existing NIH policies, programs, or resources

Guidelines for how many hours should be worked for what salary in addition to current salary recommendations.

Proven or promising external resources or approaches

Many benefits that are offered by private companies to increase their recruitment could be applied to the postdoc such as relocation packages to defray moving expenses, child care subsidization, access to retirement funds. I think postdocs should be recognized and treated as full employees of their institutions as much as their PIs, with access to retirement funds, full insurance benefits, etc. They are producing valuable labor and work products and their low compensation already reflects a sacrifice made in the name of additional training, there need not be any additional humiliations in the name of training.

Response 351

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is two-fold. First, the postdoc should support the projects of the lab and mentor they’re working under. Second, the postdoc should gain new skills and experience to assist them in preparing for a long-term position in industry or academia. Depending on the funding (e.g., postdoc being funded from a PI’s grant for a specific project vs. bringing in their own funding for a specific project vs. being part of a T32 training program), the balance between supporting the PI/lba and the postdoc pursuing more independent projects, interests, and training may shift, but both sides should be included in all postdocs.

Fundamental issues and challenges

I was a postdoc for 3 years. For me, the greatest struggle was the uncertainty of the position—I applied for academic jobs during all three years, and it was difficult to make long term plans or feel settled because of the temporary nature of the postdoc. I luckily avoided many of the struggles I saw other postdocs deal with, but frequently, the costs of moving (yourself and potentially a partner/family) for a short-term position can be taxing, postdoc salaries do not allow for a decent standard of living in some regions, expectations for the postdoc may not be clear or may differ from what they expected coming in with no avenues for redress, and postdocs may be isolated from other potential collaborators and department members.

Existing NIH policies, programs, or resources

NIH sets the standard for postdoctoral salaries. Raising this, or explicitly tying salary to cost of living, would help postdocs maintain a good quality of life. Encouraging relocation funds as a standard part of a postdoc package would also be appreciated. Providing models for developing IDP's for postdocs can help clarify expectations and provide a good avenue for communication between postdocs and mentors. Increasing funding for programs that create a community of postdocs can help prevent isolation.

Proven or promising external resources or approaches

See above.

Response 352

Perspectives on the postdoc roles and responsibilities

I view a postdoc as an extension of my training that has only become popularized in the last thirty years as a way to maintain cheap labor of highly educated and highly skilled people in academic and industry labs. Realistically it will not lead to a tenure track position, but one can hope.

Fundamental issues and challenges

The idea of retention of postdocs is absurd because it is by definition a temporary position. If you want to retain people give them a regular job with regular benefits.

Existing NIH policies, programs, or resources

The NIH should mandate cost of living adjustments in postdoctoral salaries. By disproportionately funding projects in high cost of living areas, the NIH pushes postdocs into extended poverty. Additionally, for as long as postdocs do not receive normal benefits, there should be a mandated time limit on the number of years an individual is a postdoc before they must be transitioned into a permanent role. Alternatively, you could give postdocs a normal benefits package.

Proven or promising external resources or approaches

Norway has a much better policy for postdoctoral training. Ultimately, there needs to be more funding in academic posts in order to support the people that have already invested time.

Response 353

Perspectives on the postdoc roles and responsibilities

Academic postdoctoral positions should be a stepping stone in a scientific career that allows scientists to transition to positions either in academia, private industry, or beyond. A postdoc position should be tailored to the needs of the scientist and the career path they are moving towards. For postdocs who want to stay in academia and begin their own lab, their postdoc should reflect that through good publications, independent funding sources and a body of research they can begin their future lab with. If a postdoc is more industry oriented or does not want to run their own lab, then their postdoc should be tailored to help them develop skills needed for those roles, potentially with more soft skills and networking with industry positions, where perhaps strong publications, funding etc are not as important since those often are not necessary for obtaining a job with those roles. Most importantly, a postdoc is NOT a trainee. Postdocs are adults with terminal degrees and should be treated as such with work life balance, pay, employee benefits and everything else offered to other working professionals who spend 10+ years earning their degree.

Fundamental issues and challenges

The two most obvious challenges postdoctoral researchers face are

1. Amount of pay and
2. Prospects for a job in academia.

Academia operates in an apprenticeship format, with graduate students, technicians and postdoctoral researchers being severely underpaid for their contributions to labs, institutions, and federally funded research. Postdoctoral researchers should be paid enough to support themselves and their families, regardless of the cost of living of their respective cities. Their pay should reflect the time spent training

and should afford them the ability to pay for a good quality of life wherever they live. I will refrain my previous statement: postdocs are adults with terminal degrees and should be treated as such with work life balance, pay, employee benefits and everything else offered to other working professionals who spend 10+ years earning their degree. The second issue of job prospects is no secret. Academic positions are extremely competitive, with postdocs needing to apply to hundreds of positions for even a chance at getting an offer for a faculty position. And, once in these positions, obtaining funding with paylines for grants hovering between 10-15 percentile is a bleak prospect for a sustainable career. Outside of faculty appointments are staff scientist positions, but these typically do not pay as well as a faculty position and it is too easy to find a similar but better paying position in industry to justify staying on the academic side in these positions long term. I am approaching middle age and have not been able to establish long term financial stability for myself because of low pay and zero benefits. Treat us better and we will stick around.

Existing NIH policies, programs, or resources

The solution is actually very simple. Give research more money. Expand grant paylines, increase budgets for stipends in grants which have not changed in nearly 20+ years. Guarantee positions for postdocs if you are truly concerned about losing us to better paying industry positions. Treat us like the trained, professional adults that we have worked to become.

Proven or promising external resources or approaches

Ask industry what they're doing to retain their employees. Hint: It starts with money and job prospects. Pay us better and we will stick around.

Response 354

Perspectives on the postdoc roles and responsibilities

A postdoc is supposed to be a transitional/ extra training position on the way to gaining a tenure track position. During a postdoc you will work on a project that is focused on your scientific interests that you hope to expand upon once in your own lab upon gaining a tenure track position and establishing a lab where you are the principal investigator. It has become vital during a postdoc to "prove you're fundable" by being awarded some sort of training or research grant.

Fundamental issues and challenges

An academic postdoc used to be a short approx. 2 year transitional/ extra training position on the way to gaining a tenure track position. Now, early-career scientists interested in remaining in academia are regularly expected to do a longer postoc, 4-5 years, or take two or three 2-3 year postdoctoral positions for a stagnant, low salary with a tenure-track position far from guaranteed at the end. Additionally, academia in general has become so funding focused that you can expect to spend a large amount of time writing grants rather than exploring interesting research questions. It is also an expectation that you be willing to work long, odd hours and after 5-6 years as a graduate student this leaves many early-career scientists feeling tired, underappreciated, and burnt out. My significant other works a standard academic postdoc while I work as an industry postdoc. Starting these positions immediately after grad school my salary was 10k more (with a 3-5% raise yearly), I worked 9-5, and I did not have the stress of writing/ depending on grants for my livelihood.

Existing NIH policies, programs, or resources

Academia needs to accept that it is not just competing with fellow academic institutions for talent; they are competing with industry. You want to recruit and retain talent? You have to offer competitive salaries, there's no two-ways about it. People are no longer willing to sacrifice their livelihoods to chase a "passion for science", and many of us have had that passion burned out of us by the end of grad school anyway. We're good at what we do and we want to be compensated fairly. The length of a postdoc/ the expectation that people do multiple postdocs in order to have a shot at a tenure track position also needs to be changed. The training period has gotten excessive and people are tired and bored. 10-12 years and approaching 40 before you have a shot at a reasonable wage and the STARTING POSITION (assistant professor) toward the job you desire as a highly educated individual with several advanced degrees? No thanks, I'll take the easier job, with nearly guaranteed career advancement opportunities, and more money.

Proven or promising external resources or approaches
More pay

Response 358

Perspectives on the postdoc roles and responsibilities
The academic postdoc position is for a recent doctoral graduate to gain additional training and time to increase their research output and write grants, all with the goal of increasing their odds of obtaining a

research-oriented faculty position within academia. This position additionally fulfills many roles for the PI, including mentoring junior researchers, teaching, writing grants for themselves and the PI, and pursuing independent research.

Fundamental issues and challenges

The postdoc period can be an indefinite holding pattern until a grant or faculty position is obtained, which can often take many years and has low odds of success. During that time there is considerable job and financial stress. The postdoc could be putting in long hours writing grants or papers and the pay for postdoctoral trainees is quite poor. This poses a challenge for supporting the cost of living and raising a family. In some cases the pay is just above that of a doctoral student but does not typically come with subsidized housing or on-campus housing options, forcing trainees to move off of the university campus into the community, pay community cost-of-living rates, and extends the commute. High housing costs and low pay make recruitment difficult in high cost-of-living areas. Further, sustained periods of stress can lower retention within academia as postdocs leave for industry careers.

Existing NIH policies, programs, or resources

Higher minimum pay for postdoctoral trainees, postdoctoral trainee support within industry or for academic-industry partnerships to encourage training within an industry setting.

Proven or promising external resources or approaches

No response

Response 359

Perspectives on the postdoc roles and responsibilities

The postdoctoral position needs to be re-imagined. The goal of the postdoctoral "training" is largely to prepare individuals to run their own independent research laboratory, and yet, postdocs receive no formal training in budgeting, personnel management, and many of the other skills required to run a lab. For me, my first year of postdoctoral training was learning a new field, but after that point, the "trainee" designation was no longer justified. I was directing my research projects at the bench, mentoring students, and writing grants to support my research. I obtained an F32 fellowship that included new directions for the lab, which required my optimization of two new techniques. When I brought up writing a K99 two years into my postdoc, my PI was "supportive", but dismissive and said I would be more competitive if I got my paper out. I continued to bring this up, but also got derailed by COVID and birthing my first child. Finally, after nearly four years of my postdoc, I published my paper and was now generating data the final new directions that I had proposed in my F32, but it became clear that my PI wanted to hold on to that line of inquiry. At that point, I did not want to write a K99 and invest another 1-2 years in developing another new project and so, for this and other reasons, I did not pursue the TT route. We need to find ways to accelerate postdocs transition to independence and give them ownership over their ideas and work. I might have applied for TT positions after 2-3 years, but the norm is for postdocs to spend an additional 5-7 years "training". It's unnecessary and all of this extra "training" feels like a pyramid scheme to benefit the mentor.

Fundamental issues and challenges

Pay is the main reason I transitioned out of my postdoc. I might have stayed attempted the TT route if I had been making 75-85k (and my university like many others does not allow postdocs to take the 75k limit for K99 but rather whatever the NIH minimum is for their years of experience). I am now making >110k (same COL) and working less. After years of putting off saving for retirement, I simply couldn't afford to stay in a postdoc position. Also, I learned in informational interviews that my additional years of postdoctoral training was not benefitting my career progression/salary pay band outside of academia. Moreover, when I transitioned to my F32, I lost my employment status and was taxed on the full cost of my healthcare benefits. My university did not offer any retirement match for postdocs and I couldn't even invest in a 403b when I was on my F32. When I had my child, the on-campus childcare had a two-year waitlist and was almost half of my post-tax salary, and thus, we had to use a daycare that was more affordable but farther away, which meant I spent more time commuting. In order to attract and retain the best people in science, we need to:

1. pay postdocs more and adjust for COL,
2. reduce the "training period" or include more actual training in necessary skills,
3. create a mechanism for postdocs to have more ownership over their research that doesn't rely on the mentor,
4. require universities to treat postdocs as employees regardless of funding (retirement benefits, etc),
5. offer more services or rebates for childcare and maternity leave, and
6. enforce institutions to allow trainees to take the max salary on grants

Existing NIH policies, programs, or resources

If NIH really cares about diversity then the academic route needs to be sustainable for people from all socio-economic backgrounds. The majority of colleagues of mine that have pursued TT options are from very privileged backgrounds where finances were not a concern. Postdocs should only be considered trainees for 1-2 years max (if at all) and then they should all move to FTE designation regardless of funding status. I would eliminate the F32 and encourage earlier submission of the K99 and/or create mechanisms in which postdocs can apply for their own grants. I would also create more postdoc-TT type grants to retain postdocs at their current institution (expecting PhDs to continually uproot their lives especially when they start families is a major barrier for young mothers). I did take advantage of the childcare supplements, but $2500 per year is not enough.

Proven or promising external resources or approaches

The academic ecosystem should be modified. PIs have too many job responsibilities and not enough time to effectively perform them. Thus, NIH should reduce the cap for faculty salaries which would free up more money to pay for staff scientists etc who could help share the responsibilities of the PI. There need to be more sustainable career paths in academia to more effectively distribute the accountability. In my opinion, part of the "reproducibility crisis" is due to an utter lack of oversight by PIs who do not put in the adequate time for training/mentoring and quality control of their research. Creating stable positions in academia to help provide some of this oversight would help ensure that the research NIH funds is high-quality and robust

Response 360

Perspectives on the postdoc roles and responsibilities

Existing NIH policies, programs, or resources

It's simple. Pay postdocs a fair salary

Proven or promising external resources or approaches

No response

Response 361

Perspectives on the postdoc roles and responsibilities

My view of this position has changed dramatically during my time in it. At first I viewed a post-doc as a training position and a pathway to research independence. However, in practice it amounts little more than a glorified technical position. Training is often lacking and resources for post-docs vary by institution. Employment status can be easily muddled depending on funding sources and actual independence within a research group varies wildly. A lack of clear expectations and training outcomes make the position difficult to understand in contrast to PhD training.

Fundamental issues and challenges

I believe many people see post-docs as a source of cheap, skilled labor. Many positions lack training and expectations are unclear. Independence is not a goal. The main motivators in an academic environment are the career aspirations of a PI and not the post-doc. Given this structure, jobs with higher pay and more clear expectations are infinitely more appealing. Without clearly defined roles, benchmarks, and training plans a post-doc is simply an underpaid position. Even with independent funding, a post-doc is at the whim of their advisor in a number of ways. This amounts to be locked into a position with the only options being to start over in a new post-doc position or leave academic science entirely.

I believe that post-doc positions should transition to be more like junior group-leaders, and less like extensions of a PhD training program. This change would empower post-docs to make their own decisions about their careers and allow them to apply for additional funding on par with PIs. This would be create additional avenues for independence and provide a more clear training relationship between the post-doc and their primary advisor. It would also place the post-docs employment squarely within the university system and not with a specific group. Changes to the group may not result in changes to the employment status of the post-doc which would provide much needed certainty.

Existing NIH policies, programs, or resources

Force NIH fund receiving institutions to allow post-docs to apply for independent funding as PIs. Allow post-docs to become great stakeholders in the research program within their labs and the institution as a whole.

Proven or promising external resources or approaches

No response

Response 362

Perspectives on the postdoc roles and responsibilities

Post-doctoral researchers are professional scientists who are in a transitionary role to

1. learn a new skill while applying their expertise to a particular project/line of research OR
2. produce publications or funding resources to bolster a resume to be viable on the current academic job market.

Fundamental issues and challenges

Pay and benefit access are paramount. Post docs have usually just completed 4-6 years of graduate school, where they are often paid at minimum wage and can have unstable access to healthcare, mental health resources etc. They graduate with the highest level of a professional degree, are professional scientists, and yet most postdoctoral positions make 50-65K a year and it’s extremely variable as to whether they have the protections of employee status.

Many grad students also don’t want to enter the academic job market and so the question becomes, what would a post-doc even do for them?

Existing NIH policies, programs, or resources

Raising the pay limit, working with institutions and PIs to appropriately fund post-doctoral researchers through granting agencies.

Proven or promising external resources or approaches

No response

Response 363

Perspectives on the postdoc roles and responsibilities

Being an academic postdoc, I must say it gives confident to be an independent researcher. Postdoc implements his/her ideas and explore new avenues in science. From project planning to execution, everything belongs to postdoc.

Fundamental issues and challenges

There are many issues with postdoc like:

1. Salary is very low,in spite of being highly educated.
2. Disparity among salary in different universities, even in different departments of sam euniversity.
3. Salary should be given as per experience , eg. if one is 5th year postdoc, he/she should be given more salary than 1st year individual.

Existing NIH policies, programs, or resources

There are several Grants which are only open for Permanent residents/citizen, which is not good. As postdocs comes from all over the world, so grants opportunity should be given equally to every postdoc irrespective of immigration status.

Response 364

Perspectives on the postdoc roles and responsibilities

For me, the academic postdoc has been a time to

1. Achieve scientific independence and
2. Develop a research program that I can use to start my own academic lab.

Fundamental issues and challenges

1. Stipends that are often below the cost of living.
2. Lack of support for childcare.
3. Lack of retirement benefits.
4. Lack of funding mechanisms for international postdocs

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 365

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should be a pathway of additional training to become a more independent biomedical researcher. Such training is vital to keep us at the leading edge of science and technology and these individuals will matriculate into many areas of science (not just academia).

Fundamental issues and challenges

The system is not currently working. Pay levels are too low compared to industry. For example, I have lost 3 postdocs to pharma over the last several years and they were hired based only on their PhD training (none of these postdocs had papers of their own out of our lab yet). Although NIH has been increasing the pay rate for postdocs over the last several years, they have NOT increased our grants to accommodate these changes. I don’t know how on earth we can pay more when our grant levels don’t change to allow us to pay more. Note that many R01s from NIGMS are being knocked down to 200K/year.which is the exact same amount I was given 15 years ago! Our ability to do the project or pay reasonable salaries is literally knee-capped by the amounts we are given. I feel it is not fair to ask us to increase postdoc salaries without it coming with grant increases along the way to do so. And we really need to do more for our postdocs. But if we don’t turn things around, we will have very few US citizens becoming more highly trained with a postdoc to feed academia/industry make future advances and discoveries. Yet, China is

pumping tons of money into science and we will just fall behind and loose our standing of being the leaders in science and technology. We REALLY need to change the system. I don't think I'm off the mark here and feel very frustrated with the current system. Related to this, T32s are broken as well.

Existing NIH policies, programs, or resources

Pay more, not just postdoc salaries but the grants at the same time to allow us to pay those amounts.

Proven or promising external resources or approaches

No response

Response 366

Perspectives on the postdoc roles and responsibilities

As a an academic postdoc, I am looking to expand my independence as an investigator by taking on more mentoring and teaching responsibilities than I did as a graduate student. Ideally, a postdoc's research focus should have a component that is significantly different from their PI's so that they can prepare to start their own lab.

Fundamental issues and challenges

Postdocs are generally in their late 20s and early 30s, at time when many of their peers are getting married and having children. The current structure of an academic postdoc is almost prohibitive to this lifestyle (unless your partner is the one carrying the child and has a job with actual benefits and maternal leave). You cannot take a break to have a child because every grant eligibility is based on how long it has been since you completed your Ph.D. Meanwhile the institutions we work for consider us trainees or employees when it works for them (not having to provide retirement matching, transit benefits, health insurance or leave offered to employees, while not giving us access to benefits undergraduate/graduate students have such as access to student health, on campus fitness).

Because postdocs generally have to select their institution based on what labs/ PIs meet their research needs, we to not have much choice in the institution we work for based on the benefits they provide. The institutions know this and have us essentially hostage while offering every group around us better benefits.

Existing NIH policies, programs, or resources

1. Include minimum requirement for benefits in addition to just salary in your requirements for postdocs, or at least a requirement that postdocs receive benefits commensurate with other employees at the institution with the same level of education and experience
2. Go through the current F award application and streamline it so postdocs can spend more time actually doing research and less on writing grants. For example, in an F32 application there are three separate sections that require you to describe the available equipment and "Research Environment and Commitment to Training" and parts B and C of "Applicant's Background and Goals For Fellowship Training" can cover much of the same ground.
3. Allow R grants to incorporate increasing year over year direct costs. The NIH raises the minimum salary for grad students and postdocs, yet somehow over a 5 year R35 my PI's direct costs are expected to remain the same? Even without accounting for inflation increasing supply costs, we are struggling to have any money for actual research after salaries are paid, and yet as a postdoc I am now getting paid LESS than the minimum salary for a technician with no PhD at my institution.

Proven or promising external resources or approaches

No response

Response 367

Perspectives on the postdoc roles and responsibilities

I view a post-doc as a semi-independent position that is the culmination of your trainee period. You take on a research project that is almost completely driven by yourself with consultation by your postdoc

mentor. You should be able to use your critical thinking skills, laboratory skills and other skills learned from your graduate period to apply to your post doc to show that you can perform as an independent researcher in the future.

Fundamental issues and challenges

Lack of competitive pay with industry and other non-postdoctoral positions; uncertainty in the stability of future grant funding availability; perceived lack of tenure-track jobs that might be available after a post-doc; general decline in the prestige of being a scientist in the view of the general public—mostly due to polarizing political views

Existing NIH policies, programs, or resources

Put more emphasis on non-traditional career paths (deemphasize tenure-track research PI positions); ensure that postdocs at non-NIH institutes are paying post doc positions at competitive pay levels

Proven or promising external resources or approaches

No response

Response 368

Perspectives on the postdoc roles and responsibilities

My position goes beyond the scope of a trainee, to be designated as such is an insult and an opportunity for institutions like UPenn to exploit postdocs. A postdoc is a position that does have an element of training, but we are experts in our field, we are simply expanding that knowledge. Just like a PI on any other project. Should PIs discovering new science be considered a trainee? Apart from conducting research projects, there are responsibilities beyond that including mentorship of undergraduate/postgraduate students. We are expected to conduct outreach and be involved in academic service in order to enhance our CVs to survive and have a chance for tenure. We write grants. However, because of the NIH's discriminatory and exclusionary policies to only allow international postdocs apply for a handful of grants (and education opportunities) we are not able to enhance our CVs and demonstrate our independence unlike our US citizen counterparts. While I am at a wealthy institution, I can't help but recognise that the plight of postdocs in less well-off institutions have it even worse than me and their possibilities to gain a K99 or lobby for salary increases are even less than my own. This is a total system failure perpetuated by the NIH and exploited by US academic institutions.

Fundamental issues and challenges

It really is simple:

Poor SALARY.

This is obvious, most postdocs live paycheck to paycheck and would not be able to afford surprise bills. Furthermore, you are taking advantage of people at the prime of their lives in their early 30s who may be thinking of having a family, owning a home, or having children. How do you expect people to stay in a post that limits their quality of life. A lot of PIs play the card of "well you are getting experience and training you have to sacrifice salary". This is nonsense. Why should anyone have to sacrifice their livelihood, health, wellbeing and happiness for a job. Furthermore, in my institution, grad students earn more from their stipend than we do after tax per month. Therefore, the grad student I mentor earns more . make sense of that. Do better NIH.

Poor BENEFITS.

As a consequence of "trainee" status we have poorer health, dental and eye insurance benefits compared to our non-postdoc co-workers. Families have to pay awful high fees, which all comes out of your abhorrent salary.

VISA Issues.

Stating the obvious, the US immigration system is poorly managed causing visa issues. This is compounded by institution only offering 1 year visas that have to be renewed every year. This causes great cost to postdocs. I have to return every year to Europe. Between the costs of travel ($800-1500), accommodation ($~400-800) and visa related costs (~$400) I spend over $2000 dollars to renew my J1 visa. Who pays for that? I pay for it. Where does that money come from? My abhorrent salary.

LACK OF JOB PROSPECTS.

This is simple, most postdocs go to industry because of lack of salary and benefits. I truly want to research and teach in the US, but it won't happen. Your benefits hold us back.

Existing NIH policies, programs, or resources

I think the feedback above gives you something to work on.

Increase salary.

Extend visa length.

Provide relief for visa renewal costs.

Set a minimum standard for health benefits.

Change postdoc status from trainees to employees.

Promote staff scientist positions.

Increase international postdoc eligibility for grants and training (you can't on one hand be all about inclusion, and then show us the door when funding opportunities arise).

Proven or promising external resources or approaches

I am going to use this space to tell you that despite the negativity in my responses, I care about the future of postdocs and the role of the NIH in their development. The problems are obvious, the solutions are obvious. Please take immediate and meaningful action. Furthermore, put the opinions of younger early career researchers in your organization first. They understand the problems better and they will have to deal with the consequences of the decisions the NIH makes today.

Response 369

Perspectives on the postdoc roles and responsibilities

When I chose to pursue a postdoctoral position, I was grasping for a position that allowed for further training in techniques, lab budgeting, teaching opportunity, and lab management. A postdoctoral position should be treated as a preceptor to becoming academic faculty.

Fundamental issues and challenges

1. Salary. I think this is the biggest issue. It is very difficult to convince graduate students who are overworked and extremely underpaid to then sign on to another 3-5 year commitment of being overworked and still underpaid. Many graduate students look at the work/life balance and large paycheck of industry, and postdoc positions simply just can't compete. Ask yourself—why would you get underpaid, no bonus, no raise, when you can begin your career in industry making double what an academic postdoc receives plus yearly bonuses and raises. It is honestly surprising that people are still pursuing postdoc positions.
2. Work/Life balance. In many institutions postdocs are treated as 'free labor'. We are given massive, extensive projects with short time lines. This leads to extremely poor work/life balance (sometimes working 60 hours a week with no overtime pay!). It also leads to a lack of time available to work on professional development.
3. Professional development. Postdocs are not given opportunities to grow professionally. There is a lack of training on how to budget, grant writing, opportunity to serve as a reviewer, serve on a committee to plan a conference, how to manage a lab, how to deal with conflict, etc. Everything that a research faculty might encounter, we should be getting trained for. There is also a lack of opportunity to teach which is a skill that is VERY important if pursuing a professor position.

Existing NIH policies, programs, or resources

SUNY has a program—PRODiG—that allows grad students and postdocs to serve as a 'faculty' member at an institution for 2 years to gain experience in teaching and professional development. If there were more funded opportunities like this—to gain hands on experience—that would be GREAT!

Proven or promising external resources or approaches

[redacted for anonymity] has a postdoctoral organization that meets monthly that encourages support of each other and socialization. GREAT!

Response 370

Perspectives on the postdoc roles and responsibilities

As an international trainee, I expected to master neuroimaging methodology, and develop a research question on substance use disorders or related areas, then become an independent researcher in 3-5 years.

I think NIH didn't lead the postdoc training in the Biomedical research field. The quality of postdoc training is varied a lot, relying solely on PI, and not being supervised AT ALL other than by the PI.

Fundamental issues and challenges

International trainees are likely to be treated as a technician + research assistant + project manager. They have less opportunity to write grants, less network, and secure time to explore and develop skills

Changing lab or PI for an international postdoc is very challenging, even being treated improperly, many of them chose to bear with it to secure their visa status.

Existing NIH policies, programs, or resources

I think the problem is many postdocs are hired by PI, and only supervised by PI. Some PIs will require postdocs to work on multiple projects, not only the ones to support them.

Postdocs have very few grant opportunities and support, it gets worse if their mentors want them to work more on their projects.

Suggestions: Postdocs should have external support and supervision outside of PI, to make sure they are on the track toward their academic goal.

Proven or promising external resources or approaches

NIH have training programs that only for citizens or permanent residents. However, many postdocs are international and therefore do not qualify for these training programs. I wonder if NIH is aware of the number difference between U.S. postdocs and international postdocs, and how competitive NIH-funded postdoc programs are. I hope the NIH can either accept international trainees (especially those who are already in the U.S.), supervise all postdocs, and provide help to postdocs to match/switch PI when needed.

Response 371

Perspectives on the postdoc roles and responsibilities

Academic postdocs are highly skilled, doctoral level researchers that contribute to moving scientific projects forward under the guidance of a principal investigator. Considering the postdoctoral role as a "training" period is discounting their contributions and value to their lab. It is also misleading to consider postdoctoral "training" to be in preparation for a faculty position given the increasing competitiveness of the faculty job market. If all postdocs that will eventually be unsuccessful in this job market left academic research, there would be a massive productivity issue as postdocs are often the employees that are progressing the research on a day to day basis.

Fundamental issues and challenges

1. Postdoc pay is too low for the level of expertise they bring to labs. This is particularly true in high cost of living areas (NYC, SF, LA, Seattle).
2. The academic job market is too saturated for most postdocs to remain, so due to the low pay and low job security many are opting out of postdoctoral positions entirely to go into industry positions that often pay 3x what an entry level postdoc job offers.
3. The suggested pay range from NIH is so low that in high cost of living areas, non-PhD roles in the lab (i.e. research techs, etc) are often being paid the same or more than the postdocs that help oversee their work
4. In WA state, state law now requires (as of Jan 2023) that overtime exempt employees make a minimum of $65,500. This number is projected to increase over the next 5 years. Faculty are having to stretch grant budgets to meet this new salary requirement. This new salary requirement also disincentivizes applying for F32 or similar awards that pay below the state minimum threshold.

Existing NIH policies, programs, or resources

1. We need a higher cap on R01 budgets to support increased salaries.
2. Raise the suggested minimum pay scale for postdocs.
3. Consider paying postdocs based on geographic cost of living adjustments. Currently a postdoc in Mississippi has significantly more spending power than a postdoc in California.
4. Raise the salary allowance on postdoc fellowship awards (F32, K99, etc).

Proven or promising external resources or approaches

No response

Response 372

Perspectives on the postdoc roles and responsibilities

When I joined the lab as a postdoc, my role was related to developed my supervisor idea. As I became more senior, I have enjoyed the intelectual freedom of deciding my own projects and developing my own ideas

Fundamental issues and challenges

Salary is terrible and immigration paperwork makes the life of a postdoc in the US miserable. Fear to not get your visa granted, fear to leave the country (just in case you have problems re-entering the country), always on and edge. I LOVE science and I have enjoyed every minute of my postdoc, but as an immigrant mother of 2, married with another postdoctoral fellow, I feel I have jeopardized everything else just to get me doing science. It should be this way

Existing NIH policies, programs, or resources

It should be easier to get a faculty position. Besides K99 should be other mechanism.

Proven or promising external resources or approaches

Increase salary and benefits. Visa paperwork should be Free for the postdoc and visas should be more flexibles to allow the postdoc to switch jobs (many people stay in a toxic environment because of the visa). More faculty positions and More representation—in my current lab (made up of several research groups there are 0 PIs that are women and the las hiring: a white man! Is this equity? I have felt support by my mentors and colleagues but I don’t see INSTITUTIONAL support

Response 373

Perspectives on the postdoc roles and responsibilities

My postdoc was intended to be a scientific role only. I am the lab coordinator, lab manager—I handle ordering, maintaining budgets and maintaining inventory. I also need to coordinate with grants manager for funds allocation.

Fundamental issues and challenges

The salary is the major limiting factor. Like most other countries, postdoc salaries should be consistent on the city they are working in. Boston is the 2nd most expensive city and someone working in Kansas/Boston is veing paid the same salary. This is not sustainable.

Career progression is another reason. PI should be trained in promoting postdocs to better roles in their labs as time progresses, regular salary revisions. Incentivizing PIs who do this could be one way to go about it.

Existing NIH policies, programs, or resources

Put the onus on PIs and not on postdocs for career development. PIs who show that postdocs have made progress with PIs support should be given higher ranking in the NIH system for future grants.

Proven or promising external resources or approaches

A good postdoctoral programs office and competent people running it will definitely help.

Response 374

Perspectives on the postdoc roles and responsibilities

My understanding of a postdoc is that it is supposed to be a time when an early career scientist gains additional training prior to moving into an established scientist role (career-track faculty, research/senior scientist, government staff scientist, or industry positions). In practice, the postdoc is often treated as a senior scientist in the lab with additional duties training students and technicians, establishing new protocols, writing grants and papers, and troubleshooting equipment and protocols within the lab. The smaller the lab budget, the more reliant upon postdocs the lab seems (they often have few or no technicians).

Fundamental issues and challenges

The responsibilities of labs, departments, and institutions to their postdocs are ill-defined. While postdocs at well-established labs from coastal institutions may have success obtaining funding leading to careers (coastal schools have better rates of F32 and K99 awards), postdocs training at state schools generally don't. Instead, the postdoc period seems to extend indefinitely, with few raises and often no avenue to the next career phase. Even at state schools, they seem to only interview candidates from the coasts.

Additionally, despite the discussion of NIH payscales being inadequate for cost-of-living, PIs pay well under these rates and generally do not support benefits. For those of us "lucky" enough to have benefits, if we earn a fellowship that brings us up to NIH rates, we lose benefits. We might consider this worth it if at the end of our training we had job prospects, but many faculty searches have over 100 applicants and they hire 0-2.

Another issue I feel strongly about as a postdoc is watching MDs with little to no scientific training given PI status over labs. How is an MD with maybe a 2-year scientific fellowship more qualified to run a research lab than a postdoc who has minimally completed training as a graduate student and as a postdoc (often more when you include the undergraduate and post-bac research required to get into grad school today)?

This brings me to the final dominant issue facing postdocs: time to career. I have been a trainee in labs for 18 years now (2 in HS, 4 in undergraduate, 7 in GS, and now 5 in postdoc), and I'm still considered a trainee. I can think of no other profession that perpetuates this level of infantilization to justify the lack of careers for those being trained.

Existing NIH policies, programs, or resources

F32s and K99s need to be more equitably distributed. In their current state, they simply funnel more money into the big name labs and perpetuate the bias against postdocs from non-coastal or Ivy league institutions.

Proven or promising external resources or approaches

Internships. Internships are a common portion of training for CS and engineering students and help them build industry contacts facilitating careers post-training. In the life sciences, postdocs are expected to work exclusively for a PI without any tangible requirements of the PI to help them build their future career. Its basically an extension of grad school in its current state, allowing PIs to keep inexpensive labor in their labs with no real responsibilities to the trainee.

Response 375

Perspectives on the postdoc roles and responsibilities

My perspective stems from my own experience as an NIH supported postdoc, supported for 3 years and 3 months on an NRSA F32 (with small COVID extension). By choice, I am not participating in academic research at this time—though I have bench space available in previous laboratories should I wish to contribute.

A postdoctoral position, to me, should enable an individual to ask and answer a research question through gaining new skills, training and expertise in addition to utilizing the skills attained from previous training. Ideally, an academic postdoctoral position would help an individual explore and expand an area of research that in the future they can use as the basis for starting their own laboratory.

Fundamental issues and challenges

From my perspective, it is not cost effective for a postdoc to follow an academic path, especially since the path itself is uncertain and will likely only end in disappointment. During the beginning and throughout doctoral studies at an R1 university, it was stressed that no one was going to get an academic job. We were coached to think about alternate career paths from the first semester of study onward, though a few of my cohort now run labs.

It is IMPERATIVE to ensure that universities support their postdocs during their investigations, as they promised to do. In my own F32 supported postdoc, my research greatly suffered from my university's lack of accountability. During my project, I was consistently misadvised on how to spend my funds and how to order supplies with my funds, despite being able to successfully do this as a graduate student at the same university. Access to my grant funds was not allowed until near the end of my project to "spend down" funds, since no one seemed to know what funds I had. For the majority of my grant I was limping by on whatever supplies I could borrow. I was specifically not allowed to use my funds to pay for my mouse facility costs and this led to overdue facility bills and a grumpy PI since I had no other way to pay for my mice. I spent the majority of my postdoc writing grants (submitted 4! federal) to pay for the postdoc I was already doing. Eventually, IACUC refused to renew my protocol, citing lack of funds, leading to termination of my mouse colony prior to the end of my grant. I applied for and received a COVID extension, but without my mice, could only justify a few months time.

Existing NIH policies, programs, or resources

Expand the financial resources available for supplies and specify that funds need to be used by X time in allotments for X thing on the grant. For example, by 6 months in on the project, X% of funds need to be spent in the supplies budget (based on individual grant items, justified in the grant submission). If a project calls for mouse work, allow for $ to be spent on facility costs. If a project calls for mouse breeding, support the facility costs for breeding.

Require yearly documentation from the PI about what projects they are asking you to contribute to—and specify a percentage of time that should be devoted to projects that are not in the grant you are responsible for. For example, while working on other grants the PI has is beneficial for learning new techniques, less than X% of time should be devoted to work on other grants. I am grateful for the extra training, however, this cost time on my own grant.

Specify the postdocs can only mentor X number of students. Personally, I mentored half a dozen undergraduates for my entire postdoc, which were enrolled under my PI for their university research credits. Require documentation from the university from NIH supported labs for X students per grad, per postdoc. I did not need an undergraduate army and did not yet know how to say no.

Coach postdocs on when and how to say no! Hold a mandatory training session on what a postdoc is supposed to be doing. Tell them it's okay to say "NO" to extra students, etc. and enable your postdocs to advocate for themselves or position an NIH advocate to deal with university communication/purchasing/ordering/etc.

Proven or promising external resources or approaches

Fund the entire project on F32's, even if this means reduced numbers of F32s awarded—since clearly there are not enough academic research positions to go around for trainees. Eliminate the push for PIs to use their own research funds to support a postdoc on their own project—especially when mice are involved—since this leads to time misspent on grant writing for the PI and resentment from other lab members, etc.

Push accountability for spending funds in a timely fashion—require receipt of necessary supplies in yearly documentation and review it. If a grantee is not spending, require justification—and pull funds if necessary. Empower your postdocs by training them on what they should and should not do to succeed in an academic role (eg. how to spend grant funds, how to talk to universities, how and when to write a K99) at the BEGINNING of their postdoc.

Assign and publicize the availability of an NIH individual to interface with the university on behalf of postdocs—to circumvent issues of spending availability, spending concerns (how to pay for the facility costs for the genetically modified mouse colony specified in the grant???). Introduce this person to postdocs at the start of the grant, perhaps at an "all hands" style meeting.

Hold a required yearly Zoom meeting with all postdocs for advice based on year of progress, Q&A, etc. to expand mentorship. Do workshops to increase camaraderie. Connect people in similar fields in breakout rooms—increase networking. Force interactions by requiring low key 5 min quick talks (oral presentation) of progress on grants to a group followed by Q&A for years 2+ and promote troubleshooting among peers.

Response 376

Perspectives on the postdoc roles and responsibilities

I see the postdoctoral position as a transition to independence, in terms of research, administration, and mentoring. This means that the most valuable postdoc positions only last as long as is necessary to publish and gain funding for attaining an independent position in academia or industry.

Fundamental issues and challenges

Too few postdoctoral positions are a true path to independence, and are often treated by supervisors as "secondary graduate training", with limited-to-no abilities to pursue independent funding, primary mentoring, and administrative training opportunities. Very few postdoc positions are also meaningfully coupled with industry work, making them seem like a narrowing of the career path (with few "final" tenure-track positions available at the end). Coupled with the relatively low pay of these positions relative to comparable industry roles, postdoc positions are not seen as worthwhile by many newly-minted PhDs.

Existing NIH policies, programs, or resources

First and foremost, the NIH postdoctoral payscale should be increased and should scale based on the local cost-of-living (COL). It is impractical to expect academic institutions in e.g., NYC to compete with industry positions in the same area that pay three times as much. This would also (hopefully) encourage many institutions in high COL areas who use these scales as guidance to increase the wages of postdocs who are not supported by NIH fellowships.

NIH postdoctoral fellowships should also preferentially target new PhDs, rather than those who have already established themselves in a postdoc laboratory (following the NINDS F32 format, for example). These fellowships should promote research and academic independence more than they currently do, rather than simply being a slightly modified version of predoctoral equivalents (e.g., the F31/F30 mechanism). Alongside these changes, it would be very encouraging to see small-to-medium sized research grants available to postdoctoral researchers, perhaps even as a "supplement" to fellowships—this would allow postdocs to build their research portfolio, while also allowing them to develop collaborations orthogonal to those with their supervisor.

Proven or promising external resources or approaches

The NINDS F32 format is a good starting point for providing fellowships to postdocs at a stage where they are deciding whether to transition to industry or remain in academia.

The European system for postdoc independence is more enticing (although it has different problems that should not be emulated)—small grants for postdocs to lead their own projects and the ability to act as MPI on major grants would make postdoc positions seem more like a true pathway to independence.

Response 377

Perspectives on the postdoc roles and responsibilities

I am currently an assistant professor in a 60% research position. I was a postdoctoral researcher from October 2013 to March 2018 at [redacted for anonymity]. Throughout that time I was supported exclusively out of R01 funds awarded to my mentor. Here are my main thoughts from that time:

For the early part of my postdoc I held an H1B visa. I only obtained permanent resident status through marriage (as an LBGT person that was only made possible by the supreme court repeal of DOMA). As an H1B holder I was unable to apply for any NIH training awards other than the K99/R00, which made my resume seem less competitive than peers (I have observed this now in search committees as a faculty member). When combined with the highly restrictive (and open to workplace exploitation) nature of H1B employment, this puts non US postdocs (a SIGNIFICANT portion of the postdoc population) at a double disadvantage in terms of career progression.

A postdoc is a job. The idea that it is "training" is deeply demoralising. As a faculty member I recognize that skilled lab members (ie, postdocs by and large) are essential to run a modern extramurally funded lab. Thus, they do work. That these are also stepping stone positions to other jobs doesn't negate that. Many positions are. But postdocs should be treated as employees, with the attendant benefits, job protection and remuneration.

The cost of living factor. I was on the NIH pay scale at the time ($43,000 a year initially). Where I lived (rural northeast [redacted for anonymity]) this was more than median household income. That said that amount (in particular with dependents, poor health insurance, etc.) was inadequate in Boston or San Francisco. The concentration of Postdocs in large, expensive urban areas exacerbates the cost of living issue.

Fundamental issues and challenges

- Job prospects. Graduate students now are aware that academic research jobs are difficult, rare and stressful. No grad students I have spoken to in years are interested in pursuing academic jobs. The postdoc is perceived as only necessary as a stepping stone to those jobs. Thus, no graduate students are interested in postdocs. Anecdotally I will note I ended my postdoc with 15 published papers. I applied to 45 tenure track faculty positions. I obtained 1 offer.
- Quality of life. Postdocs are in their late twenties/early thirties and often trying to start the "adult" phase of life with partners and children. Work-life balance is extremely important to current young people (see also how Med student interest in high burn out specialties is dropping off lately). Yet the expectation remains that postdocs will work any and all hours to get work done. This is combined with the resume arms race to get high profile papers and funding. Again given the low chance of success (as defined by getting a tenure track academic position), the lifestyle of the postdoc is unnatractive
- Concentration of postdocs in unnafordable coastal cities.

Response 378

Perspectives on the postdoc roles and responsibilities

A postdoc is a position for academic researchers to conduct more research in order to get an academic position. Despite many labeling it as a "training position," there is relatively little training involved in the nuances of being a professor. Essentially, a PI has a grant that needs a scientist, but the project is too important/complex for a new PhD student, so a professor hires a postdoc to complete the project. The postdoc MIGHT receive training on grant writing, teaching, budgeting, managing, etc, but mostly the postdoc is solely used to build the CV to apply for academic positions (and be the PI's slave). Also, there is a good chance the PI is abusive and a terrible boss that doesn't care about their workers.

Many of my peers feel that a postdoc position is a "scam" position that academia has made to keep trained researchers but compensate them poorly. If you look at the history of academia, where postdocs only started because open professor positions started dwindling, you come to realize that it seems like further and further gatekeeping position to "haze" you on path of professorship. Now, academia runs on postdocs, and essentially the whole system has become a "suffer until you get a professor position." However, less than 10% of PhDs now become professors and most go to industry, where a postdoc is not necessary. This has led most PhD students to reject postdoc positions, and now there is a postdoc shortage where professors can't find enough qualified postdocs. Essentially, a postdoc has been a "kick the

can down the road" problem/position that failed to address the real issue: lack of positions in academia that aren't professors and lack of professor positions.

Fundamental issues and challenges

Postdoc positions rarely contribute to career advancement outside of academia, and there are barely any career advancement options for postdocs that do not want to be principle investigators in academia (few university research assistant professor or staff scientist positions), making it essentially a dead-end position. Most postdocs will turn to industry, where they realize they did not need the postdoc at all and it was wasted time. To fix recruitment, postdoctoral positions need to have better incentives for people that want to go both to academia or industry. To fix retention, there needs to be proper career advancement options and actual career development. To fix quality of life, having better pay and longer contracts is important, but also actually punishing bad PI bosses who promote toxic environments. Academia has a mindset of: we invested in this PI, so we need to protect our investment over a postdoc or student that is temporary and doesn't matter. If you don't fix that problem, then retention and quality of life will always be poor.

Existing NIH policies, programs, or resources

Reducing large academic labs with many students that have a large number of grants. Most of these large labs run like companies that can get cheap labor every year. If you spread the wealth, there will be more positions and more reasons to stay in academia because of actual career advancement opportunities. Leverage universities to have staff scientist positions, or more research professors. Otherwise, I don't see the problem ever getting better.

Proven or promising external resources or approaches

I have only seen 2 places that postdocs are done well. One is at a national lab, where the pay is good, postdocs are 75% effort to a chosen project and 25% personal effort (career development, own research projects, etc). Many postdocs also stay on at a national lab after the position, where they can become a staff scientist. Second is in industry companies that allow postdocs to move to senior scientists (or Scientist II+), meaning that there is actual career progression.

Response 379

Perspectives on the postdoc roles and responsibilities

Functionally, it's a job. We are primarily highly skilled and productive members of labs, filling a broad set of needs for a lab including performing experiments, mentoring lab members, leading subteams, designing projects, and providing institutional knowledge and experience to address the myriad challenges that any lab faces. From my perspective, it's clear that we make an outsized impact on the success of a lab. While we receive some informal training, it is a very small fraction of our time spent in the lab. The vast majority of "development" we achieve is driven by our own experiences in the lab. I therefore think it is far more accurate to describe us as employees rather than trainees. Obviously, we are not financially compensated in line with our extensive skill sets and productivity.

Fundamental issues and challenges

1. Low salaries.
2. Lack of secure job prospects.
3. Lack of respect relative to our importance/skillset.
4. Well-known rampant abuse by the majority of lab heads regarding work life balance, support for postdocs raising children, mismanagement of projects.
5. For demographic groups underrepresented and undersupported at the PI level, there are very few actual policies used by the NIH or academic institutions that seek to remedy these issues. There are tons of words being thrown around in support of these groups but almost no mechanisms that either provide financial support or that impose consequences on institutions that fail to substantively act on the problem.

We are mostly in our thirties, often trying to raise families or at least establish a secure career and lifestyle. These goals are largely incompatible with most postdoc experiences.

Existing NIH policies, programs, or resources

Pay us better (raise the postdoc minimum salary). Do more to restrict lab sizes (fewer R01s to big labs, spread the funding around) so that smaller labs can afford to pay postdocs better.

Extension of K99 etc deadlines for new parent postdocs is really good. These deadlines should be extended farther.

Motivate PIs to find co-mentors for postdocs and reward PIs that agree to serve as co-mentors for postdocs.

Proven or promising external resources or approaches

I don't understand the question so I will just bring up a topic that I think can help postdocs a lot. Collaboration. It makes no sense for postdocs to learn how to physically perform 30 different types of experiments in 5+ disciplines. Papers have more types of experiments/analyses than ever before. Science is more complex than ever. It is very difficult to become an expert in so many technical disciplines (examples: microscopy, bioinformatics, behavioral neuroscence, machine learning, molecular genetics), but it is common to see a single postdoc try to cram all of these types of skills into their 5+ year postdoc and combine them in one paper. For some reason PIs and the community seem to perceive this as a good way to train postdocs. As soon as these postdocs become PIs, they will stop using the technical expertise they worked so hard to gain, and instead will have to rely on higher level project design and management skills that they didn't get a chance to develop as postdocs because they were busy trying to learn all this technical stuff. I think the NIH should financially reward postdocs that write (and PIs that support) fellowships and grants that are truly collaborative. (Not just statements about the postdoc receiving training and advice from other labs.) I would like to see a funding mechanism for postdocs from different disciplines that propose a project together. This would speed up postdocs and might also foster relationships that will continue to be fruitful when these postdocs start their labs. This could also be incorporated at the level of PI grants if they're willing to specifically identify cross-lab postdoc joint projects.

Response 380

Perspectives on the postdoc roles and responsibilities

To be honest I wasn't sure the postdoc was something I wanted. I was encouraged to consider however because it was promoted as a "protected time to get papers published." This has been true and I am grateful for the time. I also have come to see it as a time to reflect on my dissertation work and to actively think about the next steps. I say actively because, during the predoctoral phase, this time didn't exist. I've come to believe it is a time for recovery (from the PHD process), reflection, and refueling. I am meeting other experts in the field, establishing mentored relationships, teaching a little, and learning about the policy and practice of the academy. I am also restoring my soul. All of this is happening at a pace that is manageable.

Fundamental issues and challenges

My research is heavily focused on social health and its relationship to physical health in women and gender-expansive people. Research informs us that social support positively impacts a myriad of physical and mental health outcomes. The opposite of this, social isolation, negatively impacts health. I believe this is the same for academia. The power play between gender, race, and other sociocultural norms are upstream factors impacting social health, leaving many postdocs isolated and lost. I am fortunate to have solid support in my space but when that is lacking, it makes it difficult to really understand how one truly "builds their own program of research." This lack of support can be seen in all aspects of academic duty and is discouraging to the postdoc. Although not a biomedical researcher, I was invited to complete this questionnaire. The siloing nature of some academic spaces also affects the quality of life for the postdoc. I am in nursing but my academic institution is heavily focused on medicine postdocs, adding a feeling of exclusion. Interdisciplinary work and team science are what I believe we need to effectively advance research but if our institutions don't recognize this in our training then we are likely to miss a valuable lesson in working together.

Existing NIH policies, programs, or resources

Perhaps building interdisciplinary postdoctoral training teams or creating early career investigator grants that are interdisciplinary. I'm still learning NIH policies, and resources myself but this seems like a useful

addition. Currently, through the school of medicine, we are required to attend the RCR series offered by NIH. I'd like to see a collaborative effort among the leaders/coordinators from all of the schools to present this content. Research misconduct occurs in all areas of research and it would be nice to have presenters share cases and experiences from areas other than bench science. Mentor matching when postdocs begin their time but with someone in another discipline with similar interests. Perhaps this already exists but it just came to mind. Start-up funding also matters. Ensuring that postdocs have ample financial support to begin projects is always attractive.

Proven or promising external resources or approaches

I am not familiar with any promising external approaches.

Response 381

Perspectives on the postdoc roles and responsibilities

To me, it seems like a postdoctoral position is an unnecessary position that academia has deemed necessary for not many other reasons than that they can pay postdocs less than full scientists or professors. It is almost always necessary to get a position in academia but not industry, and seems like it functions the same as just extending your PhD in many ways.

Fundamental issues and challenges

I think the fundamental issues all relate to how postdocs are treated. They are treated as being more knowledgeable than PhD students, but not worth paying much more money. A lot of times they are treated as a resource for teaching lab members skills and helping lead the lab when the PI is too busy. They don't get all the benefits of being a PI but are expected to almost have the knowledge of one. As with PIs, they are often also expected to be good mentors/teachers, without having any training in how to do so. They are expected to be okay with moving long distances for short periods of time. Overall, I think postdocs are severely undervalued.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Giving postdocs better pay, better training, better benefits, and more stability in their positions would help increase their retention. Also potentially formalizing career pathways (some people need a postdoc to get a position, some people don't, etc.).

Response 382

Perspectives on the postdoc roles and responsibilities

My postdoc training has been so important to me. I got essential training in running an experiment from getting IRB approval, recruiting, performing experiments, data analysis, and publishing. This gave me basic knowledge and experiences in doing responsible and rigorous science, and pave new avenues for my career.

Fundamental issues and challenges

The relatively low salary is absolutely a drawback of choosing post-doc work over entering the industry.

Existing NIH policies, programs, or resources

Not anything in my mind.

Proven or promising external resources or approaches

It will be helpful for postdocs to focus on science if the salary of postdoc can be increased.

Response 383

Perspectives on the postdoc roles and responsibilities

Post-docs are absolutely essential in the research process. I also train doctoral students, but there is many tasks that require the degree of specialization that only a post-doc has.

Fundamental issues and challenges

- NIH postdoctoral stipend levels: The current NIH post-doctoral stipend levels are about $10k too low to be competitive (i.e. to keep the best graduating doctoral students in an academic setting, rather than have them go to industry)
- Professional development funds: a post-docs is not a job; it is a training position. Training requires professional development, which comes with costs. NIH grants only allow the salary to be charged to the grant, but post-docs need to attend–workshops (content focused or professional development focused) and conferences (sometimes not directly related to the purpose of the grant). $2,000 per year would go a long way.
- Moving costs: graduate students taking post-doctoral positions are often not in the position to have enough savings to pay for a national or international move.

Existing NIH policies, programs, or resources

allow for budgeting of professional development for post-doc in a grant.

allow for budgeting of moving costs in a grant.

increase post-doc stipend.

Proven or promising external resources or approaches

universities now often offer "presidential post-doc programs". These programs can inform the NIH post-doctoral program.

Response 384

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

- Salary is too low for positions in most cities in america
- Training is variable based on PI
- Expected time it takes to become independent and transition takes way too long to be successful
- Too difficult to land a PI job
- Most funding is funneled to the top; postdoc attitude is that there is a low chance of success even if you land a PI job

Existing NIH policies, programs, or resources

- Limit number of grants funded and staff a PI can have; PI does not need a team of postdocs larger than they can adequately train
- Blind grant reviews; do initial review on grants; pool the grants together that are sufficient quality, then blind lottery; need to prevent funneling money to the top; new PIs will provide more hands on training of postdocs if given the opportunity
- The career outlook for postdocs is abysmal and they would rather go to industry than academia
- Higher salary to allow postdocs to start families without destroying the PI's research budget

Proven or promising external resources or approaches

I do not have a proven approach, but maybe implement a blind system for postdocs to submit reviews of their mentors to the NIH; this will negatively or positively impact their grant acquisition to prevent poor postdoc training from being further funded and festering; just an idea

Response 385

Perspectives on the postdoc roles and responsibilities

To me, the postdoc is a necessary step to obtaining a tenure track faculty position as an independent researcher. It's a way for me to be further trained as a scientist, both technically and professionally, but it is also required to 'prove myself' in a competitive job market with few open positions. In my view, I am responsible for developing and executing a project that can be expanded upon in a future research program. Included in executing this project is writing at least one peer-reviewed manuscript. While I recognize that my research contributes to the larger research program of my current lab, I mostly view it as my own independent work. Within my lab, postdocs are also expected to mentor junior postdocs, graduate students, and technicians, apply for fellowships, and help write grant applications. The postdocs are the engine of the lab.

Fundamental issues and challenges

Regarding recruitment and retention, the postdoc position is becoming less relevant in the scientific enterprise, particularly in the United States, where biotech is booming. Unless someone is strongly considering staying in academia, a postdoc position, in its current form, provides little to no benefit. Recent PhDs can continue to do fulfilling, exciting research in industry for much more pay, with the structures that normally exist in corporations to protect workers (regulated hours, HR departments, good benefits, etc.). The length of postdoc positions are far too long and only increasing--at this point they are a second PhD. Living off of a postdoc salary for that long is not sustainable, particularly for the stage of life that many postdocs are in (starting families or already with children, wanting to settle down, supporting other family members, etc.). The "unique" training environment is not enough to make up for the financial strain, which has current and future consequences. Many postdocs can't afford to contribute to retirement plans, and holding out for a rare tenure track job is just not worth it for many. Another aspect of quality of life involves the quality of mentoring. Many postdocs are expected to be very independent, and the actual mentoring received directly from the PI is minimal. Nevertheless, there remains an expectation to produce top-tier research with little to no guidance. Thus, postdocs not only deal with the stress of the PI's expectations, but they are also not adequately supported to reach those expectations.

Existing NIH policies, programs, or resources

For the F99/K00 program, graduate students should not be rushed into a postdoc right away. Many students finish the PhD burned out, and starting a postdoc immediately only sets them up to struggle. While the policy is intended to hasten the path to independence, it has the opposite effect, rushing trainees into a new position without adequate rest.

In general, postdocs need more pay and/or shorter postdocs. In theory, the NIH can continue to raise the minimum postdoc salary or shorten the time of fellowships and transition awards. However, this would have a negative ripple effect if the expectations from PIs and academia as a whole doesn't change. A big paper in a top-ranking journal requires years of work and lots of funding, so such changes in policy might only hurt the ability of postdocs to obtain competitive faculty positions, or might make it difficult for PIs to afford postdocs. Addressing the postdoc crisis in isolation will not be enough.

Nevertheless, one potential improvement would be a fellowship for those who want to do a short postdoc (1-2 years) for the purpose of learning a specific skill. The goal would not be a paper but rather, technical training, which could be useful for a future job in industry. This could also benefit new PIs struggling to recruit traditional postdocs, as this would allow them to have paid, PhD-level scientists getting projects off the ground.

Proven or promising external resources or approaches

- The academic path can be very isolating. One thing that helps with such isolation in grad school is the fact that students enter with a cohort. They immediately have a group of people who are experiencing that same ups and downs of grad school alongside them. I've been thinking that something similar would be helpful for new postdocs. Of course, this would have to be done on an institution-by-institution basis.
- Improving mentoring and job satisfaction requires more accountability on the part of the PIs. Some postdocs have great experiences with their mentors, and some quit academia entirely because of their mentors. There is too much variability and too little accountability.

Response 386

Perspectives on the postdoc roles and responsibilities

I view it as the final step of training before a career leading a research group

Fundamental issues and challenges

1. Money
2. Money
3. Money
4. Money
5. Money

The NIH baseline level for postdocs salary is not at all comparable to what one could make in an industry position. Some people have undergraduate loans which must be paid off after the PhD; this introduces another financial strain. I had these loans; in my case I would not be able to make monthly payments on rent, food and loans if I were to take a postdoc paying the NIH salary, which would have precluded me from an independent research career simply because of money, not because of any lack of qualifications. In the end, I found a postdoc that will pay much more, and that is the only reason I can pursue this career.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 387

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is the best way to get hand on training to explore a different field of a research area with simple supervision of the PI/professor. As a postdoc researcher, it is expected to perform different experiments, supervise a junior student, and participate in the manuscript and grant writing. I considered postdoc training as the initial stage of preparation to get a professor position in the academia/university. It is the best way to learn how to organize your lab in the future and gain deep knowledge of how to supervise students who has a several backgrounds.

Fundamental issues and challenges

The socio-economic burden of COVID-19 throughout the world is a big challenge for recruiting very competent postdoc. In addition, due to inflation and less salary payment for postdoc researcher, majority of postdoc trainees are looking for other job options. Recently, there are biotechnology and biopharmaceutical industries that can pay two or three times more salary than a postdoc position. Maybe the salary of a BSc holder in the company can be more than the Ph.D. holder postdoc researcher. Most of the postdoc researchers are forced to leave their position to earn more money to improve the quality of life of their families. As the result, to increase the retention time of postdoc researchers, the salary must be improved. In addition, similar to other workers, a postdoc researcher must earn bonus money at the end of each semester.

Existing NIH policies, programs, or resources

NIH must scale up a salary range for postdoc which is really very low in comparison to other campanies. In addition, It is not easy to receive or win NIH grants as a postdoctoral researcher and there is less chance to get external funds to support and establish your labs to conduct research. In addition to conducting research of PI, a postdoctoral researcher must participate in lecture activities (i.e, teaching activities, and mentoring students) for which he/she must get extra payment. There must be oportunity for postdoc to be promoted to assiatant professor. This activity is very important for acquiring experience and improving postdoc academic research career pathways.

Proven or promising external resources or approaches

No response

Response 388

Perspectives on the postdoc roles and responsibilities

A hired researcher that holds a doctoral degree to perform research-oriented tasks to further their academic career with scientific publications.

Fundamental issues and challenges

Low salaries. Difficult to recruit and retain postdocs since we must compete with industry, especially after 2 years and for those in the computer science field.

Visa issues. Postdocs spend a lot of time worrying and making efforts to ensure they can stay in the US.

Existing NIH policies, programs, or resources

More grants for postdocs to apply for funding their research to accelerate their academic career, especially smaller grants that can be more easily obtained vs more competitive ones like the K99 and K01.

Proven or promising external resources or approaches

Dedicated funds for postdoc travel to conferences, better mechanisms for postdocs to get academic credit for grants, more grant systems that promote postdocs to build an individual career within the same PI lab.

Response 389

Perspectives on the postdoc roles and responsibilities

The traditional post-doc is a training position, for an individual who is already exceptionally trained. It serves as a stepping stone to an academic position. seemingly as a formality, rather than providing additional skills necessary for a professorship (i.e., management training, lab budgeting, administrative expertise, teaching). This does trainees a disservice.

Importantly, there are academic post-docs beyond the bench. Currently, I am an NIH post-doc in technology transfer. This provides a unique training experience completely different than that of the PhD, where there is a greater opportunity to diversify a skill set and specialize.

Fundamental issues and challenges

Salary, work-life balance, benefits, duration of fellowship, uncertainty of a tenure-track position afterwards

Existing NIH policies, programs, or resources

- Increase minimum salary requirements. Current rates are laughably low.
- Implement a more holistic approach to the training experience that better prepares for a professorship: management training, lab budgeting, administrative expertise, teaching
- It’s possible that more remote work flexibility could help. This could lessen the burden of challenging decisions around relocation/ cost of living, family planning, etc.

Proven or promising external resources or approaches

I am not familiar with any proven, successful approaches.

Response 390

Perspectives on the postdoc roles and responsibilities

A post-doc is primarily responsible for driving progress on 1-3 specific scientific projects within the context of their mentor’s laboratory. A post-doc may also be responsible for training graduate, post-baccalaureate, or undergraduate students in scientific techniques related to their projects. As I see it, a post-doc position typically has one of two purposes:

1. Training in how to manage a scientific laboratory (progress on specific projects vs. a longer-term vision for a field, training others vs. conducting research, etc.), or
2. Training in a specific technical skill set to later apply in other laboratory contexts (inside or outside of academia). A post-doc and mentor ought to agree on the purpose, even if it is not one of these two typical examples.

Fundamental issues and challenges

There can be a stigma that post-docs are "cheap labor" to conduct research, or a cog in a machine that is designed and run by the lab head. After spending ~5 years as a graduate student, perhaps under the same stigma, some graduates may be reticent to experience that for another 2-5 years. Up to 10 years of total training while largely feeling unvalued can feel too high a cost for the chance at someday being a lab head yourself. Discouragingly, it can feel as though the amount of respect/authority you receive as a scientist is binary: 0 as a graduate student and post-doc, and 100 if you ultimately attain a lab head position. Many post-docs may have been treated poorly (made to work many hours beyond 40 each week, not given credit for their results, etc), reinforcing this discouraging feeling. However, in my personal experience, I have felt that the respect/authority I've received as a scientist has gradually increased with each year of training regardless of my title, and I have not experienced any mistreatment. Nonetheless, I still sense the "cultural norm" among post-docs to view ourselves as unvalued. Overcoming this cultural norm may be just as important as rooting out actual cases of mistreatment when it comes to improving post-doc recruitment and quality of life. Changes in job title and/or pay that gradually improve with experience, rather than taking an enormous leap between the stages of post-doc and lab head, might begin to rectify this cultural norm.

Existing NIH policies, programs, or resources

In my experience, the NIH post-doc experience is already excellent. The gradual pay increases with each year of experience, the opportunities to train post-baccalaureates or graduate students, and the events for post-docs to showcase their research (e.g. NIAID fellows workshop) all provide a sense that post-docs are valued and are facilitated along a positive career trajectory. That said, individual dynamics between lab heads and post-docs may leave some post-docs feeling unvalued or mistreated. I have had only good experiences and I know how to report and seek help if I were to have bad experiences, so I have a very favorable view of what the NIH already does. But I recognize that I cannot speak for everyone.

Proven or promising external resources or approaches

No response

Response 391

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdocs are highly trained individuals with an advanced degree, and yet are not offered benefits or pay reflective of their training. The average postdoc is in their mid thirties, and do not want to continue living a student's life. Many want to start families and be financially solvent. Continuing training in a postdoctoral position for little pay, long hours, and no benefits (retirement, etc) is not an attractive alternative to jumping into industry, being paid adequately and receiving benefits. If the NIH wants to increase postdoctoral involvement and retention, they need to pay these individuals in a manner reflective of their training and capability and in a manner competitive to the positions they can obtain in industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 392

Perspectives on the postdoc roles and responsibilities

Postdocs are to acquire new skills during their training, as well as further their professional development through publications, talks, and grants. They assist with existing grants/projects attained by their PI/mentor, as well as applying for their own funding in efforts to demonstrate their grantsmanship, scientific ideas, and application of training. Lastly, postdocs may mentor and train others, though service should be minimal.

Fundamental issues and challenges

Low pay and cost of childcare. I currently make about as much as a senior research tech with a MS, though I have way more education and research experience. Because my salary is less than double minimum wage, I am overtime eligible, however, the process to file OT is arduous. OT has to be approved by my PI, and there is no direction from my university on what is considered OT eligible so it is left to the PIs digression which leaves opportunities for inequity. Additionally, my income hasn't adjusted for inflation, but all other life expenses have, to include child care. My university does not offer on campus care and the cost for child care in my city has increased 30% in the last 2 years. When inquiring about increasing my pay, I am told that NIH grant budgets currently funded don't accommodate a higher postdoc salary and that the department/university isn't in a place to cover the difference. It feels very much, from the NIH down, that postdocs are seen as cheap labor when we contribute significantly to scientific progress/thought, support of ongoing grants, and securing future grants. My low salary (after 12+years of training) is not only problematic for my daily functions today, it compromises my earning potential for years to come. There is little motivation to stay in academia between the low pay **and challenges** with work/life balance.

Existing NIH policies, programs, or resources

A program in need of modification is the re-entry supplement. Immediately following graduate school I moved abroad to support my family during a military tour. I could not secure employment/postdoc abroad due to a NATO restrictions with my military visa (prior to covid and remote work), and could not secure a postdoc in the States for after our tour because we didn't know where we would be stationed (and too far out). I secured a postdoc immediately after I returned to the states and tried to apply for a reentry. However, I was told I wasn't eligible because I didn't have to leave a job to assist my family (my graduate student status didn't count). Had I had a postdoc when I moved I would have been eligible. The reentry supplement should accommodate circumstances unique to military spouses.

Proven or promising external resources or approaches

Though I am not happy with my salary and how the university handles recognizing postdoc contributions, or parents' contributions (ie not providing affordable care for children on campus), I am very happy with my PI/mentor. Work/life balance has been accommodated as much as it can and I feel supported mental health wise. This was especially true during the pandemic. Our department and lab is very team oriented on all all aspects of research, from poster, talks, papers, to grants. By team, I mean we write papers collaboratively and secure funding together, so papers get out faster (divide and concur) and there is shared burden to secure funding (not all on one PIs shoulders). Having a supportive work environment is the only reason I am considering staying in academia after my postdoc.

Response 393

Perspectives on the postdoc roles and responsibilities

Postdocs are supposed to be trainees. This typically means trainees to one day run their own labs. Training should reflect all that this entails, not just doing bench research. There should be a holistic training that includes mentorship, lab management, and a heavy dose of scientific communication skills. Mentors need to communicate the EXPECTATION that the postdoc will seek and participate in these trainings. Too often, postdocs believe, correctly or incorrectly, that their mentors only want them working at the bench. I do not view a postdoc as being critical for roles other than becoming a lab head. There are ways that postdoc training could better prepare PhDs for other types of jobs, but it remains fuzzy whether the postdoc training is needed or primarily serves a networking role.

Fundamental issues and challenges

The KEY issue is that academia has done a terrible job of communicating and executing what training means. Consequently, postdocs across institutions view themselves as underpaid workers, not trainees. There is too much push from grad school mentors to do a postdoc as the natural next step. That should not be a default. Grad students should think long and hard about where they want to end up and how postdoc training will help them achieve that goal. Labs and institutions need to communicate how they will robustly accomplish postdoctoral training goals and needs. This requires much more than institution wide powerpoint presentations. Based on my own experience, lab heads and even committees of lab heads need to directly coach postdocs. The other major issue is convincing postdocs that there is a benefit to doing a postdoc. It shouldn't be a letdown to not get a faculty position or even expect to get one. There's simply not enough positions to go around, so there needs to be a reframing of the rationale for recruitment and why people should do a postdoc. If the answer is to supply labor, then postdocs are getting a pretty bad deal.

Existing NIH policies, programs, or resources

The NIH should require grant applicants to describe their postdoc training plan and then have some confirmation that the plan is happening. Currently, one simply gets money to employ a postdoc to execute the grant, so not surprisingly, doing work at the bench is more or less the extent of postdoc training. NIH could also require institutions to demonstrate a commitment to postdoc training. Having postdoc offices is nice, but there needs to be individual coaching of trainees. If a PI or an institution cannot demonstrate dedication to this idea, then NIH should forbid labs/institutions from employing postdocs. That's a strong financial incentive to do something more substantial in terms of training.

Proven or promising external resources or approaches

Coaching. Can't say it enough. Plenty of postdoc offices provide counseling and bring in speakers of varying usefulness. I know some places are also doing something programmatic that results in a certificate. I personally think this is misleading at best. At this career stage, everything is about genuine mastery as evidenced by writing papers/preprints, presenting at meetings, writing for fellowships, giving chalk talks, teaching, etc. What communicates is mastery is actually doing these things, not simply showing up for a workshop. Great to have workshops, but I feel sad when a postdoc tells me that she attended a workshop on X, but clearly is not any more capable of writing a grant or presenting an elevator pitch. Until there is a genuine commitment to training these things, who really cares about recruitment? Mentoring is definitely integral to postdoc training and job satisfaction will only come from knowing that doing a postdoc is going to be both engaging AND help the trainee get ahead. There needs to be a well articulated justification for taking a "training position" instead of taking a well paying career job. I don't think the answer ultimately has to be about high pay. People will do internships for free or minimal wages if they think it will clearly benefit them. Not suggesting postdocs not be compensated, simply that the value proposition of postdoc'ing needs to be made by NIH, academic institutions, and labs.

Response 394

Perspectives on the postdoc roles and responsibilities

I believe a postdoctoral position should be an opportunity to advance your scientific training and enable exploration of a new field of research/technical skill. For those expecting to transition to a faculty position, this is a critical time for establishing a new area of research on which to build a future lab. For those transitioning to positions outside of academia, this position should be focused on expanding the skillset of the postdoc.

Fundamental issues and challenges

Many postdocs are severely underpaid compared to industry positions. Similarly, postdocs tend to lack many benefits that even graduate students receive. For example, I am a post-doc at the [redacted for anonymity] and I am unable to access the campus gym, do not receive any mental health coverage, and my ability to access a dental hygienist is severely limited. I am not counted as a "benefits eligible employee" so typical benefits do not apply to me (e.g. employer matching on retirement accounts). The lack of benefits and pay disparity significantly reduce my excitement about my post-doc position.

Existing NIH policies, programs, or resources

Please raise the minimum pay for post-docs as well as ensure basic benefits are provided. Gym access, health coverage, parental leave, retirement matching/bonuses, childcare supplements, etc. are all critical for post-doc recruitment.

Proven or promising external resources or approaches

No response

Response 395

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Lack of pay. Industry jobs offer 2-3x the salary coming out of graduate school. Many universities are pushing to raise graduate student stipends while postdoc salaries are being left behind since the NIH minimum is used as the standard for many places, including where I work. Postdocs have PhDs and should be paid significantly more than graduate students and that is just not the case anymore.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 396

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Unlivable wages, lack of incentives. Unequal compensation in different areas with different cost of living.

Existing NIH policies, programs, or resources

Pay them more.

Proven or promising external resources or approaches

Pay them more, stop disregarding the fact that postdoctoral wages have not increased the way rent has increased.

Response 397

Perspectives on the postdoc roles and responsibilities

The roles of a postdoc to me, as someone who is about to finish their time as a postdoc, needs to be more defined. In some areas I'm expected to lead, other areas I'm really just the grunt laborer. I am in a weird position where the university doesn't treat me as faculty or a student and get the benefits of neither. I would really focus on ensuring that future postdocs are more specified in their defined roles. That said, I would advocate for the removal of the existence of postdocs. I'm about to take on a faculty position. I will never recommend that a student take on a postdoc unless they specifically want to go into an academic setting. There is now ROI for being a postdoc outside of wanting to be a professor. I personally did not want to be a professor, I just happen to end up in an academic setting where I liked the job opportunity. I applied to one academic job, got the job, and took it. Postdoctoral positions should mean professor training. If they don't want to do that, then no one should be a postdoc. It just isn't worth it.

Fundamental issues and challenges

The fundamental challenge is that the NIH and all government entitites just do not pay enough. Making 60k a year in major cities that house postdocs is fundamentally flawed. I had the opportunity to be recruited to a government organization and they were offering only 80k for a job. For people with PhDs and other advanced degrees in a postdoc world. Especially for those who may have had a full career outside of academia and went back to school like I did. Postdocs are just not worth it. The ROI for going into industry, or really any place outside of academia just doesn't care about things like publication counts. I personally think postdoc positions should be eliminated all together. And that is from someone who did one. Hindsight 20/20, but I would never recommend a postdoc position for anyone who didn't want to be a professor. Post docs are antiquated and if I had to do it over, I wouldn't do it again. I spent the last 2 years being miserable in my life and job, and would not want that for others. Living paycheck to paycheck. Getting more in debt. Living in a city I didn't want to be in because I was affiliated with a major university. I will forever going forward be the person telling people not to do a postdoc without very specific goals to be a professor somewhere, so I personally will pose a challenge for you, because I will advise most to do something else. The ROI just is not there.

Existing NIH policies, programs, or resources

The policy that needs to be changed is the salary scale. Eliminate it. Start paying people what they are worth, that is competitive with business and the private sector. If you want the best people, then they need to be paid like the best people. A post doc is a glorified PhD student that universities can flaunt around. Ensure that working remotely is an option for everyone if possible. But overall, I'd say until a payscale is eliminated and capped at a tiny amount of money, post docs are not the place to go.

Proven or promising external resources or approaches

Literally any private sector can tell you. Post doc jobs just don't pay as well. The training is good for grant writing and paper counts. Stop focusing on these things. They don't matter to humanity. Advise people to make the right decision for themselves and what they want to do in the world. Not because we need skilled grunt workers.

Response 398

Perspectives on the postdoc roles and responsibilities

I love my postdoc, but the stipend is unlivable in any major city without an additional job/external monetary support/partner monetary support. The only reason that I can afford to do my postdoc in my current city is because my partner makes enough money to support our living expenses. We are in our early thirties and still renting, I cannot afford to put away money every month to save towards a house or even consider having kids soon. I will be leaving my postdoc so that I can actually afford to move forward on life goals like buying a house or having kids.

Fundamental issues and challenges

These contract positions exist in a liminal space between faculty, staff, and student/trainees. We are not supported enough at either the federal or university level because of this. Why would anyone finish a PhD to take a contract position making so little money after committing already at least 5 years to low wages. At my university, there is also no 401k matching for postdocs, only other faculty. This makes NO sense that universities are not required to start 401k matching, especially with low pay already. How is any adult supposed to choose between a postdoc with low pay and no retirement considerations when you could leave for industry with better pay/retirement matching at this stage in our lives?

Existing NIH policies, programs, or resources

The stipend needs to increase, and the NIH should require universities to match 401k contributions for postdocs as they do for faculty.

Proven or promising external resources or approaches

Increase the pay so that postdocs can feel like this is actually the next step in academia, rather than an elongation of the graduate student period. We want to feel like we can be set up for life successes. Right now it feels like taking a postdoc is trading off between your academic dreams and the desire to work towards other life goals.

Response 399

Perspectives on the postdoc roles and responsibilities

Contribution to scientific work

Fundamental issues and challenges

Job security, Salary, Paid leave, and work stress

Existing NIH policies, programs, or resources

Increase the base salary, Increase postdoc benefits, and increase internal post-doc grants and training opportunities.

Proven or promising external resources or approaches

To mproving postdoctoral recruitment more visa assistance and tract for legal employment, increase training opportunities and transition into fields , PI should be trained to treat postdoc more respectfully rather than work donkeys in working environment, PIs should be get proper training how to mentor just not being selfish at their personal growth , Paid leave and vacation days to be increase for better job satisfaction

Response 400

Perspectives on the postdoc roles and responsibilities

Time to publish papers in a specialty area adjacent to my training in an effort to make my line of research more distinct from what it was during the PhD.

Fundamental issues and challenges

Low pay, particularly for clinicians. I am fortunate to be paid at the NIH level for year four upon matriculating into my postdoctoral fellowship. Still, this salary is weak in high cost of living areas. It does not consider prior relevant experience and is half of what I made prior my PhD training. The opportunity costs of a 4 year PhD and 2 year postdoc exceed $350,000. When the stipend barely affords rent, combined with these opportunity costs, it is not logical for many hard working and intelligent people to put themselves in such a situation

Existing NIH policies, programs, or resources

Please consider modifying NIH loan repayment program to permit repaying spouse’s loans in addition or instead of trainees. I worked professionally prior to PhD training and paid off my loans. My spouse still have significant student loans that are a burden to our family. If I would have known about this opportunity, I would have paid off hers and never touched mine. Broadening the loan repayment eligibility would significantly improve our family’s quality of life if I were to be awarded this prestigious benefit.

Proven or promising external resources or approaches

Please peg the annual stipend to consumer price index and raise the base stipend based on area-level cost of living

Response 401

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a transition position from PhD to faculty. It is aimed at providing training to develop the skills to become an independently funded researcher. I have come to both hate and love the position. Doing my research, asking scientific questions, teaching, mentoring are what keeps me going. But being able to stay in the postdoctoral position is one of privilege. Not everyone can do it—the pay is low, hours are long and prospects of staying in academia are less. I have spent years being away from my family (two-body problem) and working long hours as that is how the system is set up. I was able to do it (with SO much support) but it was not easy and it is not sustainable.

Fundamental issues and challenges

The fundamental issue is that the systemic problems in academia make this transition career filled with stress, uncertainty and distress. This is not something a PhD student or a faculty would feel because these positions are more permanent with guaranteed benefits from the institute.

Being a postdoctoral parent on a temporary position is even harder. It is not possible to retain women if this position is anti-parent. You cannot expect every women in the field to choose career over family constantly. Fellowships are great for the CV but they make you self-employed which means you are no longer qualified for University insurance rates or retirement benefits. This is hard on families as family insurance plans skyrocket. Most universities provide benefits such as subsidized childcare to faculty but not to postdocs. Mental health resources like counsellors are subsidized for faculty but not for postdocs. Rents are subsidized for faculty and not for postdocs. Many postdocs are well into their thirties hoping to have a house, a child, a family, but everything about the position creates an environment that makes it impossible. It is as though the position is built to increase mental and financial distress and decrease any kind of work-life balance. How can we then wonder why postdocs are leaving in large numbers?

Existing NIH policies, programs, or resources

Make it mandatory and provide funding for support structures like Postdoctoral Associations, Postdoctoral Offices and Career Offices in every institution. A support structure in the institute and someone who can ensure postdocs receive the benefits they deserve and have their voices heard is necessary.

Make it mandatory for guaranteed maternity leave that is at least 10 weeks. 6 weeks is garbage and it is not even enough time to recover from a c-section. It is great that NIH grants now include a 1-year extension for parental leave, please keep that going.

Make it mandatory that institutes provide supplementary stipends to postdocs on fellowships—more if they have families.

Make it possible for postdocs to apply for childcare related expenses, more for economically disadvantaged, single parents, URMs—I know NIH provides $2000 a year, but you have to realize that is garbage. It costs me $2000 a month for daycare. I am lucky to have a spouse who earns too, to be able to afford this, if only for my postdoc salary I won't be able to afford a kid. This is not sustainable. Again it is like the position is built to cause mental and financial distress and is hostile to those that want families.

Proven or promising external resources or approaches

Funding for support structures in the institute is extremely important. PDAs and PDOs do great work for postdocs and every university must have them. Provide mental health support—this has proven time and again to be important to retain employees across the board. This must be granted by institutes.

The skills being learnt as a postdoc are a must, that is impossible to garner as a PhD student before making the transition to faculty. However, the temporary nature of the position is hard. Make postdoc a proper career path which is not one that is temporary, without yearly renewals and guaranteed benefits whether or not the postdoc is on fellowship. This is especially important for international postdocs whose visa depends on the position and yearly renewals are just a way to attract mentors that take advantage of this.

Response 402

Perspectives on the postdoc roles and responsibilities

A post doc is a highly trained professional, post docs are responsible for the bulk of scientific work in the United States.

Fundamental issues and challenges

Temporary nature of a post doc—discourages one from "settling down" in an area. Post doc pay. retirement benefits, and health insurance is poor compared to industry.

Existing NIH policies, programs, or resources

Post doc NIH minimum salary should be raised from $55,000 to 70,000-75,000. This will discourage hiring many post docs to compete for few faculty positions and although post docs who do get hired to have a better compensation.

Proven or promising external resources or approaches

No response

Response 403

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

NIH sets the national standard for post doc pay, and in many parts of the country this salary is insufficient. Many people do not take a post doc because it is a financial burden or they have to depend on loans or support from others. This is not a sustainable way to recruit the best of the field to participate in science.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 404

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Need for higher salary.

Existing NIH policies, programs, or resources

Response 405

Perspectives on the postdoc roles and responsibilities

I think the purpose of a postdoc is to

1. gain more training under a different advisor and in a different area of science and
2. to prove that you can be successful in a different environment, meaning your graduate school success wasn’t only because of your advisor or other environmental factors.

You show you can adapt, learn, and succeed. This type of position is good for most jobs that come after, not just academic. Also, doing a postdoc does not close any doors. You are still free to pivot to most career paths afterward. All of this makes a postdoc seem like it makes sense and is an attractive path for a lot of graduate students who are finishing up their work. The responsibility of a postdoc would be to learn, develop more independence and leadership in a lab setting, and be mentored by their advising professor as to what next career step makes sense for them.

Fundamental issues and challenges

Issues:

1. Applying is largely "who you know" which is extremely discriminatory toward students with limited networks (i.e. small school, young grad school PI, etc.).
2. No protections; most schools don't categorize postdocs as students or faculty, so we have no job protection, no means to negotiate benefits, no benefits occasionally (I had zero maternity leave during my postdoc when graduate students received paid leave).
3. No oversight or upper management; I understand it's difficult to ask a PI to be some many things, including a mentor for postdocs, but then why don't schools assume that responsibility? There are almost no postdoc specific offices, also no path forward if a postdoc is having issues with their PI. It's like being a graduate student but worse.
4. Pay. Usually people in a postdoc are around 30 years old, give or take a few years, which is when most people start a family. After being in school for 10 years, undergrad and grad school included, accumulating debt, postponing our lives, we have to accept a level of pay that is so embarrassing and laughable for the amount of training we have had. Why would anyone continue to take a postdoc position when they could go to industry and make a six-figure salary in an entry position? We do not want to struggle when there is a better option, one that allows us to afford good childcare, a small home purchase, and to start living a normal life.

Existing NIH policies, programs, or resources

1. Increase pay to match industry positions for postdocs and faculty, including teaching faculty. People deserve to live comfortably. We're not talking buying a boat and going sailing in the Caribbean here. 85-90k per year starting, plus benefits, is only enough if both parents are working. If you have one earner in a family of four, that amount won't be enough. I live in a 1200 square foot small home in a medium cost of living area, and we could not live on that amount with two children. Seriously.do some research into the cost of living.
2. Paid parental leave, guaranteed healthcare benefits, moving allowances, cost of living salary increases, etc. It is literally that simple. Pay more money so that we don't have to leave for industry to be able to afford a normal life.

Proven or promising external resources or approaches

Stop making faculty do everything. Somehow professors are supposed to be good teachers, good mentors, good researchers, good writers, good presenters, good article reviewers, good board members, good volunteers, good fellowship application reviewers, good conflict resolvers, etc. It's no wonder that they are struggling to give grad students and postdocs what they need. Start funding paid positions for all those things that faculty are forced to do for free, and that'll be a good start.

Response 406

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary needs to be increased drastically. Financial support for childcare. The $2500 (pre-tax) a year that is included in F30/F31 awards for childcare costs barely covers the cost of one month of childcare in most cities.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 407

Perspectives on the postdoc roles and responsibilities

A postdoc is a step in the career progression of a scientist. It is an opportunity for the scientist to become more independent than what usually occurs during graduate school. Mentoring is still an important part of this step. This is also an important time for growth as a scientist. Usually it does not include as many administrative or teaching responsibilities as there are for a faculty member, therefore allowing a high level of focus on the research itself.

Fundamental issues and challenges

Low salary is probably the #1 issue for postdocs. They are often at a stage of life where they want to start a family, buy a house, or do other things like an adult rather than a student. The relatively low salary, especially for the level of education, is the major barrier to improving postdoc quality of life.

The next major issue is the "trainee" aspect of the postdoc. This makes them both disposable and dependent. As a "trainee" they are usually given short term appointments (1yr) that are completely at the whims of their mentor. It is much easier to fire a postdoc then most real employees. Similarly, employment benefits are not always in line with other employees. This is particularly evident at some institutions where postdocs who get an NIH (or other agency) fellowship may have a lower salary and worse or no benefits than other postdocs without a fellowship. Having a fellowship puts them into a different employment category at the institution because their salary is coming from a source other than the institution itself. Furthermore, since postdocs are "trainees" of their mentor their career progress is almost entirely linked to support from that mentor. A bad mentor can completely sink a career. Even just a mediocre letter of support from a mentor can prevent academic career progression. This dependence creates a system that is rife for abuse.

It should be noted that postdocs were not always a step in career progression for scientists. Just a few decades ago, many scientists got faculty positions directly after their PhD training. These positions, and the perception that more training is necessary, are primarily because there were not enough faculty positions available for all of the PhD graduates, so more "training" became the norm.

Existing NIH policies, programs, or resources

Increase NRSA stipend levels. Most institutions use that as the standard for a postdoc salary, and often it is not possible to pay an individual postdoc a higher salary than the NRSA level because the institution wants pay equity across all postdocs at the institution. In this way, postdoc salaries are not competitive and are not set by market forces.

Providing more support or programs for scientist to avoid a postdoc and get a faculty position right after the PhD could also help.

Changing the postdoc fellowship into something more like a true funding award that is given to the postdoc could help them become more independent and eliminate the "trainee" badge. It may be necessary to get rid of the "fellowship" name and rather call it a grant, more like an R grant. Making the grant portable would make them less dependent on the mentor, and could allow them to escape an abusive mentor if they are in that situation. The K99 is somewhat like this, but there are not enough K99 awards available and they still require too much preliminary data.

Proven or promising external resources or approaches

The TRIUMPH program at MD Anderson is a promising approach. In this program, many of the postdocs are hired by the program prior to joining a specific lab. Since the program gives them salary support, the lab choice is truly about finding the best research environment. The postdocs also have a mentoring committee that provides support outside of their chosen lab. The program also actively supports the postdocs and makes sure they have everything they need for success. These postdocs are less likely to get off track during their research and are less dependent on their primary mentor.

Response 408

Perspectives on the postdoc roles and responsibilities

1. No job security (most of the contact for 1-2 years), uncertain position and every time look for next
2. No working hours
3. Lowest salary
4. Highest work stress
5. No work life balance
6. No define holidays (leave rules)
7. No respect, no recognition

To me, PostDocs are just personal slave of PI. I am in the 4th years of my post doctoral training (2nd postdoctoral position) and my current salary and starting salary (3 years back) difference is only 3K, I have a 4 members family and we are just surviving somehow.

Fundamental issues and challenges

To me, the main issue of postdoc scarcity in US academia is job uncertainty & lowest wages. For example, my friend who joined in industry after completing Doctoral training, has almost double my salary , we live in the same city. I preferred academia, finding independent grant and independent Faculty position becoming difficult. I wish to stay in academic research (accepting that my salary will be low but I need to survive with my family) but afraid, in academia, postdocs have no promotional opportunities, no salary hike, no satisfaction and aftercall no recognition.

Existing NIH policies, programs, or resources

I wish, postdocs will have long term research grant opportunities (internal/external) even though they don't want to accept faculty role and will have promotional opportunities like, scientist/research scientist.

Will have define leave rules, fixed working hours.

Proven or promising external resources or approaches

No response

Response 409

Perspectives on the postdoc roles and responsibilities

Traditionally, the postdoctoral roll was meant to supplement an individuals graduate training before advancing into a permanent academic position. Currently, these days it serves as a secondary stage for research development and and building a track record of success before meeting the criteria for professor and primary investigators.

Fundamental issues and challenges

Primarily finances. As post docs we are encouraged to work long hours and be more productive than our colleagues in order to edge out competition in the sparse job availability of an academic primary investigator. We are vastly underpaid and individuals without additional support (ie single, or lack additional funds) barley make a livable wage. Thus forced to sacrifice things like owning a car, buying a house, or even purchasing professional attire for the workspace. Furthermore, we are encouraged to get independent funding, but once received the institution drops us as employees and we lose benefits, such as retirement matching amongst other benefits. Most post docs have nearly a decade of research experience, and its far more appealing from a financial and career longevity perspective to leave the academy.

Existing NIH policies, programs, or resources

Increased salary stipends, retirement benefits and student loan support would go a long ways.

Proven or promising external resources or approaches

No response

Response 410

Perspectives on the postdoc roles and responsibilities

The post-doc was vital in developing the skills to become a faculty member.

Fundamental issues and challenges

The lack of stability during the postdoc and uncertainty about the future took a toll on my mental health. The financial penalty of moving to a very expensive city and getting a car under a post-doc salary led to debt that I am still recovering from. Isolation as a post-doc, coming in on your own into a zone where the university doesn't care about as you are not a student or faculty. Lack of job opportunities in academia

Existing NIH policies, programs, or resources

Increase post-doc salaries, increase funding opportunities for post-docs as PIs (beyond K99R00 and F32). Small postdoctoral grants (R03 or R21-like)

Proven or promising external resources or approaches

Setting salary levels adjsuted to cost of living in the respective location

Response 411

Perspectives on the postdoc roles and responsibilities

Mentored position to further build skills, begin to individuate scientifically, and collect data and publish for future funding and jobs.

Fundamental issues and challenges

Time commitment (often years) in the role

Work hours

Pay, pay, pay (and lack thereof)

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 412

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

This is not a difficult question. The issue is money. E.g., for computational biology, candidates could make 2-3x on a DARPA grant. They could get 5 times as much working for industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 413

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Very simple: Financial instability and career uncertainty

1. Salary is nowhere near the amount needed to:
    a) sustain a reasonable lifestyle and
    b) to plan for the future financially (retirement savings, family planning, owning a home, investing, etc.)
2. Realistic chances of becoming a PI are slim for most and average time for postdocs is increasing, but even if one does become a PI, life does not get "easier" (e.g., R01 modular budget has not increased since 1999)

At least one of the two needs to be solved/addressed, otherwise conditions will only worsen over time.

Both are financial problems, fundamentally.

Existing NIH policies, programs, or resources

Everything ultimately trickles down from funding, so:

- Increase R01 modular budget
- Increase minimum postdoc salary
- Expand ESI programs/opportunities
- Expand postdoc fellowship programs

Proven or promising external resources or approaches

No response

Response 414

Perspectives on the postdoc roles and responsibilities

While I am a T32 postdoctoral fellow, my responsibilities often require me to do simply whatever my mentor deems necessary on his projects. This ultimately obstructs my ability to advance my own career goals. A postdoc, to me, is a servant for faculty members and simply perpetuates an elitist system of science that has existed for the past 100+ years within the US and Western Europe.

Fundamental issues and challenges

1. Being overworked. While my mentors often assume being a postdoc is a "fun time" to engage in research and little administrative work, I end up having to complete so many administrative tasks for them and working on their papers that I get little credit for as third or fourth author that in order to also advance my own goals, I end up working between 50-90 hours a week.
2. The salary is too low. Asking a postdoc to live on $50,000/year in major urban cities in the US is difficult. It was already difficult before the exorbitant inflation of 2023, but it is even more difficult now to afford transportation, housing, food, and other things needed in order to succeed.
3. The temporary status of a postdoc with the requirement to move cross-country. A postdoc is generally a 1-3 year position during which one must move temporarily to a new location. Moving is extremely costly, and some individuals cannot move due to family or disability. The reality is a postdoc can generally be completed anywhere. Unless one is engaging in basic science or carrying out the actual work of an efficacy trial, they shouldn't be required to move. It should be an option.
4. We are not guaranteed faculty positions afterward. Faculty positions are more and more rare. The amount of work we do in a postdoc is meant to assist us on that pathway, yet the reality is that it remains just as difficult to obtain a faculty position at one's postdoc institute let alone any other institution.

Existing NIH policies, programs, or resources

The requirement that one be a citizen or on a particular type of visa in order to an NIH-funded postdoc is racist and xenophobic and counter to the realities of science. Science is transnational and supersedes

borders. Faculty members, themselves, are often immigrants from other countries, let alone many graduate students in the sciences across the U.S. We should not preclude immigrants from accessing NIH-funded postdoctoral or predoctoral training.

Proven or promising external resources or approaches

Increase funding, develop a postdoc-to-faculty transitional pipeline, require mentors allow their postdocs to work remotely unless absolutely necessary to fulfill job duties, allow all immigrants to receive NIH-funded postdoctoral training, and require mentors to create a better work-life-balance for postdocs.

Response 415

Perspectives on the postdoc roles and responsibilities

Postdocs conduct research, provide mentorship to graduate and undergraduate students, may have limited roles in teaching courses, publish and write up their projects, write grants

Fundamental issues and challenges

Postdoc salaries are too low to provide a living wage. Postdocs are people with PhDs and likely close to a decade of experience, they should be compensated as such. Furthermore, postdocs need increased leave time to at least 4-6 weeks per year. Postdocs should not be considered trainees and should be considered as professionals and treated as such. Postdocs are an integral part of research and are widely undervalued. Postdoc positions should have the option to be longer (3-5 years) as no one wants to relocate their life after one or two years, while being a postdoc is often seen as a stepping stone, often folks have to postdoc for more than one year, and making this transitional role more livable will help. Also, offering more permanent research positions (e.g., research associate for a person with a PhD) is critical, there are not enough faculty positions for all postdocs, but many are happy to continue conducting research in that fashion and this role should be expanded upon and valued.

Existing NIH policies, programs, or resources

Pay postdocs more, substantially more, the minimum postdoc salary should be at least 75k/year. Provide more paid time off. Respect postdocs more and treat postdocs as professionals and not as trainees, in any other field a person with as much experience as a postdoc would never be considered a "trainee".

Proven or promising external resources or approaches

No response

Response 416

Perspectives on the postdoc roles and responsibilities

Due to my drastic change in research topic, I sort of feel like a rookie trainee, rather than the confident mentor I was in graduate school. However, I still view this as an opportunity to learn new techniques and background to hopefully enable me to be a tenure-track faculty at a university one day.

Fundamental issues and challenges

The major one is salary, which isn't sufficient to allow for one salary to provide sufficiently for a growing family. And this is a MAJOR thing, since a lot postdocs are certainly trying to start their families after the graduate school years.

Existing NIH policies, programs, or resources

Salary increase, and more benefits to aid in childcare.

Proven or promising external resources or approaches

No response

Response 417

Perspectives on the postdoc roles and responsibilities

I think an academic postdoc can be both training for a future career as an academic scientist OR a chance for a recent graduate to shift gears/switch fields/gain experience in order to find a job outside academia. I think both paths are equally valid and not enough is done to help individuals who want to keep their options open to identify a PI who is open to assisting in that. Not all PIs are interested or helpful in helping their postdocs do this. They mostly consider postdocs to be "mini Mes" in training. Having a database of PI trainee outcomes might be helpful (i.e. X% of this PI's mentees went to a job outside academia after graduating/finishing their postdoc)

Fundamental issues and challenges

The number one issue for any postdoc with computational skills is that industry salaries are FAR higher than postdoc salaries. Very few people, especially from an under-represented background, can justify turning down a $150,000-$300,000 industry salary with for $50k as a postdoc (AND you can't even legally save for retirement in a Roth IRA as a postdoc). Similarly, when industry jobs come with 3-6 month paid parental leave, it's hard for prospective parent postdocs to stay. This results in a situation that perpetuates inequity and inequality in outcomes and retention rates as the people who stay in academia as postdocs are those who can afford it financially and/or can easily delay having children (i.e. males).

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 418

Perspectives on the postdoc roles and responsibilities

Being postdoctoral is crucial in medicine and science. The pay is absolutely ridiculous and reason why I quit graduate school after I witnessed how awful researchers are paid. Moved onto industry and I feel like I get paid my worth. Postdoctoral pay is a joke and so many people no longer want to do it.

Fundamental issues and challenges

HORRIBLE PAY. no work like balance

Existing NIH policies, programs, or resources

Better pay. How would you like it if you lived off $3000 a month and want a family but you can't because of inflation. You want science done and NIH takes the credit but what about the actual minds and excessive training ? Pay more and you will get better results

Proven or promising external resources or approaches

If you pay better, you will have happier employees and better science. I did all of my science in a bad mood because of the awful Pay which made me hate it. It's free labor and slavery.

Response 419

Perspectives on the postdoc roles and responsibilities

Conduct independent research within the broader mission/interest of a hosting institution, lab, or team. Receive professional development opportunities to propel into an independent career in the field. Gain project management, fund acquisition, and other skills that are needed to excel in academic or research positions that may not have been obtained during graduate program.

Fundamental issues and challenges

Pay. Postdocs do not get paid for their worth and the value they bring as experts. Currently, there are ALOT of STEM jobs outside of academia that easily pay over double the average postdoc salary. With the

limited percentage of PhDs who end up getting a full time (tenure track) job in academia, many PhDs are starting to look at jobs outside of academia or similar (e.g., NIH) right after graduating. Additionally, postdocs are not really treated like experts. The culture remains hierarchical with postdocs unable to access the same benefits and funding opportunities as research scientists or faculty, and are not treated with the same respect. They are in a temporary position and have to spend time looking for a permanent job, and may lack the motivation to invest in a project because they know they will not be there long-term.

Existing NIH policies, programs, or resources

NIH table on minimum postdoctoral salaries. This table is referenced by many institutions and these salaries are not high enough to support a postdoc. Many postdocs have families, loans, and are in a phase in their life when money matters. For me, personally, as a postdoc, one of the top two reasons I am applying for jobs outside of academia is because of the postdoc salary being so low. NIH has the position to change this across the country at least within academy and possibly beyond.

Proven or promising external resources or approaches

No response

Response 420

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The post-doc should serve as a bridge to more stable/long-term employment. Universities should be able to offer career pathways at their own institution, or partner with other institutions to secure/make clear what options post-docs would have. That way, postdocs are more likely to be a career step rather than a trap (getting stuck in research associate limbo)

Existing NIH policies, programs, or resources

NIH should change its postdoc funding policy to enable location specific adjustment of their salaries (e.g, the way WHO provides salary increases depending on location). A cost of living tool, such as MTI's living wage calculator (https://livingwage.mit.edu/), can be used to provide both a base salary and adjustment depending on location.

Proven or promising external resources or approaches

No response

Response 421

Perspectives on the postdoc roles and responsibilities

The post doc position for me when I came from my country was like I would get independency to work. I will have my own opinion and my own way to work on the project. But the scenario here is totally different. Your PI is everything who governs what you have to do and what not. Its upon your PI who decide whether to go with your opinion or not. And after giving so much time to the lab, science and research as you are not a US citizen you have no right to write a grant. This is the biggest frustration. I never thought that after such a hard work in Phd i will have to work just like a Phd but with a mere tag of postdoc. Perhaps Phd's at last will get a doctorate degree but a postdoc will not even get a job.

Fundamental issues and challenges

The salary of the postdoc is just like peanuts just go and talk to any person a mere graduate earns more than a postdoc. This is why we chose to devote our time for science. I know money is not everything but to live a descent life you have to have some money with savings. I think the minimum starting salary should be atleast 65K and with 10% increment every year.

Secondly, retention, this is the biggest problem after you complete your postdoc or if your PI is no more funded the postdoc is the first person to be thrown out of the lab. If the PI doesnt have grants NIH should hold the postdocs for certain time.

NIH should come with some policies for the people who are not US citizens to give them right to apply for grants and secure a permanent position as soon as possible.

Existing NIH policies, programs, or resources

NIH should change their salary structure it should be increased right away. More projects should be funded to retain the postdoc instead science. More money should be given in the grants. A postdoc should be given atleast 10K yearly irrespective of the salary and grant for conference, visits etc

Proven or promising external resources or approaches

No response

Response 422

Perspectives on the postdoc roles and responsibilities

In the academic field, the postdoc is the major power to generate papers. For each individual, the postdoc is the time to learn new skills and get more achievements to prepare them to get the PI position or a leading position in the industry field. Considering it takes usually a long time more than 4 years for people to finish their postdoc training, a decent life quality should also be provided.

Fundamental issues and challenges

1. The academic field is very competitive, which shrinks the chance for the postdoc to become PI and extends the time required for postdoc training.
2. The skill set of postdoc and industry is not necessarily matched. Making postdoc position not comfortable but gambling.
3. The low salary and benefits of a postdoc cause pressure on life quality, children’s education, and worries about future income, and life after retirement.

Existing NIH policies, programs, or resources

1. In general more funding should be available for PIs and postdocs, especially if the postdocs are not citizens or permanent residents in the US.
2. Increase the amount for each funding according to the inflation.

Proven or promising external resources or approaches

No response

Response 423

Perspectives on the postdoc roles and responsibilities

The roles of an academic postdoc are to train undergraduate students, drive multiple projects (and publish findings), generate key portions of data for high-importance studies, and perhaps most importantly, receive training and experience otherwise lacking in their career development up to that point which will allow them to extend their career either further along the academic path or transition out of academia.

Fundamental issues and challenges

I believe that I speak for all postdocs when I state that if the pay were fair (and reflective of the specific cost-of-living of a specific region), the benefits were comprehensive, and work hours/environments were heavily standardized, many more individuals would consider a postdoc or remain in a postdoc long term. With many postdocs (aged 30 years+) having families, the lack of adequate remuneration and benefits is even more of a challenge and is a deterrent to remaining as a postdoc long-term. Faculty positions and funding are also increasingly hard to come by, facilitating a bleak outlook for potential applicants hoping to continue in academia. Lastly, as a large (if not the largest portion) of postdocs in the US are from other countries, the process of applying for, maintaining and renewing visas can be a huge hurdle. As a

minimum, institutions, particularly public institutions, should hire postdocs under an H1B or similar visa status. Temporary visas such as J1 etc., are counterproductive to work, and have detrimental financial sequences (frequent renewals required) and only add to the stress of doing a postdoc in the US.

Existing NIH policies, programs, or resources

There is a lot of funding (both from the NIH and privately) available to US citizens and very little (other than the F05) available to foreign postdocs that would facilitate long-term stay. Further, what is available is extremely competitive, with rejection rates being very high and applications needing a significant amount of pilot data, to begin with. Additionally, while underpaid, postdocs are still a significant financial expense to any laboratory. Thus, the lack of external funding opportunities for foreign postdocs significantly shortens the feasibility of long-term retention while increasing the pressure to be productive; which can lead to negative health consequences (stress-related disorders, burnout etc.) and questionable scientific practices. Ultimately, while there are many great mentors and labs facilitating career development for postdocs, the salaries, benefits and expectations have not changed to reflect the working/living conditions of the time.

Proven or promising external resources or approaches

The following would significantly assist in improving the postdoc experience and result in increased retention:

Fair pay (and benefits) that is competitive (if perhaps slightly less than entry positions in the industry) (https://www.science.org/content/article/postdocs-need-raises-who-will-foot-bill),

Access to additional sources of funding to lower the burden on the host lab/institution

Expedited access to institutional-sponsored visas such as H1B etc. (https://www.whitehouse.gov/briefing-room/statements-releases/2022/01/21/fact-sheet-biden-harris-administration-actions-to-attract-stem-talent-and-strengthen-our-economy-and-competitiveness/)

A standardized set of rules for work hours and a respectable amount of leave. Life is more than the lab, and academia needs to adapt to this idea to create a productive, but most importantly, healthy environments in which trainees can be productive and thrive. The era of 6-day work weeks has only served to push underpaid postdocs away from academia to more balanced (and financially lucrative) opportunities.

Response 424

Perspectives on the postdoc roles and responsibilities

My main motivation for becoming a postdoc is to improve my research skills and get training on high-level leadership skills for becoming an adaptive PI in the future.

Fundamental issues and challenges

The payment disparities for postdocs are abysmal and need to be addressed. Although our skills and work are appreciated, used, and important for the University our pay-rate force us to delay personal and professional goals.

Existing NIH policies, programs, or resources

The current barriers for non-Americans to apply for grants impose an unfair disadvantage for immigrants to properly collaborate with scientific advances in the US. While we are allowed to become postdocs most NIH funding mechanisms prohibit us to advance our research and put us in an impossible comparison with our colleagues.

Proven or promising external resources or approaches

No response

Response 425

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdoctoral pay is not sufficient to cover the cost of living in most major US cities. Institutions in these cities often rely on their name brand as their selling point, and offer no additional support. Within institutions, postdoctoral salaries and raises are dictated by the individual PI, who has a vested interest in keeping costs low. If a postdoc could be making 4x the salary by entering industry or stay in academia, and struggle to pay rent, the decision is an easy one.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

NIH grants evaluate the quality of the institution for most, if not all, grant applications. One aspect of the institution's quality should be an objective measure of postdoctoral quality of life. This could be implemented by requiring that NIH-funded institutions request feedback from current postdoctoral trainees about their salary, quality of life, and career opportunities. If an institution, or a department within an institution, has an overwhelmingly negative rating by its own postdoctoral trainees, it should negatively impact their ability to gain future funding. This would provide a financial incentive for the institution, department, and individual PIs to improve the quality of life for postdocs. Alternatively, if an institution supports the generation of a postdoctoral union or has a record of maintaining a high quality of life for its postdoctoral fellows, it should be rewarded by increasing their funding probability.

Response 426

Perspectives on the postdoc roles and responsibilities

To do science.

Fundamental issues and challenges

salary. Postdocs do not get paid enough and the NIH modular budget has not changed to reflect this. NIH should award more money per grant, even if it's at the expense of labs funded. Better to have fewer high functioning groups and retain postdocs in academic science to continue these groups versus training the biotech workforce.

Existing NIH policies, programs, or resources

NIH modular budget should be larger with requirements for salary. Some percentage may only be used on salary.

Proven or promising external resources or approaches

increase NIH modular budget, pay postdocs higher salary

Response 427

Perspectives on the postdoc roles and responsibilities

As an academic postdoc, I view my position as an opportunity to continue developing my research skills and expertise while contributing to the advancement of knowledge in my field. I see my role as a critical part of the research team, responsible for conducting experiments, analyzing data, and communicating findings to other researchers and the scientific community. The postdoctoral position provides a valuable opportunity to work with leading experts in the field, collaborate on interdisciplinary projects, and participate in professional development activities. I also view the postdoctoral position as a stepping stone to a future career in academia or industry, where I can continue to contribute to scientific advancements while mentoring and guiding the next generation of researchers. Overall, the postdoctoral position is an essential and exciting phase of my career, and I am grateful for the opportunity to contribute to the scientific community in this role.

Fundamental issues and challenges

One of the primary challenges is the lack of career prospects for postdoctoral trainees. Many researchers spend several years in postdoctoral positions with no clear path to tenure-track faculty positions or other

long-term career opportunities. This lack of job security can lead to stress, burnout, and a loss of motivation among postdoctoral trainees.

Another challenge is the relatively low pay for postdoctoral trainees. Many postdoctoral researchers are paid significantly less than other professionals with similar levels of education, despite their vital role in advancing scientific knowledge. This low pay can make it difficult for postdoctoral trainees to support themselves and their families, and can lead to financial stress that affects their overall quality of life.

Additionally, postdoctoral trainees often face challenges related to work-life balance. Many researchers work long hours, including evenings and weekends, and may be required to move frequently to advance their careers. This can make it difficult to maintain relationships, raise families, and engage in other activities outside of work.

Finally, there are cultural and systemic issues that can inhibit recruitment, retention, and overall quality of life for postdoctoral trainees. These can include gender and racial bias, lack of mentorship, and institutional policies that do not adequately support postdoctoral trainees.

Existing NIH policies, programs, or resources

While these policies, programs, and resources are valuable, there is always room for improvement. One potential improvement would be to increase funding for postdoctoral research and career development programs. This would help ensure that postdoctoral trainees have the resources they need to conduct high-quality research and develop their skills and expertise.

Another potential improvement would be to create more opportunities for postdoctoral trainees to engage in mentoring and leadership activities. This could involve creating formal mentoring programs or providing support for postdoctoral trainees to serve as mentors to undergraduate or graduate students.

Proven or promising external resources or approaches

No response

Response 428

Perspectives on the postdoc roles and responsibilities

In my institution, postdocs are the main researchers responsible for generating and analyzing the research data. Their activities are critical for the success of their PIs e.g. grant submissions.

Fundamental issues and challenges

Despite holding the burden and primary responsibility for the research data generation and analysis, postdocs are often paid less than technicians (B.S.) whose responsibilities are much lower!

Existing NIH policies, programs, or resources

Increase postdoc salaries.

Make health insurance, paid sick leave, paid vacation days, and other benefits mandatory for postdocs. Match what "industry" offers.

Expand funding eligibility to non-citizens/non-green card holders in all grant scheme

Proven or promising external resources or approaches

" What can you be with a PhD"

Response 429

Perspectives on the postdoc roles and responsibilities

Protected time to develop research skills and to get ready to submit a career-development award (CDA) application, such as a K award.

Fundamental issues and challenges

As an MD post-doc, the salary for post-doctoral fellows makes this a hard sell, particularly among people not still in training.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Response 430

Perspectives on the postdoc roles and responsibilities

I am a second year post-doc in an academic institution. Although I am happy with the job on an academic level, it is intellectually stimulating, collaborative, and creative, I am unhappy with most of the resources surrounding the job. I am inspired by my medical research, I get to make discoveries about the world around us and help people by inventing new medical therapeutics. However, I am deeply dissatisfied with the state of the vocation to the point where I am actively now looking to leave the field of my passion and find a job elsewhere, anywhere that will support what I produce at work. However, I find this vocation isn't supported effectively enough by academic institutions world-wide (same problems occurred in European academic institutions).

Fundamental issues and challenges

The main point is that we as postodocs do not get back what we put into our work. This is evident in the literal sense (salary, stipends, jobs, lack of career progression), as well as in the figurative (how postdocs/lower career-level scientists are viewed and treated). Our PhD degrees equal and rival the years and effort invested into training to MD and engineering degrees, yet our salaries are between a 1/4th to a 1/10th of those other vocations. It's so ridiculous that my friend works as a maid turning beds at a hotel in Los Angeles and earns more than I do when I obtained a summa cum laude Bachelors, two Master's and a PhD. The main fundamental issue is that academic salaries are absolutely laughable and job retention is low when every other week I am looking at job posts from big pharma companies that offer a 3x salary for the same exact post. I stay because I love my lab and our research, but any logical person would've jumped ship a lot sooner. The salaries for PhD's must match and be as competitive as the biotech and MDs salaries to give the PhDs the full support that they need. I often work long hours (12+ hour days) on a salary that makes it difficult to live with 3 other roommates in a city like Los Angeles (I couldn't afford a car for the first 10 months). However, to stay competitive, to obtain data and publish to secure the next position, I have to work those hours. My other friend (that works for a film company) asked if we get paid overtime or get other compensation and I just started laughing because our industry has strayed so far away from the modern norm that it is ridiculous.

Existing NIH policies, programs, or resources

I am not too versed with the existing policies but I would simply suggest more funding for postdocs, whether that is salaries and/or grants. Research career pathways can be supported by more jobs and more support at existing research institutes. The main problem is that the whole system, which is based upon publications selects people willing to handle the pressure of these overworked labs. The use of publications as a measure of success in our industry is deeply flawed and has been address previously, and likely unable to be changed. However, more funding to academic career positions and more support is much easier obtained in the short term.

Proven or promising external resources or approaches

The training is fine, we obtain that on the job. The postdoctoral recruitment would be in a much better state if there was a centralized PhD/postdoc recruitment system as there is in Europe. The main thing is that the working environment must change, we must get the proper support and recognition that most research institutions do not provide to their research staff. At some institutes things are fine, but in others even having a cafe or a coffee corner would be a huge improvement. I am not even talking about support in the form of subsidies for a gym membership or other incentives that would improve the quality and health of the employees. How come the big pharma, biotechs, and tech companies strive? Because they provide food, a gym, and financial support to their employees. In turn, that makes the employees happy and satisfied in the job that they perform and they work efficiently and continue in that job. It really isn't that complicated. However, we still have this ancient, orthodox state of our academia industry as if it is the 1950s where a PhD could do a postdoc for 2 years, buy a house, become a professor and live happily.

In our modern world, a postdoc earning the NIH 60,000 USD salary is unable to save up (I live in Los Angeles so I understand the costs are higher, but the point remains), unable to plan for the future when there are no jobs and no progression, and the jobs that are available are insanely competitive and pay basically nothing when compared to their equals in other industries. Nevermind buying a house, that is an illusion. How is that okay? It's an underpaid, overworked, unsupported, and un-cared for labor force practice that somehow is still legal.

Response 431

Perspectives on the postdoc roles and responsibilities

An opportunity to learn techniques, writing skills, and leadership, to prepare me for an independent role in academia or industry.

Fundamental issues and challenges

Extremely low pay for the level of experience which is unsolvable because NIH is not increasing overall funding to PIs (their boss).

High pressure and workload vs low recognition in the society.

Few chances of becoming independent.

Existing NIH policies, programs, or resources

In this great recession, fewer Americans would choose postdoc, so instead of pouring money on T and F grants, focus recruit more international researchers.

Proven or promising external resources or approaches

U.S is losing competitiveness in biomedical research to China and India. It is inevitable and there is nothing NIH can do about it.

Response 432

Perspectives on the postdoc roles and responsibilities

The Postdoc position is an opportunity to further my research career by gaining more experience in advanced-level analyses and accumulating more publications. Also, during the postdoc position, it will be important to have experience in writing a grant proposal for the preparation of further funding applications. Additionally, I also see the postdoc position as a period of incubation of research ideas. I personally think that postdocs should have more time on focusing on developing their own future in academia.

Fundamental issues and challenges

The first and most important issue is the salary for postdocs. Most postdocs when starting their postdoctoral position are already in their late 20s and most probably in their 30s and the financial load on them is a lot higher than when they are in graduate school. Considering the past 3 years of COVID and the historically high inflation rate, the money gets to postdocs' hands worth less than ever. When industries can easily provide compensation at least 2-3 times what postdoc positions can offer, it only makes sense that more and more PhDs moved to industries after graduating. Furthermore, the available faculty positions are only a fraction of the number of postdocs positions, meaning the possibility of getting into faculty positions is statistically impossible even if you already had a very impressive research track record. Last but not least, like the tech industries, lots of postdocs are foreign individuals who heavily rely on visa sponsorship. It is very rare that institutes will sponsor postdocs for green card applications compared to most of the companies out there, making it even harder for them to see the future to stay in the US after getting into academia. The restriction of non-citizen postdocs in applying for NIH grants also limits their hope of getting external funding which is a key factor to get a faculty position in most cases.

Existing NIH policies, programs, or resources

Increase salary significantly for postdocs and include mandatory annual adjustments for inflation rate and living cost for different locations (e.g., Boston area, NYC, SF bay area). Provide more funding opportunities for non-citizen postdocs. Enhance job security for postdoctoral appointments.

Proven or promising external resources or approaches

No response

Response 433

Perspectives on the postdoc roles and responsibilities

I see the role of a postdoc as someone who is an independent scientist working on a larger project within a lab. It is common for postdocs to be involved in methods development or producing a large dataset that can be mined for many years. Typically they play a mentoring role to undergraduate and graduate students. A postdoc fellowship is a jumping off point or place to acquire more skills before moving on to the next thing. For me, it is not something I'm particularly excited about doing although I think I want to do a short postdoc closer to the geographical location I'd like to settle in for networking purposes. Postdocs are dramatically underpaid for their skillset, productivity, and other various responsibilities they take on in the lab. They are treated like students and employees, but only whichever role is more convenient for the university in a particular context. For example, trainees at my institution get free healthcare, but postdocs do not. Postdoc positions can be exploitative when hiring international Ph.D. holders, as their visa is tied to a postdoctoral fellowship in what could be a toxic lab environment. I have seen several professors with unrealistic expectations for their trainees convert to a lab of primarily international postdocs. Graduate students and postdocs in the US benefit from a whisper network that is not available to international trainees. To me, the primary function of a postdoc is to prepare a person for a career as a tenure track professor, although some people may use postdocs for other reasons as well.

Fundamental issues and challenges

As a senior graduate student, my peers and I frequently discuss our next steps. I was adamantly against doing a postdoc because of the pay, but I think I will be forced to do one to get to where I want to go career wise. I know many people who are going to industry because we know academic jobs are scarce, independent funding is difficult to acquire (but often required to be hired as a tenure track faculty member), and the compensation is MUCH lower than a Ph.D. could receive from an industry job. Higher pay, better benefits, more tenure track job availability, tailored career training for post-docs who don't want to stay in academia, and improved mentoring could improve recruitment and retention.

Existing NIH policies, programs, or resources

Raising the NIH minimum postdoc salary would be a great start. Increasing coverage of childcare expenses for F32 recipients. Increase T32 slots for postdocs and encourage T32 applications that facilitate skill development aimed at a job in industry.

Proven or promising external resources or approaches

No response

Response 434

Perspectives on the postdoc roles and responsibilities

It is an opportunity to do exciting cutting-edge research and expand the frontiers of knowledge. And gain the networking and soft skills to transition from academia to Industry or to another full-time academic position.

Fundamental issues and challenges

Post-docs are not 'my trainees'. This is highly offensive, as post-docs have a PhD and have cutting edge skills and most often than not, know more about the intricate details of latest research. Language matters. We are junior colleagues to be treated with mutual respect, not 'your trainees'. NIH should remove this language immediately.

Pay is abysmal and laughable. $55k vs. more than $200k if someone chooses to go to Industry.

Lack of permanent staff positions; Faculty positions do not justify the number of PhDs churned out every year. Only way to retain post-doc talent in academia is to offer them multiple options, such as hard money staff scientist positions.

Power imbalance between P.I and post-docs.

Existing NIH policies, programs, or resources

For appraisal of faculty and deans etc., either for grant or tenure or other reasons, they should be evaluated not only on their publishing track record but also on the feedback given by their junior colleagues. If a faculty's success is dependent on the evaluation of junior colleagues, it alleviates the power imbalance and provides an incentive to do good by junior colleagues.

Proven or promising external resources or approaches

No response

Response 435

Perspectives on the postdoc roles and responsibilities

Postdoc is a pivotal step to gain additional training in preparation for an independent career as a researcher. It is particularly important for those who want to pursue a career in academia so that after learning basic research skills in graduate school, they can gain additional research independence as well as skills in grant writing, manuscript preparation, personnel oversight, etc.

Fundamental issues and challenges

I think the single greatest issue affecting postdocs is the relationship between work effort / hours and salary + benefits. To be clear, this is a significant problem for academic researchers beyond the postdoctoral level but is particularly acute at this stage in training. Postdoc salaries have improved significantly but could still be improved further. Benefits are still lacking and there are a lot of often unforeseen built in penalties for postdocs as they advance in their career. For example, it is often the case that postdocs who are hired on R01 or similar funds are hired as official university employees but transition to a non-employee status upon receiving support from an F or T fellowship award. Instead of experiencing this as the accomplishment that it is, trainees often experience a "penalty" during this transition that includes loss of health care, retirement benefits, and resulting lower net income as they must gain benefits out of pocket (e.g., via ACA). Universities are frequently unprepared to navigate these kinds of transitions yet postdocs are often required to endure such things in order to gain the most training and be most competitive for academic positions (an F begets a K begets a TT position). This comes at a time when those trainees who are interested in children are often considering expansion of their family. Yet doing so frequently comes at a cost to the trainee's time, flexibility, and overall income as healthcare and childcare expenses skyrocket. Many choose income and/or family plans over enduring these setbacks that only seem necessary if one wants to remain in academia. Inevitably, those that are willing to endure the financial hits are those who come from greater means—typically those of higher socioeconomic status and/or with greater familial support.

Existing NIH policies, programs, or resources

A lot of the above issue would be resolved in NIH were able to cut the university out completely from the employment aspect of postdoctoral training and develop a plan where trainees are considered federal employees or NIH fellows (I don't know what the appropriate classification would be). If postdocs could be hired by PIs at a university but paid through a federal system it would ensure equity of pay (at NIH designated minimum with option for universities to supplement if so desired), continuity of health benefits (e.g., through ACA or other federal employer/employee plan), and availability of retirement contribution options. The government/NIH doesn't even have to consider contributions to such a plan but simply the availability of plans that postdocs could enroll in pre-tax. Having said this, I can't see why NIH cannot negotiate with universities to facilitate health care premium and retirement contributions as they do for standard employees.

The equity and continuity this would provide would eliminate inappropriately low pay (often experienced by foreign postdocs in particular), repeated changes to benefits coverage, loss of university retirement contributions when postdocs transition away from standard university employment status before contributes are vested, etc.

Separately, raising the NIH minimum salary for trainees is great but we are reaching a point where continues to increase for postdocs in particular, NIH will also need to instate a minimum salary for faculty by rank by university classification. I am all for increasing trainee salary but there is little incentive to

remain in academia if the transition from postdoc to faculty does not also come with an appropriate increase in salary and assurance of continuity and equity as well.

Proven or promising external resources or approaches

No response

Response 436

Perspectives on the postdoc roles and responsibilities

The postdoc is an extended training period which, ideally, should end with the postdoc being completely independent. The postdoc should have the freedom to pursue their own ideas, learn skills independently and drive impactful projects to completion. The postdoc should not be a means of recruiting skilled scientists to do heavily supervised or production-oriented work that could be done by a staff scientist. Trainees should choose to do a postdoc because they want to acquire additional skills and independence, rather than being forced into a postdoc because of a lack of other options.

Fundamental issues and challenges

Usually, there is a nuanced answer to these sorts of questions. But, in this case there is not. The fundamental issue that limits the recruitment, retention and QoL of postdocs is simple: lack of adequate compensation. Inflation, especially in high cost of living cities where most science research is concentrated, combined with intense need for talent in industry, has made the postdoc a losing proposition.

Existing NIH policies, programs, or resources

I have a few thoughts:

- The size of investigator-initiated grants should be increased so that adequate compensation can be offered. I realize this is a throwaway comment, but, honestly, that is what limits my ability to pay postdocs more money.
- The NIH should abolish the policy that prevents training grant and fellowship recipients from having their salary supplemented with Federal funds. At best, t limitation prevents PIs from supplementing the salary of meritorious postdocs who earn these awards. At worst, it creates a perverse incentive whereby postdocs cannot accept these awards.

Proven or promising external resources or approaches

No response

Response 437

Perspectives on the postdoc roles and responsibilities

To me, postdoctoral position means a training role (in the capacity of a transient, mid-level staff scientist) supporting the research mission of an academic lab. Key responsibilities involve generating data, producing publications, and pioneering an area of research to then be able to leverage those training experiences into establishing his or her own academic lab. It serves as a stepping stone to apply for faculty positions. Although many companies offer postdoc training, it first and foremost implies an association to an academic or government institution.

Fundamental issues and challenges

The biggest challenge inhibiting recruitment, retention, and overall quality of life is the NIH pay scale, and the “publish or perish” culture of academia. It is not sustainable nor realistic for young professionals (who are highly trained—they are all PhD level scientists!) to thrive on a 55-60k salary. Many postdocs are young professionals who are looking to get married, start their own families, and fulfill other life goals beyond the bench. This salary cap is a major hurdle in incentivizing talented individuals to stay in postdoc training.

For example, I am a PhD candiates and my partner is a postdoc. I am having to take a medical leave near the end of my training, and a sole 55k income was not enough for us to feel secure about our future.

Thus, my partner decided to transition into the industry to be able to provide for our family. This was devastating—both of us had imagined ourselves one day applying to tenure track positions. We realized this was simply not realistic given our circumstances that were out of our control. We did not want to ask for financial assistance from our family and friends in our early 30's, especially after having earned both of our PhD's at a competitive R1 institution. What if we were to start a family? Faced another medical emergency, a tragedy or an accident? All these questions discouraged us from continuing with postdoctoral training.

Life happens, and the rigors of postdoc training and the lack of financial compensation simply leaves no room for mistakes or safety nets that are not only necessary but rather critical for the well-being of young professionals. The lack of support for aspiring scientists who are postdocs is truly astonishing and detrimental.

Existing NIH policies, programs, or resources

Response 438

Perspectives on the postdoc roles and responsibilities

The postdoc position should be a *short* training position to gain new technical and career development expertise and to transition to a PI-like role, where they direct their own research. In reality, the postdoc position has become an avenue for PIs to get cheap physical and intellectual labor with almost zero commitment from the University.

Fundamental issues and challenges

The entire academic system is damaged, and postdocs are the most vulnerable for multiple reasons. First, we are underpaid. My monthly rent is more than my salary. If I did not have a partner with a non-academic job, I do not know how I would eat. Second, the expectations for postdocs staying in academia are untenable. We are in a position of precarity in that most of us will not get the opportunity to have a faculty position, so we are working for a reward that we will likely not receive. Our job is thus inherently unstable, which is extremely stressful. We are taught that our labor is not transactional and that daily suffering is in fact necessary for success. All of this radiates from the current demands of publication and faculty search, which require an enormous amount of work to put on one person's shoulders. We don't have a system set up for postdocs who are good scientists but who don't get faculty jobs to move forward. Further, current PIs, especially those who are older, often have very little training in good mentorship practices. Most are bad, if not emotionally abusive to their trainees, and as we are transient but the PI is permanent, universities have no interest in real discipline.

I, as a 4th year postdoc, would never recommend that a graduate student start an academic postdoc. I know very few postdocs who are more than 2 years in who have a good quality of life.

Existing NIH policies, programs, or resources

At this point, the only thing the NIH can do is get more money overall so that more people can be successful at the faculty stage/open up more positions. But the entire system and culture needs to change, likely starting with the universities becoming nationalized.

No response

Response 439

Perspectives on the postdoc roles and responsibilities

A step towards professorship.

Fundamental issues and challenges

Low pay.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 440

Perspectives on the postdoc roles and responsibilities

Post-doctoral training is extremely important and effective for training the next generation of academic researchers. Post-doc research serves two important purposes.

1) It gives already trained scientists an opportunity to drive research projects effectively. Without post-docs, too much of our time would be spent on basic skills training versus more high-level critical thinking training. I did my most intense project-focused research as a post-doc, resulting in great research productivity for myself, team, and community.
2) Second, it provides the opportunity for post-docs to learn advanced research skills. I learned many of the collaboration and grant-writing skills that I would need to succeed as a faculty member.

Fundamental issues and challenges

There is really a singular issue. Low salary. Most PhDs can make much more money elsewhere. Increasing post-doc salary is especially important for retention of female scientists, as post-doctoral years can overlap with child rearing years. During my post-doc, I was losing money by working because I had two kids in childcare. The only reason I was able to continue is because I was fortunate to have a spouse that was not a scientist, and because I was extremely committed to my long-term goals. This is not the case for everyone.

Existing NIH policies, programs, or resources

Continuing to increase financial support or reimbursement for childcare costs. Continuing to increase postdoc salaries (using a transformative rather than incremental increase).

Proven or promising external resources or approaches

Not sure.

Response 441

Perspectives on the postdoc roles and responsibilities

Post docs have an advanced degree in an incredibly specialized field of study, and some might have the only skillset necessary for their research in the entire world. They have to write, do research, and be human beings (but that is treated as something to joke about and is a weakness).

Fundamental issues and challenges

Post docs have an advanced degree in an incredibly specialized field of study, and some might have the only skillset necessary for their research in the entire world. And they are paid less than an entry level worker at many fast food chains.

They are expected to work much harder than they receive monetarily, and the pressure to publish and to work destroy people in their graduate studies, so why would people want to do it during their post doc?

Existing NIH policies, programs, or resources

Pay. Pay. Pay. Pay.

Workers rights. Increase the quality of life and work for post docs.

Proven or promising external resources or approaches

Just pay them more. They worked hard to get their degrees and get paid like trash and treated worse than it. Other advanced degrees like an MD or a law degree get you much more monetary compensation with a guarantee of a timeline and end. Post-docs don't get a guaranteed timeline or anything.

Response 442

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is still a trainee position, but I think it is training in a different capacity than graduate school. In graduate school we learn how to conduct experiments and think critically, but as a postdoctoral fellow, I want to be trained as an independent investigator who will set up their own laboratory. This training should include how to budget, write grants, manage students/staff, and teach. I know this is also a time for postdocs to get a lot of science done with less restrictions, but I think there should still be a balance of training and experiments. We put too much pressure on postdocs to publish high and fast, but not enough effort on training for a professorship. A lot of early stage PI's struggle with this aspect because they were not trained.

Fundamental issues and challenges

Because postdocs have their PhD and are highly trained scientists, they should be compensated as such. I think there is a big draw to industry because of the money alone. If postdocs would get $80,000 (or more!) as salary, there would be more recruitment at that stage. I also think retention is down because of the work-life balance that postdocs face. There is a pressure to publish in high impact journals quickly or else you will never get to be a professor. This, along with the low salary, make postdocs want to leave academia for industry or other positions. If they cannot get a job as a professor, they feel as though all of the years being paid abysmally weren't worth it.

Existing NIH policies, programs, or resources

Higher NIH minimums for salaries and more grant opportunities. Potentially more training opportunities for teaching and mentorship.

Proven or promising external resources or approaches

No response

Response 443

Perspectives on the postdoc roles and responsibilities

The postdoc should be a high-functioning training position where the postdoc utilizes current skills to manage and advance scientific projects while also receiving mentorship and resources to pursue additional training opportunities, career exploration, and guidance on achieving research and professional goals

Fundamental issues and challenges

Advisors pay lip service to training but in many cases are almost exclusively focused on research output and productivity, especially that influences their own abilities to receive grant funding, at the expense of postdocs being allowed to develop their own research directions. I have carried out research that supports my PI's grants but that has not been published in an academic journal. This type of work, which is very common for postdocs, advances the career and research prospects of their PIs but does not help the postdoc advance his or her career. There are numerous institutional barriers that prevent postdocs accessing equipment housed in different departments without payment for service. If a postdoc wants to learn and apply a new technique, there should be less institutional barriers to them pursuing new methodological training and applications to advance their research project. Annual reviews with a mentoring PI often either are ignored, only carried out on paper, or focus almost exclusively on a postdocs research progress; there is a severe lack of professional development and strategic career planning to prepare postdocs to pursue the careers they desire. Postdocs also lack power over deciding when and how to publish; even when completely capable of acting as independent PIs, postdocs are highly dependent on the power dynamics and relationship they have with their supervising PI.

Existing NIH policies, programs, or resources

Postdocs need more power and resources to chart their own training and research pathways. Too often, PIs use their postdocs as cheap labor to increase research output instead of working with a postdoc to strategize how to advance the postdoc's research program and career trajectory. Many industry positions I have applied to have almost no respect for my years of postdoctoral experience. The NIH needs to do some deep reflecting on why the biomedical and biotechnological industries devalue postdoctoral experience. If the goal is to prepare the majority of the postdoctoral workforce for positions in industry, since it seems like there are fewer academic positions and funding is increasingly competitive, then perhaps postdoctoral training should work more like industry. Multi-disciplinary projects could be proposed with multi-PI leadership and more defined roles for postdocs within these projects. If postdocs have an increasingly small chance of resulting in a faculty position, and faculty positions come with a plethora of administrative and service duties that impede or interfere with ones ability to pursue high impact research, and postdoc positions don't help people get good jobs in industry, then why would anyone do a postdoc?

Proven or promising external resources or approaches

Lab safety is not prioritized in many academic labs. Instead of paying lip service to this in grants, then not actually prioritizing lab safety, the NIH should support professional positions in academic institutions that encourage and support lab safety (not through penalties and regulation enforcement, but by serving as experts in chemical and biological safety that help plan and design methods while taking protocol safety into account from the beginning of the experimental design). Being told we are trainees as highly experienced and trained workers, then denied employee benefits such as retirement matching that other employees are eligible for is extremely distasteful. The power of individual PIs over their postdocs, especially international postdocs who may be relying on a visa for their ability to stay in the country, is untenable.

Response 444

Perspectives on the postdoc roles and responsibilities

Postdocs are a critical piece of a skilled workforce in an academic lab. Having a well developed skillset and more independence than other trainees is critical and the motivation to accomplish goals before moving on makes postdocs uniquely productive (although I do not ascribe to the idea that they are work horses who should be treated as such). Having done a 5 year academic post-doc, those years were some of my favorite research years because I had freedom to work independently without being responsible for funding and also knowing I could move on if it wasn't the right fit for me or I wasn't learning. I was only able to do this long of a postdoc because I was unmarried, did not have children and had a relatively low COL. Knowing how rewarding and FUN postdoc years can be, it saddens me that this is not at all even considered by many students and I can't blame them for feeling that way.

Fundamental issues and challenges

The payscale is challenging, however without changing the paylines for grants, this is a double edged sword. I think the bigger issue than pay is the outlook beyond the postdoc. A 3 year postdoc that leads to being perhaps LESS qualified to move into industry, unable to gain independent grant funding and no longterm stability in an academic lab feels very worthless, especially when the pay is not particularly competitive. I think at the current pay level, there needs to be a better long term outlook for postdocs AFTER they're done. Whether thats creating more stable, full benefits eligible, staff roles within academic labs or having pathways toward that in other areas, something needs to change. Its hard to convince someone who does not want to be a PI (and MANY PhDs are not interested with the current funding climate, academic job availability and geographic stranglehold) that spending 3-5 years making $55k is worth it when they are able to go make more elsewhere and gain more relevant long term skills.

Existing NIH policies, programs, or resources

If NIH Postdoc payscales are moved up, the grants must also change. I now serve as a research program manager in a fairly big academic lab and I see the budgets and the grant amounts are low for the amount of time/effort that goes into an R01. Make non-citizens eligible for T32 slots.

Proven or promising external resources or approaches

NIH should support/incentivize the research associate or staff scientist track within academic labs to give long term stability that would benefit both the labs and the staff—No one benefits from a 7 year postdoc especially when the benefits associated are generally garbage (no retirement, subpar health insurance) except mentors who are typically not treating their people well.

Response 445

Perspectives on the postdoc roles and responsibilities

As a postdoc I have done most of the types of work required of faculty: committee memberships, mentoring students, developing projects, writing grants, writing papers, reviewing grants and papers, organizing laboratory maintenance, making purchasing decisions. All of this is in addition to conducting bench work for my own projects. As a postdoc, I am already an expert in my field (more so than my advisor), and though I am learning a lot, there is little "training" involved. I see this as a temporary position that is required for my goal of attaining an independent position in academic research. I accept that the career is competitive, however I feel that the idea of "postdoctoral training" is a ruse.

Fundamental issues and challenges

Both graduate school and postdoc take longer and the expectations are higher than in years past. Furthermore, the publication process can now take a year or more (my last paper took 500 days from submission to acceptance). As the pathway to independence in academia has lengthened, salaries have contracted relative to cost of living. Coupled with the increased competition, I notice now that most graduate students dread the idea of doing a postdoc as they see little value in it unless they are 100% committed to an academic position and willing to take on the risk of things not going well.

Existing NIH policies, programs, or resources

The payscale could be adjusted to put postdoc pay more in line with that of staff scientists or research assistant professors, reflecting the actual work and expertise that they provide. This would cause a dramatic change: it would be a calamity for faculty who are used to having 5 or more postdocs. Maybe they should have 3 or 4 instead of 5, pay them better, and provide closer mentorship. These labs would appear less productive, because paper output is in general a function of the size of the lab. This might also make postdoc positions desirable for excellent scientists (currently they are not). With a good PhD, you can get a job as a postdoc in any lab you want, because faculty are desperate for competent postdocs. This indicates the value of a competent postdoc is well beyond the cost for the lab. Most people I know get offers from every lab they apply to. A postdoc job opportunity is not seen as much of an opportunity, it is simply a choice.

Timelines such as the K99 clock were I think intended to help postdocs by discouraging faculty from hanging on to productive postdocs. In reality, these timelines do not prevent abuse by PIs because the postdoc is almost entirely dependent on the PI to win these awards. I have several colleagues whos mentors prevented them from applying for K99. Again the notion of K99 "training" is a ruse, and the writing about additional training is almost entirely an exercise in grantsmanship. Instead, the K99 timeline and others like it place unnecessary stress on the postdoc: punishing nonconventional paths and enforcing rigid structures that provide no benefit.

Proven or promising external resources or approaches

Dont know.

Response 446

Perspectives on the postdoc roles and responsibilities

Most PI treats postdocs as cheap labor. they just squeeze them to get many papers to support their grants. look how many post doc become PI by training. it is a very small percentage because of no clear commitments from NIH to force PI to implement a clear transition plan for this poor postdoc

Fundamental issues and challenges

I was postdoc, for 2016-2019, with many promising plans from my PI to support my career, the truth is the postdoc is just a waste of time. NIH must implement a clear transition plan for postdoc trainees.

Existing NIH policies, programs, or resources

Policies should change. PI should submit a transition plan to the NIH to show them how the mutual benefits between PI and postdoc happened.

Proven or promising external resources or approaches

Just enforce a plan to implement IDP for postdoc and PI should agree to advocate for their trainees.

Response 447

Perspectives on the postdoc roles and responsibilities

Postdoc year is an opportunity to solidify skills and provide a transition year from being a trainee with limited responsibilities to being a full-fledged faculty member. And in my field (Clinical Psychology), accrue hours towards licensure.

From a systems' perspective, it provides a workforce with enough skills to operate more independently than grad students for example and who are less expensive.

Fundamental issues and challenges

What I've heard across fields is that postdocs, particularly in the hard sciences, are treated like "slaves" (actual quotes) and get paid very little. Sometimes, particularly for international students, they feel stuck in labs without options if they want to remain in the US. Higher salaries seem essential as well as better working conditions.

Within my field (Clinical Psychology), the shortage of postdocs has led placements to hire postdocs as unlicensed psychologists (in much better positions--higher status, greater salaries) while earning hours towards licensure. So, this means that someone with the very exact same credentials could be on a postdoc position earning $55K whereas someone else can be in an unlicensed psychologist position or an assistant professor position (where they get to accrue hours towards licensure all the same) earning around $80K. The choice is easy to make! So, we are having more and more difficulty recruiting postdocs. It can also create great inequities where two people with similar qualifications are in drastically different positions.

Existing NIH policies, programs, or resources

Higher salaries. I also think that T32s with a focus on preparing postdocs for an academic path makes a lot of sense. I think the LRP options also make it a lot more appealing to be a postdoc financially. However, a lot of T32s are only awarded to power house academic institutions that have the amazing infrastructure. This often ends up overlooking postdocs at institutions with fewer resources/more diverse pool of postdocs, thus perpetuating existing differences.

Proven or promising external resources or approaches

I see a lot of initiatives by NIMH that are steps in the right direction: webinars and conferences geared towards junior/new investigators, LRPs, etc and these should continue. However, to make a systemic change, you may need to "throw money" at the problem:

1) Higher salaries for postdocs of course.
2) I think that providing NIH-based financial reimbursement to MENTORS for just training postdocs would go a long way to improve mentorship. Oftentimes, mentors don't have the time/bandwidth to just train postdocs and institutions often do not really compensate mentors/allow the time for this role. What I've witnessed across the last 25 years in this field is that if people are pressed for time, often, training is the first thing to be neglected. If NIH provides compensation for just training (as opposed to requiring in-kind matching by institution), this would elevate training tasks to a different tier of priority and would help recruit mentors who are good at training and have a lot of experience.

Response 448

Perspectives on the postdoc roles and responsibilities

Faculty rely on postdocs as catch-alls to do most of the heavy lifting in implementing the faculty's research agenda. Postdocs are expected to manage and troubleshoot project development, data acquisition and

analysis, keep up with modern developments in methods and analysis, handle dissemination of the faculty's research program through papers and presentations, on top of mentoring and smoothing over any issues with the faculty's junior trainees or other research staff, and handling coordination with the faculty's collaborators. It's a great deal for faculty (lots of value for little money), but not so much for the postdocs.

Fundamental issues and challenges

Postdocs are overworked and underpaid for the expertise and management they provide. All this extra work frees up the faculty sponsor's time to do the fun parts of the work—planning next research directions, networking and building collaborations, traveling for conferences/speaking engagements, and angling for better positions at better institutions. But it leaves postdocs little time/energy to pursue independent training, develop their own research ideas or grants, or travel/network for their own careers. After a few years, postdocs are burnt-out. When it comes time to enter the faculty job market, we consider how much work goes into preparing faculty applications, how many people are competing, how long the search process is, the relative chance of success, relative pay, etc. and it feels futile. For people from underprivileged backgrounds, our trajectories have already been long and difficult—we know we stand less of a chance landing one of these positions than a more privileged peer, and we're tired of working as hard as we have for so long with little pay off. Especially with many faculty positions being filled by faculty from other institutions. There isn't space for us, and we want to get started living our lives. Doing grad school and postdocs puts you at a financial disadvantage compared to your peers. Few institutions provide retirement matching to postdocs, and people often leave graduate school with no retirement savings. It's also hard on your health—I know many postdocs who developed serious chronic health problems vs. folks who left academia after grad school or got jobs after undergrad. Many have had to make the difficult decision to leave academia for their own health and wellbeing; since many folks from underprivileged backgrounds have a greater risk of health problems, it's a double-whammy.

Existing NIH policies, programs, or resources

If faculty take postdocs on grants, there needs to be some evaluation of whether they are doing enough to support postdoc training and development toward independence. There should also be guidance or incentives for academic departments to factor in the diversity of postdocs in the gatekeeping process (i.e., in departmental review—deciding which postdocs get to submit grants from the department). It doesn't matter how much the NIH improves funding opportunities for under-represented folks if the departments are restricting who gets to even submit an application, especially if it's in a manner that disadvantages or prevents those candidates from getting applications out. Limits on how many years of postdoc experience applicants can have when applying for NIH funding disadvantages people from underprivileged backgrounds—it often takes these folks longer to get to a place where they are competitive for funding, and by the time they get there they find out they aren't eligible anymore. It would be great if there were dedicated funding opportunities for people who have had more difficult or lengthier academic trajectories. The mentored clinician scientist postdoc fellowships seem really great—but it would be wonderful to have a parallel fellowship track for basic scientists to get clinical training, especially in the psychology/neuroscience fields. Many of us are in a catch-22 of wanting to work in clinical applications of our cognitive psychology or neuroscience areas of expertise, but not having the clinical expertise or credentials to do so. Few of our cognitive psych or cognitive neuroscience graduate mentors know how to help bridge this gap. We need a dedicated pathway to get the training to establish our research programs. It would also be great to have a pathway for folks with lived experience of the diseases they are studying.

Proven or promising external resources or approaches

Increase salary guidelines, require academic institutions to provide retirement matching for postdocs at least (preferably also for grad students)

Response 449

Perspectives on the postdoc roles and responsibilities

I see the postdoc position as an occasion to:

1. Acquire additional skills and knowledge that complement my PhD ones, to have a broader view and set of tools to draw from when leading a research project as a faculty/research scientist
2. Learn practices and culture from another continent/domain
3. Expand my network to another continent/domain

I also see the postdoc position as the last and short (2-3 years long) step before a faculty/research scientist position.

Fundamental issues and challenges

1. Salary is awfully low, at least for my area (Boston, MA)
2. Most US grants are not accessible to non-US citizens/permanent residents
3. Many contracts/fellowships are for less than 2 years
4. The position does not guarantee access to tenure-track or tenured positions
5. Possibility of having a tenure-track position are in general extremely low (in my field we're speaking of ~300 applicants per each position, with few positions each year), making the hardship of a postdoc salary not worth it for many
6. By looking at demographics of candidates shortlisted for tenure-track positions compared to phd and postdoc demographics, DEI policies disregard nationality (in other words: the share of US citizens among tenure-track faculty is overwhelmingly high compared to the share of US citizens among graduate students and postdocs), again discouraging the pursue of more time in a postdoc position for foreigners

Existing NIH policies, programs, or resources

NIH should extend eligibility for Fellowships to non-US citizens/permanent residents, or have dedicated fellowships for them (e.g. Marie-Curie fellowship in Europe).

NIH could also envision promoting fellowships that lead to permanent positions, e.g. a postdoc fellowship that after 3 year allows the postdoc to submit a research proposal which would support the starting of a group; since the start of the postdoc, NIH would require the hosting institute to commit to grant the postdoc a tenured or tenure-track PI position at the end of the first 3-year phase should the proposal be accepted.

Proven or promising external resources or approaches

No response

Response 450

Perspectives on the postdoc roles and responsibilities

This position is one in which a highly skilled researcher further develops their research portfolio through publication and learning of techniques needed for long term research goals

Fundamental issues and challenges

Compensation, it is unreasonable to expect a skilled and credentialed individual to be paid a sub—professional starting salary. This alone would mitigate financial pressures and stress that many individuals feel working challenging hours in lab while still struggling to make financial ends meet.

Existing NIH policies, programs, or resources

Lengthen the time of eligibility during postdoctoral training for F99/K00 awards. If the financial issue isn't fixed this could be a helpful alternative to reduce the pressure of publication in early years of postdoctoral training, especially for individuals that are struggling with financial or family issues

Proven or promising external resources or approaches

No response

Response 451

Perspectives on the postdoc roles and responsibilities

I see the postdoc as a chance to learn and expand scientific and training repertoire, via three major aspects:

a) Learning new techniques, ideas, organisms, etc. For me, the transition from one organism to another really opened my perspective and allowed me to do stronger science at the interface of my prior training and the new lab.
b) Taking on more risky or ambitious projects. Grad school provides the central training of how to troubleshoot, how to organize data, what the key concepts in a field are, etc. With those skills in hand, postdocs are often well placed to put more of their effort into big picture, ambitious directions.
c) Taking on greater independence in one's projects and career. Postdocs should be helping with manuscript reviewer roles and doing some independent manuscript reviews. They should take on more grantwriting efforts as appropriate, mostly for their own grants. They should be attending conferences at least once a year, and developing their own networks both with and without the PI.

Fundamental issues and challenges

Because science projects are long-term, postdocs often feel trapped in a bad environment because they "can't" leave without a paper. This problem is far worse for foreign nationals, because the visa literally traps them. There is often a conflict of interest between the PI and postdoc; if the postdoc wants to go on the job market, some PIs are supportive but some say, "You can't work on job applications in lab and you can't take work time for interviews." Worse, the PI sees the postdoc as a competitor and refuses to write them letters. Finally, the pay of postdocs is well behind industry, most institutions don't give postdocs retirement benefits, and the huge uncertainty of the academic job market makes it difficult to see the postdoc as a healthy career choice. Unfortunately, the pay of professors is not so much higher than that of postdocs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

- Requesting an annual statement from all postdocs funded off of a PI R grant, submitted at the same time as the RPPR, but only visible to the PO, not the PI or the administrators. This statement could include a short questionnaire about postdoctoral treatment in the lab and an open-ended response section. This information would be collected by POs, stored in an NIH-wide database, and could inform future funding decisions for the PI especially regarding grants that are being considered for funding outside the payline. Just having the threat of this information being used against the PI could be enough to improve a LOT of PI behavior.
- Explicit requirement from NIH to the host institution that NIH-funded postdocs be treated as staff positions with equivalent benefits, regardless of whether the postdoc is funded by an NIH grant to the PI or by the postdoc's own NIH grant. I don't know if this is even possible, but NIH makes a lot of other fairly burdensome requests of institutions, so why not?

Response 452

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdoc salary and benefits. We lose good postdoc candidates to industry because there is no way we can compete on salary.

Existing NIH policies, programs, or resources

Changing this would involve increasing the modular R01 budget and/or NIH postdoc salary structure to increase pay.

Proven or promising external resources or approaches

No response

Response 453

Perspectives on the postdoc roles and responsibilities

I have been on two different T32 mechanisms and what I find is that there is very little communication about expectations, support, or training. The roles and responsibilities are ill defined and there seems to be little oversight of the professors who run the T32. This leaves room for a lot of toxic behaviors and even abuse. While I know each postdoctoral trainee has different goals, it is also frustrating to receive very little actual training. I pursued a postdoc to be trained, and there was no structure in place to support my training. I had to fight for training and sort all of it out for myself. There has also been no support at all from the T32 for my career beyond the post doc. The expectation is to write a K award and that is the only path that has been laid out for me. This is far from the only path that the academic postdoc should be preparing one for. Especially considering how difficult it is to get a K. We need alternatives. Finally, T32 and LRP mechanisms are extremely restrictive in their contractual obligation for postdocs to continue to do certain kinds of "qualifying research." This does not reflect the reality of the job market or the extreme difficulty associated with finding employment that will fulfill NIH obligations. Especially when postdoctoral funding is often very time limited. Two year time limits on postdocs are often not enough to facilitate people having successful academic careers. Maybe they were in the past, but not anymore.

Fundamental issues and challenges

I mentioned a lot of issues with postdoctoral positions and contracts above. I've also noticed there seems to be no mechanism in place for postdoc retention. Racially minoritized, first gen, and disabled postdocs especially are enthusiastically recruited and then just kind of left to our own devices. The rigid expectations for certain kinds of productivity and achievement within postdocs also greatly disadvantages marginalized scholars, and I have personally seen scholars pushed out because they needed "too much" support or were not producing "enough" even though they were not receiving adequate support. Postdocs are given no assistance in terms of navigating academic career trajectories, and NIH efforts to support career development simply feel like they are pushing us to crank out papers with no regard for what they mean, what our work does in the world, or how this helps us advance as scholars. The focus on metrics rather than meaningful work makes being a postdoc feel like working in a publication mill. I could go on about this for a while, but I will refrain. The last thing I will say is that NIH salary scales do not come anywhere near providing us with thriving wages that account for our many years of experience and expertise. Framing postdocs as just "trainees" who can be poorly compensated while we often receive little to no training and while we already have PhDs and many years of experience does us a disservice. It also significantly disadvantages low income people and people supporting families.

Existing NIH policies, programs, or resources

You need to update your salary scales. Nearly every postdoctoral position I'm aware of bases their salaries on your scales. Even those who are not NIH funded. This is a serious equity issue. You also need to remove contractual obligations that penalize researchers for what is an incredibly difficult and inequitable job market. You need to explicitly build support and retention mechanisms into postdoctoral positions for marginalized scholars. There also must be some kind of mechanism in place that ensures that postdoc positions include very clear expectations, provide the training they say they will provide, and that postdocs who need more time on their contracts can get it. You need to do more to offer support for various research paths other than just T32-K-R which is just not realistic for everyone. The last thing I will mention is that there MUST be a mechanism in place for mentees to provide ANONYMOUS feedback on mentors. There is so much toxic behavior, bullying, gatekeeping, and pushing out of marginalized researchers that happens that just is not covered by traditional mechanisms of reporting overt harassment or assault. These factors lead to hostile environments and I honestly don't think that mentors who engage in these behaviors should continue to be allowed to run T32 programs.

Proven or promising external resources or approaches

There is so much evidence from other countries with better social safety nets that shorter working hours, more vacations, better pay all improve job satisfaction, employee retention, and the work environment. We need to do more to ensure that we are offering these supports to employees and fighting the extremely toxic culture of academic overwork. Churning out paper after paper at the expense of doing deep, meaningful research and maintaining a balanced life is something we should explicitly discourage.

Response 454

Perspectives on the postdoc roles and responsibilities

An academic postdoc should include teaching responsibilities and mentoring of students that will be incorporated in their research project and will need supervision and guiding. Teaching should be in areas where the postdoc excels and the mentoring should include discussions to incentivize critical thinking in the mentee, like the establishment of a journal club. But it should be defined and restricted to 20-40% of the time. The research responsibilities should take a 60-80% of the time. This should include manuscript writing, design and doing experiments, data analysis, professional development and traveling to conferences/annual meetings.

Fundamental issues and challenges

One of the challenges is defined roles when hiring and assign time/effort for each role. Also, established clear expectations in responsibilities and how much time will be use in the exchange of knowledge and training of both parts involved.

A postdoc faces a new environment with unique dynamics that are difficult to navigate without guidance. As a postdoc, you come to fill the gaps of roles in administration, laboratory management, supervision, mentoring and teaching, diluting the time doing research. The expectations of solving all the problems, is inherent in the hiring process, but the consequences in postdoctoral training and the effect on research turnaround is not acknowledged. The principal investigator many times pass their own responsibilities to the postdoc. The training expected is a challenge when the PI do not have time, and no one else is available or able to train. The department at the hiring institution, ask to fill roles and responsibilities from a trained professional (postdoc) taking advantage of being authority figures and having seniority. The balance between providing the expertise to the laboratory and be trained in new techniques is disrupted, when the laboratory asked for more for the trained professional.

How can you sell this complex environment?—you cannot! Better communication is a key to recruitment, retention and overall success. Starting with establishing concrete and detailed expectations for the role in the hiring process with responsibilities of each part of the contract, as well as subsequent re-evaluation after each year of postdoctoral work.

Existing NIH policies, programs, or resources

Remove limitations in applications for postdoctoral fellows, like recent graduate (completed doctoral degree within the past 4 years) or early career (< 5 years from obtaining your PhD) What happens when you are looking for a second postdoc to be train in something new but the timing requirement does not work?

Add restrictions of the kind of work you can do under the funding period to eliminate some of the unexpected responsibilities falling on postdocs or define such roles as part of the compensation package to the institutions hiring postdocs, and/or add compensation to roles gained after the first year as a postdoctoral fellow. How to fix the problem of an oversaturated system? by slowly incorporating new talent to the department to fill those gaps.

Look for better ways to make accountable the principal investigators in their role as trainer of the fellow, maybe by asking the postdoctoral fellow to also submit a report. By acting as a moderator to asses communication between principal investigator and postdoctoral fellow, who better than the funding agency to make everyone accountable?

Response 455

Perspectives on the postdoc roles and responsibilities

I was a postdoc for 3 years and now I work as a staff scientists in a lab at a different institution that has many postdoctoral fellows. I am married to someone who is still a postdoctoral fellow. Despite having the exact same amount of experience and training, simply because I chose a staff route and he decided to remain a postdoc, he makes $20,000 less than I do and his benefits are much worse. He loves being a scientist, but it is difficult for him to reconcile wanting to continue his academic training with feeling like he doesn't have a "real job". I also felt this way as a postdoc so I decided to switch to a more stable job as a staff member. Postdocs are often viewed as extensions of graduate school instead of as independent staff members which is compounded by lower salaries than corresponding staff scientists.

Fundamental issues and challenges

- Low compensation and poor benefits, not attractive to retain people in academia when many postdocs are in their late 20s or early 30s and want to have stability and may be looking to expand their families or buy homes
- Being viewed as "better" for postdocs to move to a new institution for their training—this is extremely disruptive for many people again who may want to be starting to settle down and remain in a certain city due to family or personal reasons
- Being viewed as trainees similar to an older grad student instead of a real job (a postdoc should not just be viewed by the PI as another 5-6 year grad school on repeat)

To be balanced, many benefits to being a postdoc at this time in life, including flexibility and ability to make your own schedule to a reasonable extent, which is very attractive for many people at this time!

Existing NIH policies, programs, or resources

Truthfully, the bottom line is the postdoc salaries need to be raised and therefore R01 budgets need to increase. As an academic scientist and parent, the benefits of academic life are amazing, but given the economy and the de-stabilization after COVID it's just not enough for many people anymore.

Proven or promising external resources or approaches

No response

Response 456

Perspectives on the postdoc roles and responsibilities

Post docs are acquiring skills and techniques to become independent scientists.

Fundamental issues and challenges

PhDs are expected to have the knowledge of an mba, the technical abilities of an MD, and the abilities of a wizard for less than the pay of a high school dropout working any job whatsoever.

Existing NIH policies, programs, or resources

All post docs should get fellowships. You shouldn't have to apply.

Proven or promising external resources or approaches

Post docs get few to no benefits while working. Except it is a real and difficult job which has none of the upsides and many more downsides than other jobs.

Response 457

Perspectives on the postdoc roles and responsibilities

Ideally, an academic postdoctoral position would be treated as an entry-level PhD scientist role in a robust, publicly-funded research system. Academic postdocs would have several options for career progression within academia and government agencies, especially as senior research scientists (non-professor) in addition research professor, teaching professor, and full-fledged tenure track professor.

Academic postdocs would be treated with the dignity of a working professional, including being guaranteed fair compensation in terms of salary and benefits, such as paid family leave. Academic postdocs would have a level of intellectual freedom that would be the envy of their counterparts in the private sector. Academic postdocs would be seen by the scientific community and by the public at large as an investment in scientific excellence and a prosperous future for the country.

Sadly, the current role an academic postdoc does not meet these ideals. Instead, academic postdocs are treated as 2nd-class scientists. They are not afforded the the intellectual freedom or financial freedom they deserve. They described as "trainees" when they demand fair employment practices and "employees" when they demand adequate training. In some fields, academic postdoctoral positions are treated as a cost-effective dumping ground for PhD scientists which are grossly overproduced by irresponsible graduate programs. The extended length of time that someone may be a postdoc without promotion has generated a sort of professional purgatory of poorly compensated and overworked intellectuals, contributing to the burnout and exodus from academia we have seen over the past several years.

Fundamental issues and challenges

To quote previous answer: "Academic postdocs are treated as 2nd-class scientists. They are not afforded the the intellectual freedom or financial freedom they deserve. They described as "trainees" when they demand fair employment practices and "employees" when they demand adequate training. In some fields, academic postdoctoral positions are treated as a cost-effective dumping ground for PhD scientists which are grossly overproduced by irresponsible graduate programs. The extended length of time that someone may be a postdoc without promotion has generated a sort of professional purgatory of poorly compensated and overworked intellectuals, contributing to the burnout and exodus from academia we have seen over the past several years."

The drastic gap between public and private sector opportunities for PhD scientists is a disgrace. The size of this gap is a consequence of, among other things, the fact that the value generated by academic research is unfairly diverted away from researchers, including postdoctoral researchers. What remains for postdocs is pennies. Postdoctoral researchers are often so burdened by high cost of living and that they are unable or unwilling to start a family.

Some would argue that improving the postdoctoral experience through compensation and benefits would be a waste of public funds. I would argue that it is instead a waste (and a foolish, shortsighted one at that) for a society to force some of its brightest minds out participation in public life (including becoming parents!) through the status quo of the academic postdoc role.

Existing NIH policies, programs, or resources

1. Raise base pay for any postdocs paid via NIH grants
2. Mandate paid family leave for any postdocs paid via NIH grants
3. Do not classify post-docs as trainees
4. Incentivize universities to create non-professorial roles for PhD scientists (core facilities, etc)
5. Create more non-professorial roles within NIH, at Maryland sites and possibly embedded within other publicly owned research sites outside of Maryland
6. Require annual meeting with PI, postdoc on NIH grant, and program officer (or someone within University grant office) with report submitted to NIH
7. Stop PIs from wasting NIH grant money on summer salary for themselves
8. Put greater restriction on "overhead" cost skimmed from NIH grants by universities

Proven or promising external resources or approaches

1. It is proven that when employers guarantee paid family leave, their employees are more willing and able to become parents
2. It is proven that when employers pay their workers a living wage, the workers tend to stay around longer
3. It is proven that when employers provide mentorship and career advancement resources to their employees, the employees tend to stay around longer and blossom into more productive and efficient workers

Fixing the postdoctoral experience is not rocket science. The balance of power and resources must be shifted away from the universities and the PIs and towards the researchers themselves. The funding agencies control all the levers and can fix the problem without any cooperation from universities or PIs. The people losing power will be unhappy but it will create a more just and prosperous scientific career pipeline. The culture glorifying the scientist as a "starving artist" is a quickly dying. The early career scientists of today reject the tradition of labor exploitation and demand to be treated with respect.

Response 458

Perspectives on the postdoc roles and responsibilities

The post-doctorate scientist has a major role in improving knowledge and innovations. This position requires doing hypothesis-driven experiments, performing experiments, analyzing data, bringing technologies and innovations to the lab, writing grants or participating in grants (experiments, writing, analyzing), and also presenting the data in the scientific community. The postdoc will also have a major implementing collaboration in the lab!

Fundamental issues and challenges

- Low salary
- Low benefits (housing issues (time, unsanitary, expensive), not protected by basic rights such as harassment, access to a retirement account, and access to childcare)
- Poor visibility (grants and reviewing always under the PI's name)
- Low number of vacation days
- Visa issues
- Expensive green card application process
- No access to training like mentorship training (which should be mandatory for everyone!)

Existing NIH policies, programs, or resources

- Increase the minimum for salaries (minimum should be 90K/year) to be competitive with the industry
- Render a number of mandatory vacation (25 days should be the minimum)
- Increase the number of post-doctoral grants
- Open new grants for international postdocs
- Create a transitioning postdoc-PI grant

Proven or promising external resources or approaches

- Approach all the union organizations which speak for all the postdocs!

Response 459

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

We struggle to recruit postdocs because the cost of living in our city is so high, and the NIH stipend is so low. It would be wonderful if the stipends could vary based on the cost of living in different cities. In fact, our postdocs are unionized and have negotiated a salary that is higher than what NIH provides; this means that we have to have separate non-federal funds with which to supplement the stipends, which is a substantial barrier for our school. Similarly, the annual child care allowance the NIH offers doesn't even cover one month of full-time child care in our city.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Response 460

Perspectives on the postdoc roles and responsibilities

Often, the job market envisioned by PIs (and institutions, postdocs, and funders) is the academic job market. But, we know that there are far too few good/non-adjunct/TT academic positions—the academic job market is not good in many fields. So, a low postdoc stipend with potential entry into academic positions is not a good bet.

If NIH is trying to foster the biomedical workforce or innovation or public health, then postdocs who subsequently go into industry, policy, or other related positions would also contribute to that. If there are not enough NIH grants for faculty to get funded and not enough faculty positions for postdocs to get jobs, then there should be explicit recognition and encouragement of non-academic careers AFTER the postdoc as well as right out of grad school. This would mean changing the metrics for success during the postdoc period. Not every postdoc should develop a project pipeline and apply for grants if their goals are to transition to industry or other related fields; mentors and funders should be more appreciative of the types of training and experience that best prepare postdocs, tailored to the postdoc's specific goals.

If there is not a shortage of stellar people applying for scarce faculty positions, why worry about fewer people applying for postdocs? Probably because labs rely on postdoc labor. This means those positions could be filled by techs/research scientists. Tech/research scientist positions in academia could be, in fact, much more desirable positions than time-limited postdoc positions since they would have more stability/longevity (pending lab funds and performance). It would in fact make more sense to worry that academia can't compete with industry for highly trained techs, rather than to complain that PhD grads decide to become techs for industry rather than do a postdoc.

Fundamental issues and challenges

Postdocs are under-compensated, struggle financially, and have poor resources. Postdoctoral salaries should be increased and postdoctoral fellows should have benefits similar to other university employees (postdocs often fall through the cracks of being considered neither students nor employees—can't access student services, can't access employee services, can't contribute to retirement accounts, etc.).

The job market in academia is not good. Why stay in academia, why do a postdoc, if there won't be jobs at the end? We justify lower salaries/benefits because a postdoc is a trainee who benefits from mentorship etc. with the idea that they will later have access to a better job market.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 461

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

NIH postdoc stipends significantly undervalue the work that postdocs do and the training that we already have. It is also frustrating not to be able to contribute to certain retirement savings accounts throughout graduate school and then again during postdoc. In my opinion, changing these financial issues is essential to recruiting postdocs.

Existing NIH policies, programs, or resources

The NIH T32 payback policy limits what postdocs are able to do and their timeline for doing it. Eliminating this policy or allowing for more flexibility would be helpful.

Proven or promising external resources or approaches

No response

Response 462

Perspectives on the postdoc roles and responsibilities

In an ideal condition, Postdocs provide a bridge between graduate students and faculty, as well as a source of innovation and creativity for research and teaching. As such, postdocs are expected to fulfill many roles and responsibilities.

1. Research: Postdocs are expected to conduct and lead research projects, either independently or as part of a larger team. Postdocs are expected to produce meaningful results and publish them in peer-reviewed journals.
2. Mentoring: Postdocs are expected to mentor and guide graduate students, both in research and teaching. Postdocs should provide guidance and support to ensure that graduate students are successful in their research projects and courses.
3. Teaching: Postdocs are expected to assist faculty in teaching courses, either through lecturing or providing teaching assistance. This can involve leading discussions, developing new materials, and providing feedback to students.

Fundamental issues and challenges

Postdocs in the often face a number of issues, from limited job opportunities and job security to low salaries and limited benefits.

Low salaries: Postdocs in the US often make less than their peers in other countries, with median salaries ranging from $56,484 to $68,604

Limited job opportunities: Postdocs are often limited to research positions in academia, and may find it difficult to transition to industry jobs.

Job security: Postdocs are often employed on short-term contracts, and may face uncertainty when their contracts expire.

Limited benefits: Postdocs often receive limited health and dental care, as well as limited vacation time.

Limited career development: Postdocs often lack access to mentoring and professional development opportunities, and may lack access to resources such as job postings and networking opportunities.

Existing NIH policies, programs, or resources

Restructure salary first

Proven or promising external resources or approaches

If you are looking to provide additional money for postdoc training in a grant, there are a few options available to you. Depending on the grant and the funding agency, you may be able to request an increase in the budget for training or travel costs. You may also be able to use a portion of the grant to pay for a postdoc training program or to hire a consultant to provide training. Additionally, some grants may allow for the use of a postdoc training supplement to pay for training-related costs. Finally, you may also be able to apply for a separate grant specifically for postdoc training.

Response 463

Perspectives on the postdoc roles and responsibilities

My postdoc is a job. A job I am underpaid to perform. I lived on a poverty wage all through my 20s to complete grad school. Now as an adult who wants a family, security, and independence I live off of a shameful stipend. The NIH pay rates are deplorable. They make academia untenable to folks from lower income background. Salaries fail to account for local cost of living. There is nothing you can do to make a postdoc more palatable that erases the harm you do with low pay. It’s very simple: Increase the pay.

Fundamental issues and challenges

The pay rates set forth by the NIH are shameful. Postdocs are adults. Stop infantilizing postdocs with shameful pay rates under the guise of "providing further training". Many post docs skills are superior to the PIs that they work under. Postdoc positions may result in career advancement but many do not. Many PIs hoard power and resources. The skills of postdocs enrich PIs. The fact that grant mechanisms handicap postdocs is ridiculous (i.e., R21 grants making early career scientists ineligible for K awards). The entire premise that F and K awards rely upon PIs and "training" perpetuate a hierarchy in academia that actively harms early career scientists, indenturing them under senior PIs and limiting the pursuit of opportunities at other institutions. Increase postdoc pay so that the pursuit of grants is not necessary.

Existing NIH policies, programs, or resources

More money for postdocs.

Create more grant mechanisms that actually foster independent development in postdocs, rather than arduous grants that shackle postdocs to toxic, prestigious universities/institutions and senior PIs with bloated resources.

Stop treating postdocs as "trainees" and give them actual resources.

Proven or promising external resources or approaches

Increase salaries for post docs.

Response 464

Perspectives on the postdoc roles and responsibilities

Protected time and resources (including funding, mentorship, facilities and equipment) to refine one's research direction, and to gather and analyze data which may be used to support grant applications for further training or to become independently funded.

Fundamental issues and challenges

In general, postdocs are poorly compensated for their level of skill and work hours, compared to non-academic jobs. This also includes worse benefits, including health insurance and paid parental leave, compared to non-academic jobs (especially those in the tech industry).

Existing NIH policies, programs, or resources

Increasing paid parental leave up to 6 months, especially for mothers who bear a larger burden of child-rearing responsibilities due to biology (e.g. breastfeeding) and cultural norms. Many women leave academia due to perceived or actual discrimination against mothers, and lack of financial and structural support during the most demanding period of infant-rearing.

Proven or promising external resources or approaches

No response

Response 465

Perspectives on the postdoc roles and responsibilities

It is a training stage, and it should enhance my experiences of science, however, if I am not appreciated, then I will escape and move to industry.

Fundamental issues and challenges

work like a slave with a very low salary.

The salary is a mess unfortunately.

Existing NIH policies, programs, or resources

We need more appreciation to the postdoc not to the PIs.

Proven or promising external resources or approaches

No response

Response 466

Perspectives on the postdoc roles and responsibilities

I'd say postdocs provide a dedicated opportunity for early career researchers to build an independent research program and establish credibility for implementing that program and should involve direct training from a supervisor on both scientific and non-scientific aspects of running a lab. I do not think postdocs should be required or encouraged for trainees who don't want to become academic faculty members—PhD training should be of sufficient quality for positions outside of academia (and if that's not the case, PhD training should improve).

Fundamental issues and challenges

- Low pay. My graduate school classmates in industry make 2x what I make, and I live in a high-cost area with one of the highest postdoc minimum salaries in the country. It is very unlikely I will recover my lost income in the future.
- Disruption to personal life when having to move to take on a postdoc
- Lack of adequate support, guidance, or mentoring from supervisors
- Lack of institutional policies that protect postdocs from abusive supervisors
- Lack of institutional policies or incentives to improve mentoring quality
- Lack of institutional power for postdocs in general. Often your choices are just to put up with unfavorable conditions or leave.
- Perception that academic faculty positions are difficult to get and not worth the effort or the loss of income that comes with a postdoc
- Availability of other career paths that do not have these problems

I may be the only student out of my PhD cohort of 10 at a high-tier US program to do a traditional academic postdoc, which is largely due to the poor pay and general disenchantment with academia, compounded by several negative experiences with supervisors and the institution. The perception is that postdocs aren't at all worth the pain and that doing a postdoc is a pretty stupid decision.

Existing NIH policies, programs, or resources

- Mandated increased pay for NIH-funded postdocs, possibly adjusted for cost of living
- Mandated mentorship training and employment protection for postdocs for NIH-funded labs or training programs
- Mandated review of mentorship quality and student/postdoc outcomes (including confidential interviews with *ALL* current trainees) for initial award/renewal of non-project-based grants (e.g., U54)
- Collection/publication of data on student/postdoc outcomes from individual institutions (and preferably individual PIs), including mental health outcomes. This should be mandatory for receiving NIH funding.
- Reducing funding for large, high-profile labs in which there is no way the PI is actually adequately supervising all of their trainees. Increase funding for early career PIs instead, so postdocs in these labs can instead get independent positions (which they already functionally occupy) where they get the pay and respect commensurate with what they are actually doing day-to-day.

Policy changes will only be effective if they actually have teeth—optional things like mentorship training, etc have quite frankly proven to be ineffective. The most effective way for the NIH to step in is to tie these goals directly to funding. If there is no financial incentive for change, it will never happen.

Proven or promising external resources or approaches

No response

Response 467

Perspectives on the postdoc roles and responsibilities

It is a required position if I want to be tenure-track faculty. It is working under a professor and learning how to run a lab, manage people, and still produce high-quality science.

Fundamental issues and challenges

Money. That's it. I'm sure someone on your team has access to the Internet and is aware of this at this point, but that's it. It must be painful for some people to know that they can earn so much more and have their work more highly valued in a private environment, but that they must do an academic post-doc to pursue academia. Which I guess is fine, I understand that giving up earning potential is part of the process, but we exist in a capitalist economy—if you want your top talent to be happy, you need to pay them. Speaking candidly, I am wealthy and my partner is wealthy and also not an academic. I have fewer issues earning less—all that paying post-docs low wages does is widen the gap between privileged researchers and non-privileged researchers.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 468

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary is too low for the expertise we as postdocs have. For expensive cities (ie boston), the cost of living adjustment is a joke. Having to pay for childcare is a huge burden on the person, especially if the other parent can't/doesn't work. There are not enough PI positions for the postdocs. NIH needs to recognize the importance of staff scientist positions in the academic lab and have funding mechanisms to support these (ie NCI R50 staff scientist awards).

Existing NIH policies, programs, or resources

There are not enough PI positions for the postdocs. NIH needs to recognize the importance of staff scientist positions in the academic lab and have funding mechanisms to support these (ie NCI R50 staff scientist awards).

Proven or promising external resources or approaches

No response

Response 469

Perspectives on the postdoc roles and responsibilities

It's a position where a PhD holder expands their expertise and experience in a related field or subfield. They learn to develop more skills making them prepared for their future career

Fundamental issues and challenges

Low pay in comparison to industry.

Lack of job security.

For International postdocs visa options are limited which affects future employment opportunities.

For International postdocs, less opportunities to get NIH funding.

Existing NIH policies, programs, or resources

Increase minimum pay stipulated by the NIH.

Open grants/fellowships to International postdocs.

Proven or promising external resources or approaches

No response

Response 470

Perspectives on the postdoc roles and responsibilities

An academic postdoc is a training position with more seniority and independence than a graduate student, but less than a junior faculty member. A postdoc should fundamentally be a temporary position to enable the trainee to gain experience and credentials necessary to obtain a permanent position in academia or elsewhere.

Fundamental issues and challenges

Limits placed by NIH on the ability to apply for grants based on time in the postdoctoral stage are harmful to those whose careers do not follow a smooth and traditional path. The postdoctoral years are a time when many female trainees must have children, and NIH policies on application limits for career-development awards and for the timing of career development awards themselves (e.g., the two-year K99 phase) result in an impossible balancing act. I am a K99 awardee who has recently given birth, and my institution has been unable to apply for a maternity leave extension on my behalf. I run the risk of losing my ability to transition to R00 because I took time away from the lab and from my job search to care for my baby. I also lost time at the beginning of my K99 phase because of the pandemic, when I did not have childcare for my older child. As a postdoc, and in my faculty job search, I am expected to move away from my family and other resources I could have used for childcare, but I am penalized in multiple ways for my children requiring ongoing resources and time to raise. I am nearly 40 years old and could not have delayed having children until after I was in a faculty position. The limits NIH places on the length of the postdoctoral period have the effect of winnowing the faculty application pool only to those who are able pursue a traditional, uninterrupted path, and to those who were lucky enough, or in labs with enough resources, to have successful projects early in the postdoctoral period.

Existing NIH policies, programs, or resources

K fellows should have access to childcare supplements as F fellows do. Policies on childbirth leave for trainees on K grants should be made more clear to institutions, and childbirth should result in an automatic extension of the K99 phase to enable parents to recover from birth and care for their newborns. NIH could expand or simplify the application process for supplemental awards to K99 recipients to make it easier to apply for funds to cover the cost of a technician or other support while the K99 awardee is on parental leave. The K99 phase should have more flexibility during the postdoc-to-faculty transition so K99 recipients are not pressured to take subpar faculty positions in order not to lose their R00 funding. NIH should encourage institutions to retain their K99 fellows so that junior faculty are not severed from their community and support systems at this critical point in their careers.

Proven or promising external resources or approaches

No response

Response 471

Perspectives on the postdoc roles and responsibilities

In an R1 institution, the roles and responsibilities of an academic postdoc are to

1. Understand the research landscape in their area of expertise and synthesize new ideas and hypotheses,
2. Carry out research to test these hypotheses, and
3. Author scientific publications.

Postdocs may also support their PIs

- Mentoring trainees,
- Writing grants to support research.
- Fundamental issues and challenges
- Postdocs get paid poorly, often have insufficient healthcare support and don't have long-term financial security such as retirement benefits.
- Academic PIs overwork and mistreat postdocs. There is a glaring lack of accountability such as a HR department in industries. Further, the power disparity between a PI and postdoc, where a postdoc heavy relies on the good graces of their PI, promotes abuse.
- Postdocs are always forgotten in the support services provided by universities. For instance, universities will regularly provide housing for students, staff and faculty, but not consider postdocs in any of these categories. Same goes with other benefits and support structures in universities. Therefore, postdocs are forgotten and let to slip through the cracks,

Therefore, the current structure treats postdocs as temporary and dispensable labor.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

a) Improve NIHs scale for postdoc pay.
b) Create the equivalent of "Ratemyprofessor" to support sharing feedback on trainee experiences with different PIs. This will enable postdocs to make an informed choice.
c) Create clear guidance towards suitable work environment for postdocs, and portals to lodge complaints. This will help stem abuse of postdocs.

Response 472

Perspectives on the postdoc roles and responsibilities

I feel the postdoctoral scientist is a very important role in academic research. They are often the glue of the lab and play a large role in mentorship and teaching/inspiring younger students.

Fundamental issues and challenges

The single biggest issue with recruitment and retention is low pay. Especially in high cost of living cities, people do not want to spend 5+ more years barely making ends meet after going to graduate school. At our institution postdocs are not eligible for retirement matches and it is very clear in the US this is an important topic. Postdoctoral scientists deserve to be paid more.

Existing NIH policies, programs, or resources

Grants to cover childcare and housing offsets programs to help people in their late 20s/early 30s not have to choose between postdoc roles and life events.

Proven or promising external resources or approaches

No comment

Response 473

Perspectives on the postdoc roles and responsibilities

A postdoc is generally a short-term research position that provides further training in a field or even a very different field and opportunities to develop as an independent researcher. For me, the postdoc year(s) can be an opportunity to develop independence, hone technical skills, focus research interests and develop leadership and project management skills.

Fundamental issues and challenges

I live in the Washington D.C. area (Rockville) and I am supporting my partner and two kids. It's really hard to pay all of my monthly expenses on one income. I'm often stressed about finances due to high inflation and it's really mentally tiring. As far as I know, the St. Jude Children Research Hospital has increased its employee's income to $70,000 each year since last October, 2022. Living in Washington D.C. is really expensive for a family. NIH should consider improving or changing this situation for the postdocs immediately.

Existing NIH policies, programs, or resources

None.

Proven or promising external resources or approaches

NIH should consider providing financial aid or support for the postdocs(especially for the postdocs living with family) to find economical apartments.

Response 475

Perspectives on the postdoc roles and responsibilities

Mostly independent research.

Supporting and mentoring in lab group.

Training new skills.

Applying for an interviewing for new opportunities.

This position is a nearly independent position; research should be mostly guided by the postdoc's own research instincts, while aware that other people will have to ultimately be the responsible party. The reason why pay is lower, in my opinion, is that there should be protection for the trainee—this means that the PI is ultimately responsible for any mistakes, the postdoc should have protected time for professional development, paid opportunities to continue training, and paid to further their careers in whatever way makes sense.

Fundamental issues and challenges

Low pay for highly trained position.

No guarantee for funds to do training/attend essential conferences.

No guarantee for funds to start independent research project.s

Most likely involves moving, possibly far distances with little support and relocation stipend hardly ever supported.

Not every institution has protected days off/parental leave/sick leave.

Not easy to get a mortgage because it often technically a year-to-year contract position.

Confusing taxes with training grants.

International people often rely on the position for visa status, so can easily be put in a bad lab with a toxic PI and not a good way to move.

Not enough academic positions to hire all postdocs, but training for other positions is limited.

Often the workhorse of publications in a lab, but there needs to be reasonable hours (appx 40 per week) and protected time to develop and train for the next stages of their career.

PI is in charge of your fate—if you don't end up with a good one, you could loose out on an essential recommendation.

Existing NIH policies, programs, or resources

T32 and F32s should have higher minimum salaries (at least and funding to support 1x relocation fees). Minimum salaries should be 80% of the average starting professor salary (to represent the slight difference in ultimate responsibility) and there should continue to be a set yearly fund to pay for other training/small research projects/conference fees (I think it is close to $5k right now). Contracts for these should include minimums sick days and paid time off.

Postdocs should have a way to report PIs that break contracts (parental leave, hours worked, time off, commitment to training opportunities), and there should be yellow/red card system that will instate fines for these PIs. Postdocs subject to other workplace harassment (discrimination or otherwise) should be placed on paid administrative leave while the PI is investigated.

Contracts should offered to be at least 2 years (unless the postdoc does not want).

Contracts off NIH supported grants (R01, P30, R35 etc) should abide by these same criteria, with dedicated funding to support the postdoc's training.

Proven or promising external resources or approaches

haven't seen any yet

Response 476

Perspectives on the postdoc roles and responsibilities

I think the roles and responsibilities are not clearly defined and this depends on the lab and PIs. That said, I view the postdoctoral fellows as an upgraded PhD student. Although I view postdocs are bringing new ideas, mentoring students, writing grants, essentially postdocs are playing the same role as PhD students, but with more skills.

Fundamental issues and challenges

1. Low salary. There is not even a job guarantee after a postdoc training, so low salary as an introductory salary is not excused. Most people I personally know went directly into industry or more teaching-based universities after graduating primarily because of this reason. Training with low salary with job guarantee will be completely fine, but the current system does not do this.
2. Job availabilities. In line with the first point, there is too much uncertainty in job search. Most people who go into postdoc training would look for tenure-track positions, but there are limited availabilities in the first place. If then, there is really no reason to go into postdoc positions with low salary knowing that the job search will be devastating.
3. Rigid funding mechanisms. As an international student, it's almost impossible to get any government fundings. Considering the high number of international students who are doing a phd program in the US, there are very limited number of fundings available. This further hinders willingness to take postdoc training, even stay in academia at all

Existing NIH policies, programs, or resources

F32: open to all PhDs without nationality restrictions. Also increase the time limit since graduation.

Proven or promising external resources or approaches

No response

Response 477

Perspectives on the postdoc roles and responsibilities

Doing a postdoc at [redacted for anonymity] gives me a lot of freedom, which I enjoy. Freedom to figure out what I want to research, how I want to do it, and why. This is the greatest part of being a postdoc. I do see a postdoc position as a temporary position between a PhD student and faculty and ideally, I don't do this for more than 3 years. I also enjoy the mindset of the people and the network of ambitious people that I've built.

Fundamental issues and challenges

It is very challenging to be an academic postdoc. First of all, being an international from Europe, the process for the visa is long and time-consuming. The salary and benefits are absolutely minimal and a big downside of academia in the US. I am considering moving back to Europe to receive a proper academic salary including benefits like health care and pension. Academia in the US is extremely underpaid, and this is a shame. Without the job of my partner, I would not be able to survive on this salary. Combined with the skewed work-life balance, I'm strongly considering moving to industry at the moment.

Existing NIH policies, programs, or resources

I find the NIH programs too strongly focused on US citizenship

Proven or promising external resources or approaches

Postdocs in the US are seen as students, but there is very little training and mentoring provided, this is an area of improvement.

Response 478

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is to be further trained and to perform research with the goal of becoming an independent scientist (whether or not the career goal is an academic career).

Fundamental issues and challenges

Fundamental issues are low salaries, poor benefits at many institutions, a lack of overall support from institutions, and in some cases, active disdain from upper administration. Regarding low salaries, many postdocs cannot afford to live near their home institutions due to living costs. Further, the average age of postdocs seems to be rising (I have personally seen new postdocs well into their thirties). As a result, postdocs very often put off major life events (marriage, children, etc) or choose to leave postdoctoral training for jobs with more better salaries and benefits. I, as a postdoc in his late thirties, have put off having children and have had medical issues become worse because I am continually denied care by the only affordable insurance option our institution gives us. Even worse, despite being a postdoc in a medical system ([redacted for anonymity]), many of our own physicians do not accept our health insurance. I have heard similar situations from other institutions as well. Taken together, if these conditions continue, I can only predict postdoctoral recruitment and retention will continue to dwindle.

Existing NIH policies, programs, or resources

First, salaries must be raised significantly ($70-$75K, minimally). With the current economic climate and inflation, being a postdoc is extremely difficult. We were already living from paycheck to paycheck and inflation has made this even worse. Second, there needs to be some minimal standard for health insurance. Postdocs are the backbone of academic research. We should be focusing on our work in the lab and not worrying about what bills we should pay and which to put off or about how long we can put off a necessary medical test or medication until we have better health insurance. To be clear, I love being a postdoc and I love what I do, but I don't know how much longer I can safely be a postdoc and continue to be financially unstable.

Proven or promising external resources or approaches

Working environment and job satisfaction are both important, but the main issue driving new PhDs and existing postdocs away from postdoctoral training is the poor salary and poor benefits. Some kind of oversight regarding how institutions communicate with and treat their postdocs would also be very

welcome. As it sits, my experience has been that we are generally ignored or get push back when asking for things like better medical coverage or for our own medical system to accept our health insurance. How can anyone be expected to stay in an environment where they are not paid well, where their well-being is of no concern to the institution, and where your life is essentially put on hold for an open ended period of time?

Response 479

Perspectives on the postdoc roles and responsibilities

Do independent research, participate in collaborations, train new talent joining the lab, and develop organizational and problem-solving skills.

Fundamental issues and challenges

Low salaries are the main issue inhibiting the recruitment and retention of postdocs, together with long working hours. It is extremely hard to have a family and buy a house with a postdoc salary and we are talking about people with a PhD, doing stuff that few people in the world can achieve. It gets worse when on top of that, the projects were not well thought out or involved techniques that had to be developed, therefore taking a long time to get any type of results, which is discouraging even if doing this for vocation. As an international postdoc, it is even worse for us. On one side, we are living far away from our families making it hard to get that important emotional support. Then, given that many PIs don't know or don't care about the complexity of the immigration system -and many times, even human resources-, we feel alone trying to figure it out, resulting in more anxiety and uncertainty. For example, there are PIs who won't give enough time off to be able to renew visas when traveling abroad, resulting in the inability to travel back home to visit family.

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

No response

Response 480

Perspectives on the postdoc roles and responsibilities

The Postdoc roles means I have the opportunity to further my career development in a safe (protected) environment.

Fundamental issues and challenges

Quality of life: inhibiting factors include the paygrade; it is hard to live on the NIH postdoc salary amount.

Also, interaction with mentor; it sometimes feels very isolating from my mentor.

Existing NIH policies, programs, or resources

Postdoc paygrade—increased to better support postdocs.

Proven or promising external resources or approaches

No response

Response 481

Perspectives on the postdoc roles and responsibilities

I primarily think of the postdoctoral position as a "middle management" equivalent for academic labs. They have enough experience with experimental design and project execution that they can work productively with little input from their principal investigator (PI). The purpose of a postdoctoral position is to gain the skills needed operate an independent lab.

Their specific job functions are:

1. Design and execute a project with minimal input from the PI. At this career stage the advice from the PI is usually focused on project choice and lab operation skills (such as grant writing, reviewing, presentations, ect.)
2. Provide hands-on mentorship to junior mentees. The PI is typically unable to completely fulfill this role, and it falls to the postdoc.
3. Instilling lab culture. The manner in which the PI's policies are translated into actions depends largely on the culture in the lab. A postdoc has a critical role of leveraging their experience to create a productive lab culture that aligns with the PI's policies.

Fundamental issues and challenges

Put briefly, the problem with postdoctoral positions is that they are training individuals for jobs that don't exist. A single academic PI position can yield more than 100 applicants. Hiring committees search for the most qualified candidate. From the perspective of the postdoc, the criteria for obtaining a PI position appear increasingly arbitrary and outside the control of the candidate. Successful candidates have assets that are difficult to obtain. High impact papers and awards have a major luck component. Continuous productivity (especially during the pandemic) requires the postdoc to prioritize lab work over family and health obligations. Obtaining a good academic pedigree typically requires the postdoc to move to coastal areas with a very high cost of living. In summary, the postdoctoral position demands major personal sacrifices to obtain a position that is statistically unlikely to exist.

All of the above concerns could be ameliorated if postdoctoral positions offered alternative careers that could justify the sacrifices they demand. This does not appear to be the case. Among my colleagues it is well-understood that industry does not financially reward people for postdoctoral training (see: The Price Of Doing a Postdoc publish in Science 2017 and The Impact of Postdoctoral Training on Early Careers in Biomedicine published in Nature Biotechnology 2017). Put simply, if a person were to commit to a 5 year postdoc ($50,000/year) and then transition to industry ($120,000/year), that decision will cost them $350,000 up front plus losing 5 years of their time. That gap has been growing rapidly the last few years.

It appears that the pandemic has given trainees the opportunity to critically evaluate their career path, and the postdoctoral position is no longer a competitive option.

Existing NIH policies, programs, or resources

Unfortunately, the problems outlined above are mostly outside the control of the NIH. The core problem is a mismatch between the number of people being trained and the number of positions available.

1. Remove or lengthen the eligibility timelines for career transition grants (such as the K99/R00). The initial goal of discouraging "forever" postdocs is worthwhile, but in practice these grants are awarded to trainees that don't require additional training. The timelines end up excluding the trainees who would actually benefit from more training.
2. Increase the resources allocated to K grants and decrease the amount given to F grants (F31 and F32 specifically). The pipeline clog is at the postdoc level, not the graduate student level.
3. Increase pay. This might help, but in all likelihood the postdoc exodus is driven by the gap between industry and postdoc pay. Increasing pay may help a bit but starting pay rates in industry have been growing so quickly that I imagine the gap will continue to grow even if postdoc pay is increased.

Overall, I feel that the NIH does a good job at supporting postdocs where they can.

Proven or promising external resources or approaches

Encourage or require universities that hire foreign postdocs under J1 visas to sponsor them for an H1B visa or a green card. The NIH should offer the support labs need to achieve this goal.

The postdoctoral workforce includes a large number of foreign workers. The steady flow of foreign talent into the US is critical to overall health of the NIH's scientific endeavor. However, the current model is problematic. Foreign workers usually have a J1 visa. This arrangement is detrimental to many members of the scientific community. The J1 visa worker is severely limited in employment options and is vulnerable to exploitative working arrangements. Other postdocs suffer because J1 workers are unable seek employment on the open marker, which artificially swells the ranks of postdocs. The primary beneficiary of the current policies are labs that require extremely cheap lab that is unsupported without the aid of monopsony.

Response 482

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are absolutely essential to the conduction of science. In our lab, they are responsible for the data collection and analysis, manuscript writing and generate critical preliminary data for grant proposals. Our postdocs go onto successful scientific careers in academia or industry and we work hard to prepare them for either path.

Fundamental issues and challenges

Cost of living is rapidly increasing and salary scales and benefits are not keeping up. Postdocs also need paid maternity/paternity leave as they are at a stage when they want to start families.

Existing NIH policies, programs, or resources

The most fundamental change that NIH can make is to raise the modular budget. It has been at $250,000 since 1999—24 years with no adjustment for inflation means scientists have lost ~45% of purchasing power while having to cover an increasing portion of salary and costs. Institutions look to NIH to set postdoc salaries so raising the scales for fellowships would also improve retention of postdocs in academia. The immense pressure for postdocs to continue on to academic careers must also be addressed. Fellowships that are directed at mentoring postdocs for industry careers is also important.

Proven or promising external resources or approaches

All of these are band-aids—postdocs must be able to make a living wage. If they are financial stable, then everything else will come.

Response 483

Perspectives on the postdoc roles and responsibilities

A postdoc is a full-time entry-level position for someone with a doctoral degree. It is similar to a research scientist position, except that there should be more independent research/creative control in a postdoc (ex: developing new grant proposals or leading new analyses and manuscripts). It is only a "training" position in that any early-career position involves training. A postdoc's supervisor should also serve as their mentor, and the postdoc should be gaining new professional and scientific skills. The roles **and responsibilities** of a postdoc are negotiated between the postdoc and their supervisor, in order to meet the needs of both the postdoc and supervisor. But fundamentally, it is a full-time job for a highly skilled expert and should be compensated accordingly.

Fundamental issues and challenges

Recruitment I imagine is challenging due to a lack of centralized, systematic approaches for advertising postdoc positions. It was difficult to find postdoc positions that I was suited to, even when actively searching for them. Also, salary and moving cost reimbursements are rarely noted in the job ads, which would greatly help people make decisions on whether to apply.

Quality of life issues are largely related to salary and supervisor/university admin policies. As a postdoc, I work full-time on research and student mentoring. Due to new [redacted for anonymity] State laws on salary and overtime, and my institution's refusal to pay overtime to postdocs, the hours I spend on academic service (ex: peer reviewing, serving on a postdoctoral association) are uncompensated. Research not directly related to my postdoctoral position (ex: publishing my dissertation research, continuing collaborative research from my PhD) is also uncompensated. So I end up working as many hours per week as I would as an assistant professor, but at a fraction of the pay. All postdoctoral positions should be only slightly below the salary of an assistant professor in the same department and all moving costs should be fully reimbursed.

Additionally, it is a huge challenge to move sometimes across the country for a 1 year postdoc. I would have declined any postdoctoral position that was 1-year only due to the expenses and massive life upheaval of moving twice in a year.

Also, the lack of unions for most postdocs makes those positions less enticing.

Existing NIH policies, programs, or resources

The NIH LRP should be advertised and funded more. It would also be nice to have a shorter turn-around time on the application period—people will mostly qualify for those awards when in a postdoc, but will probably not know where their postdoc will be in time to apply for the first year of the postdoc. I could not apply until I was already in my postdoc, and then that did not go into effect until the second year (a challenge for people whose postdocs are only 2 years, given the required 2 year commitment for the NIH LRP). Knowing that a postdoc could also come with substantial loan repayments would make postdoc positions more enticing, but the timing of the NIH LRP does not work well with the typical hiring schedule and contract length of a postdoc.

Otherwise I think the NIH programs and policies and resources are generally good. I am glad to see increasing stipends for postdocs.

Proven or promising external resources or approaches

Providing a network of external postdoctoral mentors would be helpful, as well as a community of postdocs across universities to compare experiences. NIH should also have clearly communicated opportunities and plans for if a postdoctoral position goes awry—for example if a supervisor is abusive or negligent and the postdoc would like to leave the position and pursue a postdoc elsewhere.

Response 484

Perspectives on the postdoc roles and responsibilities

Academic research is hindered in the scope of its expertise. These positions require highly specific training that doesn't overlap with other fields. When a project requires multidisciplinary approaches, areas outside of expertise are often patched over with the postdoc needing to learn the bare minimum as they go. As an example, an electrophysiologist needs knowledge in animal models, animal behavior training, electrical engineering, software engineering, computer science, etc to successfully run an experiment. However, it is difficult to be an expert in all these fields and depending on the environment, the postdoc may not have the support to be able to adequately run the experiment, data collection, and analysis in an efficient manner.

Fundamental issues and challenges

Postdoctoral associates are still viewed as "trainees," and as such there is less (or no) incentive to provide a competitive salary as compared to industry. In many ways, the term postdoctoral "trainee" is not associated with gainful employment and more with continued education, despite the many years spent in graduate school. Coupled with the NIH-posted stipends for postdoctoral fellows, PIs are given no incentive to provide a salary beyond the NIH-mandated minimum, which also goes against the grain of providing a salary commensurate with skill/ability and relies more on years of experience.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

View the postdoctoral associate position as highly skilled, gainful employment and provide benefits as such, including benefits existing in industry such as providing retirement matching.

Response 485

Perspectives on the postdoc roles and responsibilities

In my view, postdoctoral position means continuation of a training in research with opportunity to generate ideas, be further trained in data processing, presentation, grant application. At the end of the postdoctoral training, one should be comfortable being an independent scientist.

Fundamental issues and challenges

Overall system lacks in many aspects:

1. One major problem is that lab environments are not regulated at all. PI is the primary and most powerful figure in the lab. HR tells you: it's to the discretion of the PI. Universities are not exhibiting any source of regulation of the PI's management. Therefore, a lot of labs become toxic workplaces where postdocs leave as soon as they can and pass the message to other possible candidates not to join. I believe if universities had a way to get PI's reviewed/graded on some scale by postdocs/employees and had a proper HR system that had repercussions for "malfunctioning" labs/bad managing PIs—it would be a huge positive change in the system. There could be ranking for best labs to do a postdoctoral training at across the country. Maybe ranking system would make universities care to have better labs.
2. Also, because labs are not regulated by any means and the PI is the sole manager—unethical science can be performed easily. I believe there needs to be a system in each university that checks the draft of publications (at least for the western blot images) before the paper is published. Research misconduct workshops should be enforced yearly among PIs and postdocs/students.
3. Many PIs do not see postdocs as trainees, but rather as technicians executing their tasks. PIs must be required to pass mentorship and management workshops. Postdocs should have "learning funds" to use for conferences or whatever classes towards their training.
4. Salary and benefits need to be increased.

Existing NIH policies, programs, or resources

NIH representatives should go to universities and present these programs and resources and talk to postdocs at least once a year. PIs do not promote this information and most of postdocs have no idea about such opportunities.

Proven or promising external resources or approaches

Increasing salary would be number one proven approach.

Response 486

Perspectives on the postdoc roles and responsibilities

A postdoctoral position that would be funded by the NIH should prepare the postdoc for independent research as a principal investigator. I would actually, ideally, eliminate the postdoctoral training system altogether, as postdoctoral researchers should not be considered trainees, but colleagues.

Fundamental issues and challenges

As postdoctoral researchers are currently defined they are trainees, which leads downstream negative effects: Low pay (especially as compared to industry positions), lack of benefits (401K, health insurance, sufficient leave policies including parental leave), perpetual postdoc-ism where fully qualified individuals have trouble accessing their career path, and two year positions that are distributed across the US. This leads to people leaving the profession for better pay, benefits, job security, and life stability. In the end, it leads to a system where individuals are obtaining their first faculty position at ~35-40 years of age, which is an incredibly long, unnecessary training period, sacrificing years of earning potential and other important life milestones such as buying houses, having kids, etc.

Alternatively, there should be space for researchers to not necessarily be PIs on projects, but instead be respected as colleagues that are contributing to research productivity. Not everyone wants to be forced into obtaining funding individually in order to contribute to research.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 487

Perspectives on the postdoc roles and responsibilities

Supposed to train you for a professorship, but most won't make it that far as most labs do not publish the necessary type of journals to secure a faculty role. So for 90%+ of postdocs they are essentially a staff scientist with lower pay and less job security.

Fundamental issues and challenges

Money.

Money.

Money.

Opportunity for advancement.

Toxic advisors and no accountability.

Existing NIH policies, programs, or resources

Increase pay and limit postdoc positions in grants to labs with a history of placing them in faculty roles. Alternatively, require alternate career training as a part of any postdoc position in a grant.

Proven or promising external resources or approaches

No Response

Response 488

Perspectives on the postdoc roles and responsibilities

Roles: I few a postdoc as a person who is furthering their training/gaining more experience before obtaining a faculty position or similar with full responsibility over a lab. A post doc can work independently on a project they design themselves, can entertain various leadership and mentor roles, while also still being a mentee—especially in areas in which the postdoc is less experienced than their PI. The postdoc has full responsibility over the work he/she conducts but can turn to the PI or other more experienced peers with questions without losing credibility.

Fundamental issues and challenges

Postdocs appear to be cheap labor for many PIs that they can order around and disrespect. They are overburdened with work—often work that a well trained lab tech can and should do. But well trained lab techs seem to be even harder to find than postdocs, so postdocs end up doing the work, whether it helps their personal career or not. I feel like it should be mandatory for PIs to create a milestone plan for the work with their postdocs that is mutually beneficial and this plan should be reviewed by other PIs and the milestone progress should be checked by other PIs to hold the postdoc and his/her PI accountable. I feel extremely fortunate that I am a postdoc in very nurturing lab with extremely experienced PIs who put all focus on the training of their PhD students and postdocs and through that they are extremely successful with their research as well.

Existing NIH policies, programs, or resources

To be honest—I am not to familiar with these.

Proven or promising external resources or approaches

I believe that the above mentioned milestone plan would be great. Also, there could e.g., be incentives to train more lab techs and to train them at a higher level so that postdocs can do postdoc work and lab techs can flourish in their job. The application for a postdoc position should include more than a CV and a 30 min interview. PIs should ask themselves if they are willing to train somebody who is from a slightly different field or if they are looking for someone to bring their expertise to the project. In the latter case there is no room for micromanaging and there should be mutual respect between postdoc and PI.

Response 489

Perspectives on the postdoc roles and responsibilities

As Ph.D, I was expected that a postdoc position will be form me a beginning of a promising career in research. Unfortunately, postdocs are just exploited by academic research, we are used as super technician to generate data for PI's grant. In this whole story, we put a lot of efforts working without any compensation or a slight promotion to reward our work. From my point of view, it doesn't worth it to be a postdoc, I will quit ASAP.

Fundamental issues and challenges

High competition with Indian and Chinese makes recruitment hard, those are cheaper for academic research then a US citizen/resident. The second point and the most important one, is the salary. It's shameful how Postdoctoral salary is nowadays. The salary of a postdoc is indeed considered to be low income in today's society, which let us Surviving and not live comfortably as we should, which is shameful. the salary is not proportional to the number of years of studies carried out, a Doordash delivery guy can make the same or even more that un postdoc in a 4 hours work!!!

The last point is also the fact that a BS technician with one year experience is payed same or more than a postdoc, which is not acceptable.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 490

Perspectives on the postdoc roles and responsibilities

Being a postdoc to me means bringing a very specific skill to a lab (usually learnt as part of the PhD) while also acquiring new skills from the PI and other lab members. It involves contributing to and extending research programs of the lab, supervising junior scientists, and building ones own research program to move on after the postdoctoral phase.

I love my job very much but the financial strain and lack of security make it not sustainable to do this job much longer. Starting a family means that I will basically work for free because child care costs and rents are so high that I won't be able to cover them with my income.

Fundamental issues and challenges

Usually people are going into postdoc programs when they are at the beginning of their 30s. For many this coincides with the time when they want to build a family. The low pay, lack of support for childcare and maternity, lack of job security, inability to travel because of visa related reasons, and poor social security make postdoc programs very unattractive. It's hard to uproot partners and find new jobs every 2-3 years, especially when the working rights situation for partners is the way it is currently. While the US is actively trying to get rid of foreign postdocs after program completion (i.e., home-rule after J1 visa), they make it incredibly hard to actually go for jobs outside of the US by requiring you to renew your US visa in your home country *every year*. This rule is so silly and actually means for many of us that we cannot take up opportunities to interview somewhere else because it would mean we are unable to re-enter the US (renewing a visa required a 3-week stay abroad and involves significant cost —something that is hard to do with the low income and any sort of family responsibility). You cannot actually live on a postdoc income in most major US cities, so it feels like we are undervalued as "trainees" who are in actual fact highly skilled workers who have a huge contribution to the US as a research hub.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

- Academic systems and funding bodies in the EU support young families much more (e.g., https://www.humboldt-foundation.de/en/apply/sponsorship-during-your-stay/sponsorship-during-your-research-stay-in-germany/further-benefits-to-support-families)
- Postdocs are employees not trainees and should be paid/treated like this (basically any other western country)

Response 491

Perspectives on the postdoc roles and responsibilities

Advance science using groundbreaking techniques or asking challenging mechanistic questions

Fundamental issues and challenges

My trainees look at how hard it is to get the first R01 as a junior investigator and say 'no thanks'. I don't blame them but it is causing a lot of trainees to not even want to pursue a postdoc

Existing NIH policies, programs, or resources

The ridiculous condition that postdocs can only be funded if the PIs are funded. This creates a system of more wealth to the wealthy. Get rid of timelines. It takes longer to get published and then get fellowships

Proven or promising external resources or approaches

If PIs grants can't pay a living wage for trainees, what's the point? It's absurd that NIH doesn't even pay COLA. No supplementation of grants when inflation hits (like it has now at the highest levels in history).

Response 492

Perspectives on the postdoc roles and responsibilities

A postdoc position is meant to give a person more experience, training, and opportunities to build upon their graduate education and further prepare them for a faculty position.

Fundamental issues and challenges

Postdoc positions do not pay enough. The pay is not reasonable given the level of education and cost of living. These same amazing candidates can get jobs in industry with better hours and 3x the pay.

Existing NIH policies, programs, or resources

Increase the minimum stipend amount by at least 30%.

Proven or promising external resources or approaches

No response

Response 493

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral process as a stage during which a research trainee can explore their scientific and professional interests without the limitations to which graduate student researchers are subject. Personally, it has thus far proven a valuable experience during which I have become acquainted with the ins-and-outs of academic administration and the process of running a lab. I also believe that postdoctoral positions are crucial for the natural lifecycle of expansion of research fields—a postdoc taking their project from a lab and establishing their own group to focus on that subject is necessary to continue the growth and development of that field.

Fundamental issues and challenges

I believe the core challenge facing postdoctoral trainees is, frankly put, inadequate financial compensation. Especially during a prolonged period of economic hardship for the majority of American residents, the prospect of making nearly half as much as colleagues who have gone on to senior scientist positions or

other similar non-trainee career opportunities is extremely unattractive. Then, once in a postdoctoral position, attempting to live on a limited salary is difficult, considering that many training institutions are located in areas with high cost-of-living and rarely compensate in line with local costs. All of which is compounded by the financial stresses of student debt and attempting to raise and support a family. Many who pursue a postdoc choose to do so out of a desire to enter academia, better understand their strengths, and give back to the broader academic community. I believe that a higher postdoctoral stipend is required such that this choice is made easier and less existentially threatening.

Additionally, I believe that the current state of biomedical funding in academia discourages trainees to pursue the academic track overall, the postdoctoral training step included. A highly competitive environment in which academics compete for faculty positions and funding, neither of which are anywhere close to assured, results in a postdoctoral position at times feeling like a lost cause—sacrificing financial gain elsewhere for the opportunity to be one of the many professionals to fail to gain a foothold in the academic sector.

Existing NIH policies, programs, or resources

As stated earlier, I believe that the most impactful step that might be taken to improve the postdoctoral ecosystem would be to increase the postdoctoral stipend such that pursuing a postdoctoral position and an academic research career feels less exploitative. Compensating postdocs in line with experienced professionals who have received their terminal degrees would go a long way to attract and retain trainees.

In terms of the broad ecosystem of academic career pathways, the difficulty of establishing oneself as a new Principal Investigator is a major bottleneck to continued growth and innovation in academia. While not specific to postdoctoral trainees, I believe that increasing grant funding such that fewer grants are required to fund new research will increase the pool of postdocs willing to take the risk of applying for tenure track faculty positions (and subsequently increase the attractiveness of postdoctoral positions.)

Proven or promising external resources or approaches

No response

Response 494

Perspectives on the postdoc roles and responsibilities

Postdocs are not students!

Postdocs are not trainees!

Postdocs are not technicians!

Postdocs are highly skilled employees that bring their unique skillset to the lab to beyond the current scope of technicians, students and PIs.

The postdoctoral career is a transitionary stage that should fully support (through mentorship, visa, training) to take the next step, wether that is academia, industry, non-profit, governmental or a combination thereof.

A postdoc should offer the chance to learn or advance techniques/skills beyond the scope of the PhD within the context of conducting novel research.

There is only one responsibility of a postdoc: Bring value to the lab. This can be a combination of the following: funding, teaching, mentorship, publications, novel techniques, etc.

This responsibility immediately ties in to the different roles a postdoc may have. These roles should be with an absolute freedom of choice and preferable with mentoring from a PI that is accepting and directing towards all possible career opportunities.

Fundamental issues and challenges

Take a governing stance at the NIH to re-identify postdocs as employees, not students. A fundamental issue with classifying postdocs (still) as students is that they will not be able to have any benefits that regular employees do have (such as contributory retirement plans, wellness perks, child care, discounts perks, etc.).

The many strict ruling and policies of NIH and government are too limiting in the freedom of the postdoctoral role. Institutions often have more strict rules around the rules set forward by government. There are many limits and regulations that seem to be driven to protect the institutions from "bad postdocs". Regulations such as location/residency of postdocs, role definitions, obligations, mandatory courses etc. Many of these could just as easily be agreed upon between the PI/postdoc and their expectations (both ways). A postdoc generally is more mature than undergrad / grad students and the current policies can be limiting in making life choices that could be very important for the postdoc to be generally happy (e.g. work where possible, child-care support, consultation/interning outside of academia).

These regulations are even worse for non US permanent residents or citizens that are here on a J visa. These postdocs are severely limited in having the same opportunities and transition possibilities as H1B or other visas. Spouses are not able to work on J2. The postdoc is completely tied (golden handcuff) to the institution through the current visas.

The salary & benefits—If a postdoc is interested in solely conducting research, no longer Academic institutions are competive as opposed to research oriented industry. Conducting similar research and publishing in industry, without the bureaucratic hassle often required by academic institutions, easily offer 2x—2.5x the postdoc salary, in addition to the many benefits (retirement, bonus, vacation time, etc.).

Existing NIH policies, programs, or resources

Better visas that are not tied to the institution

Classify postdocs as employees and not as trainees or students. Too often this is abused by institutions to offer lesser pay and benefits.

Better salary definitions (make it more compitetive to academic industry).

Correct grant awards for inflation.

Proven or promising external resources or approaches

No response

Response 495

Perspectives on the postdoc roles and responsibilities

Carry out independent research under the guidance of Principle investigator.

Develop skills to become an independent investigator.

Help to move research projects in the lab forward.

Fundamental issues and challenges

Most of the postdocs work on projects to get more funding for the lab. PI does not think about how PostDoc going to evolve and become an independent researcher. All PI want to get more and more RO1s and expand the labs, which I think in fact is ridiculous. Each scientist should focus on one untackled question and really try to solve unanswered questions in that area rather than hopping and jumping on multiple projects. The rate of transition from a PostDoc to an independent faculty position is dismal. Most American Citizens do not want to do a postdoc at the payscale that academia offers as they get better jobs in the industry. Whereas for international PostDocs it is mandatory to work as per PI's wish in order to fulfill the visa requirements. Isn't it modern-day slavery?

Existing NIH policies, programs, or resources

Increase Post-Doc salaries comparable to the industry level.

Increase funding opportunities for senior post-docs who are not US citizens.

Fix PI to Postdoc ratio.

Limit the number of people that can work in one lab.

Limit funding of PI who work on multiple projects without significant contribution to the science.

Proven or promising external resources or approaches

Post-Docs should get independent funding and should be based on the number of RO1s each university gets. Which then should get distributed amongst the PI. Like Ph.D. each year there should be a recruitment process for PostDocs and international PostDocs should get mandatory training exposing themselves to funding opportunities and career development plans. Out-of-turn PoStDoc recruitment should be prohibited and future funding of the PIs should be based on how successful PostDocs perform in their career in terms of first-author publications, representation in conferences, and transitioning to independent careers. Unless academia starts valuing the efforts of the Post-doc, fewer and fewer Post-Docs will join academia.

Response 496

Perspectives on the postdoc roles and responsibilities

Doing a postdoc was one of the best career decisions I have made. I am leaning in an immersive and supportive environment. That said, even though my experience is positive, there are an abundance of things I would change. See below.

Fundamental issues and challenges

There are several key issues posdocs face.

1. The pay is abysmal. Almost all entry level scientist positions in industry pay significantly more than a postdoc. I personally feel like my financial goals have been put on hold while I am in this position. How can any postdoc expect to contribute to retirement, save for a house/wedding/pet/baby etc. on this salary? The poor pay is exacerbated by the routinely long hours.
2. The mechanisms for human resources are poorly defined. The NIH makes no mention (to my knowledge) about sick-time, vacation, 401K contributions etc.
3. The prospects for a career after a postdoc are poorly defined. Most advisors seem only to know about academic positions and are keen to push their trainees in that direction. There is little to no representation from those outside of academia.
4. I feel somewhat dehumanized at the [redacted for anonymity]. We are explicitly referred to “trainees” and not employees. This precludes us from access to certain employment benefits.

Existing NIH policies, programs, or resources

It is difficult to comment on these. These were never mentioned to me previously. Navigating the myriad of information thrown at us can be overwhelming. This was not covered in new postdoc orientation.

Proven or promising external resources or approaches

It is difficult to navigate applying to a postdoc. Very few are advertised.

Response 497

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is primarily a job with a training component. The goal of the position is to gain skills and knowledge and to demonstrate productivity for advancement to the next career stage.

Fundamental issues and challenges

There is a push-pull here. In order to recruit and retain and improve the quality of life of postdoctoral fellows, salaries need to be higher on the order to compete with the private sector. However, there is an unrealistic sense of generational entitlement that is undeniable and requires a culture change. Many modern postdocs simply have no desire to work hard in this type of position, which is a requirement for success. A few postdocs do, but there simply are not enough of them to support the work funded by the NIH.

Existing NIH policies, programs, or resources

Individual F32s and T32 slots for postdocs should be eliminated and RO1 funded laboratories may seek a supplement in order to hire a postdoc at slightly improved salary bands from the current rate. This would be a 3-4 year position with the intent of training to become a future PI. At the same time, staff scientist

positions (PhD or MD level) funded by RO1 grants should be massively expanded. A staff scientist would be paid much better than a postdoc commensurate with industry-paid positions. The net effect would cut down on the number of postdocs a lot (and the associated so-called exploitation of post-doc labor to run labs) and provide much needed continuity for RO1 funded labs. It is untenable for all of the postdocs in the current system, but also untenable for PIs. Having a revolving door of disgruntled postdocs that come and go is a broad, colossal waste of NIH funds due to the disruptive effects on RO1 research projects. Staff scientists would provide this continuity and be happy people paid properly for their efforts and provide better research continuity. Those few serious postdocs would also be happier in their temporary training positions and be more competitive for a faculty position due to the smaller pool of applicants.

Proven or promising external resources or approaches

With the massive reduction in the total number of postdocs mentioned above and the massive increase in well-paid staff scientists everyone will be more satisfied. More money needs to be paid to R grants in order to fund the staff scientist positions.

Response 498

Perspectives on the postdoc roles and responsibilities

- We need clear-cut and mandated institutional deadlines on postdoctoral training to prevent perma-docs (in the guise of instructors/senior postdoc and similar change of titles).
- NIH should promote more funding opportunities for quick postdoc-to-faculty transitions or postdoc-to-industry transitions (immersive stint with industry) to prevent stagnation

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

NIH needs to encourage a more cross-institutional pollination, for example trainees/fellows in NCI training branch should get to interact with trainees/fellows in NIAID. With a framework such as NCI's Center for Cancer Training AI-driven app, NanCI, or with broader tools such as Slack, we could be encouraged as postdocs to form deeper peer networks across institutes so we can get help/advice/information/collaborations etc.

Proven or promising external resources or approaches

Encourage more direct PhD-to-faculty fellowships (like UCSF Sandler Fellowship program) to improve retention and incentivize quick transitions.

Response 499

Perspectives on the postdoc roles and responsibilities

There is no role for a postdoc in a lab. I will elaborate on this in the next question.

Fundamental issues and challenges

The postdoc position is an indication of failure of PhD programs as a whole. The message upon being received into a postdoctoral position is that after up to 8 years of graduate education, you are still "not ready" to be a truly independent scientist. This message means that it is wiser to take a position in industry where your graduate education is appreciated through a quicker pathway to leading positions with high salaries.

Existing NIH policies, programs, or resources

Eliminate all "postdoctoral" fellowships to encourage the movement away from this position in the first place. No fiscal support means that labs will have no reason to sustain the position.

Proven or promising external resources or approaches

There is no reason for post-doctoral training, the trainees do not benefit from it and trainers find them time consuming and exhausting.

Response 500

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a transition period to build an individual program of research and supplement graduate training. I also view the postdoc as a necessary step to secure tenure-track positions at a research-intensive organization.

Fundamental issues and challenges

I believe three main issues are driving decreased recruitment for postdocs. First, the exclusion of non-US citizens for T32 programs is limiting the number of applicants who are eligible for this position. To drive diversity in our healthcare workforce, the NIH need to eliminate this policy. I believe that our scientific workforce would be greatly improved by having diverse perspectives from around the globe included. Second, the low stipends and the work-life balance for postdocs drives many to look at industry careers instead of pursuing a postdoc. Many people with families, without partners, or who come from households with low incomes cannot justify another 2-5 years with a stipend around $50,000 when a career with better money and an improved work-life balance is available. Third, there is a clear exclusion of racial and ethnic minority groups from academia. In my experience as a PhD student, I have witnessed numerous tenured faculty making clear racist statements to students, not considering diverse student perspectives unless a large group of students repeatedly bring the concerns up to them, and lack of support and consideration for the unique challenges that diverse students may face when achieving academic success (e.g., writing support and extra time for those whose first language is not English). These issues lead these students to believe academia is not for them and that they cannot succeed in this environment.

Existing NIH policies, programs, or resources

The NIH needs to change its policy regarding the need for students to be US citizens to apply for postdoctoral training fellowships. The NIH also needs to consider ways that prior trainees can submit feedback related to mentor's ability to build a diverse, equitable, and inclusive lab. This could be done via T32 program re-evaluations where trainees can be involved in scoring the grant. These individuals have a unique first-hand experience regarding their mentor's ability to make them feel included and valued. Finally, I think the scoring of grants based on institutions builds on historically racist policies. Giving certain institutions high scores based on their training environments builds a loop where certain institutions (e.g., ivy league schools) consistently receive funding, whereas other institutions (e.g., state schools) which are more likely to enroll individuals who experience health disparities do not receive funding. Changing the scoring related to the institutional evaluation would allow for individuals who experience health disparities and are likely to be enrolled at state schools might be more likely to receive funding then stay in the pipeline of academic research.

Proven or promising external resources or approaches

The NIH should look into some of the literature related to building healthcare work environments that are free of systematic racism and that build teamwork and reduce burnout. Some of these interventions (e.g., https://www.samhsa.gov/resource/ebp/addressing-burnout-behavioral-health-workforce-organizational-strategies, https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8000324/) may be applicable to building training environments that support growing academics.

Response 501

Perspectives on the postdoc roles and responsibilities

I view it as a stepping stone to the next stage, whatever that stage may be. With a PhD jobs we have to be prepared in a variety of different ways to reach the next stage. That includes research abilities, technical abilities, management of projects and personal ability.

Fundamental issues and challenges

The first big issue is quality of life is fairly low compared to peers who did not do a postdoc. The cost of living is high. Post doc income is considered near poverty level for the county. People with jobs outside academia are making double/triple the amount of money with less experience. This is also extremely unfair postdocs of different institutes have different pay scales. Long days/night/weekends for very little compensation. We feel extreme pressure by NIH PIs to work these schedules. This is a systemic issue of

science related to how funding works. The PI wants a nicer grant/renewal application and thus pressures the postdocs to work more. The pressure extended by the PI often comes in the form of emotional abuse to some extent. This is demonstrated by yelling/ negative remarks/ public embarrassment. This is a issue systemic to the sciences in academia and not NIH specific. Postdocs laugh at the "training" videos we watch with examples of hostile work environments and inappropriate comments. The NIH is checking a box that we watched a video.

Many of the facilities are horrible. And horrible working conditions. Visit building 6, a building that is literally crumbling around us. Leaking every week. Damaging/ destroying equipment. Broken heating / cooling for a year. 55-60 F as a working temp in the winter. So many things breaking / failing around, people to fix things takes 5 weeks to come investigate. The facilities are horrible at the NIH in general. Even though the NIH has many opportunities for additional trainings / experiences, these are frowned upon by the PIs. Encourage more US citizens to join the NIH. There are very few of us. Diversity is a good thing. But balance is key to diversity. It is not balanced the way it is currently.

Existing NIH policies, programs, or resources

Pay the postdocs a more competitive salary. Not competitive with academia, but with industry jobs. If I have a PhD and my worth is 100k to a company, why am I only worth 60K to the NIH? In Bethesda. One of the most expensive areas in the US. Set the example of higher salaries for universities. Some universities are starting to offer more money.

Pay us equally. There should be a rule that we all get the same amount of money as others in various institutes.

Give us more protections for things like pay time off/sick leave. Why is my sick leave combined with vacation time? That is generally unfair practice.

Why aren't we considered real employees? If I had an MD, I would be considered a real employee. I miss out on benefits like retirement, and having to pay quarterly taxes.

We should have more connections with companies/ other agencies to visit and talk to them about job opportunities. We should have more resources to be able to do a bit of career exploration. It is still impossible to know other roles outside of lab work. Even though we see so many seminars that say they are out there. Why not have people we can discuss with or visit in other parts of gov.

Set working hours. The FDA has more strict working rules. Why doesn't the NIH set the same types of working regulations. This would greatly improve the mental health of the postdocs.

Proven or promising external resources or approaches

By setting examples. Postdocs will want to come to the NIH if it sets examples in higher pay, higher job satisfaction. As it stands postdocs just feel taken advantage of for a variety of reasons.

Response 502

Perspectives on the postdoc roles and responsibilities

A temporary position for the purpose of continued training and the execution of deliverables after PhD conferral that must be completed before securing a permanent position in academia. Roles and responsibilities vary but should move the academic postdoc toward independence in all areas necessary to be successful in a senior academic role, including but not limited to research, publishing, grant-writing, and mentorship.

Fundamental issues and challenges

I have almost left my postdoc several times because of the low pay and lack of family support. I'm a female first generation student who worked full time as an undergrad and still left with 60k of student debt which I am still unable to pay off. I live in a tech-heavy area and do computational biology. I get contacted by head hunters at least twice a month about jobs here offering starting pay that is x3-x5 what I am making now, with full benefits and retirement contributions. Why is my skill set so undervalued in academia? Worse, I have no hope that this will change once I become an PI: x3-x5 what I am making now is easily more than my PI is making after many years in the lab. I have put off having a family because of the lack of adequate family support (such as paid leave, and child care options) and the long hours required by my position. Every year this decision becomes more difficult and I resent having to choose

between being a scientist and being a parent, all while not having the money to pay off my debt or support my family.

Existing NIH policies, programs, or resources

Higher pay for PDs.

Higher pay and larger grants for PIs.

Better family leave support.

Proven or promising external resources or approaches

Student loan forgiveness.

Retirement contributions.

Response 503

Perspectives on the postdoc roles and responsibilities

When I was introduced to the idea of a postdoc, it was described to me as someone who works in a lab for a few years before moving on to a professorship. These professorship jobs are now so competitive that a postdoc is in a lab so long that they are essentially fulltime lab staff.

Fundamental issues and challenges

The low pay compared to the cost of living in the U.S. makes postdocs unattractive positions, especially given how long they last now. Maybe if the average postdoc was short and they were more likely to find a faculty position after, recruitment would be easier. Retention is harmed by this when postdocs want to start families but cannot afford to. Many appointments are also very short and need renewal every year, which ironically makes the job security quite poor as well. Academia is also notoriously protective of abusers of all stripes, making these environments less likely to recruit or retain marginalized folks in particular.

Existing NIH policies, programs, or resources

While NIH pay guidelines are supposed to be the minimum, many institutions use them as the target for postdoc pay. Raise the guidelines so postdocs can make a living wage while starting a family if they choose. Further, increase the size of grants provided to faculty (they haven't grown in 20 years) so they can afford to do research and pay their employees a living wage as well.

Proven or promising external resources or approaches

No response

Response 504

Perspectives on the postdoc roles and responsibilities

Postdocs are early career researchers who have completed a PhD and wish to continue conducting academic research. Postdocs are highly educated research scientists who conduct research under the direction of a principal investigator.

Fundamental issues and challenges

Academia treats postdocs as trainees rather than the highly qualified professionals that they are. The pay is abysmal and the lack of guaranteed benefits is appalling. As a soon-to-be PhD in my late 20's, I cannot afford to do a postdoc because this will set me too far back in saving for retirement and starting a family.

Existing NIH policies, programs, or resources

The minimum postdoc salary must be elevated to at least $90,000 per year, if not higher. Additionally, institutions must provide retirement and health insurance benefits similar to other staff.

Proven or promising external resources or approaches

Increase pay and benefits. To support this funding, lobby for congress to increase the NIH budget. Perhaps the military can cut back on fighter jets and tomahawk missiles and instead funnel this toward the NIH.

Response 505

Perspectives on the postdoc roles and responsibilities

Entering graduate school, going into a postdoctoral role was an automatic no. Now as a recent hire for a postdoctoral, some perspectives have changed though some issues are still present that make this role less attractive. First of all the postdoctoral position is almost a faculty position with training wheels (as per design). The postdoc is responsible for training new members, help with purchasing/lab maintenance (all dependent on a lab manager), help advance current research projects with experiments and writing papers/grants, and attending internal or external meetings all the while carve out a research direction to become a future faculty researcher or enter industry. These tasks can be manageable or overwhelming depending on laboratory environment, mentor's management style, department support, funding situation, and compensation. This is a lot of pressure to put on a recently defended graduate student when there are attractive alternatives that compensate 1.5-2x more and have improved work/life balances. While that pressure can be beneficial in helping someone become a successful faculty member or non-academic role, it has led to people feeling deflated, invisible, expendable, and not worth the headache. With that, some people will use the postdoctoral position to gain experience as a manager, learn a few new skills, and then after 1-2 years of networking leave to for a non-academic role.

Fundamental issues and challenges

Regarding the challenges and issues related to the postdoctoral position, I assume majority of responses will be related to the compensation, which is a major concern, but my response will trying to stray away it to highlight other concerns. While less so now than before, postdoctoral training is the default and finishing PhD students are to go to collaborating laboratories or it is on the PhD student to determine which postdoctoral position is right for them. From my experience, there are much more resources and opportunities to investigate roles outside academia through conferences, internal student organizations, Nucleate, or industry hosted/sponsored events than roles within academia. The marketing for non-academic positions are much more apparent, visible, and perceived to have much more improvements to someone's quality of life than that as a postdoctoral trainee. In addition, hearing, seeing, and experiencing the difficulties of becoming a faculty member and running a laboratory due to politics, funding, and other issues, is very deterring for graduate students in wanting to pursue a role and career in academia (even while some of those issues exist in industry). With the idea or perception that a postdoctoral position is only necessary if you want to become faculty, why would a graduate student want to pursue that route when becoming faculty is fraught with issues (as perceived by graduate students)? With all the tasks listed previously of a postdoctoral trainee, with minimal internal (i.e. mentor and department) and/or external (i.e. NIH) guidance, current postdoctoral trainees will recommend PhD students to look elsewhere and will transition to non-academic positions. Lastly, the increase of postdoctoral trainees needed 2 or even 3 postdoctoral positions before becoming faculty hinders the retention of other postdocs and hinders recruiting PhD students into becoming future postdoctoral trainees.

Existing NIH policies, programs, or resources

As a recent postdoctoral trainee, I cannot speak too much to this, however other than funding opportunities, I am not aware of career resources provided by the NIH. Also these resources were much present through emails and seminars at my previous institution that had a postdoctoral association where my current institution does not have an active one.

Proven or promising external resources or approaches

There are two external resources that help in deciding my future direction post graduate school. What Can You Be with a PhD conference (https://www.whatcanyoubewithaphd.com/) was one of the most informative things in determining my future direction after graduate school (that I had to personally pay for and would not be reimbursed). It provided a two day event to evaluate both academic and non-academic positions and how people enjoyed their roles, pros/cons of each position, and how they entered that position. The second external resource that had some promise is the Gordon Research Conference (I have attended the Proteoglycan conference and am co-organizing it for 2024). There was one panel

session to talk to professors about becoming faculty and discuss other non-academic opportunities. However, there was no panel members that worked in industry (only one professor had a startup company on the side) and when asked about work life balance and faculty position, answers were mostly negative or faculty members did not know what they were describing was not work/life balance at all. While this panel was not well received, PhD and postdocs saw the value of it and wanted to improve this session.

Response 506

Perspectives on the postdoc roles and responsibilities

The main role of an academic postdoctoral researcher is to conceptualize and execute research projects. This main role will almost certainly require assembling collaborative teams, building new research skills, and high level communication. Other roles may or may not also include applying for and earning external funding, laboratory and facility management, trainee mentoring, staff management, and classroom teaching.

Fundamental issues and challenges

Compensation (salary, retirement benefits, and insurance) is not serious or fair for the skills and experience required to work at the postdoctoral level.

1) Salary is insufficient for many postdoctoral researchers to survive and thrive, let alone support family members or other dependents. Many R1 research institutions are in large cities, and the salary simply does not keep up with cost of living. Postdoctoral researchers are specialists, and their labor (along with labor of graduate students) forms the backbone of biomedical research progress. They should be compensated as such.
2) Most academic postdoc positions provide literally zero retirement benefits. This follows years of graduate/PhD level labor which also provides zero retirement benefits. In fact, some graduate & postdoc fellows are legally not allowed to contribute to retirement savings due to their classification as non-comp. So postdoctoral researchers may be entering their late 20s and 30s (key saving years) with little to no opportunity to build retirement savings. Any attempt to recover the pace of retirement saving will contribute to greater out-of-pocket costs from the already-insufficient salary.
3) Comprehensive health insurance (including dental and eye) provided by postdoctoral research positions is often insufficient. Incomplete insurance coverage contributes to higher out-of-pocket costs for literal bodily survival during a postdoctoral research position.

Existing NIH policies, programs, or resources

1) NIH salary minimums are often used as the standard for academic institutions, rather than a true minimum. NIH should raise the minimums and include provisions for automatic cost of living adjustment. NIH minimums should also include required retirement compensation.
2) NIH policy should prohibit any NIH-funded institution from engaging in anti-union activity, including hiring anti-union law firms to implicitly or explicitly threaten negative consequences of unionization.

Proven or promising external resources or approaches

No response

Response 507

Perspectives on the postdoc roles and responsibilities

We’ve had several postdocs conducting research and providing clinical care as part of NIMH research over the past decade. As a university student counseling center, many of our postdocs accepted permanent positions with us and launched their careers in college counseling. We were able to recruit, train, and retain more qualified professionals as a result of our grant-funded postdoctoral positions, and postdocs were able to received high quality training and education.

Fundamental issues and challenges

Our state licensing board and the field of psychology have both been increasing standardized testing and other requirements for postdocs to become licensed, slowing their progress, and consuming additional non-clinical time without clear, certain benefits in protecting the public. A national mental health crisis is a

strange time to increase barriers to licensure. We would also love to compensate postdocs more during an era of escalating inflation and increased cost of living, but our budget and grants are not growing at the same pace. Suddenly, we are facing challenges recruiting postdocs for our grant research and have extended our search deadline.

Existing NIH policies, programs, or resources

Adjust grant funding to inflation.

Proven or promising external resources or approaches

No response

Response 508

Perspectives on the postdoc roles and responsibilities

I am a postdoctoral researcher at an institution that receives very significant NIH funding, and I previously worked as a research technician at this same institution prior to getting my PhD. I do not have faculty member ambitions. My postdoc position is an opportunity to keep engaging in academic research that I love, gain skills for potential future opportunities, and establish myself at a research institution that I may want to pursue a career at either as a staff scientist or as a administrator. A postdoc position is a transition role for individuals following a PhD to gain training, gain independence, and obtain mentorship. It is also a time to build reputation and become established after being a student for 5 or more years. However, I would have chosen to go to a staff position instead of a postdoc if that path existed in academia. For the university and research programs, postdocs are full-time research professionals dedicated to moving projects forward that the primary investigator (PI) has received funding for and do not have time to do the research themselves. Postdocs produce the necessary data, writings, and new ideas to support PIs receiving more grant money and ultimately the institution. Postdocs are the backbone of academic research and are the individuals driving ground-breaking findings through their cheap labor. We provide an asset that technicians cannot provide. We are trained professionals that can think creatively, solve problems technically and intellectually, and critically evaluate data and literature.

Fundamental issues and challenges

1. Compensation/Benefits. Many of my peers have not sought academic postdoc positions because of the pay. Many of my peers from graduate school make 50-75% more as a new PhD in industry than I do as. From a recruitment standpoint, salary differences strongly discourage scientists from pursuing postdocs, especially those not seeking faculty careers. From a retention standpoint, it is extremely hard to sit back and take a lower salary for more than 1-2 years despite an average postdoc period being 5 years. Postdocs are often 30+ years old that have real adult lives, and we have sacrificed wage-earning years to gain education and experience to change lives. My institution does not provide retirement matching, and if I transition from a postdoctoral associate to a T32 grant, I will lose my ability to contribute through my institution’s system. Not having any retirement matching is a huge drawback. Provide funding for paid 12 week maternity leave, which research supports for best outcomes for mother/child. As a postdoc, I have not had years to build up sick and vacation time to pay for maternity leave. Given our ages and poor salaries, paid maternity leave would help.
2. Postdocs are not generally respected in academic institutions. We are considered the bottom of the totem pole in the research professional world. We are expected to work for minimal pay to gain respect in our field, and this presumption often includes ridiculously long hours and no work-life balance. We aren’t recognized. We are often excluded from certain things. We are basically staff but not even paid like full time research professionals.
3. Lack of career path for individuals not seeking faculty positions.
4. Faculty positions are not appealing. Faculty positions require a lot of grant writing, constant meetings, lengthy tenure requirements, and general a culture of overworking.

Existing NIH policies, programs, or resources

Flexible T32 programs that allow for postdocs to combine their efforts between research and other training (project management, business, etc.) to prepare for a career in biomedical research across multiple potential positions regardless of faculty motivations.

Proven or promising external resources or approaches

No response

Response 509

Perspectives on the postdoc roles and responsibilities

An academic postdoc position is a transient position meant to foster independent research that is self-led under guidance of a PI. As an intermediate between graduate student and faculty, the academic post-doc is largely meant to be able to run their own projects, mentor students, and complete many manuscripts. All of this is done in an effort to demonstrate productivity and good science.

Fundamental issues and challenges

A large issue with post doctoral programs is the lack of financial incentive. Largely academic postdocs are understood to be underpaid for the time and expected effort of the position. Given the amount of training and expertise required to obtain these positions, moving costs (which can involve family units), and life stage delays due to work can lead to PhDs not wanting pursue postdoctoral positions in academia.

Existing NIH policies, programs, or resources

Additional training for PIs of postdoctoral students would enhance can enhance the training environment of postdocs. Given the non-uniformity of a postdoctoral position, there are many gaps that can be created in areas such as lab management, project design, grant applications, etc.

Proven or promising external resources or approaches

No response

Response 510

Perspectives on the postdoc roles and responsibilities

Streamlined advanced training undertaken by individual to obtain necessary experience to be able to move to next desired career level. This can include advanced/ new technique training, writing (grants and publications) training, experience working with various academic offices in a larger capacity, and management experience. Support should include job salary that reflects required knowledge and experience, as well as workload as well as non-research requirements such as mentoring. institutional opportunities should include programs to assist in progression of career and support to find additional funding. Institutional support for post-docs to run small pilot projects to initiate their own desired protects that can be transitioned into a K99 application with preliminary results would also be beneficial. While this job is typically limited in duration, it is critical to the survival and progression of a university’s research.

Fundamental issues and challenges

A post-doc, is not cheap labor. It is a critical period of development that will ultimately decide if an individual will continue into academic research. Considering post-docs already face great financial hardships and are not unaware that these continue as a professor–and depending on where you are, assistant professorships can actually be decrease in salary. Furthermore, studies have suggest that individuals stay at a job for just over 4 years–that’s shorter than the typical duration of graduate school or a post-doc. This means that while post-docs are going into a position knowing it is only for a short period of time, the turnover is not above the national average.

However, academia also faces a problem of low professor turnover, especially those with tenure track or tenured positions. The downside to non-tenured positions is the unknown duration of a research professor appointment. Moving a lab requires a large amount of money and time–and time away from the lab that will lower research production for months and after effects remaining for years. Willingly versus needing to move a lab are very different. Many institutions will use teaching as a way to support a research professor (at a higher rate above tenure-track), however, this then reduces their ability to focus on research.

Post docs require additional funding–critically in salary support and also in institutional support for pilot projects. Healthcare and retirement benefits are also critical. A better prospective future as a research professor–with or without tenure track–is also required, otherwise, academia will continue to lose

promising scientists to industry when they can easily work a 40 hour work with, great benefits, and a salary near or above $100,000 from the start.

Existing NIH policies, programs, or resources

Over half of my monthly stipend goes to paying off graduate school loans. I still require additional parental support financially in my 30s. PhDs, unlike clinical researchers, rarely qualify for the NIH loan repayback program. Expanding this program would greatly improve my financial standing.

Additionally, having NIH policies clarify the expected benefits of both the graduate school and post doc positions would be beneficial. I did not find out until 3 years after I finished my PHD program that I could have gotten retirement benefits during my PhD years from my school.

Having a cost of living adjustment for pay scale for graduate and post doc / A minimum stipend requirement and then suggested adjusted state by state is another alternative.

Proven or promising external resources or approaches

Increased institutional support for post docs. Transition money in case of PI emergency/ assistance with placement at same university. Small grants for pilot projects to increase success of K99/K08 applications.

Response 511

Perspectives on the postdoc roles and responsibilities

It means take the responsibility of success a certain research project, as published work.

Fundamental issues and challenges

Immigration issues mainly causes feel of instability and the rush to finish this period of training with best available resources.

Existing NIH policies, programs, or resources

1. Immigration policy and fee.
2. Health insurance and benefit coverage.
3. Support postdoctoral participation and presentation in scientific meetings.
4. Extra support to the activities of NPA to be like syndicate.so postdocs can feel safer.

Proven or promising external resources or approaches

Increase and expand the funding opportunities for non-American postdocs working in American institutions.

Response 512

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

1. Support for moving/relocation costs should be granted to NIH awarded investigators who recruit and support post-doc trainees. I had to shoulder the burden of a $6,000 cross country relocation for my postdoc
2. Timing limits on application for K awards (e.g. K99R00) are unfair and unproductive. These limits penalize trainees who relocate to new labs far from where they did graduate training
3. Postdoc F awards and K awards should be considered separately from R level awards in study section
4. Postdoc (and all R grants) grants from IDEA state institutions should be considered separately from historically well-funded institutions
5. NIGMS should extend co-funding support to K awards (not just R awards)
6. Given that age at time of first R01 has not substantially improved in the last decade, the window for ESI status needs to be extended from 10 years to 15
7. Allowing postdocs to be considered Co-investigators vs just Key Person on R grants
8. Adding additional funding mechanisms exclusively available to postdocs (pilot awards; development awards, etc)
9. Putting pressure on institutions to better support their postdocs (paid leave, benefits eligibility, min/max expected work hours, etc) and rewarding institutions that create pathways for career advancement from within
10. Mentors must provide evidence of their mentoring effectiveness to be considered suitable mentors for training awards (e.g. mentor letter of reference)
11. Broadening what is considered meaningful contribution to science beyond grants and papers in the biosketch. This can include classroom teaching, excellence in mentoring, community service

Proven or promising external resources or approaches

No response

Response 513

Perspectives on the postdoc roles and responsibilities

The role of an academic post-doc is to practice being a PI either through gaining new skills and/or refining existing skills in the safety of a lab environment where they are primarily responsible for research (ie. not be responsible for grants and/or administration).

Fundamental issues and challenges

Post-doc salaries are too low. Such low salaries prohibit advancement in other areas of life like purchasing a home or starting a family.

Existing NIH policies, programs, or resources

Increase or adjust the post-doc minimum salary with respect to each state's cost of living so that post-docs can maintain a reasonable standard of living. Currently, many post-docs rely on having a spouse and/or family that financially supports them.

Proven or promising external resources or approaches

No response

Response 514

Perspectives on the postdoc roles and responsibilities

I view my position as both a trainee and a scientist, but primarily as a scientist. Ideally, I drive the direction of my project and rely on my PI for advice/funding. I think there's a substantial difference between a postdoc (a highly trained scientist) and a graduate student, who is still a trainee and earning a degree.

Fundamental issues and challenges

Salaries are below the cost of living for major cities (I qualify for low-income housing, and yet I have a PhD). Salaries are FAR BELOW the value of work provided by highly educated scientists who are the only ones who can do this job. Accepting a postdoc is a sacrifice. Most postdocs are in their early 30s. This is a critical time to save for retirement, buy a house, etc. Those (especially women) who wish to have a family would not be able to afford one without the help of a spouse. Given that female fertility sharply declines around 35, this creates an impossible situation for many, where they choose career or family, but cannot choose both.

Existing NIH policies, programs, or resources

Requiring payback agreements for non-MD NRSA trainees is a terrible and discriminatory policy. Women are more likely to halt their careers to take care of family, and so are also more likely to fail to continue in a career for the second year. This puts undue burden on them to continue or face substantial financial consequences. The first year of an NRSA represents work from a qualified and highly trained scientist. It should not be free or contingent upon career choice. For any other employer, this agreement would be illegal.

Furthermore, paying NRSAs as stipends rather than salaries removes many benefits (retirement, payment into social security). Trainees are pressured to pursue and accept such funding for the benefit of the lab and their research. This is an unfair situation.

Proven or promising external resources or approaches

Pay us a living wage consistent with our job responsibilities and training. This is the only way to retain postdocs.

Response 515

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are a short position that should be a place for people to learn more about research (project design, experimental design, etc) in an academic setting. In addition, it should be a place for people to explore opportunities for future careers inside and outside of academia, with provided resources for getting the job that is a perfect fit for that person.

Fundamental issues and challenges

Compensation is a serious problem. Postdocs are generally in their 30’s and should be making enough to put aside and save for the future. Instead, they are living paycheck to paycheck with credit card debt just trying to break even. Nevermind PARENTS who are paying for childcare that is not subsidized. It depends on the postdoc to enforce a good work life balance, which goes against the culture of working until burnout. Too many postdocs are burnt out from poor work life balance and bad compensation. Really low vacation days are also a problem.

Existing NIH policies, programs, or resources

Provide more money in grants to pay postdocs better. Provide training programs for careers outside of academia. Normalize a career outside of academia. Normalize a healthy work life balance. Normalize taking mental health days to recover from burnout.

Proven or promising external resources or approaches

Provide more money in grants to pay postdocs better. Provide training programs for careers outside of academia. Normalize a career outside of academia. Normalize a healthy work life balance. Normalize taking mental health days to recover from burnout.

Response 516

Perspectives on the postdoc roles and responsibilities

Postdocs are treated by universities and, perhaps to a lesser extent the NIH, as simultaneously work horses and “trainees.” From the perspective of the university, they’re not given the same respect in tangible (salary or benefits) or intangible ways (academic freedom) as PIs, but also not given appropriate

training opportunities to set them up for future success. I feel in general that most postdocs are not trained to be PIs, they're trained to collect data under the guise of extended training needed to be a PI. As an ESI who recently made the transition from postdoc to PI, I feel I had a very supportive postdoc advisor and training environment, but I was unprepared for about 70% of what my job as a PI entails.

Fundamental issues and challenges

Salary and benefits that are not comparable with industry, and lack of appropriate job opportunities in academia once the postdoc "training" period is up.

Existing NIH policies, programs, or resources

Expanded funding for T32 and K99/R00 mechanisms.

Proven or promising external resources or approaches

No response

Response 517

Perspectives on the postdoc roles and responsibilities

Training to become independent or supporting research scientist in academic (or industry-see below) setting.

Fundamental issues and challenges

We don't pay postdocs enough. Being paid low salaries for half a decade or more and having little or no access to retirement savings through the institute makes academic path very financially challenging. Industry offers more money and benefits sooner and many are attracted to or choosing this path.

Existing NIH policies, programs, or resources

R01 budgets and NIH recommended annual salary pay scales need to be adjusted to support 75K starting (1st year) salaries for postdocs. This should adjust up with years of experience. NIH should encourage/support institutes to provide retirement savings for post doc career stages.

Proven or promising external resources or approaches

No response

Response 518

Perspectives on the postdoc roles and responsibilities

I'm interested in non-profit research for which the postdoctoral position allows me to gain additional skills and independence. It also is the first opportunity for international students / non-citizens like myself to apply for government funding which was not available during my graduate training. It provides experience with for research publication writing and for grant writing. Lastly, the environment helps narrow down the extent to pursue managerial, teaching, or more focused technical work after postdoctoral training.

Fundamental issues and challenges

Cost of living is the main factor. As a graduate student, 75% of my income went into rent, groceries, academic fees, commuting, and other essential expenses, even in a rural area, and with sharing living space with other graduate students. The pressure to start a family is currently most likely to make me consider abandon my postdoctoral training because of no child support: a postdoctoral colleague reported spending as much on child care as typical college tuition. University postdoctoral employers offer no support for the ~$15,000 net cost of a green card application. Green card sponsorship support is possible at later stages in my career if applying as an academic faculty member. My experience in industry with the green card application was unnerving; the company used its leverage to wait until the last minute to apply, and silently didn't apply for those employees that they didn't intend to retain. Those unfortunate employees only found out when they followed up, and then were required to leave the country soon after.

Existing NIH policies, programs, or resources

My colleagues in the U.K. gain automatic citizenship after 10 years of employment. Canada has a points-based system for citizenship. In the U.S. I still have a lottery with an EB-1 green card application. I've spent more years of my life in education, employment, and other training in the U.S. than I have in my home country but that adds no weight to my chances for residency. Just as loan forgiveness is offered to citizens, a pathway to citizenship for non-citizens would hold greater interest in pursuing academic research. The U.S. Military offers a pathway to naturalization without any fees. Only about 9% of PhD biologists will secure a tenure track job that sponsors a green card application.

Proven or promising external resources or approaches

No response

Response 519

Perspectives on the postdoc roles and responsibilities

Additional training for professional terminal degree holds that should be classified as employment with salary commensurate to degree received and contributions.

Fundamental issues and challenges

- Salary is below cost of living in many desirable geographical areas for postdoctoral training
- Institutions and departments have different expectations, classifications (employee/ non employee) of postdocs leading to lack of clarity of job role, performance evaluations, milestones
- Lack of support for non-academic careers, exit strategy
- Lack of training for PIs on how to properly manage postdocs
- Lack of institutional support, protection if environment is abusive or otherwise rampant with scientific misconduct or harassment, discrimination against underrepresented groups, and ways to preserve career if this is the case
- Exploitation of foreign trainees

Existing NIH policies, programs, or resources

Additional funding for salary support.

Standardization of postdoctoral contracts, classifications, expectations, benefits (similar to residencies for medical doctors).

Reviews and assessment of institutions, departments, grant recipients on their training/management.

Management training–how to support a postdoc career development.

Prevent abusers from employing trainees.

Proven or promising external resources or approaches

Working environment, mentoring.

Mentoring: many PhD programs offer more avenues of support in social circles, common interest groups/organizations, as well as research milestone tracking in the form of a committee. A committee for a postdoc could also help with accountability for postdoc and PI.

Response 520

Perspectives on the postdoc roles and responsibilities

I view a post-doc as being a career stage where the focus is to conduct independent research and gain the skills needed to successfully manage a lab or team in the subsequent phases of my career. It's odd that academia insists on this being a "training" position, considering all non-academic areas treat you as an "employee" immediately following a PhD. While the post-doc phase provides further experience and (ideally) widens or deepens our expertise, we are already highly trained and have skills that qualify us for higher-paying jobs outside of industry. For this reason, I consider a post-doc to be more about advancing

project management skills, leadership, and networking within our chosen niche. This helps us gain the expertise needed to become scientists in leadership positions rather than independent workers. As independent workers, we are already highly trained.

Fundamental issues and challenges

I wish the answer was more complex than "pay more". There are absolutely issues with toxic work environments, burnout, and discrimination. I hope those continue to improve. However, based on my interactions in graduate school and now at a major research university, the number 1 challenge is pay. I am 32 years old, I have $20k in student loans, and I have little saved for retirement. I now make $60k/year in one of the most expensive cities in the US, during a time with record inflation. I do not get retirement match, meaning I put more of my paycheck toward retirement than I would need to if I worked in a more traditional workplace. Further, it cost me $5000 to move to my post-doc city, and I had to find that money from my $34k graduate stipend.

I am one of the lucky ones. I have a partner whose income helps defray my cost of living, and we don't plan on having children. If my husband lost his job, I would need to leave for industry. If we wanted to have a child, or if we faced some sort of medical emergency, I would need to leave for industry. Being an academic post-doc comes with financial sacrifice.

No surprise that many people can't justify that sacrifice. This is not a "I want a nice house and luxury vacations" sacrifice. This is a "I need to afford rent, student loan payments, and retirement savings" sacrifice.

What is the incentive to stay in academia? The reality is that in current economic and cultural conditions, there is none. People will continue to leave for higher paying and lower-stress jobs unless academia lowers the emotional and financial costs of post-doc and faculty positions.

Existing NIH policies, programs, or resources

Policies and programs are less helpful than financial resources. A seminar on avoiding burnout is fine, but perhaps we'd be less burnt out if we had less financial burden. DEI is great, but perhaps diversity would improve if we didn't work in a field that's a terrible financial choice for anyone without family money or a high-earning spouse. Anti-bullying policies and protections are critical as well! But all of these initiatives need to be in addition to higher pay.

PIs cannot be left solely responsible for increasing post-doc pay during inflation and rising rents. As is, PI budgets are strained, and R01 and other grants do not provide flexibility for increasing costs of living. The NIH absolutely has to increase pay scales as economic conditions allow. I realize this is constrained by government budgets, but with every year that industry pay increases and academic pay stagnates, the gap grows, and more people leave.

Beyond higher stipends, even small allowances would be hugely beneficial. A relocation stipend would encourage post-docs to move to places with available opportunities. A computer stipend would mean we don't need to use 6 year old laptops in order to do our jobs. Some sort of retirement match would mean we aren't falling behind in retirement savings for the 10+ years of our graduate+postdoctoral training. Further, potentially some level of student loan forgiveness to stay in academia, even if small, could go a long way in supporting scientists from lower-income backgrounds.

Proven or promising external resources or approaches

No response

Response 521

Perspectives on the postdoc roles and responsibilities

To me the postdoctoral position has become nothing more than an extended pre-doctoral training period in which trainees do not do anything more or less than what they did during their graduate studies. As a postdoc I have not really received any knew knowledge or training that would suit me well in either an industry lab and certainly not for a tenure track position as I had anticipated moving on to (i.e. I still don't know about the grant submission process or day-to-day dealings as academic faculty)—I've pretty much done the same level of rigorous research studies in order to fulfill experiments proposed in a grant.

Postdocs are also (slightly) better paying pre-doctoral positions and are used to coordinate pre-doctoral training so that PI's can focus on other things.

The cynic in me also thinks that this recent push/idea from the NIH and academic institutions of trying to promote/encourage post-doctoral training positions is two-fold:

1) To delay the time and number of new applicants from applying to tenure-track positions so that full-tenured professors can delay their own retirement and
2) Allow PI's to recruit fewer pre-doctoral trainees since postdocs are usually more ready to complete work and require less bench/experiment training; thus they can complete grant work faster and more efficiently than new undergraduate/graduate trainees.

Fundamental issues and challenges

I think there's one main fundamental issue that is at the root of all postdoc issues—money/salary. If I were just now finishing my pre-doctoral training and earning my PhD it would take a significant amount of convincing that I should take a position that will pay a little over $50,000/year working ~80 hrs/week; most undergraduates with a STEM degree could make that salary only working 40 hrs/week without having to go to graduate school. I have no issues with putting in more work doing something that I love (biomedical research), but pragmatically there's a complete imbalance between the amount of time required to do a postdoc and the money I am making. I started my postdoc pre-COVID pandemic and was willing to put in this work because I loved it but now that the COVID pandemic has taught me that if you don't have money saved you are completely screwed to be able to support yourself. The only reason I stay with my postdoc is that I do not want to deal with the wrath of my PI for, as they've said, "abandoning" them and the lab with an incomplete paper which makes me miserable. If I could at least make a salary that's much more reasonable I would be less miserable because I don't have to spend my days wondering if I'll have rent money at the end of the day on top of all other costs. When I have contemporaries/friends who graduated at the same time as me with a PhD in biomedical sciences are making 6-figure salaries and working 40 hrs a week in industry it's really hard to argue the following: why I am doing a postdoc when I am nothing more than a glorified pre-doctoral trainee with a doctoral degree as a postdoc?

Existing NIH policies, programs, or resources

I really think that there's not much the NIH can do until academia writ large is ready to have a significant amount of institutional change that makes academic research more rewarding and less like a chore to do.

Proven or promising external resources or approaches

I'm not aware of anything from the NIH or academic institutions that suggest an attitude that they want to enhance the postdoctoral training ecosystem. I'm sure surveys/feedback requests like these are helpful (I have filled out similar forms before from the academic institutions I have worked at regarding diminishing postdoc returns) but there is nothing to suggest that either the NIH or academic institutions *want* to do anything about it. Until real action is done to try and improve the postdoc experience I doubt anything will be done.

Response 522

Perspectives on the postdoc roles and responsibilities

To me, a post doctoral position is training to become a PI. As it stands, there's no reason to be a post doc if this isn't your goal.

Fundamental issues and challenges

Limited upward mobility towards faculty position. Without the prospect of a faculty position, it's just a job with poor pay and incredibly high responsibility.

I have failed to obtain a faculty position after 2 years of trying, despite multiple high impact first author publications and prestigious fellowships. I'm now looking into industry because I have a family and can't keep putting this stress on them.

Existing NIH policies, programs, or resources

???

Increase the number of faculty / independent scientist positions so that there is a reason to stay in academia.

Proven or promising external resources or approaches

As of now, there is little oversight towards the treatment of postdocs. Having better systems of support and interventions for fair expectations would go a long way.

Response 523

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I would have loved to do a post-doc after my PhD. However, I graduated at the age of 35 and did not want to move somewhere new only to have to move again two years later. It's hard to make friends as an adult, especially if I'm pushing 40. Additionally, I'm carrying more than $50,000 in student loan debt and I worried about my ability to both pay it off and save for a house at the same time. Plus, the benefit of a postdoc is the opportunity to focus on research for a while and learn new research skills before entering a tenure-track position where I have to balance teaching and service, too. But

1. that protected time only lasts one year because the second year is spent on the job market, and
2. the level of protected time can vary, depending on the PI.

It's not always clear from the description how much opportunity you'll have to publish your own research, especially as a first-author. The low pay, high level of disruption to my personal life, and variability in protected time pushed me to apply directly to tenure-track positions straight out of grad school, skipping the postdoc phase.

Existing NIH policies, programs, or resources

1) Salaries for postdocs need to be substantially higher ($80k or more per year) and they also need to be indexed to the area's cost of housing. Housing costs often rise much faster than overall inflation and it represents the largest recurring expense for most post-docs.
2) If you don't want to raise salaries, then postdocs should be allowed to work remotely. I can fly in monthly for meetings, but if you're not going to pay me enough to live in San Francisco, then let me live somewhere else.
3) It would be nice if I could have a certain amount of guaranteed protected time to work on my own research.

Proven or promising external resources or approaches

No response

Response 524

Perspectives on the postdoc roles and responsibilities

Academic postdocs execute on existing grants, develop and test new ideas for personal research programs on the side, and develops mentorship and/or project management skills.

Fundamental issues and challenges

The minimum pay for Biomedical NIH postdocs is 1/2 to 1/3 what individuals can make in industry. It is an extreme financial sacrifice, often comes with little or no benefits (i.e. retirement, unemployment insurance, vacation time, etc.), and is tenuous / dependent on continued funding.

Existing NIH policies, programs, or resources

Minimum pay needs to be increased by at least $10,000/year.

Also, the Kirchstein Award Payback Agreement would be illegal in any other industry —why does it still exist? It creates situations where people working in toxic environments are less able to leave for fear of being unable to repay their "debt." It seems like a modern form of Indentured Servitude.

Proven or promising external resources or approaches

Increase pay. Require benefits.

Response 525

Perspectives on the postdoc roles and responsibilities

I view my post-doctoral fellowship as an additional training opportunity that allows me to gain additional expertise in certain areas (both conceptual and technical) while simultaneously doing science at a high post-graduate level of independence.

Fundamental issues and challenges

THE MONEY. PAY POST-DOCs MORE. I have dozens of friends from grad school who seriously considered doing academic post-docs, but the financial stability that industry or other opportunities offered drew them away. While I do l love my post-doc position and am happy that I have the opportunity to continue learning and growing as a scientist, the truth is that I am only able to afford it because of a spouse with a good income. This work is very hard and often demanding. You cannot reasonably expect most people to do it while being grossly underpaid.

Existing NIH policies, programs, or resources

The NIH post-doc payscale should reflect the difficulty and rigor of a post-doc job. More mentorship and support networks would also be helpful to increase academic retention.

Proven or promising external resources or approaches

No response

Response 526

Perspectives on the postdoc roles and responsibilities

Postdocs are the backbone of our academic research structure; highly skilled and trained researchers who pursue difficult research questions. They are meant to be experts in their research field, producing high quality research, while simultaneously working as mentors for junior lab members. They are at a point in their career where productivity is crucial in order to move on to the next step in their career.

Fundamental issues and challenges

Postdocs are barely paid a sustainable rate if they live in any city. Being a postdoc means you are underpaid and overworked while constantly pressured to work more. It generally comes at a time in ones life (late 20s-mid 30s) where they consider starting family, and neither of those are beneficial to family life. So you must choose to pursue research that interests you at the expense of financial stability, or departing from academia entirely so you do not struggle to purchase food every week.

Existing NIH policies, programs, or resources

Money is a resource. That is all that every postdoc asks for.

Proven or promising external resources or approaches

More and better funding opportunities, or recognizing that any national salary cap is not equitable.

Response 527

Perspectives on the postdoc roles and responsibilities

The postdoc is called a training position, but structurally often postdocs do not get a lot of training, and instead use the postdoc as a time to use training they already have and (hopefully) get some cool results and connections for future job applications. The main defining component of being a postdoc is that it temporary, and viewed as such. A postdoc-like research position that was not viewed as temporary, and that paid well (unlike current postdoc salaries), would be awesome for many people. The postdoc can be used to prepare yourself very well for what you want to do next, and that’s how I have used the time. I

also observe that sometimes people get guided, or drift into projects, to do work that is not preparing them for good future positions.

Fundamental issues and challenges

Postdocs are severely underpaid compared to non-academic career options, and also compared to the cost of living, especially in cities, especially for people of postdoc age who may want to start a family. I've seen this drive multiple people, especially URMs, away from a career in academia.

Existing NIH policies, programs, or resources

Better pay (need a dramatic increase). This is the only real way to fix a lot of the systemic issues (related to equity, harassment, power imbalances, leaky pipeline.)

Proven or promising external resources or approaches

Postdocs need to be paid more, for the health of our academic system.

Response 528

Perspectives on the postdoc roles and responsibilities

The postdoctoral position in my opinion is employment following completion of a PhD where the postdoc works as a qualified independent researcher to conduct research for an academic who has secured the research funding, in order to establish a greater personal research profile and better establish a position as an active researcher prior to applying for independent research funding or research exposure for non-academic purposes. I do not view the postdoc position as a 'trainee' position (as this very questionnaire states in the following question), as the postdoc is already highly qualified and holds a PhD. A postdoc is a qualified researcher, and any learning done throughout the role is done through the work and research the postdoc does, and the role is not a 'learning opportunity' and postdocs should not be considered analogous to graduate students.

Fundamental issues and challenges

The key issue for postdoctoral researches remuneration. Salaries for postdocs are not much higher than the average salary of bachelors degree graduates, despite possessing greater research and analytical skills. This undervaluation of postdoctoral skills is unique to academia, as PhD holders performing analogous research in any other type of institution may enjoy double the salary. In addition to abysmal salaries, the hours worked by the average postdoc are often greater than what they are employed for. This obviously reduces the attraction and retention and quality of life of postdoctoral researchers in all possible ways, and is especially a barrier to single parent postdocs, and postdocs who may not enjoy a family wealthy enough to supplement their living costs.

In addition to poor personal finances, the upward mobility in academia is overly competitive and funding opportunities too sparse. Applying for a K99/R00 following a postdoc is the status quo, and is the typical entry into the academic tenure track. The competitive nature of these grants is desirable but the success rate of ~25% dooms the remaining 75% to reassess their entire career if unsuccessful. The odds of success are too low to make academic research a worthwhile endeavor. Coupled with more attractive salary ranges available elsewhere, the most competitive and qualified candidates may not consider academia at all. I am a early postdoc and have no intention of ever applying for an academic tenure track position. In addition to the low success rate of grants, the value of grants are diminishing in value in real terms. The inflation rate for the 12 months to January 2023 inflation rate was ~7%, but the R01 value has not increased to match, meaning grants are more competitive and less valuable.

Existing NIH policies, programs, or resources

Simply put, the NIH needs to fund more grants.

The NIH need to increase the grant size.

The NIH needs to increase the salary minimum for postdocs.

The NIH should also address the fee crisis in the publishing industry (for example, $10,000 to publish in nature) by refusing to allow NIH funds be spent on journal publishing fees to make research outputs more

equitable. This would ensure capable postdocs in laboratories with less funding than others to publish in high-impact journals.

Proven or promising external resources or approaches

No response

Response 529

Perspectives on the postdoc roles and responsibilities

The postdoc allows for additional training or to rebrand one's choice of discipline, but offers few other benefits. Roles include research, teaching, grant writing, mentoring, management, and training.

Fundamental issues and challenges

Postdoctoral positions rarely offer compensation that allows for comfortable living. Additionally, most postdocs are required to work grueling hours in a given week. These grueling hours drive many potential candidates away, since they are often prohibitive to those with families, and likely leads to the gender mismatch among academic faculty, due to the perception of the USA's societal roles for women in child-rearing. Further, the actual experience gained is often little: a couple more techniques, a few more presentations, and several witnessed seminars, generally just making up for some deficits from graduate education. This is frequently observed from industry hirers, who frequently discount time spent as a postdoc as actual job experience. In those industry positions, the postdoc is typically in a role reserved for those with less than doctoral achievement, thus delaying the career for those that would consider industry as a career choice. All these negatives are in pursuit of a role that is typically underpaid, overworked, and one of the most competitive in the country. That competitiveness also carries negatives, since the stories of "eternal postdocs" are not entirely exaggerated, and many who continue to serve as a postdoc find that is the only position for which they can be hired. The postdoc position is also flawed. What should be a position that could lead the bleeding edge of research is being relegated to only the safest and uninteresting of projects since one's publication record during the postdoc is of the highest importance.

Existing NIH policies, programs, or resources

The NIH postdoctoral grants should be increased in financial compensation without reducing the number offered. Probably a minimum of 80k in 2023 USD would be appropriate with increases to match inflation. Grants should also provide some funding for conferences and travel. Additionally, an expansion of NIH grants to create a category for industry positions, or simply promote industry-academia-based partnerships. There should be greater oversight of postdoctoral progress, and a general reduction of hours through mandate, since many postdocs work 80hr weeks.

Proven or promising external resources or approaches

Providing external funding promotes postdoc positions.

Response 530

Perspectives on the postdoc roles and responsibilities

Ideally, where independent training happens. Responsibilities like drafting and submitting grants based on original scientific ideas, conducting bench science to meet those ends, publishing papers based on that work, and building the experience necessary to independently fund and run a lab.

Fundamental issues and challenges

PAY. The unavoidable truth is that the work of post docs often is used to build the primary mentors labs and or grants and this effort is not incentivized or rewarded with a livable wage. Many people are well into their adulthood with considerations like children, aging parents, cost of living, inflation, and quality of life. This balance between work and life is largely dependent on the generosity of the mentor, and there is a lack of balanced give and take from institution to institution about vacation days, paid time off, the daily work hours, childcare considerations, and over time pay. I've seen so many post docs work asinine hours with little to no vacation and still struggle to meet the daily cost of their own and their family's needs. This is not an attractive quality as a trainee weighing my options about my career options and trajectory. Additionally, once again, this effort may be turned to naught if the mentor inhibits these people from

publishing and effectively disrupting the post doc trainee's ability to advance in an academic career. There seems to be no other way that productivity, quality, and good science seem to be measured except in publications. This is a poor measurement of the environment and quality of science.

Existing NIH policies, programs, or resources

Resources that encourage and formally develop team management, project management, mentorship, lab management, funds management, hiring and firing practices, and creating safe workplace environments. It would also be beneficial to have follow up and review processes that help keep the persons responsible for this development accountable and a point of consequence.

Proven or promising external resources or approaches

Please pay post docs more. The minimum should be at least 75K in yearly salary, and if grant allocations need to be expanded because of it, so be it.

Response 531

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a role in which a scientist may gain additional experience in new disciplines as well as techniques and skills not explored during the doctoral training. The goal is to synergistically combine experiences from the doctoral and postdoctoral training to develop a new research theme to launch an independent research career.

Fundamental issues and challenges

Below are listed a number of identified concerns addressing this question.

1. The fundamental issue is that academic research works under a pyramidal system. A single principal investigator (PI) trains dozens of PhD students and postdocs that are expected to establish independent research careers, become PIs and run laboratories supported by extramural funding, being the NIH the principal funding agency for biomedical research despite a flat NIH budget since 2003 when adjusting for inflation. The numbers no longer support being a PI as a viable career path.
2. Postdoctoral pay is low when accounting for the level of educational attainment.
3. Amounting the low success rates in extramural funding there is a high level of funding inequality across laboratories, a phenomenon known as the Matthew effect. Research by the NIH has shown that additional funding secured by large laboratories does not translate to higher research productivity (https://nexus.od.nih.gov/all/2017/01/26/research-commitment-index-a-new-tool-for-describing-grant-support/). Also, one has to put into question the capacity of PIs running large laboratories to mentor effectively every lab member
4. The average age of the NIH-funded PI workforce is skewing older over time, which tends to be supported by multiple—3, 4, or 5 or more—grants in FY2020 than in FY1995 (Lauer et al. 2021 Elife. 10:e71712. doi: 10.7554/eLife.71712. PMID: 34477108). This plays against the odds of early-stage investigators to secure tenure-track faculty positions in academia necessary for sustaining stable PI roles.
5. There is no funding parity for gender or race for researchers in the workforce, which are unacceptable inequalities (Lauer et al 2021).
6. Postdoctoral training is narrowly focused on academic research. The power imbalance between postdoctoral trainees and principal investigators diminishes the success of postdoctoral trainees to seek additional training in careers outside academia.

Existing NIH policies, programs, or resources

1) Postdoctoral fellowships such as T32 and F32 do not guarantee that the postdoctoral trainees will continue a path in academia. The T32 and F32 programs (PA-21-048, PA-23-048) should be retired. Instead, the T32 and F32 grants should be reallocated to K99/R00 grants (PA-20-188) to accelerate the transition of postdoctoral trainees to independence.
2) The Grant Support Index (GSI) of a NIH-funded principal investigator (PI) should be no more than 21. PIs with GSI scores over 21 (the equivalent of 3 single-PI R01 awards) should include a plan in their applications for how they would adjust those researchers' existing grant load to be within the GSI limits if their application is awarded. In 2017 this measure was expected to free up to 1,600 new awards that would benefit an equitative distribution of funds (https://www.nih.gov/about-nih/who-we-are/nih-director/statements/new-nih-approach-grant-funding-aimed-optimizing-stewardship-taxpayer-dollars#10).
3) Incentivize the transition of PIs to non-PIs roles past the Full Retirement Age or Social Security Retirement Age. Develop an honorific mentorship funding mechanism to incentivize the transition of late-stage PIs to roles that focus on supporting early and mid-career sciences on mentoring.
4) Increase congressional advocacy for more NIH funding on the merits of keeping the United States at the forefront of biomedical research given the increasing competitive environment by other nations and to sustain the capacity to attract talent.

Proven or promising external resources or approaches

The NIH Faculty Institutional Recruitment for Sustainable Transformation program is an excellent resource to incentivize the recruitment of faculty from underrepresented and underprivileged backgrounds.

Th NIH Director's Biomedical Research Workforce Innovation Award: Broadening Experiences in Scientific Training (BEST) is another example of a successful program that is helping PhD students and postdocs find alternative career paths to academia given the current strenuous environment.

Response 532

Perspectives on the postdoc roles and responsibilities

This is essentially an apprenticeship to provide further training as an independent scientist.

Fundamental issues and challenges

Post docs have a PhD and are often in their late 20's and early 30's with spouses and families. They are not paid well enough to live in major metro areas and support a family. Coupled with the uncertainty of the academic track and the length of time expected, this makes this an unattractive option. Childcare costs alone likely cost us many, particularly women.

Existing NIH policies, programs, or resources

Better funding for postdoc salaries (raise the modular budget!). Funding for childcare costs for post docs that will actually cover real world childcare. Find more of the postdoc awards that are now required for an academic job.

Proven or promising external resources or approaches

Increased salary. Childcare benefits. Cost of living adjustments for salary?

Response 533

Perspectives on the postdoc roles and responsibilities

My answer is specifically for academic postdocs for people wanting to pursue a faculty position: I view the postdoc as a mentored time where you are generating the skills and the data to be able to start an independent research lab. For skills, you have an opportunity to mentor junior members of the lab with access to your mentor for suggestions/feedback. It is also a time to demonstrate ability to switch between projects/methods/organism and develop the ability to learn new research skills at the bench in a facile way. It obviously needs to be a productive time as well to qualify for transition grants, faculty positions, so it seems to be more demanding than graduate school where your focus was mostly on the science (instead of setting one's entire career up for a successful launch).

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

As a physician scientist, I think the K08 awards are designed to be awarded too late into a post-doc's time in the lab when they are already start their own lab (or for early assistant faculty who already have a lab) so it doesn't seem like it functions as a career transition award anymore. I think they should focus less on preliminary data and publications during the post-doc period and more on the potential of the trainee and the project in determining who to fund.

Proven or promising external resources or approaches

UCSF and USF have a joint workshop they host on 'inclusive mentoring for academic labs" that I participated in and found extremely helpful for informing my mentorship style currently and management style going forward as I hopefully start a lab.

Response 534

Perspectives on the postdoc roles and responsibilities

I'm gaining additional research training, publication opportunities, and professional development as I prepare for the faculty job market. I see the academic postdoc as a temporary position to help me increase the odds that I am viewed as a strong, attractive candidate for a TT assistant professor position.

Fundamental issues and challenges

The pay is pretty horrible. I think this is the driving factor for why labs are having a hard time with recruiting. Like many postdocs, I had to move to a new city after I graduated to start my postdoc, and I'm still feeling the financial squeeze six months later from all the moving expenses. In grad school, there was the shaky argument that we were also being compensated with tuition remission, in addition to our small stipend. As a postdoc, the training opportunities, while excellent, don't help pay the bills.

Existing NIH policies, programs, or resources

Increase the NIH minimum postdoc salary!

Proven or promising external resources or approaches

No Response

Response 535

Perspectives on the postdoc roles and responsibilities

I am extraordinarily lucky to work in an extremely prestigious lab in a very well funded research institute. If I had to make the decision to do a postdoc or not over again, knowing what I know now, there is no chance I would do a postdoc. There is simply no need for additional training after a PhD. This is evidenced by the prevalence of early independence options, including those supported by the NIH. If one is interested in having an academic career, they seem uniformly better served by one of these options. If one is interested in an industry career, it is well documented how detrimental doing a postdoc can be. There is irrefutable proof that postdoctoral training is financially harmful, and I would argue that it is also exploitive, even in the best environments. Please review PMID: 28072769.

I have had a very successful training period, with two dozen papers --many in flagship journals—and two NIH-funded grants. I am 38 years old and I have one child and a second child on the way. Starting in September, my childcare bill will be $45K/year. for two children. My current salary is below that of the average garbage collector. And this is AFTER the NIH increased the stipend levels. If I leave my postdoc, I have a highly desirable skillset and extremely strong professional pedigree, and I know that in the private sector, I will make at least 3x my current wage —more than a professor. I will be leaving academia this spring.

My professional credentials are very strong and I have been extremely successful while working with the most powerful and well funded scientists/mentors in the world. Still, I can't make this work for my family. The cost is too great. I'm leaving academia this spring.

Fundamental issues and challenges

1. No need for additional training.
2. Wages that are 50% below market value, or more.
3. Career disadvantage (PMID: 28072769)
4. Work for managers who have no management training
5. Work in environments with unstable funding/ funding stress.
6. Retirement/college savings disadvantage
7. Lack of work-life balance required.
8. Poor salary prospects EVEN IF a postdoc transitions to a faculty role.

Existing NIH policies, programs, or resources

The NIH already supports parental leave for NRSA funded postdocs. This needs to be enhanced by providing a childcare supplement that fully covers the cost of childcare. If you REALLY want to promote the advancement of women in science, don't make them choose between their families and their academic careers. Make it possible to have it all.

There has been substantial discussion about promoting diversity in the academic science workforce. It is no mystery that many scientists from underrepresented groups are from economically disadvantaged backgrounds. It is laughable that the NIH expects first generation scientists (who now have a degree that qualifies them to make $150k+ in pharma) to work for $60K as postdocs. Large companies are ALSO seeking to increase the diversity in their ranks, and the highly remunerative jobs are there. If the NIH wants to retain scientists from economically disadvantaged backgrounds they need to make it possible for them to train without needing to choose between continued poverty and almost immediate financial success.

The IDP program is a joke. I have never worked in an organization where even the administration or faculty took IDPs seriously. These should be either reimagined or scrapped. In their current form, they only serve to propagate the illusion that faculty is invested in the development of trainees.

The career transition programs are inadequate. There need to be more K99s, DP5s, etc awarded.

Proven or promising external resources or approaches

I have little hope for postdoctoral training. I think it's an outdated model that needs to be scrapped. Support staff scientists in academia and pay them a living wage.

Response 536

Perspectives on the postdoc roles and responsibilities

The last step of a career that allows scientists to become independent investigators

Fundamental issues and challenges

1. Increasing administrative and bureaucratic burden with no clear benefits and no clear reason to exist. Basically only to check newly created regulatory boxes.
2. Low pay

Existing NIH policies, programs, or resources

Decrease bureaucracy and increase stipends.

Proven or promising external resources or approaches

Just decrease bureaucracy and increase stipends.

Response 537

Perspectives on the postdoc roles and responsibilities

I'm a scientist with my own expertise. I work with other scientists, some with deep expertise in specific topics I want to learn more about. By being able to conduct research without the work of managing a lab one hopes to have the time and resources to build a useful and unique research program.

Fundamental issues and challenges

Among professions with comparable levels of education, the compensation that postdocs receive (salary or otherwise) is completely inadequate, to the point of not being able to afford housing and basic childcare, which speaks to a shortsighted devaluing of research and highly skilled scientists.

Along with the stress of the job, and highly uncertain job prospects in academia, the only people to survive in the system are those with numerous external advantages that buffer them from its effects

Existing NIH policies, programs, or resources

Grant budgets earmarked for salary increases

A system for formal scientific communication that bypasses corporate publishing houses.

Proven or promising external resources or approaches

Mentoring is key.

Fewer postdocs and more well paid staff scientists, fewer labs that function like sweatshops, and incentives to reduce the volume of research and improve quality of a smaller body of research output

Response 538

Perspectives on the postdoc roles and responsibilities

A postdoc position to me is a way to gain additional training after my PhD in order to develop an independent research niche. My goal in my postdoc was also to gain more skills that I would need to become a Principal Investigator, including learning about which grants to apply for and when, the different types of salary at academic institutions (hard vs soft money), grantsmanship, and networking. I view it as a temporary position, but I also view myself as a valuable addition to the institution, even though I am technically still in training. I have a lot more responsibilities than I do as a graduate student.

Fundamental issues and challenges

The primary issue is the pay. I am a single female living in a city, and I am just able to have a decent quality of life on the NIH minimum standards. I know for my colleagues who are single mom's/have families, they really are not able to make it work on a postdoc salary. I cannot imagine the NIH wants to exclude single mom's or the primary breadwinners from being able to do a postdoc, but the truth is that that is the case on the current salary the NIH sets. Even though they are the minimum, Universities use these as the standard pay. Furthermore, we are all coming from a grad school stipend, which most likely means we have little savings. A post-doc position often requires a move, which I found almost impossible to do without external help from family and friends, and I am about as frugal as they come. A post-doc comes with no benefits (no type of retirement benefits, I pay a lot to have health insurance), and it is likely you will have to move for the postdoc, as well as after the post doc. As people in their late 20's to early 30's, this is not ideal for personal relationships. Furthermore, to have the best chance of getting a job in academia, you have to get an F32 as well as a K99, which requires several years of a postdoc and begins to feel like a giant scam. This all happens while your peers go into industry with much better pay, work life balance, and 1,000,000X better benefits. Besides personal fulfillment, what benefit does doing a postdoc really have for our life? I love my research, but I am not sacrificing my life or well-being for a job that offers nothing back.

Existing NIH policies, programs, or resources

The NIH are the ones who would spearhead salary increases, since Universities have to decide if the PI or the school makes up the difference as the salary is now. Why can't the NIH increase the award amount so Universities don't have to have these conversations? Its really the NIH that is allowing us to be poorly paid.

Proven or promising external resources or approaches

No response

Response 539

Perspectives on the postdoc roles and responsibilities

It is only useful for people who want to be professors and not worth it for people who don't want to stay in academia. It's just like a second PhD except way more is expected of you.

Fundamental issues and challenges

The culture is still such that people don't expect postdocs to have a life outside of lab so their quality of life seems even lower than a PhD's. It doesn't pay well enough so why do it if you don't want to be a professor (which there aren't enough openings for anyway). I would rather just go industry and start making more money right off the bat and have a life outside of work. It's also intimidating not knowing if you will be a good fit for the lab, so you might be miserable for a few years, just to get a few more niche skills that would only matter if you plan on starting a lab with those skills. It also seems like a waste of time.

Existing NIH policies, programs, or resources

Current funding from the NIH doesn't track with inflation but I'm not sure what the source of that problem is.

Proven or promising external resources or approaches

I'm not clear what this section is talking about. But I think a cultural shift needs to happen in what is expected of a post-doc which would probably happen at the PI level.

Response 540

Perspectives on the postdoc roles and responsibilities

It's great opportunity to strengthen the skills and learn new methods or technique. Learn how to mentor.

Fundamental issues and challenges

The salary is very low to support the family and even individual needs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 541

Perspectives on the postdoc roles and responsibilities

I view this as a short term job to gain training and experience to prepare for the academic job market.

Fundamental issues and challenges

1) Salaries are typically not commensurate to the area for the level of education achieved. Postdocs can make much more in industry with their degree.
2) lack of structured PTO puts the entire management of time off on the relationship a postdoc has with their advisor. I routinely hear how strange it is that I get 0 sick days and 0 PTO days and there are 0 rules for hours worked. Which comes with a great flexibility but if the relationship between the advisor and postdoc is poor, it can easily lead to abuse of the postdoc.

Existing NIH policies, programs, or resources

Have a safety net in place that guarantees minimum PTO and sick leave for postdocs, in case a relationship sours.

Proven or promising external resources or approaches

Look at how much major companies pay people with PhDs.

Response 542

Perspectives on the postdoc roles and responsibilities

For over 30 years, my lab has relied on post-doctoral trainees for just about every aspect of our research. These folks have gone on to academic, pharma, government, and other commercial jobs and have been highly successful with important scientific findings and improving human health. They have matured in the lab to independent scientists, thinkers, and entrepreneurs, and along the way they have fueled the engine of innovation in our lab.

Fundamental issues and challenges

Even here in the midwest, starting postdocs are rarely paid what is defined as a living wage for a family with one child, and many are starting families. There is no band-aid that we can use to cover this wound.

Existing NIH policies, programs, or resources

Graduate students in biomedical research are generally paid $30,000+ per year for a half-time stipend (they are registered for thesis research the other 50% effort). When they graduate and take a post-doc, they are paid $56,000 for a full-time position, which translates to a 10-20% (or more) pay cut! One would think that $80,000 should be the minimum that we would consider fair for a starting PhD salary. If we did that and provided typical benefits, most everything else would be straight forward to address.

Proven or promising external resources or approaches

Pay a fair wage—that is why we are losing post-docs to industry.

Response 543

Perspectives on the postdoc roles and responsibilities

It’s a bridge between PhD and my next job. Hopefully industry because postdoc salary is unsustainable. I love the lab and my PI is supportive but it’s simply not sustainable.

Fundamental issues and challenges

Salary. And maternity leave. Benefits.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 544

Perspectives on the postdoc roles and responsibilities

I view it as employment after graduate training. While it will lead to an academic or industry positions, I am expected to work as an employee and not a “student” and therefore I should not be categorized as a “trainee” which does not help postdocs but only helps the employer evade responsibilities.

Fundamental issues and challenges

Unsustainably low pay for the work demanded. Many universities, including [redacted for anonymity], categorize postdocs as “contractors” therefore we are not allowed seek guidance from Human Relations, we are not allowed employee benefits, we are not allowed retirement contributions.

Existing NIH policies, programs, or resources

NIH must mandate that postdocs be treated as employees and not contractors which universities use to evade responsibility. NIH must also collect annual surveys from postdocs to rate their institution and

employee treatment to hold universities responsible. Even high profile universities such as [redacted for anonymity] take advantage and mistreat their postdocs.

Proven or promising external resources or approaches

Many postdocs, especially in biomedical sciences where PhD averages 5.5 years, are in the age group of starting families and need basic employee benefits that are essential to pay for mortgage, family health insurance plans and childcare.

Response 545

Perspectives on the postdoc roles and responsibilities

Gearing up for a faculty position. Helping with grant writing, producing a lot of data, at least one publication per year, mentoring students.

Fundamental issues and challenges

Salaries—pay is not enough for scientists with 5-8 years of post-bac experience. Students with Bachelor's degrees make more in industry jobs. There is simply no incentive.

Visa issues for international post-docs. A special visa category or treating post-docs as students for an F-1 student visa purpose.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 546

Perspectives on the postdoc roles and responsibilities

Extant characterizations of a post-doctoral position as a trainee position is, at best, misguided and, at worst, intentional in justifying their poor salary, job security and career prospects. Post-docs are highly trained/qualified individuals that provide essential labor (whether that be towards research, teaching or mentorship). The current system—directly informed by NIH's funding habits/norms—enforces low pay and high insecurity amongst post-docs, leading to high turnover in these positions. This disrespects their individual rights as workers, as well as being highly destructive for science.

Fundamental issues and challenges

The NIH modular budget has remained stagnant since it was introduced in 1998. Adjusting for inflation, this means PIs have ~50% less funds now than they did when the policy was introduced. This pits research costs/equipment against personnel. This means that fewer post-docs can be employed on a standard NIH grant, and those employed can be kept on for a shorter duration. There should be better pay offered to post-docs and, critically, a restructuring of science to afford them better career prospects. Given the shortage of available PI positions, staff scientist/research associate positions should be more widely recognized as a *secure* and viable long-term career option in Science. Otherwise, the brain drain from academia to industry will intensify, and publicly funded research will be made extinct.

Existing NIH policies, programs, or resources

See my previous response—funding to the NIH needs to be increased to allow for a higher modular budget than that which has remained stagnant since 1998. This will allow better pay for post-docs and longer contracts, as well as allow for staff scientist/research associate positions with better pay to become normalized as viable long-term career options for post-docs.

Proven or promising external resources or approaches

The issue is a monetary/material one as highlighted above—no amount of NIH-sponsored training, mentorship etc can rectify the fact that there is not enough money to pay post-docs, nor to provide them with a viable path to a secure future in science.

Response 547

Perspectives on the postdoc roles and responsibilities

Ability to explore the science one is passionate about

Fundamental issues and challenges

The payscale should be adjusted based on the location. Else, a subsidized facility for stay should be offered to every postdoctoral candidate

Existing NIH policies, programs, or resources

More grants for non US residents to compete for

Proven or promising external resources or approaches

Increased salary, and more grants to compete for.

Response 548

Perspectives on the postdoc roles and responsibilities

Cheap labor

Fundamental issues and challenges

Long time hard working but always treated as cheap labor.

Existing NIH policies, programs, or resources

First of all NIH needs to treat us fair. Postdoc salary is between 46-50k. Librarian minimum wage starts with 65k. During the inflation NIH never considered helping Postdocs thats why many of them are leaving including my self. After all the education and hard work No one doesn’t want to work for 46k.

Proven or promising external resources or approaches

NIH has to consider paying better

Response 549

Perspectives on the postdoc roles and responsibilities

I career transition period to gain additional and complementary training to independent faculty level positions.

Fundamental issues and challenges

Pay/stipend is very poor, not enough to have a decent lifestyle in major US cities.

Visa and international regulations are prohibitive for several fellowship applications.

Very limited faculty/ academic positions to apply fo.r

Existing NIH policies, programs, or resources

Many institutions follow NIH pay scale for postdoc trainees. Updating the pay scales by NIH to better support trainees will bring about changes in many major institutions

Proven or promising external resources or approaches

No response

Response 550

Perspectives on the postdoc roles and responsibilities

A hired scientist, the treatment to whom highly depends on the head of the lab.

Fundamental issues and challenges

1. Salary, relative to the work they already had posed on their PhD period
2. Instability even after they got a job as a faculty (e.g., lack of funds to run a lab, low possibility to get a grant.)

Existing NIH policies, programs, or resources

R01 could be expanded and it would be helpful as we think getting an R01 as an early-phase independent investigator would be hard.

Proven or promising external resources or approaches

No response

Response 551

Perspectives on the postdoc roles and responsibilities

a temporary position, building intellectual independence, learning how to mentor students, and obtaining problem-identifying and organizational skills necessary to establish a highly productive research laboratory.

Fundamental issues and challenges

The salary is way too low and has not kept up with inflation. Few academic jobs are available, which forces people to remain in postdoc roles for many years until they either land an academic position or until they can no longer afford it and leave to pursue careers outside of academia. Data shows most postdocs that land faculty jobs are frequently hired from institutions in major metropolitan cities, and the NIH minimum is not nearly enough to live by oneself in any one of these cities. I know many people often delay having children or have to leave academia entirely because the salary cannot support families.

Existing NIH policies, programs, or resources

Increase postdoc salaries.

Proven or promising external resources or approaches

No response

Response 552

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a training position that allows be to prepare to become an principal investigator while receiving mentorship from world class scientist. Additionally, it gives me time to broaden my expertise and expand my research scope into a new field. In this role I lead studies, apply for grants, write manuscripts, manage laboratory staff, present at conferences, and serve on committees. I essentially perform all the roles and responsibilities of a PI while still having access to mentorship and trainee opportunities.

Fundamental issues and challenges

The greatest barrier to postdoc recruitment, retention, and overall quality of life for postdocs is the low salary set by the NIH. The NIH stipend levels for postdoctoral salary have not kept up with the cost of living and is not commensurate with the education and experience of postdoctoral researchers. Postdocs typically work over 40 hours a week only to be compensated below the value they bring to the lab. If the NIH is going to retain postdoctoral researchers in academic research, especially those from disadvantaged backgrounds and those that don’t come from economic privilege, stipend levels need to be raised. I love my research and everyday I wake up excited to continue my academic inquiry. Academia is a calling for me but the pay makes it difficult to stay. When students ask about my PhD journey I tell them about the excitement of discovery and the satisfaction that comes from scientific competence. I leave out that doing a PhD is economically difficult and there is no relieve after graduation. If the NIH is going to broaden the talent pool of academic research the postdoc salary must be increased.

Existing NIH policies, programs, or resources

Raise the stipend amounts. Increase funding for career development awards.

Proven or promising external resources or approaches

No response

Response 553

Perspectives on the postdoc roles and responsibilities

Extended research beyond grad school with more independence in framing the right problems to solve.

Fundamental issues and challenges

No visa sponsorship.

No pathway to tenure track.

Low pay.

Professors have no management training

Uncertain temporary contracts.

Toxic environment

Unrealistic expectations on intellectual rigor.

Existing NIH policies, programs, or resources

Improve salary

Proven or promising external resources or approaches

No response

Response 554

Perspectives on the postdoc roles and responsibilities

I believe role and responsibilities of a postdoc entail keeping up on current research, mentorship of undergraduate/grad students, performing experiments and collecting data, writing grants and papers. Postdocs should still be receiving training to prepare them for becoming a PI

Fundamental issues and challenges

Money. Postdoc positions in academia are not as well compensated as in industry. While health benefits are usually well compensated it is University dependent. Postdoc positions in CA for example do not pay enough for rent and general living expenses. Ability to sponsor visas for international scholars is good but only for the first few years on J1 visas, however it can be burdensome on the institution to further sponsor an H1B or permanent residency.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 555

Perspectives on the postdoc roles and responsibilities

The expertise and labor is entirely out of line with the salary, particularly given that most postdoctoral researchers are in their 30s. I ran up credit card debt in [redacted for anonymity]; a friend at [redacted for anonymity] had to shoplift to eat. Saving for a home or having children was impossible, even as I inched toward 40. I still harbor significant anger about this time in my life.

I learned a lot as a postdoc and grew as a researcher. As someone without familial support.

Fundamental issues and challenges

As I mentioned above, the amount of work expected for the money paid and the educational experience (post PhD) is entirely unacceptable and will drive many working class people and people who want to have children out of the field.

Postdoctoral mentors have essentially full control of the postdoc's labor, and this can easily lead to abuse. This leads to the further degradation of working conditions. It's exacerbated in the postdoc over in the PhD because one cannot as easily change labs, there's fewer institutional supports, and no social cohort to support.

Existing NIH policies, programs, or resources

No. Pay more money. The system is broken and no number of "Alternative Career Seminars" or "Work/life Balance Workshops" will fix it. This is an embarrassment.

Proven or promising external resources or approaches

Pay more and have real and meaningful oversight of mentors that offer pathways out of abusive or hostile work environments without hurting the trainee's career.

Response 556

Perspectives on the postdoc roles and responsibilities

What it should be: A mentored transition from being a trainee to becoming an independent scientist.

What it currently is: A multi-year position with poor benefits, a poor job perspective, and only little training.

Fundamental issues and challenges

High pressure. Poor work-life balance.

Existing NIH policies, programs, or resources

1) Increase in pay so that a postdoctoral position is a real job that one, if needed, can do for multiple years.
2) Postdocs now get stuck in the 'academic pyramid', where the mantra is 'up or out'. There is not enough space in the pyramid for us to all go up. However, after spending ~6 years in grad school and 8 years as a postdoc, it is hard to decide to leave 'empty handed', without an independent lab, and being too old to start from scratch in a new career. Instead, we need fewer postdocs, and more long-term career scientists in labs so that people can stay in the field. This means that some graduate students will leave the traditional academic field, but that is not a problem: it is better to leave for a good alternative career before investing another decade in academia. Fewer postdocs also often means that labs become smaller, which should not be a problem if the people that end up staying long term are highly skilled at what they do (e.g. staff scientists).

Proven or promising external resources or approaches

No response

Response 557

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salaries are too low for the current cost of life, especially on the East and West Coast

it is very difficult for foreign postdocs to obtain a fellowship since for example most NIH and all NSF fellowships are restricted to US citizens or permanent residents (foreign postdocs represent or used to represent 50% of postdocs in the US) and this makes their chances of getting a tenure track position

unfairly low after just as many sacrifices as US postdocs if not more (distance from family and friends especially during the pandemic).

Foreign postdocs also do not have the possibility of having a 401(k) or equivalent retirement saving program.

Response 558

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows/researchers are just beginning their own careers as investigators. They partner with a PI who hires them as a contractor and they then work on a project for their PI in order to learn new skills they will need in pursuing their career and their field of research. Postdocs should be required to teach or advise students in some capacity (TAing, working with graduate students, et cetera). They should also work out an agreement with their PI as to what kind of contribution they are required to make as a member of the PI's lab. These are the only required responsibilities of a postdoc, but they may also review manuscripts for submission as part of their training. Posdocs are often required by their PI to apply for certain grants, but this shouldn't be a requirement of the position per se.

Fundamental issues and challenges

Postdocs are often paid far less than they would make if they took a position in industry. This greatly diminishes the appeal of a postdoctoral position and an academic career in general. Postdocs are also often offered 2-3 year contracts and this often necessitates taking a second postdoc position after the first is completed before attempting to apply for tenure track faculty positions. They may also be required to take on moving expenses which will not be reimbursed by their employer or which may be reimbursed several months later. Therefore, many postdocs make sacrifices in their pay and their family lives to pursue a postdoctoral position. Quality of life and recruitment of Postdocs is at a crossroads right not as many PhD recipients see no reason to pursue low paying and highly competitive contract positions for 3+ years just to get their foot in the door for an academic (maybe) tenure track position in academia.

Existing NIH policies, programs, or resources

NIH could increase all postdoctoral fellowship and training stipends by 30% and allow PI's to pay additional salary beyond the NIH pay caps. NIH could also increase the number of program awards (T, F, K, and R programs) given each year and decrease the burden to apply for grants by reducing paperwork across the NIH system, which would lead to more grant submissions and money available to pay for postdocs.

Proven or promising external resources or approaches

Improving the pay of postdocs is the single most important way NIH could improve recruitment and retention of postdoctoral candidates. Other improvements include allowing postdocs to make intellectual property claims on research findings and providing childcare support benefits and maternity/paternity support benefits in all grants as possible indirect costs.

Response 559

Perspectives on the postdoc roles and responsibilities

Postdoc years should be made to refine one's skills in view of an independent academic position and perform research as a highly-skilled individual without the burden of managing a lab.

Fundamental issues and challenges

The quality of life strongly depends on the lab culture and the salary with respect to the cost of living. For big cities, having 34-35 y.o. highly-educated Ph.D. (possibly with kids) paid less than a third of the median

salary for equally-educated workers (https://www.glassdoor.com/Salaries/new-york-city-phd-salary-SRCH_IL.0,13_IM615_KO14,17.htm) is borderline criminous. However, since there is no alternative path to an independent research career besides postdoc positions, and being the academic structure designed to hire 1/10th of the people it educates, people that are really motivated to become scientists are forced to stay in these paradoxical conditions for many years.

Existing NIH policies, programs, or resources

Salary, salary, salary. Postdocs should be able to afford a living, and salaries should be massively adjusted with seniority. Creating alternative paths for postdocs in academia to become independent researchers with a living wage besides the lab-head PI (which is an incredibly competitive market that results in a high rate of anxiety and mental health problems) would also help shorten the postdoc "training" period within reasonable boundaries.

Proven or promising external resources or approaches

No response

Response 560

Perspectives on the postdoc roles and responsibilities

A precursor (not strictly a training position) to gain experience prior to initiating faculty or industry positions.

Fundamental issues and challenges

A large barrier, and the only one I can truly think of, is pay. If I personally didn't have a spouse with an established career and high salary I would not be able to survive on my NRSA salary.

Existing NIH policies, programs, or resources

The timeline for independent postdoctoral (F32) funding needs to be accelerated. Even if you apply as soon as you graduate, and have your application funded on first submission, you are well into your postdoctoral training when you begin the grant.

Proven or promising external resources or approaches

Improving pay and benefits, in addition to flexibility within the role (e.g., payback requirements).

Response 561

Perspectives on the postdoc roles and responsibilities

Provides training and opportunities to publish that are integral to obtaining a tenure-track job.

Fundamental issues and challenges

Recruitment: Jobs are not well publicized, and it seems to be about who you know with introduces bias. The pay is also terrible. Several friends left for industry positions because they couldn't sustain 2/3 more years of poor pay (living in CA).

Retention: For me, the biggest challenge has been childcare. My university does not offer childcare support to postdocs, and maternity leave is very short. Several female postdocs have left their position recently due to the prohibitive cost of childcare and lack of support. In general, there is a lack of support for postdocs who are traditionally in a very active life stage (having children, saving for a home). It can sometimes feel like spending this time has actually set a person back financially, versus propelling them forward.

Quality of life: loneliness, lack of support, ambiguous expectations

Existing NIH policies, programs, or resources

Clarification on whether/what role postdocs can play on a grant application that still maintains early-career status and does not influence eligibility for a K-award (e.g., can they be a co-PI and still maintain status/eligibility). Alternatively, grant opportunities for postdocs who are currently employed. Most of the small grants/pilot-funding opportunities require individuals to be faculty.

Building a larger network of resources for postdocs that includes information on wellness, financial support, balancing work/life, etc.

Proven or promising external resources or approaches

Required mentor training provided by the NIH for PIs who employ postdocs!

Getting input from postdocs more frequently

Response 562

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a trainee position for post-PhDs to either gain skills or prepare for an academic career. Mentors have an obligation to their trainees to provide space, training, and research equipment/materials and guide them to meet their career goals.

However, this has not been what many of my colleagues and I have experienced: postdocs are often treated like independent workers with uneven access to space, training, and mentorship. Without these guardrails, it feels instead like a low paying, flexible job with a narrow path to a tenure track position and few tangible benefits over working in industry.

Fundamental issues and challenges

Postdoctoral responsibilities are so varied that it is hard to evaluate the desirability of a postdoctoral position. The obligations with respect to each of administrative tasks, mentoring junior lab members, writing grants, and attending meetings can consume most of one's time and effort or none at all. More broadly, there is a lack of accountability for PIs that fail to advocate for their trainees. I have a heavy service load of administrative work and mentorship, which hinders my career advancement much more than it helps. If I were appointed by a department, other faculty might see the work that I do, but as it is, my PI both insists that I do substantial service work while also suggesting that I am not productive enough in my research.

It's hard to ignore how visa status creates a fundamental power imbalance. I am lucky because I can leave my position at will. Many of my colleagues are trapped in undesirable positions because that is their only legal option.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

We need cost-of-living adjusted minimum postdoctoral scholar salary guidelines that ensure trainees can afford housing. This is especially true for immigrant researchers who do not have a credit history in the United States. The alternative is a series of strikes that disrupt postdoctoral training and incite waves of retribution from PIs and institutions.

Programs that assign postdoctoral scholars to a department rather than an individual lab would remediate some of the biggest issues. Immigrant scholars could not have their legal status threatened by a lone individual. Service work could be meted out more equitably and visibly. Departments could gain a reputation for successfully training tenure track professors or industry leaders. Given the sparse training and mentorship I have received in my postdoctoral position, I would have preferred an arrangement that

facilitated switching focus to other professors' labs in my department and having a community of fellow postdoctoral scholars who were similarly funded.

Proven or promising external resources or approaches

UCSD Postdoctoral scholar survey showing large disparities for LGBT postdocs as well as illustrating various other concerns: https://tritonlytics.ucsd.edu/_files/UCSD-ALL-S3.pdf

Response 564

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position to be a short (~2 year) temporary position where a PhD researcher learns project management skills necessary to lead a research team as a principal investigator. The postdoctoral position is also an opportunity for a researcher to develop skills that would better enable his/her long-term research plan.

Fundamental issues and challenges

The primary problem with postdoctoral positions in the US is the dismal pay. Recruitment has finally been inhibited by the low salary and poor academic job prospects that have plagued academia for years; industry offers in many cases >2-fold higher salaries and critical retirement benefits / vacation, all while expecting traditional work weeks of ~40 hours. No one enters academia with goals of "being rich", but when one cannot provide for a family, academia is not a viable career path. Many current postdoctoral researchers, myself included, have been effectively "priced-out" by the recent economic downturn, coupled with soaring inflation and stagnant wages. I cannot provide for my family of 3 on a postdoctoral salary, and my partner is not wealthy enough to subsidize my "poor career choice". Academic research has become a privilege solely for the affluent. Furthermore, my quality of life has significantly deteriorated since completing my undergraduate degree, and I am unable to afford the help I need to navigate the overwhelming stress I feel in trying to provide for my family. I would not recommend anyone pursue a postdoctoral position, and I would caution recent graduates against pursuing a PhD for similar reasons. The financial value is, in many cases, non-existent, and the mental toll is severe. It has become apparent the USA does not value academic research, and that researchers should look to foreign nations, such as Europe or China, for adequate funding and a more positive life outlook.

Existing NIH policies, programs, or resources

Pay a living wage, and adjust salaries annually to accommodate inflation. Until then, academia will continue to suffer "brain drain" as people leave for industry to earn more money, do less work and collect better benefits.

Proven or promising external resources or approaches

These various training grants are of little value. I am a current trainee, and I find zero value in the system. It exists solely to provide funding to my PI, and the training has been nonexistent.

Response 565

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low salary is a major challenge for postdocs that often live in expensive cities. Raising salaries however is not easy when grants are difficult to secure and are often cut.

Another thing I have noticed is that entry into graduate programs is increasingly competitive, requiring trainees to obtain masters degrees or postbac experience prior to entering graduate school. This trend further prolongs the time it takes for students to secure their first academic faculty position.

Existing NIH policies, programs, or resources

The K99/R00 program allowed me to continue an academic research career.

Mandating institutions to provide retirement benefits and providing meaningful financial support for childcare for postdocs would be very helpful.

Proven or promising external resources or approaches

No response

Response 566

Perspectives on the postdoc roles and responsibilities

Postdoctoral research is a way for those who have completed training to apply their skills (and degree) to their own independent scientific interest.

Fundamental issues and challenges

Salary. Like obviously it's the salary. The US is very expensive and most postdoctoral research do not get nearly the amount they are owed.

Existing NIH policies, programs, or resources

Salary.

Proven or promising external resources or approaches

Actually listening to postdoctoral researchers and not the mentors who often take advantage of the position they are in.

Response 567

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

International postdocs face a real problem with their salaries, which are significantly lower than what private companies, industries, and startups offer. Furthermore, to support their research, many universities sponsor postdocs on a one-year basis, with the option to renew up to five years for a J-1 research scholar visa. This creates a difficult situation for scientists, who can become 'stuck' in the USA and unable to return to their home countries because of the need to renew their visas. The process of visa renewal is both lengthy and stressful, especially for individuals from developing countries who may face long wait times for US embassy appointments. This strict visa policy poses a significant challenge for international postdocs.

Existing NIH policies, programs, or resources

I would suggest a modification to the current visa policy for J-1 research scholars occurring in many universities by extending the visa sponsorship from one year to up to five years. This change would prevent the current situation where international postdocs are 'stuck' in the USA as they need to renew their Visa if they leave the country.

Proven or promising external resources or approaches

Increase salary at the level of private companies, industries, and start-ups. Propose less strict visa policy for international postdoc scientists (stop the '1-year' policy, allow to up-to initial 5 years contract).

Response 568

Perspectives on the postdoc roles and responsibilities

A postdoc is an expected step before most positions I am interested in. It is a somewhat frustrating requirement, as I feel ready to do my own research, and overqualified for a "trainee" position.

Fundamental issues and challenges

It is an inappropriate requirement. Scientists who have already received years of training are expected to perform research for PIs who provide little to no actual training, for compensation well below what we would make in other positions, when we are already fully qualified to perform research of our own. This is essentially a pyramid scheme, where PIs run large labs which do research in their name. The postdoctoral role does not exist in non-lab sciences (eg economics), where there is less tedious but highly technical work to be done. Post docs are dramatically underpaid for the work we do, and only go through this because of hope we will get to do our own research one day.

Existing NIH policies, programs, or resources

Pay postdocs more

Proven or promising external resources or approaches

Establish non-trainee positions for PhD graduates outside of tenure track academic roles. Fund positions where early career PhDs with or without postdoctoral training can conduct their own research, but cannot take on trainees. Cap how many trainees NIH funded scientists can supervise, as one person cannot actually train a dozen scientists. 3 might be an appropriate limit. If a PI wishes to employ scientists to conduct their research, rather than training them as an act of community service, the "postdoc" should be paid accordingly.

Response 569

Perspectives on the postdoc roles and responsibilities

The postdoc position is an opportunity to continue scientific training. This could be to gain additional skills or expertise in another discipline. If the individual's goals are to establish their own academic lab then the postdoc is an opportunity to establish and pursue their own research interests and questions. In this case the PI's role is to support them, guide them and offer input, but ultimately the postdoc will take that research to their own lab. If the individual's goal to to move to industry then the postdoc is designed to gain additional skills and expertise. Finding their own research interests and developing projects they will take with them to their next institution is not relevant. In this case the PI can give the postdoc a project that needs to be completed and these projects tend to be shorter in nature. In this case the postdoc may be learning an entirely new field and may require additional 'ramp-up' time to orient themselves in a new field. Again the PI must provide support and guidance but should focus on connecting the postdoc with industry professionals.

Fundamental issues and challenges

Low-pay, low-pay, and low-pay. A postdoc has just spent years completing a challenging PhD. They are a highly skilled and qualified scientist. Yet, they are paid substantially LESS than a technician with zero-two years of experience in the industry setting. This signals to the postdocs that they are un-valued by the institutions that employ them. The NIH needs to increase the pay standard and account for regional costs of living.

Existing NIH policies, programs, or resources

Improve websites and navigation ease when finding information on these websites. I think rather than expanding the NIH needs to consider streamlining.

Proven or promising external resources or approaches

More pay would substantially improve job satisfaction. While many love the work they are doing they do not love struggling to afford basic necessities and pay bills. They do not love having to put their personal life on hold simply because they cannot afford to buy a house, buy a car, or start a family.

Response 570

Perspectives on the postdoc roles and responsibilities

I would like it to naturally lead to a PI position in the lab/Institute where I am a postdoc.

Fundamental issues and challenges

No permanent contracts availableb for junior researchers. One have to secure their own funding to continue having a job. Lack of stability and security leads to higher stress, less focus on research and a poor life work balance.

Existing NIH policies, programs, or resources

Changes should be globally applied in academia. It would be helpful if institutes provided permanent positions based on starting NIH funds.

Proven or promising external resources or approaches

Response 571

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Pay.

Lack of journal publication standards.

Grant funding.

Existing NIH policies, programs, or resources

Increase pay.

Increased mentorship.

Proven or promising external resources or approaches

No response

Response 572

Perspectives on the postdoc roles and responsibilities

An independent research scientist-equivalent position with help on research funding and equipment/materials provided by PI/advisor. May help with training of graduate students and other junior trainees in the lab. Should continue growing area of expertise beyond PhD research with advising from PI.

Fundamental issues and challenges

Extremely low compensation especially compared to private industry and high COL in many college towns. This is often a role taken on when people have greater financial responsibilities (e.g., childcare, retirement planning, supporting parents) and potentially for much longer than graduate degree programs. Additionally, tenure-track positions are increasingly limited while adjunct/lecturer/other contract-based and short-term positions are becoming more common in academia, reducing the long-term career incentives for a postdoc. Finally, many postdocs are expected to be highly productive in a new topic with minimal training, potentially aid with funding the lab and training lab members, and essentially take on a PI-like role while not being compensated for it. Issues with PIs in general can contribute, such as a lack of a standard and effective management training program, limited use of industry-standard team-oriented tools such as project management and administrative support for all groups (not only well-funded ones), and the "publish or perish" culture which can incentivize PI abuse/mistreatment for the sake of productivity over strong mentorship. Additionally, small lab environments make it very obvious when a complaint is made about a supervisor; some thought about how to shield trainees from retaliation when making a complaint would make the work environment better.

Existing NIH policies, programs, or resources

Raising NIH salary caps closer to industry standards and to account for higher cost of living. Longer-term contracts. Modifying grant proposals to incorporate references from current trainees and/or students to

ensure PIs are incentivized to treat lab staff well, rather than rewarded for publication records and other individualized achievements. Requiring PIs to meet a minimum level of mentorship involvement and delineating reasonable expectations for workload in a given role.

Proven or promising external resources or approaches

Implementing required and effective management training programs for all PIs. Incentivizing strong mentorship and service records in addition to publications at different rungs of career progression (e.g., references from trainees). Tying institutional overhead costs to administrative support of labs (e.g., an administrative assistant assigned to a subset of labs in a given department.)

Response 573

Perspectives on the postdoc roles and responsibilities

As a postdoc, I am expected to train and mentor graduate students that join the lab, and to dedicate 100% of my efforts toward research/related activities. I am, and am expected to be, extremely independent. I view postdocs as the primary drivers of lab productivity and success.

Fundamental issues and challenges

We simply aren't paid enough. Many of us have multiple degrees and 10+ years of experience in our field, and our pay does not reflect nor appreciate the amount of experience that we have, the quality of work we produce, and the importance/integral nature of postdocs to a lab, especially to a lab with an established PI who has many other responsibilities. Many of us are at the age where we are supporting families, and this is nearly impossible to do on a postdoc salary with inflation and housing costs. I know many colleagues who have left academia for industry solely for monetary purposes.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase postdoctoral pay, more support for trainees with families/children

Response 574

Perspectives on the postdoc roles and responsibilities

I loved my time as a postdoc aside from the low pay and negative consequences of securing postdoc fellowships. I was given opportunities to expand and refine my research, mentoring, and communication skills. While it was important I generate data and publications, I was also afforded time and resources to grow as a leader and mentor. Those things are essential to the role, yet there is no oversight for investigators who do not support such opportunities.

Fundamental issues and challenges

Treat them more like employees with equal benefits. No accountability for investigators who treat postdoc a like cheap labor.

Existing NIH policies, programs, or resources

Make postdoctoral fellowships administered by institutions such that we are employees who qualify for retirement benefits and income tax withholding.

Proven or promising external resources or approaches

No response

Response 575

Perspectives on the postdoc roles and responsibilities

For context, I have a non-clinical degree. I went straight from doctoral training in a department of psychology to a non-tenure-eligible faculty position at a research intensive university (R1). I have been at

my current position for about 2.5 years. So while I am formally not a post-doc, there are similarities between my position and what is typically considered a post-doctoral position. I will comment on both my experience and my observations of post-docs in my department.

I believe the purpose of an academic post-doc is to obtain more experience in a particular area or to make a transition to a related area of expertise. Ultimately, the post-doc should be learning how to be an independent investigator, or if that is not the post-doc's goal, to better articulate and gain the experience and connections needed to make a leap into a support role within the biomedical enterprise. Many but not all in our department try to apply for K awards.

In practice, a post-doc fellow is sometimes used to do a variety of tasks that are necessary to the PI or the large research group, but lack programmatic threads of consistency. For example, a post-doc I know routinely does literature reviews on disparate areas of research, which can be helpful but generally do not lead to publications. Post-doc fellows are also sometimes used to develop the infrastructure for a long study (e.g., longitudinal, multi-site) but then rarely benefit from the fruits of that particular labor (publications and conferences come out well after the post-doc leaves). Are these all good research experiences? Perhaps in the long-run, but for short-term metrics (and post-docs are often quite short!), this does not serve the post-doc fellow well.

Fundamental issues and challenges

Low pay is an obvious one, particularly in large metropolitan areas. In some ways I feel that post-docs are treated well in my department as there is emphasis on getting them independent positions if that is their wish. They also get protected time. Post doc positions can be precarious and not well-designed in part because the positions are often opened conditional on the PI receiving a grant, and PIs needing to fill that effort almost immediately.

Existing NIH policies, programs, or resources

It seems to me some departments really value a K and some do not. If a post-doc is in a department that does value it, he/she will get the mentoring needed to develop a successful application. If they are not, then a post-doc likely has a more difficult time on the job market. Could incentives be changed so departments generally want to support their post-docs this way?

Job security is another big issue for retention. At the medical school I am at, some non-tenure-eligible faculty are on yearly contracts and some are on three-year contracts. However, this still feels very precarious. A PI has a lot of power to help or hurt post-docs. There needs to be a better check and balance at either the institutional level or the NIH-level to ensure that post-docs are not taken advantage of with little to no recourse. By taken advantage of, I mean a significant part of their day-to-day working on tasks that do not benefit their career, though of course there are other examples as well.

Proven or promising external resources or approaches

No response

Response 576

Perspectives on the postdoc roles and responsibilities

An academic postdoc should be seen as a training opportunity to develop the skills required to become an independent academic scientist. This includes receiving formal and informal mentored training in a scientific (experimental design, technical, etc) discipline of their choice, as well as career development training in teaching, mentoring, networking, grant writing, and laboratory management.

Fundamental issues and challenges

The fundamental issue inhibiting recruitment, retention, and overall quality of life for postdoctoral trainees in academic research is the complete lack of a fair or competitive salary. There is no incentive for Ph.D. scientists to do an academic postdoc with a starting salary of ~$56,000 annually (if they are even paid according to NIH stipend levels) when there are opportunities in private industry starting at 2-3X this amount. This low salary becomes even more inhibitory for scientists from historically disadvantaged or excluded backgrounds who cannot afford this "opportunity cost" or scientists who have to support families. It is a major DEI issue that the academic postdoc profession excludes any and all scientists who cannot afford to sacrifice salary or healthcare benefits for 4-5 years, not to mention job security. As a new (Fall

2022) tenure track faculty member at a costal institution, it is extremely challenging to recruit a postdoc. Not only do I struggle with the ethical quandary not being able to pay a highly skilled Ph.D. scientist what their labor is worth in the market, but it is not possible for a postdoctoral scholar paid according to the NIH stipend level to own a home or support a family in this state. I cannot in good faith advise a Ph.D. student who does not have generational wealth or support from a spouse, or someone who must also support children or other family members to give up financial security to pursue an academic postdoc position. This means that academic institutions are missing out on huge portions of the talent that could otherwise be available to advance research and teaching.

Existing NIH policies, programs, or resources

Additional allowances for housing and childcare should be included in training grants (T32, F32, K99), as well as increasing stipends. These funds should be adjusted accordingly based on local cost of living. Ultimately, increasing postdoctoral salaries for scholars not eligible for training grants, or those who are eligible but do not receive them in the incredibly competitive funding environment, will require cooperation between the federal government/NIH and extramural institutions. It is not feasible to simply declare that starting postdoc salary has been increased by whatever percentage is appropriate without providing PIs the additional budgetary support that is required to do so.

Proven or promising external resources or approaches

No response

Response 577

Perspectives on the postdoc roles and responsibilities

I view my postdoc position as an opportunity to obtain additional scientific training and prepare me for a tenure-track position in academia.

Fundamental issues and challenges

The prevailing wage is simply unable to afford postdoc scientists decent life quality that is commensurate to their education and skill levels. While postdoc makes moderately higher salaries than grad students, many postdocs have reached a later life stage when they may want to start a family. However, the child-rearing cost for someone on a postdoc salary is prohibitively high in postdoc-heavy areas like NYC, Boston, or SF. The post-COVID inflation has further pushed many postdocs to financial cliffs. Even in a perfectly supportive and vibrant lab, doing a postdoc is simply not financially sustainable except for the lucky few who are supported by rich partners or family trust funds. Saving a collapse of the American pharma/biotech industry, academic postdocs are increasingly unappealing.

Existing NIH policies, programs, or resources

I do not believe any incremental improvement would revert the ongoing hemorrhage of the postdoc-level workforce except for a substantial increase (more than 50%) in wages and benefits. It is clear to most postdocs that the chance of landing a tenure-track position is extremely slim, and most postdocs would have to end up seeking employment outside academia. Thus, for most postdocs, their best interest is to pursue an alternate career path directly out of grad school, or only stay in their postdoc position as long as it is needed to enable them to acquire the specific skills to land industry positions. I am not surprised that fewer and fewer newly minted Ph.D. scientists want to pursue postdoc training at all. In fact, what is truly remarkable is that this trend only becomes apparent in the past two years. Probably in the pre-COVID era, the steady influx of foreign-born and trained scientists has helped to stabilize the supply of postdocs. However, the deteriorating conditions for immigrant scientists and the disruption of travel during the COVID period make people less willing to relocate. I am convinced that a human resource crisis in American academia is coming. And I hope NIH will not be misled to believe that they will be able to fix this crisis with token gestures.

Proven or promising external resources or approaches

NIH should strive to convert more temporary postdoc positions to long-term research scientist positions, with competitive compensation. Hoping to lure more talented people to take poorly-paid, overworked, temporary jobs like the current postdoc positions would be a fool’s errand.

Response 578

Perspectives on the postdoc roles and responsibilities

An NIH postdoctoral position to me means a traineeship to support your emergining independence buying time between the PhD and receiving your first grant.

Fundamental issues and challenges

Lack of Salary

Existing NIH policies, programs, or resources

Improve salary structures for postdocs so they can focus on training and not worry about financial insecurities.

Proven or promising external resources or approaches

No response

Response 579

Perspectives on the postdoc roles and responsibilities

I believe postdocs mostly operate independently from their PIs, rarely receiving guidance or mentorship. They are professional researchers, and frequently serve as the primary mentors to graduate students in their labs. They are often responsible for the maintenance of complex systems (data storage, advanced equipment) that take time away from their own career development and do not receive additional compensation for this. Postdocs are considered trainees, but this is inconsistent with the work postdocs do and the responsibilities they have.

Fundamental issues and challenges

We are paid very little compared to our peers in industry. We also don’t receive competitive benefits. It is also well known that obtaining a tenure track position is highly competitive, so many postdocs feel that continuing for too long in the role is simply delaying the inevitable pivot to industry. Postdocs have trouble affording housing and child care. Postdocs put off major life events due to the financial constraints of their compensation.

Existing NIH policies, programs, or resources

Pay us more. Help us get real benefits from our host institutions like child care and retirement plans. NIH establishes a minimum salary for postdocs, but this does not scale with cost of living increases due to inflation or local economies. $54,835 might be acceptable compensation for a professional with an advanced degree in a rural community, but NIH funds many postdocs in places like Boston, New York City, Palo Alto, San Francisco, and Los Angeles. It is difficult to get by in places like that on such a salary. This is particularly true for postdocs coming from underserved communities, whose families may not be able to assist them financially.

Proven or promising external resources or approaches

Pay us more.

Response 580

Perspectives on the postdoc roles and responsibilities

To me, the purpose of this position is mentor-guided

1. development of expertise in a new field of study;
2. development of further independence in the design and execution of research projects;
3. acquisition of transitional independent funding (if academic plan);
4. optimally also mentorship experience (if academic plan) or job-relevant expertise (if industry/government/etc. plan).

Fundamental issues and challenges

1) Funding. Postdocs are not paid enough, period. They often work >60 hours per week, often in high-cost-of-living areas, for roughly half as much money as similarly trained industry peers, with fewer benefits.
    a. Benefits. Childcare resources are lacking in general in the US, and postdocs are often young parents.
2) The duration of a "successful" postdoc position is too long. In some fields, 6 or more years after PhD before true independence is expected. This is infantilizing, and combined with (1), financially impractical.
3) There are not enough accepted opportunities to prepare for the diversity of career options after postdoc period is over, e.g., networking/management for industry.

Existing NIH policies, programs, or resources

1. Salary and benefit guidance should be updated in several ways: minimum levels increased, local cost-adjustments implemented.
2. K (and similar) awards in practice seem to require significant (years' worth of) preliminary data, regardless of prior research experience and the mentor's expertise. Perhaps for PhDs (including MD/PhDs), the requirements for preliminary data in K applications could be minimized to shorten the already long postdoc period.

Proven or promising external resources or approaches

No response

Response 581

Perspectives on the postdoc roles and responsibilities

The salary is too low. There is no job security.

Fundamental issues and challenges

The salary is too low. There is no job security.

Existing NIH policies, programs, or resources

The salary is too low. There is no job security.

Proven or promising external resources or approaches

The salary is too low. There is no job security.

Response 582

Perspectives on the postdoc roles and responsibilities

Postdoc is a time to think deeply about science and develop a vision on what you want to add to your field and then start to show your ability to execute on that vision.

Fundamental issues and challenges

Major limitations are the limited number of interesting labs as well as low salary.

Existing NIH policies, programs, or resources

Main thing is increase pay. Should be possible through PI and should be able to make more if you receive funding.

Proven or promising external resources or approaches

No response

Response 583

Perspectives on the postdoc roles and responsibilities

I view postdocs as the people who lead the lab science, with intermediate experience in hands-on techniques in the lab and mentorship of students and interns. With guidance from a PI, they make the decisions about how to carry a project forward and carry out the work for that to happen. They are the next generation of scientists to lead labs, though opportunities for advancing to the next level are not as available as many would like.

Fundamental issues and challenges

Postdoc life is often time-intensive and frustrating. Between writing grants and manuscripts while also carrying out experiments and mentoring less experienced lab personnel, it is extremely exhausting and sometimes almost impossible to complete daily tasks within a normal 9-to-5 work window. This creates a poor work/life balance and incredibly high stress and pressure. To make matters worse, the pay for postdocs is atrociously low. NIH salary standards create an extremely poor threshold for how much money postdocs should make. As the NIH is the primary funding source for most academic research, setting NRSA stipend levels to below $60,000 when individuals who leave academia can receive a starting salary at twice that amount is absurd. The fact that these stipend levels also do not take into account the cost of living for the awardee also creates an incredible disparity between individuals at different locations. This is also the period of life in which many are starting their own families. Low incomes do not help with this. Another issue is that there are few academic faculty positions available, making the postdoc position one that is very indefinite and difficult to advance beyond. With all this considered, it isn't surprising that many postdocs are leaving academia to pursue other careers.

Existing NIH policies, programs, or resources

The programs, resources, and opportunities provided by the NIH are great. However, the lack of money for stipends is probably the primary concern for most postdocs. Until these are improved, many postdocs will continue to leave academia.

Proven or promising external resources or approaches

No response

Response 584

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I really appreciate what you are doing with this RFI. In addition to this RFI, I would like to suggest that quality-of-life in pre-doctoral work likely has a big impact on the number of graduates that go on to post-doctoral work. I bet there are a lot of PhD holders who got burned out before they could give postdoctoral work any significant thought.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 585

Perspectives on the postdoc roles and responsibilities

Work on one or more specific projects with minimal to no supervision.

Fundamental issues and challenges

"That's the way things are because that's the way things have always been." Faculty feel that changes to the workplace environment to help with recruitment, retention, or enhancing quality of life coddles postdocs and spares them of the gauntlet that faculty had to face when they were postdocs. I do not know a single postdoc that intends to stay in academic research. They are all either waiting for the right industry position or on their permanent residence because they are locked in their current position by a visa.

Existing NIH policies, programs, or resources

I do not know.

Proven or promising external resources or approaches

I do not know.

Response 586

Perspectives on the postdoc roles and responsibilities

A postdoctoral position has been seen as a transitional phase for individuals seeking to become independent researchers in academia. In particular, this means that as a postdoc, one should be able to:

1. Generate their own project ideas while working within the framework established by their PI,
2. Develop additional technical skills, and
3. Have the freedom to write postdoc career development research proposals (such as the K99 or K01) without restriction.

Fundamental issues and challenges

The primary issue with respect to recruiting, retaining, and improving the quality of life for postdoc trainees is the insufficient funding available to principal investigators (PIs). The persistently low salaries for postdoc trainees, in my view, are a result of the PIs' inadequate research funding. In addition, when funding is inadequate or overly competitive, PIs may assign a single postdoc with duties that would normally require the efforts of two or three postdocs or graduate students to complete within a feasible timeline, which leads to decreased quality of life of postdocs.

Existing NIH policies, programs, or resources

It would be advantageous to broaden the funding mechanisms available for postdoctoral career development. Nowadays, numerous institutions consider not only a postdoc's prior funding record, but also their current funding status and ability to bring in external funding upon employment. Expanding opportunities for postdocs to secure such funding would enhance their retention rate. Furthermore, the grant scoring process, particularly for postdoc trainees, should be revised. For instance, some grant proposals submitted by postdocs are rejected due to the perceived high risk associated with the proposed project. In my opinion, the system should encourage grants that involve high-risk, high-reward projects, particularly for postdocs who are transitioning to assistant professor positions. I believe that the NIH's cautious grant scoring approach needs to be reformed.

Proven or promising external resources or approaches

No response

Response 587

Perspectives on the postdoc roles and responsibilities

My incoming perspective to a postdoc was to learn new technical skills, and understand how to start my own lab with the developed skills from my graduate and postdoctoral training. My experience as a postdoc for several years now is that its graduate school without graduate school demands (classes, assisting professors with teaching etc). My perceived experience of postdoctoral training was only actualized after earning an NIH-NIGMS IRACDA award where the program actively trains post-docs professionally, and helps them with transitioning from that position to a faculty position.

Fundamental issues and challenges

Academia has made it a burden to maintain intimate relationships with loved ones, with no clear guidance on how to transition from postdoc to faculty without any other external aid outside of your lab. In addition, postdoctoral pay and benefits are not as competitive as industry or other nonscientific careers. A difficult realization about doing a postdoc is that it is more isolating/lonelier that doing a graduate program. You don't have a cohort to interact with, a program that can guide your or aid you with any issues that may come up and if your part of a large department you may not know/interact with other postdocs.

Existing NIH policies, programs, or resources

I believe the IRACDA program is an excellent program that successfully trains and builds a community of postdocs that can grow to depend on each other. I will admit that I was not aware of most of the other resources, programs and policies provided by NIH. But I don't believe that it would be as helpful as something like IRACDA. It would have to be something that is advertised in large conferences so that prospective postdocs or current postdocs can be aware of them.

Proven or promising external resources or approaches

Promoting more mentoring outside of postdoctoral lab (especially for required letters of recommendation for applications), external advisoray meetings to check in on postdoc candidates and their career training and mental well being. Higher wages to match industry.

Response 588

Perspectives on the postdoc roles and responsibilities

The postdoc is a mildly superfluous position mainly created by bottleneck towards permanent faculty positions. The PhD is already a training position, so there is no reason for the postdoc to be another training position. Especially in the US, increasingly longer PhDs and increasingly longer postdocs can hardly be justified as training anymore and is instead used as a tool to keep cheap labour.

Fundamental issues and challenges

Low pay, low job security, no control on how PIs treat their postdocs and students, little work-life balance, exploitation by PIs (especially based on visa status).

Existing NIH policies, programs, or resources

Increase permanent and well-paid professional research positions, maybe get rid of postdoc positions altogether? Almost 2/3 of postdocs in US are visa holders, give more grants that are open to all and not restricted by citizenship / residency status.

Proven or promising external resources or approaches

Create more opportunities for people to switch between industry and academia. Create a system that relies less on recommendation letters from your PI / supervisor (e.g. as in industry), protects against exploitation, and holds PIs accountable. Finally, as already said: Increase permanent and well-paid professional research positions, maybe get rid of postdoc positions altogether?

Response 589

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a very versatile temporary position that a scientist can use to strengthen their resume for whichever of many possible careers they might be building, whether their focus is on teaching, policy, academic research, industry, education, or many others.

I do not consider this a training position—training happens the first week you are on a new job, NOT the first ten (often quite productive) years of your career. I find the framing of a postdoc as a training period to be more and more misleading as phds and postdocs get longer. This framing provides cover for universities to exploit professional working adults with terminal degrees and plenty of experience, who also often have aging parents and young families to care for. Anywhere this type of exploitation is available (in the form of: low wages, insufficient benefits, and vulnerability to unchecked power dynamics), the most marginalized or underserved members of our community are the first to suffer and

drop out, and so I see the issue of postdocs infantilization as "trainees" to be directly related to issues of diversity, equity, and inclusion in science.

Fundamental issues and challenges

I work at a private university in [redacted for anonymity] and most of my colleagues cannot afford to live in their own apartment anywhere remotely close to the lab they work in. This is a housing issue, but it is also a salary issue.

Existing NIH policies, programs, or resources

At my university ([redacted for anonymity]), when a postdoc gets an external fellowship they lose their [redacted for anonymity] employee status (somehow???) in selective and ill-defined ways, and so the protections and benefits guaranteed to postdocs by the university drop away, including the [redacted for anonymity] adjusted postdoc salary minimum, the retirement benefits, and any family leave benefits. The benefits that we retain (health insurance) are not specified in a contract (we have no contract) and so if [redacted for anonymity] felt a financial pinch they could revoke those benefits without any recourse.

This is *crazy* and happens at lots of universities. It is a cost-saving decision that universities know they can make, because they know their postdocs are not going to turn down a prestigious fellowship, even if it comes with substantial financial losses. If NIH added a stipulation to their awards that says the host university was not allowed to use this award as an excuse to quietly revoke their responsibilities to the postdoc as an employee, that would make a huge difference, and other private fellowship-granting foundations would likely follow suit.

Proven or promising external resources or approaches

It is very weird to me that mentoring is such a relatively small and indirectly measured part of a PI's evaluations, both by their department and by funding agencies. It is complicated, of course, to avoid conflicts of interest, but I would love to see some sort of mechanism for mentoring to be considered (as reported by maybe former mentees?) as part of an applicant's academic merit. I don't know of other funding agencies that do this, but I know that some universities, including the biology department at Northwestern, have seemingly pretty effective strategy in place for evaluating PI's mentoring in their faculty evaluations, and there are some very basic things like 360Â° feedback that is common practice in business and might be adapted to academia.

Response 590

Perspectives on the postdoc roles and responsibilities

An important step to get the necessary training to move to an assistant professor position.

Fundamental issues and challenges

Salary is the biggest problem. The salary for postdoctoral trainees is too low.

Existing NIH policies, programs, or resources

All comes down to the salary.

Proven or promising external resources or approaches

Improving postdoctoral conditions.

Response 591

Perspectives on the postdoc roles and responsibilities

This postdoc position is an academic bridge to ultimately becoming a tenure-track faculty. In order to achieve my goal of becoming a faculty, I need to be very productive during my postdoctoral training in all facets (i.e., grant writing, applying and receiving postdoctoral fellowships, publishing papers and abstracts, etc.).

Fundamental issues and challenges

The fundamental issue is the low salary. Although postdocs are a very important asset to the university for conducting research, writing grants, and scientific thinking, postdocs are usually paid much less than other staff members (i.e., professional research assistants [PRA]). Also, they even get less vacation time. Some universities even do provide parental leave for postdocs.

Existing NIH policies, programs, or resources

Receiving a career development award is still very competitive. It would be very helpful to reduce the funding line for those who are applying for a career development award.

Proven or promising external resources or approaches

No response

Response 592

Perspectives on the postdoc roles and responsibilities

I view it as a training step like a medical residency. One has his/her terminal degree but wants to specialize more to obtain more skills. This can be in mentoring junior students, grant writing, or specific scientific technical skillsets. However, post-doc should not be exploited and treated like research scientists in an industry position. Working 80+ hours a week is not feasible nor is a salary of $54k after ~10 years of higher education.

Fundamental issues and challenges

With an increase in PhD graduates moving into industry roles after the completion of one's terminal degree this leaves post-doc positions unfilled (in some areas but not all). One reason I know people select industry is better compensation and maternity/paternity leave. As I enter my last year of my PhD I am contemplating applying for post-docs but am concerned I will not be able to make ends meet as I want to have a family during this time as well.

Existing NIH policies, programs, or resources

I think they should be paid more. Government post-docs at a national lab make ~$85k/year (National Renewable Energy Lab in Golden, Colorado). Also, if a person chooses to stay at an institution but move labs for a post-doc this should not be dinged on subsequent grant applications if the applicant makes the case of a reasonable training step. Expecting people to move multiple times (with significant others and children) is often not feasible.

Proven or promising external resources or approaches

Because post-docs are also going into industry there should be more training opportunities of how to get an industry job just like there are workshops for K99/R00s and K01s.

Response 593

Perspectives on the postdoc roles and responsibilities

It is like a training provided to a freshly minted doctorate to transition into an independent researcher.

Fundamental issues and challenges

The most important issue is the lack of sustainability due to an inexplicably low salary. This impacts the performance and mental health of a postdoc.

Existing NIH policies, programs, or resources

The minimum pay should be increased.

Proven or promising external resources or approaches

No response

Response 594

Perspectives on the postdoc roles and responsibilities

It is an invaluable time to have some independence yet also a nice safety net. For me, it was necessary to build experience and confidence. I view it as a learning experience but absolutely as a job and different from being a student.

Fundamental issues and challenges

Like everything else these days, cost of living, salary, and as a woman in stem, benefits like maternity leave. These are less than desirable.

Existing NIH policies, programs, or resources

Maternal and paternal leave policies and grant extensions made friendlier and more accepted. Grant writing opportunities made more available and at lower cost.

Proven or promising external resources or approaches

ASHA pathways is a great grant writing experience but so limited in the number it takes. NIH funding a much larger program would be great. ASHA also does a MARC mentorship program that's excellent and that i would love to see through the Institutes.

Response 595

Perspectives on the postdoc roles and responsibilities

Being a current second year PhD student in a very prestigious university in [redacted for anonymity], I decided to get a doctoral training because I want to learn the rigorous regimen of research, but I don't see any myself becoming a postdoctoral fellow since faculty positions are extremely scarce and working conditions such as postdoctoral wages, publication rights, postdoctoral benefits, teaching opportunities, and overall incentive to become a postdoctoral fellow is extremely poor. I therefore see the postdoctoral position as a hypothetically temporary but practically semi-permanent state during which an individual lacks the prestige and wealth that comes with a faculty position, has little to no prospect of a future academic opportunity, and gets paid a near minimum wage salary to produce life-saving science for the benefits of executives and lawmakers.

Fundamental issues and challenges

Regardless of the location of the institution, many institutes pay below to barely minimum wages to postdoctoral trainees as an academic standard is collectively established by the institutional leaders which fits the exact definition of anti-competitive behavior. It should also be recognized that postdoctoral fellows are considered to be trainees in some institutions. This poses a risk for them to receive proper benefits and insurances. Additionally, international postdoctoral fellows face heavier burdens since their employers who are citizens and permanent residents can be biased toward treating their foreign employees harsher, expecting higher output, and subjecting them to higher scientific rigor (extensively repeated experimental results, added workplace scrutiny, etc.). All these happen in unison with the ever-present increase of living costs and lack of sustainable living conditions for postdoctoral fellows. Many institutions provide temporary (1-2 years) postdoctoral housing, but recently due to the lack of faculty positions, postdoctoral fellowships tend to drag for longer periods of time which creates an added housing issue for fellows. It should also be mentioned that internationally accessible postdoctoral fellowships are next to non-existent in the industry, and they don't cover potential costs for nationalization efforts like Green Card applications and H1-B processes for many bright-eyed, cutting-edge scientists.

Existing NIH policies, programs, or resources

I am not a policymaker, and my training does not confer to identifying program details that should be improved. I have outlined the issues in detail in the previous two prompts, so I leave it in your capable hands to make tangible change for the gradually deteriorating life quality of postdoctoral fellows by identifying the lackluster policies, programs and resources.

Proven or promising external resources or approaches

A proven incentive would be to provide extensive tax breaks for postdoctoral fellows EXCLUSIVELY (not for any faculty or staff) during the FULL DURATION OF THE POSITION in any given academic institution. This would incentivize postdoctoral applications, and help retain them in academia with better living conditions. Additionally, I personally believe postdoctoral fellows should be able to publish articles in which they are considered "Corresponding Author" because after receipt of a doctoral degree, there is technically no reason why postdoctoral fellows cannot publish articles of their own. Since all publication companies artificially create demand exclusively for faculty members to publish, this leaves an untapped resource for scientific creativity both on the side of the fellows as well as academia as a whole. Finally, another proven method to incentivize sales positions in international corporations is to provide people with discernible life improvements, such as a personal vehicle, extensively enriched paid time-off (or optional remote working conditions in post-COVID working conditions), and most importantly competitive wages (above $120,000 which is the pharmaceutical industry standard). Academic institutions and corresponding resources that support them are to fund scientific advancement, not the 18th summer home purchased by CEO's and executives that sit atop the very same academic institutions.

Response 596

Perspectives on the postdoc roles and responsibilities

It's a time to learn new skills, write an NIH grant to fund me as a faculty member, and get clinically licensed

Fundamental issues and challenges

Pay. I am seeing 5 clients in a private practice next year during my first year of post doc. Even though I am practicing under the supervision of another provider, this private practice work will increase my post doc salary by 50%. I don't feel like the compensation adequately compensates me for my skills. Not sure if this is an NIH rule or my university, but faculty members aren't able to pay students more based on existing experiences.

I love research, but with more possibilities to make an impact in the growing mental health tech industry (and other industry jobs), academia becomes difficult to justify financially. I could make over $150,000 if I chose an industry job instead. Being expected to move for a 2 year position also is difficult, especially for clinical psychologists who just had to move for a 1 year internship.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 597

Perspectives on the postdoc roles and responsibilities

Postdocs mostly do faculty work for below faculty wages. There is little systematic professional development or support to advance to tenure track. Often a candidate will need to have 2 or more Postdoc positions before successfully applying for tenure. At this point I view the position as a mechanism to steal more cheap labor from future scientists after getting plenty of labor from them as graduate students.

Fundamental issues and challenges

There are just not enough "senior" or tenure track positions for all new PhDs to fill due to intentional understaffed from academic institutions. Tenure tracks are expensive so let's hire 20 Postdocs and 100 graduate students to teach and do our research. This leads to future scientists living on poverty wages for over a decade to have a chance at a "good" position. We are also expected to be able to move and live anywhere and keep moving till we get something permanent. This excludes anyone with strong connections to their extended family.

Existing NIH policies, programs, or resources

Raise the NIH minimum wage for Postdocs and graduate students. If needed let it be based on where the institution is located like a per diem. My salary does not come from the NIH but it is based on the NIH minimum. Stop expecting future scientists to be independently wealthy to survive.

Proven or promising external resources or approaches

No response

Response 598

Perspectives on the postdoc roles and responsibilities

To me, a postdoc is the final training stage before becoming a professor. It should allow room for some independence in thought, experimental design, and protocols but also still provide guidance and feedback. The postdoc is also a stage where individuals should learn more about how to be a PI—including things such as writing additional/more frequent grants, learning about budgeting, and learning how to manage a team.

Fundamental issues and challenges

The biggest issue is a lack of pay for a very high amount of experience. Going to graduate school already puts individuals at a financial disadvantage compared to their peers. On most graduate school stipends, it's challenging enough to afford to live, making it near impossible to afford to save or put money away for retirement. Postdocs are frequently expected to move to some of the most expensive places in the US without much of an increase in pay. Despite this, individuals are highly trained at their graduate institutions—often in skills that they bring with them to their postdoc. At many Universities, you're also punished for receiving external fellowships, as benefits such as health insurance are taken away if outside funding is used.

A postdoc is also challenging for women, as for many of us, this is when we would be looking to start a family, and taking time away for family life is generally frowned upon. On top of the low pay, there are few benefits for families and mothers.

Finally, the culture of academia as it stands makes it hard for many trainees to persist to the postdoc stage. There's a lack of mentors who genuinely care about their trainees as humans. Instead, they expect them to be data-producing machines regardless of outside factors. There's also an acceptance of abusive environments (especially verbal abuse) that are hard to fight as a trainee. It's exhausting and unsustainable to work in this culture long-term.

Existing NIH policies, programs, or resources

The best resource the NIH could provide is an increase in stipends.

Additionally, I do not believe the often toxic culture in academia will change unless there's money involved. I've watched as multiple toxic mentors have consistently been reported to my University and absolutely nothing has happened to any of them. It would be helpful to use mentorship/training environment as a key metric on grants such as R01s. It would also be helpful to provide trainees/alumni with a place to speak about the environment of a lab in a confidential way. Perhaps similar to the recommendation letters in an F series grant, an R01 could require confidential statements from past and present trainees speaking to the training environment and capabilities of the primary investigator.

Proven or promising external resources or approaches

No response

Response 599

Perspectives on the postdoc roles and responsibilities

The role of the postdoc is to lead research under the guidance of a faculty advisor, while getting further training in science, mentoring and lab management to eventually pursue an independent research program

Fundamental issues and challenges

- Salary is the main issue. These are highly trained individuals who are typically at the age of needing to save for retirement, start families, become home owners etc. NIH-level postdoc salaries are inadequate to achieve that. In my field, they can lag many fold behind industry salaries, so recruitment and retention is increasingly harder. This is also an issue of diversity. Trainees from underrepresented backgrounds are historically less likely to be able to afford many years of low pay due to e.g. much less transgenerational wealth
- On the other hand, the size of individual NIH awards to labs has been stagnant for almost 25 years, making it impossible for labs to support higher salaries.
- Salary problems our compounded by the increase in the length of postdoctoral training
- Postdocs have fear over the high levels of competition created by little faculty position availability
- Toxic academic culture has also pushed postdocs away in my experience

Existing NIH policies, programs, or resources

- Increase postdoc salary
- Increase modular R01 budget to match
- Allow optional supplementation on postdoctoral salary for trainees with F-type awards (Getting those often means a paycut)
- Force universities to keep F fellows as staff. Being moved to "fellow" often means they lose benefits
- Extend the eligibility window for K awards. It is increasingly hard to be competitive for e.g. a K99 after just 4 years

Proven or promising external resources or approaches

No response

Response 600

Perspectives on the postdoc roles and responsibilities

I am a PI of an NIH-funded academic lab. Postdocs in my lab are essential for my research and educational mission.

Fundamental issues and challenges

1. NIH scale of postdoctoral salary poses significant financial challenges to postdocs to make a living. My institution is in one of the most expensive cities in the country (SF). Rent for a standard studio is $2000—3000 and it goes up to $4000/month or more for a one-bedroom apartment. In addition, postdocs are often at the stage of their lives to have families. Childcare costs more than $2000/month. A salary of $54K cannot support basic living needs.
2. there is huge inequity in pay when compared to postdocs in the industry, which is vibrant in the SF Bay Area. Many graduate students go to industry for their postdoc or skip postdoc altogether. This is especially challenging for labs working on translational research that overlaps with interests in the industry. Graduate students interested in translational research have many options for their next stage of careers. In recent years, more and more choose a path in the industry right after they graduate. I have been able to recruit postdocs from overseas. However, many leave for the industry after a few years leaving their work unfinished.
3. The current NIH pay scale is grossly unfair to these highly educated people. It takes advantage of their passion for research. Technicians freshly out of college make more than postdocs in my institution. This does not make any sense.

Existing NIH policies, programs, or resources

Increase pay for postdocs to be on par with industry standards.

Consider having regional cost of living adjustments, not a flat scale across the country. Other jobs have regional adjustments in pay. It makes sense to have this for postdocs.

Consider family supplements so they do not have to choose between research and family

Increase R01 modular budget accordingly so that it will cover a postdoc's salary while still having funds for supplies and recharges

Allow international postdocs to receive NIH postdoctoral fellowships. They work in a US lab, often funded by NIH. Why shouldn't they be eligible for NIH fellowships? Many stay in the US after they finish their training. It'd be brain gain for the country.

Proven or promising external resources or approaches

Many pharma and biotech companies, Genentech, Regeneron, Merck, etc have postdoc programs that are very attractive to postdocs.

Response 601

Perspectives on the postdoc roles and responsibilities

Qualification phase before becoming an independent researcher. This includes data analysis, manuscript publication, exhibiting research at international conferences. Training and mentoring in writing grant proposals and networking with and collaborate in the future.

Fundamental issues and challenges

Too many responsabilities distributed across too many projects that are not directly related to career trajectory and keeps from focusing on own development. This results in a bad work-life balance hence 50-70 hour weeks are common. PIs are mainly interested that the postdoc keeps the projects going instead on helping him developing his own research profile and becoming an independent researcher. At the same time, quality of life is less than average. Here in [redacted for anonymity] postdocs annual income are below the median income across all occupations and costs of living are disproportionally high, especially rents. Also, holidays are only few with 15 days per year whereas in industry both income and holidays, as well as other benefits are much better. Hence, there is a strong incentive of leaving academia.

Existing NIH policies, programs, or resources

More funding opportunities and trainings for becoming an independent researcher are appreciated. Increase of the baseline salary should account for local costs of living instead of having a one size fits all approach.

Proven or promising external resources or approaches

No response

Response 602

Perspectives on the postdoc roles and responsibilities

I see the post-doc as a form of early career scientist wishing to gain additional training or networking after graduate school. While it is a training position a postdoc is typically faced with tasks outside that of a typical trainee such as supervising and training graduate students and technicians as well as providing valuable skills to push lab directives and inform future lab initiatives.

Fundamental issues and challenges

Money. Particularly payment that is not adjusted for city. Much of the strong opportunities for post-doc growth coexist at institutions in cities that are quite pricey. A flat NIH minimum is absurd as many institutions in expensive places will use the NIH minimum as a crutch to keep paying post-docs considerably little for where they are and this taxes quality of life. Additionally institutions will argue the delta can't be made up since any pay above NIH minimum must be supplemented. Lastly the pathway to principle investigator is often too long (more than 6 years) to be payed so little. It makes the academic career path way less tenable particularly for those who come from less supported backgrounds. Worse off the promise of career after post-doc is considerably risky given the limited tenure track openings. To recoup the opportunity cost from sacrificing prime earning years at what would be considered low pay to other doctoral degrees (about 10+ if you count graduate and post doc training time) with an non-tenure track salary is simply a risky career move which is pushing recent graduates out of academic science and

into industry positions. The lack of security during post doc of being able to secure a job without uprooting ones entire life is a problem. Postdocs can't spend 7 years in a city during their early to late 30s (note these are also prime years for child/family development) only to uproot it all because the only available job is on the other side of the US.

Existing NIH policies, programs, or resources

Minimums with cost of living adjustments .Increased opportunity to post-docs to gain funding security (no a few K grants is not enough).

Proven or promising external resources or approaches

Acknowledging post-docs are more than trainees and often highly skilled, specialized workers acquired by institutions to deliver research goals and really are more of an employee in that manner and should be compensated accordingly.

Response 603

Perspectives on the postdoc roles and responsibilities

A job in research for a qualified PhD scientists who need a stepping stone to a faculty position

Fundamental issues and challenges

I would not consider a postdoctoral fellowship which did not provide compensation commensurate with the job duties (i.e. a salary competitive with PhD-level jobs with similar job duties)

Existing NIH policies, programs, or resources

Salaries need to be increased. At present, they are woefully inadequate and exploit workers who are desperate for a faculty position and are forced to do a post-doc first.

Proven or promising external resources or approaches

No response

Response 604

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are meant to provide the transition to a career as an independent scientist. The postdoc's responsibility to themselves is to take advantage of opportunities for mentoring and to take on challenging research projects that will advance their scientific careers. The mentor's responsibility is to provide guidance (not to much, not too little) for research projects and their selection, design, interpretation and publication that will establish the postdoc's reputation for performing rigorous, innovative, and impactful research.

Fundamental issues and challenges

Expectations and demands are high, and compensation is low. The matter of expectations and demands disproportionately impacts women, especially if they have children. The matter of low compensation disproportionately impacts any one that doesn't have a source of wealth.

The differential cost of living in certain areas needs to be considered by the NIH. A postdoc that avoids certain regions because of the cost of living despite the possibility that the best training opportunity exists in an expensive region is unfairly handicapping their career development.

Existing NIH policies, programs, or resources

The NIH should establish policies that take regional differences in the cost of living into account. The NIH should also liberalize the policies that restrict many training/career development awards to US citizens and permanent residents.

Proven or promising external resources or approaches

Pay them more fairly.

Response 605

Perspectives on the postdoc roles and responsibilities

The postdoc position is a job that is touted as a training opportunity. This vague definition as well as other factors allows PIs who advise postdocs to treat postdocs as laborers when convenient for the PI or as trainees when convenient for the PI. Using the title of trainee allows PIs to feel justified in overworking postdocs. Using the title as worker/laborer also allows PIs to feel justified in hiring postdocs to work as technicians with specific tasks that are more removed from the independent work and thought that goes into academic work. Postdoctoral researchers are both workers and trainees and should be respected as such rather than abused when it best suits the needs of PIs. A Postdoc's role involves having ownership of multiple projects and the freedom to guide them in directions that they see fit. Postdocs have responsibilities to maintain those projects, train others to work on those projects, and report back data and results to the PI and others in their field. Postdocs are scientists and thus have a role in the scientific community and should be able to write papers, network, and present their work to their colleagues at conferences, seminars, and meetings; this is part of their job and a part of their training. Postdocs have a responsibility to read, write, apply for funding, attend seminars, attend workshops or informational sessions that are useful for their research, knowledge, and growth as a scientist. Postdocs should have the opportunity to learn new skills and have the opportunity to teach, all depending on their future career goals; this is part of their role as both a trainee and a worker. Postdocs should be able to do these things in a 40hr work week and not be pressured to work more.

Fundamental issues and challenges

Academic culture has allowed for postdoctoral abuse which pushes out talented scientists from academia. Postdocs are notoriously overworked, frequently micromanaged, and often not given freedom to develop intellectually as scientists. Most of this abusive behavior is directed immediately by PIs who believe that postdocs must work 80 hours a week. Departments, which consist of leadership who are these PIs, recruit other faculty with similar mindsets who continue the cycle of abuse. In my experience as a Postdoc, I was told that PIs have suggested to other new PIs to hire postdocs because they are financially more worth it than graduate students—PIs don't have to pay for tuition, and the salary paid to postdocs is slim compared to the number of hours that they are pressured to work. This culture becomes harder and harder to break when the postdocs who want a different academia are pushed out; in other words, academia selects for people who are able to work in an abusive environment who then go on to expect that of other postdocs. Overwork, being underpaid, and abusive work environments strongly inhibit recruitment and retention of postdocs.

Existing NIH policies, programs, or resources

This is honestly something that you should pay people to brainstorm. Having the knowledge of every nih policy, program, or resource is not something that people have time to go through to suggest changes. Rather, I suggest you create a paid working group to really dissect out how these policies should be changed. Absolutely make sure this working group includes postdocs of all races, genders, and nationalities. I would also recommend not having ANY PIs on this working group to avoid power dynamics.

Proven or promising external resources or approaches

See my suggestion previously of a working group.

Response 606

Perspectives on the postdoc roles and responsibilities

I see the postdoc position as a temporary position in which one can get to lead research projects more and more independently, contributing to a lab's research and to the PI's career while also contributing to theirs, through gaining skills (research/technical, article writing, grant writing, science communication, time, project and people management.) that can be transferred to any post-postdoc career step, whether in or outside of academia. Because the postdoc position is temporary, it is also the responsibility of both the postdoc and their advisor(s) to co-create and regularly review an Individual Development Plan for the postdoc, in which they set milestones for skill building, academic accomplishments and the transition to the post-postdoc career step (includes career exploration, networking, job applications.).

It is crucial that, during the interview process and in the invitation letter, the focus is not only put on science and that data is shared about the cost of living in the city in which the institution is located, as well as financial, health, housing, child care and professional development resources available at the institution they will join, ways to connect with other postdocs like the Postdoc Association. This is so key for postdocs to get to know their future work environment, make an informed decision about the job offer that is made to them, and have relevant information to acclimatize to their new community of practice.

It is key that the postdoc and their advisor set clear expectations at the beginning of the postdoc position, by discussing and defining each other's responsibilities and roles, project and skill building priorities, meeting frequency and ways to acclimatize to the lab, productivity, time management and work/life balance, the IDP and professional development opportunities, ways to get mentors and sponsors that can support the postdoc's professional development and career transition.

Fundamental issues and challenges

1. Low salary—the NIH minimum salary is not enforced everywhere, and the cost of living in big cities makes it hard for postdocs to live decently, especially if they have loans, health conditions, families to take care of/support financially. Also, knowing that your cost-of-living-adjusted income (fig.2 in https://elifesciences.org/articles/40189) is less than that of a clown (https://www.nature.com/articles/d41586-020-03191-7) or a public transportation driver, but that you still have to work long hours and dedicate your health, energy and life to your research is demoralizing and unsustainable in the long run. Finally, the crucial roles postdocs play in lab management, research, training/advising others, getting grants, communicating about science is hardly recognized—https://www.nature.com/articles/d41586-020-03191-7.
2. No accountability system to check on the mentoring postdocs receive (a shame given the impact it has on their career decisions and well-being: https://elifesciences.org/articles/40189), and train their advisors if needed.
3. The lack of diversity & inclusion in academia and the competitive, racist, sexist, non-meritocratic culture makes it harder for URM postdocs to feel welcome, alters their sense of belonging and self-competency, prevents them from doing the meaningful work they want, does not provide them with looking-like mentors, and reduces their chances and motivation to remain in academe = vicious cycle.
4. Decreasing availability of career opportunities in academia for the people who wish to become faculty members—https://www.science.org/content/article/amid-pandemic-us-faculty-job-openings-plummet. Also, given the fact that, for people who end up in industry, doing a postdoc does not improve their hireability nor their starting salary (https://cheekyscientist.com/postdoc-is-waste-of-time-for-phds-interested-in-industry/), why do a postdoc when one could get a competitive hiring packet in industry right after their PhD?
5. Lack of professional development support outside of the NIH (OITE is great!). With career prospects being increasingly uncertain (https://www.nature.com/articles/d41586-020-03381-3 and https://www.nature.com/articles/d41586-020-02029-6), postdocs need more and more support to explore potential career paths and prepare their transition (https://www.asbmb.org/asbmb-today/careers/010121/transferable-skills-for-industry).

Existing NIH policies, programs, or resources

Love the OITE resources!

An important proportion (~50%) of postdocs in the US are international fellows, and most of the NIH grant opportunities are for US citizens or residents, which seriously limits their prospects and the pool of fellows who could get competitive grants and become faculty members after their postdocs.

Proven or promising external resources or approaches

1. A better and competitive salary, that is adjusted to the local cost of living: https://postdocs.mit.edu/about/vice-president-research-statement-salary-and-benefits—this will inspire other institutions and equip their advocacy postdoc groups with data to improve the working conditions of postdocs.
2. To provide self-paced professional development opportunities and help postdocs meet peers from other institutions: https://www.postdocacademy.org/ and the National Postdoc Association: https://www.nationalpostdoc.org/default.aspx (they have great resources on mentoring, supporting postdoc affairs, mentoring up, diversity: https://www.nationalpostdoc.org/page/resources).
3. To improve mentoring practices and make them more inclusive and mentee-centered: CARES Mentoring program—Register as a guest following these instructions: https://ctsi-d8.dev.umn.edu/sites/ctsi.umn.edu/files/2021-04/Mentoring%20Modules%20Registration%20Guide%202021_External.pdf—The system need a few minutes to acknowledge your profile, before you can access their Canvas and take the course: https://training.umn.edu/courses/12160
4. For culturally-aware mentoring: https://nrmnet.net/videos/2021/05/03/ibiology-and-nrmn-live-qa-culturally-responsive-mentoring/ and https://courses.nrmnet.net/course/c/UnconsciousBiasCourse
5. To enforce the IDP: https://grad.msu.edu/sites/default/files/content/mentoring/1-s2.0-S109727651500307X-main.pdf
6. Invest in future faculty by supporting the postdoc-to-faculty transition and equip them to become impactful and empathetic leaders, in addition to being amazing scientists: https://faculty.northeastern.edu/advance/faculty-recruitment/future-faculty-workshop/

Response 607

Perspectives on the postdoc roles and responsibilities

A postdoc is an academic employee tasked with performing original research to develop an independent laboratory or to gain skills to lead teams of professional scientists.

Fundamental issues and challenges

Postdocs are underpaid across the board. Postdocs are revenue engines for universities and are not compensated fairly. This selects for privilege and creates academic monoculture.

Existing NIH policies, programs, or resources

Research grant budgets of all varieties must be increased. All problems stem from the small budgets that have not meaningfully increased in decades.

Proven or promising external resources or approaches

No response

Response 608

Perspectives on the postdoc roles and responsibilities

In the majority of labs, postdocs are treated as basically-free, easily-exploitable labor that must rely on staying in the good graces of their mercurial principal investigator to preserve the faintest shot at one of the vanishingly few faculty positions that open up each year. I considered doing a postdoc after successfully procuring an F31—until I finished my PhD and realized that every postdoc I knew was on the poverty line and miserable, unable to control where they lived or take enough time to have a much-desired child. I took an industry job instead that paid me six figures right out of school and it's been great. We do awesome, handsomely-funded science. I never have to pay my own upfront expenses for conferences or wonder if I'll ever be reimbursed. And there's even a HR department to protect me from supervisors who might want to abuse their power!

Fundamental issues and challenges

This is a very simple problem. Postdocs do not make enough money to live above the poverty line in major cities; they are not granted traditional job benefits like paid parental leave or a retirement savings plan; and there is no oversight (or management training) for the principal investigators that unilaterally control their fate. If your PI decides to make an international trainee's continued existence in this country contingent on them working 100-hour weeks, they can do so. If your PI decides to make lab social events awkwardly sexual and talk to you about completely inappropriate topics, you have to grin and pretend like it's okay or he will ruin your career, not in a dramatic blowout but simply by writing you mediocre recommendation letters. These scenarios are easy to recall because I've seen both of them happen more than once. Bottom line? Pay your people competitively. Mandate that universities give postdocs the benefits they need to lead stable lives. And give them access to a functional Human Resources department.

Existing NIH policies, programs, or resources

NIH postdoc salary recommendations are routinely treated as maximums, rather than the suggestions they were intended to be. Double them. Mandate that universities provide postdocs with a complete employee benefit package.

Proven or promising external resources or approaches

If you want qualified scientists to opt for an academic postdoc over an industry job, make a competitive salary offer. If you'd like to incentivize women to choose to do a postdoc, provide both genders with generous, fully-paid parental leave and a childcare stipend (since postdoc salaries are *nowhere near* able to cover childcare—my own daughter's daycare costs twice as much per month as my mortgage!). Mandate that postdocs be considered university employees, ensure they are allotted paid time off and holidays, and help them understand and prioritize retirement savings. Encourage (and pay for) industry internships during postdoctoral training. Provide PIs with mandatory management, leadership, and sexual harassment training and ensure that trainees can take real and meaningful action against a mentor for violations.

Response 609

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a training role. It is meant to give you additional experience in project management and people management (mentoring). However, in practice, there are few opportunities to gain future faculty skills. Professional societies have few ways for postdocs to do meaningful work (help score abstracts or identify speakers for conferences). And while graduate students can often take on additional TA opportunities, postdocs often cannot as they cannot be classified as "student workers". And many non TA teaching roles require faculty status so postdocs often fall through the cracks.

Fundamental issues and challenges

The 5 year time clock makes it challenging to recover if the project you're hired on fails or if your funding runs out 2-3 years in. Yes, a second postdoc is possible, but it's so much harder to make tenure-track PI applying as an RAP than as a postdoc. I have dreamed of a career in academia 15 years and had a very successful graduate career, but am about to leave academia because I don't see a realistic way to make it to PI.

I am also tired of feeling like I fall through every crack in the system. I have been denied teaching positions because I'm no longer a student but not yet faculty. I lost access to benefits because my status switched from associate to fellow. In graduate school, fellowships often get you a pay raise, but as a post doc they cost you access to employee benefits.

Existing NIH policies, programs, or resources

Please find a way to make it so post docs paid on fellowships are still considered employees of their home universities. People hired as associates have decent benefits, get what should be an excited fellowship and are rewarded with loss of benefits they used to be entitled to by law. In other words, they receive unequal pay for equal work compared to what they did before the fellowship and to their postdoc associate peers. The way that fellowships are taxed/ classified as grants vs. loans vs. stipend vs. salary impacts the ability of anyone to do anything to remedy the disparity (assuming they even want to try). If the NIH and other

granting agencies were able to change the wording of the award and/or change how the award is dispersed so that postdocs can maintain employee status, it would create greater equity.

Abolish the postdoc title and make people go from graduate student to staff scientist. Allow staff scientists to apply for K awards with no time limits from date of PhD. This should make it easier for people to transition to PI regardless of one unlucky project or a couple of hard personal years or similar circumstances that prevent people from having a competitive PI application within 5 years of defending their PhD.

Proven or promising external resources or approaches

No response

Response 610

Perspectives on the postdoc roles and responsibilities

The reality of a postdoc position is as follows: trading a substantial increase in the freedom to drive your own research focus over that in your PhD for increased working hours, increased pressure to support your own research with grants, and substantial pressure to limit your commitments outside of the laboratory. While a postdoc is a necessary step towards an academic career, it is also a sacrifice that one must choose to make in order to pursue academia. It is the workhorse attitude of a graduate student with the grant and publication expectations of a professor. I left academia for industry after 7 years as a graduate student and 1 year as a postdoc because of financial and family planning, and to escape the vast gender gap in my STEM field which increases exponentially with seniority in academia (40% female graduate students, less than 30% female postdocs, less than 10% female professors).

Fundamental issues and challenges

I believe that many rising young scientists would love the opportunity to stay in academia and pursue a career in higher education. However, the compensation for and length of a postdoc position combined with the average time-to-degree of a PhD in the US has made an academic career dependent on either

a) delaying family and life planning,

b) becoming financially dependent on a partner or spouse, or

c) having a substantial alternative income. The average time-to-degree in the US for a STEM PhD is 7 years, with up to 5 years as a postdoc.

This means that in order to pursue an academic career one has to be willing to be compensated well below industry wages until age 34 (or beyond if more than one postdoc is completed). Especially for scientists who do not come from wealthy families, the ability to meet traditional life goals during this time—purchase a house, start a family, start saving for retirement—must be all but forgotten to pursue academia. While a change of salary alone would help this problem, other substantial support (a matched 401k, child care, overtime pay, limitations on time-to-PhD) is necessary to make the academic path competitive with industry.

Existing NIH policies, programs, or resources

Increase the base pay for postdoctoral positions. Require institutions that receive these grants to offer 401ks to postdocs. Require overtime pay after 80hrs/week of work by a postdoc. Require research institutions to pay a larger percent of postdoc salaries so as to not increase grant funding to pay at a living wage. Reduce funding to institutions that have a time-to-PhD over 5 years. Limit funding to institutions that cannot meet guidance to close the gender gap between their graduate and postdoc programs. Require child care resources at funded institutions.

Proven or promising external resources or approaches

No response

Response 611

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as a means to prepare recent graduate students towards independence. While I do think additional preparation is needed to become a tenure-tracked, funded, PI, I view it as a drawn out process with no guarantees. As a successful graduate student, many PI's have encouraged me to do a post doc because they believe I'm "made for academia," but I view it as another 3-5 years of limbo with an abdominal work-life balance with no assurance that you will successfully secure a PI position.

Fundamental issues and challenges

The pay is my biggest issue with post doctoral positions. The NIH maximum salary cannot support an adult living in most cities. I refuse to even consider a post doctoral position because I cannot take the financial risk to do so. I am graduating with my PhD in Pittsburgh in less than 4 academic years and was offered an industry position with a starting salary of $90,000 in the same city. If academia wants high quality, healthy, supported researchers they need to raise the pay scale and allow them a decent quality of life. Additionally, the complete absence of a retirement plan is obscene. It's a huge sacrifice and blatantly irresponsible not to offer a retirement plan to individuals in their 20s/30s. To financially recover from these decisions, individuals would have to place at a top tier institution (less than 5% chance in STEM) following their post doc, be incredibly well-funded (less than 1-5% chance depending on the study section), experience 0 discrimination at said university and have a wealthy partner. The odds of success are extremely low and, in my opinion, not work the sacrifice. The system is broken and I hope the input accumulated in the poll is considered seriously. I recommend raising the maximum pay, treat post docs like staff instead of trainees, and formulate a pipeline for PI placement. Without doing so, talented individuals are smart enough to go where they are appreciated, with compensation and support that reflects that.

Existing NIH policies, programs, or resources

The minimum pay for a 1st year post doc should be at least $70,000. A 401k or Roth IRA should be offered, and all post docs should get staff benefits at their institution.

Proven or promising external resources or approaches

Look at the average salary of a scientist in moderately-sized cities: Pittsburgh, Cincinnati, Chicago, New Orleans, and base the pay scale off of that.

Response 613

Perspectives on the postdoc roles and responsibilities

Post docs are trainees in years 1-4, then if they stay on, they are typically scientists. This should be reflected in a pay jump and potentially a title change.

Fundamental issues and challenges

I am a physician scientist and have maintained 75% protected time through federal grants for 12 years now. Talented post docs are critical for our projects' success—work that the NIH has deemed of high importance and worth funding. Talented post docs are difficult to recruit because they have skill sets that are also highly valuable for industry, which pays 3-4 times the salary. From the post docs perspective, they do have more flexibility and freedom than they would have in an industry job, but this alone cannot bridge the current funding difference. Further it takes 4-8 years for most post docs to experience enough lab environments to develop a unique program for independent funding. But by PGY4/5, post docs have families and require higher salaries than we can provide based on nih caps. Further, with the paucity of tenure track positions available, this path is high risk with an uncertain outcome.

From the lab perspective, the science would be more efficient if we could build sustainable team without turnover every 3-4 years. This requires a post doc to abstain from pursuing industry or a tenure track position and choose a research scientist career path. But, it's hard to support talent that would even choose this. The $500k/max direct costs for R01s is met quickly when 1-2 research scientists work full time on a project if their salary is a livable $100-$150k.

Existing NIH policies, programs, or resources

We are losing talent because non U.S. citizens are not eligible to apply for T32s or career development (K) awards.

Post doc salaries are too low after they have significant experience (pgy4+)

$500k direct cost max makes it difficult to full time career scientist salaries alongside other research expenses.

Proven or promising external resources or approaches

Conferences for post docs (similar to the ninds k awardee meetings) would be useful to foster community, understand challenges, and provide mentorship and guidance.

Response 614

Perspectives on the postdoc roles and responsibilities

A post-doc should be training PhDs to become a professor. But these days, a post-doc is just synonymous with cheap labor.

Fundamental issues and challenges

Money, money, money. In 2018, I did a 4 month post doc stint that was paying me $48K annualized. I applied for industry jobs, including interviewing for an entry level clinical coordinator position (bachelor's degree only, 0 years experience required) that paid the same amount as my post-doc. The worst part is that the clinical coordinator position had more growth opportunity for my career than a post-doc as I did not want to become a professor. If academics paid post-docs more than the bare minimum, recruitment and retention wouldn't be an issue. At this point in academia you can't support a family with a post-doc salary.

Existing NIH policies, programs, or resources

I have no comment as I have little knowledge here.

Proven or promising external resources or approaches

I have no comment as I have little knowledge here.

Response 615

Perspectives on the postdoc roles and responsibilities

I love being a scientist and take great pride in my role and my work. Being a postdoc has been much more challenging than being a grad student for several reasons, but on the positive side it has meant more of a sense of agency, ownership of my work/my career, and independence.

Fundamental issues and challenges

To put it bluntly, it's simply a matter of proper compensation. Postdocs are not paid nearly enough for their level of expertise and the amount of work they put into their jobs. Especially with the growing possibility of careers in industry which actually pay a salary commensurate with our training and abilities, academia will quickly fall behind if postdoc salaries don't increase soon.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 616

Perspectives on the postdoc roles and responsibilities

The postdoc's purpose is an opportunity to learn new skills that you want to use in your own lab in the future (if you can become a PI). Academic postdocs have become a holding pattern for scientists who are hoping to become PIs. One hopes to make more discoveries in the postdoc that can make one more competitive in the ever-increasing competition for PI positions. Other than learning another new skill and working to become more competitive for PI positions, the postdoc is an unnecessary training step. Everything you learn in a postdoc, you can learn in the PhD. The postdoc should be short to take advantage of learning new skills without spending too much additional time as a trainee a second time.

Fundamental issues and challenges

Postdocs are so underpaid that they cannot afford to stay in academia. The postdoc has become a drastic financial sacrifice people make, sometimes for over a decade, in the hopes of becoming a PI. Yet, the availability of PI positions is too low to accommodate all these postdocs. The "training" in a postdoc is all possible in the PhD. Postdoc should not be a second PhD, yet it has become that. Instead of learning new skills for a couple years and moving on, postdocs must complete an entire multi year research study. This is a problem that keeps people in low paid training positions for entirely too long.

Additionally, the supervisor structure of a single PI who alone oversees the career progression of a postdoc places too much power on the advisor. This structure isolates postdocs to the whim of a single person and puts postdocs at risk of bullying and harassment. Postdocs are unsafe because there is no person above or lateral to their PI who is involved in the research and career of the postdoc. If a postdoc needs to escape a toxic supervisor and go to another lab, they must start over again from scratch. This is in contrast to non academic positions, where one's career would continue to progress as they leave a toxic job and start a new job at the next career level up.

Existing NIH policies, programs, or resources

The NIH recommended postdoc salary should be raised to a realistic living wage, if not more, in all locations. NIH should incentivize hiring more permanent and better paid staff scientist positions. The goal should be to have fewer postdoc positions, which are temporary, under paid, and often unnecessary, and replace these positions with staff scientists. A more permanent staff scientist will be more efficient at research than a rotation of new postdocs who need to be trained every few years, so the biomedical research machine will be able to function with fewer, better paid staff scientists.

Proven or promising external resources or approaches

Industry provides a model for employee satisfaction. An industry scientist does not lose time in their career progression by leaving a bad environment and starting a new job elsewhere. This causes companies to compete for talent. This competition incentivizes companies to create better working conditions for employees. Universities and labs need to do the same. NIH has the power to shift funding towards staff positions that would operate like this and hopefully have more job satisfaction. Perhaps that might create an environment where postdocs are shorter, truly about training rather than a holding ground of cheap labor, and more optional for becoming PIs.

Response 617

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

In order to have more post-docs, and post-docs of a high caliber, we need to have a better pipeline of pre-doc students who are well-supported and provided with a viable pathway to a research career. Currently, the NIH caps on pre-doc funding are shutting down the ability to recruit, fund, and graduate doctoral students. At our institution, the student union requires payment of a particular stipend level that far exceeds the NIH cap. As researchers, we are caught in the middle. If we put students on our research grants as Research Assistants, NIH cuts the funding allowed for students to a level so far below what our institution requires us to pay students that we cannot fund, and hence cannot train our students. Our students cannot successfully submit training grants because the gap between what NIH will fund for a stipend and what our institution requires is so large that the institution will not be able to fill the gap. If we don't support and graduate strong doctoral students, there is no pipeline for post-docs. NIH needs to put out a formal policy that allows researchers to flex student stipend levels to meet what researchers are required by their institutions to pay.

Existing NIH policies, programs, or resources

NIH needs to change the funding policy for pre-doctoral students to allow greater flexibility and sensitivity to local economic climates as well as institutional requirements such as binding rules put in place by university unions that require researchers to pay students a particular stipend level that far exceeds the NIH student stipend cap. NIH should be able to find a way to review funding for RAs on research grants, as well as student training grants that allows for students to be paid what is required by their institution—rules that researchers have no choice but to oblige by—while still ensuring fiscal responsibility on the part of researchers. I am not advocating for no oversight or cap, but the current capping level that is blind to individual institution restrictions is shutting down the pre-doctoral student pipeline. If you do not have good pre-doc students, you will not have any post-docs.

Proven or promising external resources or approaches

No response

Response 618

Perspectives on the postdoc roles and responsibilities

Postdocs are the backbones of research laboratories. They fill the void between graduate student and PI. They are trained enough to have the technical competence that many PIs lack, and experienced enough to have the intellectual competence and perspective of where their science stands in the field—skills that grad students are still developing. We do benchwork, write papers, write grants, train new lab members, and often perform managerial tasks that are overlooked by a lab manager. I wear nearly every hat in my lab—from autoclaving to caring for the mouse colony to running flow cytometry to writing successfully funded grants to writing successfully published papers.

The postdoctoral "trainee" needs to be abolished as a concept. We are far past the time when the average postdoctoral position in the biomedical sciences is only a few years followed by a faculty position. The landscape has drastically changed over the last 50 years. There are too many graduate students and too few faculty positions for that. Make it a real staff job with salary and benefits that are not insulting. Sure, I am learning and perfecting many skills, but

a) what position in academia doesn't involve training, and

b) why does training preclude a dignified salary/benefits package?

Any other job that I would take for this amount of time would readily offer me these things, regardless of my employment length.

Fundamental issues and challenges

Academia classically attracts the most trained, intellectually curious, and motivated scientists—and what does academia do? Treat them like [redacted]. The salary is incommensurate with our worth. The benefits are measly at best, and woefully inadequate at worst. The [redacted for anonymity] "negotiated" a postdoc healthcare plan with Aetna such that each dependent is $600/month, and a family is $1300/month. Penn does not even offer a retirement plan with matching to postdocs. How insulting—I got a retirement plan with matching as a low tier lab tech at this very institution. Dental plan? Basically nonexistent. And the person in charge of these benefits plans [redacted for anonymity] is not interested in postdoc feedback. We have a postdoc association that gathered data from hundreds of Penn postdocs that detail what benefits improvements we want. [redacted for anonymity] is not interested in seeing our data, made clear during meetings with postdoc reps that are apparently for show. On the NIH minimum pay scale (that everyone seems to consider a maximum) coupled with laughably horrible benefits, only childfree, debt-free, health issue-free people can have a decent quality of life. Ableism at its finest.

I personally know multiple postdocs and grad students who were forced out of academia due to financial and personal wellbeing concerns. They were talented scientists who could have contributed a great deal in scientific content and in improving wellbeing in academia. Academia selects for humans with poor work-life standards for themselves and others.

With these factors becoming more widely known, academia will attract those who are not competitive enough to land an industry job. The all-hallowed "NIH minimum" will push out the best scientists because they are smart enough to know they can have a much better quality of life outside of academia.

Existing NIH policies, programs, or resources

It is your job to figure this out, not mine. You need to have paid labor to explore this.

Proven or promising external resources or approaches

Pay postdocs an adequate salary. Provide postdocs adequate benefits. These measures allow postdocs to focus fully on their work without the insidious stress of financial concerns. Train PIs how to manage a lab. Train PIs how to mentor. Decrease the other loads (academic committees, etc) of early career PIs AND clinician-scientist PIs to give them time more time for their science. Job satisfaction and recruitment will follow.

It is preposterous that for all their careers, pre-PIs are promoted based on their science.and then suddenly, when they become a PI, they have to do a COMPLETELY different job for which they have minimal training. It's not fair to them and it's not fair to us. Successful PIs are either naturally good at this, or their science is so good that their lab will put up with them being a poor manager.

My PI is a veterinary clinician-scientist. She has to go on clinics for 2 weeks at a time several times throughout the year, participate in veterinary resident selection, participate in faculty selection, and countless other administrative duties. This leaves extremely little time for training or mentoring me. I don't blame her—the responsibilities placed on her are absolutely insane—but I also don't want to have to beg for mentorship. I turn to other people in my academic environment for mentorship and training because I am highly motivated, but the lab suffers because of how little time she has to dedicate to her science and the people who are doing her science.

As a veterinarian and postdoc, I would love to be an NIH-funded clinician-scientist. But I see my PI's quality of life and quality of work, and I very specifically do not want that. I want to do good work, but I also want to enjoy my life.

Response 619

Perspectives on the postdoc roles and responsibilities

A postdoctoral position means the opportunity to learn additional skills that complement those learned in graduate school while growing ones network and independence as a researcher. Because I am interested in scientific research, I see the postdoc as a period to intensely focus on conducting research without the constraints of trying to obtain funding or teaching. Generally, I see a postdoctoral position as the opportunity to dive deeply into ones individual career interests without being bogged down by administrative or university responsibilities that one has in graduate school.

Fundamental issues and challenges

Money. Money. Money. It is very hard for middle class researchers (postdocs and project scientists) to have a stable life in academia. Compared to most jobs that require a PhD, a postdoctoral position has terrible benefits and job security. The universities look to federal funding agencies to set salary guidelines which haven't changed for a while. Postdocs get basically no retirement benefits and medical insurance rarely covers mental health support which is much needed for this community. I understand that the NIH can't improve medical insurance benefits or retirement benefits, but more funding needs to be available to PIs and postdocs to increase job stability.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 620

Perspectives on the postdoc roles and responsibilities

Postdoctoral researchers basically conduct their own research projects and often mentor and train grad students. They're basically low paid unofficial PIs. They are often the source of hands on experimental expertise especially since PIs won't have the time or necessary expertise to mentor each and every student.

Fundamental issues and challenges

Salary, salary, salary. Lack of upward mobility in academia. I am a last year PhD student and have not considered doing an academic postdoc since my second year, because I do not think that academia is a financially viable career. Not when you have to do at least 5 years of low paid work, while working incredibly hard. Why would would I choose to be an academic postdoc and get paid 60-70k when I could go industry and get paid 80-100k with a better lifestyle? Or if I manage to land a job at McKinsey, I could be paid 190k. It's ironic when it seems that all of the employers outside of academia value PhDs far more than academia does, but it also makes sense because there are too many PhDs in academia (supply) but not enough jobs (demand).

Existing NIH policies, programs, or resources

Increase the floor of postdoc salaries. Maybe have a path out of postdocs into a well paid staff scientist role, akin to industry. Be paid 80-100k. If you want to retain talent, you'll have to compete with industry on compensation and benefits.

Proven or promising external resources or approaches

Increased salary would reduce financial worries.

Response 621

Perspectives on the postdoc roles and responsibilities

I am interested in doing a postdoc, and I entered grad school thinking I would do one, but now I am not sure. I love academic research and curiosity-driven science and I am excited about the idea of pursuing further postdoctoral research, potentially in a new or adjacent biology field (I am in cell biology and am interested in evolution/population genetics).

Fundamental issues and challenges

I am a woman and intend to have children in the next 2-5 years. I am concerned about the feasibility of this both financially and professionally. I have noticed many postdocs struggle to support their children, particularly in high cost of living areas. I am also concerned about inflation and the overall feasibility of relocating (possibly temporarily) for a position that would not guarantee a further career in academia. If there were more staff scientist / permanent-postdoc research fellowships or opportunities, better childcare/family support, and a higher salary payscale for postdoctoral positions, I would feel MUCH more interested in pursuing one, and would probably not consider alternative-academic careers the way I am

now. Additionally, there is a HUGE variability in quality of PI/mentor and I am concerned about joining a lab, only to find the mentor abuses or bullies their students and staff. THIS IS NOT UNCOMMON. In fact, in my department there are more faculty with reported bullying and harassment than not—the idea of changing labs / institution for a postdoc, only to have uncertainty and a non-zero chance of the mentor being terrible, is not appealing.

Existing NIH policies, programs, or resources

I would be very interested in more opportunities for postdoctoral funding beyond 5 years, for people who wish to continue working in their postdoc lab without becoming a faculty member themselves. I would also appreciate if the NIH raised their salary minimums and provided more incentive for institutions to provide family infrastructure/security.

Proven or promising external resources or approaches

Higher postdoc salary scale minimums. Incentivize mentorship training and increased resources for postdoc support at institutions.

Response 622

Perspectives on the postdoc roles and responsibilities

I view it as a job

Fundamental issues and challenges

Low salary. The temporary nature of the job adds to stress and causes insecurity.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 623

Perspectives on the postdoc roles and responsibilities

My academic postdoc allows me to obtain specialized training in a field and lab relevant to the research area I'm interested in pursuing as an independent scientist/principal investigator. It also allows me to transition into pathway to independence awards.

Fundamental issues and challenges

Pay scale is a major factor; most institutions utilize the NIH minimum as the standard pay for postdocs and that is not affordable, especially with any student loan debt. Additionally F32 and T32 stipends utilize minimum as standard pay instead of minimum.

Existing NIH policies, programs, or resources

Improve the pay scale, it should increase with inflation.

Proven or promising external resources or approaches

Standards for training and requirements at institutions would be a valuable start. Most institutions have no infrastructure in place and allow PIs to govern postdoc training, which doesn't create sustainable or equitable training for all postdocs.

Response 624

Perspectives on the postdoc roles and responsibilities

Postdocs are hired to take mentoring and more difficult training and experimental work off the shoulders of PIs and sometimes grad students who have become so burdened keeping the lab running they barely have time to work on their thesis, from what I've observed and heard from others. It's not really a

position where you're getting training anymore. You're expected to be an expert at something already and be ready to teach others so the PI doesn't have to. This is fine, but the pay needs to reflect the level of responsibility being placed on postdocs.

Fundamental issues and challenges

Mainly money. You can make twice or thrice more in industry or consulting. Why go to school for the better part of a decade to then be paid less with a PhD than a manger at McDonald's? It's madness.

Existing NIH policies, programs, or resources

Women of reproductive age need WAY more guaranteed support. Pregnancy and early childhood slows down a woman's career in the best of circumstances, but those rarely exist and people get fired or taken off their projects because of the constant pressure on the PIs to publish so they can renew their grants. Women pay the price. Also, coverage for egg freezing so a woman can put off having children and gain some peace of mind if wanting to focus on career first.

Proven or promising external resources or approaches

Again, money. Also getting rid of abusive PIs by having some kind of blacklist so these people don't continue to get funding or something to address this pervasive issue.

Response 625

Perspectives on the postdoc roles and responsibilities

This is simple. The pay for NIH funded postdocs is ridiculously low.

Fundamental issues and challenges

Extraordinary underpayment

Existing NIH policies, programs, or resources

Higher pay for postdocs so that the risk of doing a postdoc is lower and it is not impossible for them to make age appropriate life milestones (having/raising family, purchasing home, etc)

Proven or promising external resources or approaches

No response

Response 626

Perspectives on the postdoc roles and responsibilities

A postdoc is a highly trained expert doing research that, when funded by NIH or NSF, the government has determined is important to the nation's goals. It is in a midlevel position in the academic career path with a large degree of influence and decision making in projects, high level of expertise, and often management and training responsibilities. Despite being "trainees", graduate students and post docs provide an expansive breadth and depth of knowledge fundamental to the work that NIH wants to be done and often are the only ones with the technical knowledge to complete the data collection, analyses, etc of the proposed work. Post docs often spend more time training others than being trained in anything in particular, so the framing of "trainee" is not only incorrect but feels like a downplaying of post doc's contributions and expertise to justify the low pay. Post docs and grad students are fundamental to the research mission of academic institutions and of funders, but are under appreciated.

Fundamental issues and challenges

The current system provides no stability for a decade or more after college. This is fundamentally driven by the low pay that does not allow us to have a substantial emergency fund, but is exacerbated by short term contracts that come with additional costs and leave us without a robust community to lean on.

There are also no benefits to ease the low pay, our stability is entirely dependent on what we're able to save. If funding for our project runs out and we are essentially laid off, we don't get severance to ease the transition. We don't have matching for retirement to ease the burden of saving (and many of us will not be eligible for social security benefits before the fund runs out in 2035). Our healthcare options are often

dismal or we can't afford better plans. There is no overtime or bonuses even when working much more than full time. Our pay barely changes with inflation–I have an NRSA and am actually making less than I did in real pay before the pandemic and subsequent inflation, even with substantial supplementation by my institution.

It is a testament to the immense dedication that researchers have to their work that anyone is working as a post doc right now at all. I'm not sure what I'll do because I genuinely love research and think the work is important for society, but it is impossible to justify doing a post doc on paper. I have about a year of my PhD left and know almost nobody from my institution or other institutions who are seriously considering a post doc, even if they want to do research.

Existing NIH policies, programs, or resources

The pay needs to be higher. It's not the only problem, but recruitment is not going to improve when the current system is asking people to chose precarity when they have skills that are valued substantially more elsewhere.

Proven or promising external resources or approaches

I like the GS pay scale and system that the rest of the federal government uses, with locality adjustments. If I want to do work for another branch of the federal government as a fresh PhD with my skill set, I would make at least 80k in my city and have benefits, standard hours, and decent job security. If I want to be a post doc doing work for NIH, I will make 56k with few benefits, no job security, and much longer hours. It's not clear why the time and expertise of biomedical researchers is so undervalued compared to other skilled workers paid by the government and recruitment.

Response 627

Perspectives on the postdoc roles and responsibilities

It's a position that allows you to expand your individual research focus that will drive the direction of your future lab.

Fundamental issues and challenges

The compensation is inequitable for someone with a terminal, advanced degree. There are no retirement benefits, undefined limits to how long the job will last, and little to no promise that at the end of a postdoc you will get hired as tenure-track faculty. There are no relocation fees paid and you are considered a trainee despite having completed the highest degree attainable in our field. The current state of postdocs is one of persistent infantilization—it forces those who participate to suffer poor wages and job insecurity while watching their non academic peers move forward with adult milestones (purchasing a home, starting a family, saving for retirement). For students who started pursuing research later in life, it is almost unthinkable to earn a postdoc wage with no retirement well into their late 30's and early 40's.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 628

Perspectives on the postdoc roles and responsibilities

For me, postdoctoral position is a way to acquire experience, publication and skills for grant writing. Theses assets will help me getting a PI position and, I hope, being a good PI.

Fundamental issues and challenges

In my opinion:

1. in academia salary is too low, only half of what you can get in industry.
2. Number of position in academia is ridicously low when compared to the amount of applicants.
3. Healthy balance between life and work is hard to achieve, when everything and everyone remind you: Publish or perish.
4. Work laws in the US states usually give a very low amount of days off, and universities are not really offering more. It seems impossible to convince people to work the whole year, without real break to relieved stress.

Existing NIH policies, programs, or resources

I think that the NIH sould remove all limitations based on US citizenship and permanent residency, since it excludes every researcher that didn't made his PhD in the US. Also, allowing postdoct to apply for NIH fellowship, for a longer time after their PhD defense could enhance their chance to get a position ans to feel more independant for their research. Otherwise, rely on a PI for the salary is not going the help the postdoc to feel independant anc confident to start his own researches.

Proven or promising external resources or approaches

No response

Response 629

Perspectives on the postdoc roles and responsibilities

Exciting and challenging.

Fundamental issues and challenges

Funding uncertainty, and the need to balance research demands with other professional and personal goals.

Part time work policy should be given for postdocs.

Existing NIH policies, programs, or resources

1. Inclusion of J1 scholars in various translational research training
2. Salary policy. A salary of minimum amount 100, 000 dollars should be given for the first year postdocs.

Proven or promising external resources or approaches

Every postdoc must be given a chance to work on grant proposal writing. It should be mandatory.

Minimum a 5 year visa should be issued for international postdocs (Extension for the next year can be based on the performance. Or a minimum of 6 months visa extension time should be given.

Every University should provide housing support.

Now, the tax exemption treaty for J1 scholars is 2 years. It can be extended for 5 years.

Response 630

Perspectives on the postdoc roles and responsibilities

To build our skills as independent scientists. To mentor, to train, to learn how to write and communicate effectively, and ultimately to be prepared for our next career step within a reasonable amount of time.

Fundamental issues and challenges

The label of "trainee" and the corresponding salary is insulting. Postdocs are treated worse than graduate students. I'm aware that I chose to do a postdoc in a major urban city, but it is disheartening when nearly 55% of my salary goes to "subsidized" housing—and I'm single. Academia does not deserve postdocs—this enterprise is exploiting our passion for science while we train and mentor their students, contribute to

funding, and build up the prestige and reputation of the institution. We're not naive to think "the grass is always greener", but if we are going to deal with isolation, harassment, and exploitation, we might as well get a decent paycheck.

Existing NIH policies, programs, or resources

Mandate competitive salaries for postdocs and graduate students in all grants.

Proven or promising external resources or approaches

Pay us, and hold exploitative PIs accountable.

Response 631

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is extremely important because health is the meaning of a happy life not for me or you but for everyone one:)

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 632

Perspectives on the postdoc roles and responsibilities

It's supposed to be a mini test run of being a PI. More independence in the lab, more exposure to the writing side as well as budget/admin side of running a lab. It's an opportunity to learn new skills and potentially switch fields or organisms without making the big commitment of starting a lab. It's a chance to try out an academic career without committing to it. Or at least ideally that's what it should be.

Fundamental issues and challenges

Pay isn't enough, especially when you consider that most people relocate for post docs and then potentially will have to move again after the post doc. Benefits aren't enough. Post docs should be well compensated and be entitled to healthcare and a 401k and other normal benefits. Many people end up doing two post docs and that's not appealing as a current grad student. The chances of getting a TT position afterwards is also slim so at times it feels like what's the point of a post doc since you could get better pay in industry or elsewhere. The salary is hard to live on especially if you have a family. Also, academia has a lot of politics and a lot of sexism/racism/etc. Putting myself in a position where I could be taken advantage of isn't appealing. A post doc needs the position to work out well and like a grad student might feel they have to put up with workplace mispractices and abuse in order for their career to survive. In industry, there is a better balance of power that isn't found in academia.

Existing NIH policies, programs, or resources

Raise the minimum stipend for grad students and post docs.

Proven or promising external resources or approaches

Better pay and benefits. Have stricter policies regarding workplace safety/harassment/etc.

Response 633

Perspectives on the postdoc roles and responsibilities

Note: I earned a PhD from an R01.

Much of the expertise and few of the rewards. Unless they already have a faculty position lined up, in which case, they are practically paid to do whatever they want until it starts.

So easy for well-intentioned postdocs, especially international postdocs, to be screwed over by the system. Substantial reduction in lifetime earning potential (as a conglomerate) if a person chooses to do a postdoc vs if they choose almost any job outside.

Fundamental issues and challenges

Note: I earned a PhD from an R01.

Postdocs are given empty promises that their position will improve their career candidacy. This is not the case unless they have a mentor supportive of a postdoc being proactive. Flawed system where PIs can exploit postdocs' ingenuity, time, and energy without much of a limit.

Discouraged from entrepreneurship or taking outside jobs that would give them greater perspective.

Mindset of postdocs is generally negative and I would not want to be around that kind of mentality for long.

No ceiling to how many hours per week the postdoc can be pressured to work.

No economics and no control = bad investment of time.

A good but not stellar grant record where a person just misses the mark a few times as a grad student combined with the decision to go into a brand new lab often means that the grad student does not end up with the strong publication record it takes to be competitive for postdoctoral fellowships.

I could write a 60-page grant proposal to the NIH to earn $60K per year OR I could write a 2-page resume to a biotech company earn $120K per year as a starting salary. With an employer matched 401(k) and performance bonus. Even if I was not motivated by money at all, the clock is ticking and I want to have a life.

Existing NIH policies, programs, or resources

Note: I earned a PhD from an R01.

My grad program talked about NIH policies that DID NOT EXIST to pressure me into not doing an extracurricular tech project that would improve my career prospects while doing some good for the broader community. I did not believe them, so I contacted my grant administrator at the NIH directly, and found that indeed, the NIH policies that my program cited DID NOT EXIST.

I told my program director, who practically gave me a "back in my day, training was this way" spiel. And that was it. That was not helpful.

Please do not allow our program directors to give us narratives that would stall our careers if we listened to them. It is not ethical for leaders to clip our wings by being dinosaurs themselves.

Proven or promising external resources or approaches

Having 80:20 time like Google has.

40 hour workweek so time is respected like regular adults. Overtime pay if more time is needed.

Widespread usage of project management software like Jira. Collaborative tools that make for production without inefficient data systems. If these things were not efficient, industry would not use them.

Response 634

Perspectives on the postdoc roles and responsibilities

Post-docs are PI's with training wheels. They are people who want to learn how to run a lab without the pressure of funding themselves. This is a management training role and a scientific thinking role. Post-docs should be leaders in the lab, perhaps running entire divisions of research but ultimate responsibility for the lab/research falls on the PI.

Fundamental issues and challenges

Primarily money. Post-docs have already put their earning potential life on hold to become highly educated and they are not paid well enough to defer that even longer. It's a low paying, high stress job where responsibility too often falls to the post doc. More and more, it seems like doing an academic post doc just isn't worth it when you can get more money and less red tape at an industry job. The payoff is also often not good because there are so few tenure-track positions open to post docs.

Existing NIH policies, programs, or resources

The minimum pay for post docs should be increased with appropriate cost of living adjustments. Perhaps also the support for young PIs could improve to increase job opportunities for post docs.

Proven or promising external resources or approaches

No response

Response 635

Perspectives on the postdoc roles and responsibilities

Independent research scientist funded and managed by academic PI. I do not view academic postdoc positions as training positions. Postdocs may receive training in structuring large research projects, grant writing, building leadership skills, teaching, etc., but these activities would be considered career/personal development in any other job sector and not grounds to broadly classify a position as "trainee" .

Fundamental issues and challenges

I accepted an industry scientist position immediately after graduate school rather than pursuing an academic postdoc position because of significantly lower pay in academic postdoc and burn out from academic environment. I knew that I could find a scientifically fulfilling career with a high salary and good benefits outside of academia, without a post doc. I did an industry internship during my PhD at a large biopharma company, where people were much happier than in my academic department, had better work-life balances, and more resources in just about every category of daily work life. I was also afraid of landing in a postdoc with a subpar work environment/PI, even with due diligence, and getting stuck in that situation. There are more strings attached in postdoc positions rather than simply applying to another job, giving 2-4 weeks notice, and moving on.

Existing NIH policies, programs, or resources

Increase pay for NIH funded postdocs to be competitive with industry postdocs would be a good start.

Proven or promising external resources or approaches

After pay increases, improving recruitment and policies for international postdocs is another suggested route of enhancing the postdoc ecosystem.

Response 636

Perspectives on the postdoc roles and responsibilities

My viewpoint of a postdoc is a position where I would have more responsibility in planning and executing a research project toward publication, preferably 1 pub per 1-2 years or 2 mega impact papers for 4 years worth of work (neuroscience). I see the postdoc role as having more responsibility in training new graduate students in techniques. But I also see the training part of the postdoc as gaining insight into review processes (reviewing others' papers and how to respond to reviews), grant writing, and disseminating/sharing research in the form of short talks at conferences.

Fundamental issues and challenges

#1 is the money. How is it that someone who has this much training is barely able to afford rent and food in some of the most expensive cities in the US? If you all are paying attention to the publications on where postdocs are hired from at research instituions, they are coming from Harvard, MIT, Stanford, UPenn, UCSD, Caltech, UC Berkeley, all of which are fairly expensive locations. In an area that costs $3000/mo to rent an apartment, how can it be expected that the person live on a $54k/year? The postdoc has so little benefits like daily commute funds (e.g. for the Caltrain), healthcare (it's a very basic plan), etc. In

addition, for women, how is there no funds for things surrounding childcare? Why is there such little sick day allowance? Why aren't moving expenses covered? The few benefits in addition to the low stipend is really telling of what the experience is going to be like --> not very good for how hard it was to make it here. People who do a postdoc often still have debt from undergrad education. The PhD didn't pay much because it was a training experience. And now the postdoc is again treated poorly compared to an industry career which we are also qualified for. It's an overwhelming experience to carry such a financial burden into the adult 30s and have to continue living on wage restriction.

Also, I'm a woman. Husband did his PhD first. I waited because it was overwhelming for us both to do a PhD at the same time. I started my PhD after his postdoc was over and he was in a stable career. So my career is pushed back—I'm mid-30s trying to finish a PhD. I will be too old for age-restricted awards.

Existing NIH policies, programs, or resources

1) Stop preventing faculty from using unrestricted funds to increase postdoc salary
2) A lot of faculty are going the route of advertising staff scientist salaries to those who don't want the tenure track route in order to recruit talent to get their research done and to get around the postdoc salary limits, but this makes people who DO want to train for faculty positions make a hard choice of staying the route or earning more money so why force future faculty to earn less over their lifetimes? why make the pathway to faculty so restricted and only "postdocs" can apply for NIH funding?
3) Why is there not really a place for permanent staff scientists in the life sciences? Is it really postdoc->faculty or the talent is thrown in the garbage? Why is there not a national lab space for life scientists? This exists for mathematicians and engineers (e.g. Sandia, LBNL). Why not life scientists? And
4) Why is the experience for writing a NIH grant such a guessing game? Why do you all not run workshops to help graduates get postdoc funding and help postdocs get independent funding? Why is it so mystified with curt criticisms from reviewers? It's as if it IS and inside club and you have to learn the politics and it's not supposed to be known and the money only goes to the Mens club. It's almost as if the goal isn't actually to solve health problems by funding the most innovative ideas but to give money to the insiders.

Proven or promising external resources or approaches

1) recruitment bonus (can even be from companies) and moving expenses paid (fully paid, not the dollar amount minus 25% tax)
2) emphasis on a mentorship network with less empasis on the singular letter from direct supervisor to limit the conflict of interest of the supervisor retaining intellectual property created by the postdoc or creating an unachievable work atmosphere
3) You know what would be cool—a thing like youtube for life scientists. What if I'm used to using whole tissue protein analysis techniques like IHC and DREADD or optogenetic manipulation, but I want to learn ephys or various transcriptomics methods? What if there was a website where postdocs could share techniques, both videos and forums for Q&A. There's ResearchGate but I'm dreaming about more of a YouTube for life science. What if there was a "please don't be a jerk, we're all trying to learn" policy on the site and an attitude of let's learn successful techniques (and in a knowledge-seeking attitude, discuss the nuances for doing things differently) but do so together instead of each independently guessing and wasting time and money? And what if that also included a grantsmanship section? And if you're a jerk, the behavior could be flagged and externally reviewed and have posting privilege restricted. I get doing things differently can lead to new knowledge, and that different companies for life science around the world produce different products that faculty buy which makes the technique need to be different. But why does it feel like the wheel has to be reinvented each time I move to a new lab, and then I'm judged on how quickly I can get results and publish?

Response 637

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Higher salary. That's all. Any other factor is just a noise.

Proven or promising external resources or approaches

No response

Response 638

Perspectives on the postdoc roles and responsibilities

Postdoc training ideally would be me getting scientific and technical support for 3-6 years so that I can look for fully independent positions and academic rank in a research institute. Postdocs should be allowed to pursue riskier research while also getting hands on training on how to run a lab, mentor undergrad and grad students, grow their professional network and set up collaborations. They should be given time and resources to be able to maintain a healthy life balance so that they do not burn out at work.

Fundamental issues and challenges

I am a graduate student working in academic labs with 5+ postdocs. All I see right now are bright and curious postdoc trainees being burdened to do only what their PI thinks is correct and spending 7-10 years in various post doc positions to then go on to compete for scarce independent positions. All this, along with a very low salary, leads to post docs leaving academia for industry or leaving science completely.

Existing NIH policies, programs, or resources

NIH postdoc trainee salaries should be increased to be on par with industry (PhD-level jobs) right from year 1 of a postdoc.

Proven or promising external resources or approaches

No response

Response 639

Perspectives on the postdoc roles and responsibilities

Early stage investigator, went from grad school to industry without postdoc because I have no interest in perpetual adolescence and low wages in order to prop up an academic system that benefits very few faculty and an excess of administrators who contribute no value to anyone in particular.

Fundamental issues and challenges

What is the point of a post doc? There are virtually no faculty positions, all you're doing is sacrificing future earning potential. There is nothing to learn in a postdoc that couldn't be learned in a job. The majority of these positions only exist so that universities don't have to pay the salaries of scientists.

Existing NIH policies, programs, or resources

Stop providing such ridiculous levels of funding to administers rather than researchers

Proven or promising external resources or approaches

Don't recruit postdocs unless academic jobs exist for them. The vast majority of postdoc positions are exploitative wastes of time and money, unless you are the professor or dean benefitting from this extractive system. People who don't just condone but try to expand this system should be ashamed of themselves.

Response 640

Perspectives on the postdoc roles and responsibilities

Good training opportunity for transition into tenture track position .

Fundamental issues and challenges

Low salary, barely a living wage in my high cost of living area.

Existing NIH policies, programs, or resources

Improving payback system to be realistic for those pursuing non-academic jobs

Proven or promising external resources or approaches

No response

Response 641

Perspectives on the postdoc roles and responsibilities

I have applied to various postdocs. I have received three offers and have turned down all three. One was international. Receiving meager pay to move to another country with little to no help with moving costs is really an insane compromise. No other occupation in the world asks you to make these sort of compromises or sacrifices.

Fundamental issues and challenges

- Cost
- Temporary
- Benefits
- Prolonging trainee processes (2 year postbacc, 5-6 year PhD, 2-4 postdoc.)
- Isolation/lonely

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 642

Perspectives on the postdoc roles and responsibilities

As a Postdoctoral Fellow, I support the PI in scientific projects and all aspects of research, teaching and service. Specifically:

1. I lead and execute my research projects independently with minimal intervention from the PI
2. I mentor undergraduates and PhD students in their research projects
3. I undertake teaching duties in undergraduate and advanced courses
4. I provided substantial input in grant proposals (crystalizing ideas, knowledge transfer, preliminary analyses, writing)

Fundamental issues and challenges

From my personal experience and from the experience of fellow postdocs:

1. Lack of job security
2. Inadequate compensation
3. No work-life balance
4. Mobility requirements—relocation is expensive for a temporary, relatively short work duration (6-18 months)
5. Power imbalance between PIs and postdoctoral fellows (increases chances of bullying and misconduct by PI)
6. Dwindling opportunities for tenure
7. This is the biggest issue: we may be considered as trainees for a Professor position sometime in the future. However, in reality we are considered highly-trained, highly skilled researchers who advance another Professor’s career without being allowed to develop an independent line of research, and with relatively poor compensation for our valuable contributions.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 643

Perspectives on the postdoc roles and responsibilities

Despite the outdated view by the NIH that postdocs are trainees, my experience as a postdoc has been that the majority of postdoctoral scientists are independent researchers who rely on the equipment, facilities, and funding of PIs to perform their experiments. The responsibilities of postdocs often include: performing experiments, analyzing results, writing papers and presenting findings, training new researchers, and mentoring. Postdocs are almost always the most senior members of labs with the most practical experience and are in charge of both ensuring experiments and equipment run smoothly and training new members to do the same. Although some scientists acquire new skills as a postdoc my estimate is that most postdocs acquire new skills for only a brief period of their postdoctoral "training", usually limited to the first few months up to a year.

This is dramatically different from the way that postdocs are portrayed by the NIH. The K award series presumes that postdocs require additional training prior to running their own research groups, rather than that they need additional time to perform their research and funding to support their ability to apply for extremely competitive grants against senior PIs.

Fundamental issues and challenges

The largest challenge for postdoctoral scientists is that they are significantly underpaid relative to their experience and skills. At most R1 research universities the standard NIH postdoc pay scale ($56,000) means that a postdoctoral scientist can easily spend more than 50% of their salary on rent and food alone, adding anxiety about food and housing insecurity. Industry jobs commensurate with this experience often pay three times as much, causing the best scientists to choose to leave academia.

The second largest challenge for postdoctoral scientists is lack of funding and significant barriers to acquiring funding. Most postdoctoral scientists will spend one to two months preparing and submitting an NRSA and then another two months preparing and submitting a K award. At current NRSA levels, each submission therefore costs the NIH a minimum of $10,000. NIH grant submissions are onerous, requiring elements that are excessive and create a burden for new scientists. Reducing the requirements of the submission process to just a personal statement and research plan, similar to how the majority of private fellowships are implemented, would substantially reduce costs. This would also increase time for experiments, helping scientists focus on career development.

The third largest challenge for postdoctoral scientists is the stifling publication environment caused by overpriced closed-access journals. The NIH needs to require that all NIH-funded research be published as preprints first and then in open-access journals, with a reasonable limit ($3000) on the maximum allowable publication fee. NIH-funded research should not be allowed to be published in closed-access journals or journals with a fee over this limit.

Existing NIH policies, programs, or resources

The NIH postdoc payscale needs to be raised by about 50% to account for dramatic inflation and rising cost of living in the major cities where postdoctoral scientists often work. An *additional* cost-of-living adjustment should be added according to the cost of living within specific geographic regions.

NIH grant submission requirements for F and K awards need to be simplified to reduce the burden of the application process.

The NIH should require all NIH-funded postdocs to be on minimum two-year contracts to improve the stability of research positions in academia and protect precarious international workers who depend on yearly visa applications.

K awards should not require postdocs to be in labs with senior PIs. This requirement creates intense bias in the field and prevents PIs who join younger labs from succeeding in academia.

Proven or promising external resources or approaches

The majority of private fellowships for postdocs have far better applications, requiring only personal and research statements. These should be used as models for reforming the onerous requirements of F and K grants.

Response 644

Perspectives on the postdoc roles and responsibilities

My work means life to me. I did a 6 mo break after PhD and couldn't wait to start work in a new place. I know that I did choose science and an academic career because I wanted to, not because I did not explore other options.

Postdoc is a time of development on many fronts—above all scientific, but also social (new country and cultural codes), and mental (you need so much self-awareness and mindfulness to survive). Balancing all these areas is hard, Â and some others like personal life development are neglected. Science-wise, one is definitely developing new skills and perfecting the ability to discuss and communicate science. Each postdoc should be able to easily say: 'I contributed to important science and I do know that my work matters and is useful for the scientific community, industry, and humankind'. In my opinion, the postdoc time should be science-wise challenging and stimulating. Postdocs serve so many different roles, which allows one to identify which particular aspect of doing science you are most happy with (performing experiments/analyzing data/software development/designing research/ supervising younger colleagues/ giving talks.). Â You are a bit forced to do it all to enter the next stage of an academic career, but those skills are also super needed in the industry. As a part of the organization Â—postdocs are the main people doing research—the effective, well-trained workers who do the needed job. We transfer the knowledge mainly to colleagues who are trained (other postdocs or students) on one on one basis. Postdoc experience varies a lot depending on your personality and other people around you.

Fundamental issues and challenges

1. compensation—for the number of skills we have to have to ensure good results and most importantly—the level of commitment and engagement it requires to do science, we are very poorly compensated. Especially, in the areas which are more expensive (ex. Bay Area)—we could work more effectively if basic human needs are able to be paid for and some quality of life achieved financially. That applies to PIs too.
2. To get to the next position Â—the PI Â—the demand is enormous—I could be a PI already—have the skills, but I still need my CV to get pumped up with the right papers to get a foot in the door in the interview process.
3. As a non-USA citizen I did not get many chances to get a fellowship (I know they exist but is very unfair that not all fellowships are open to all).
4. A lot of diversity and inclusion policies and rules are unfortunately still empty statements and liability cover instead of a real change.
5. mental health—as a postdoc representative in my department I talk with many people and in private conversations, a huge portion (~above 60%) admitted to being on antidepressants, having anxiety and panic attacks, having sleeping issues, and trying to get help in any possible way (from medicaments and therapy to soft drugs and various self-help tools). Just in my lab (9/12 ppl I have knowledge of have/had a period that falls into the serious mental problems category). And this is not a lab with abusive supervisors—these are good mentors' labs!

Existing NIH policies, programs, or resources

1. Open all grants to all
2. Increase postdoc payment and adjust the pay scale to the cost of living in the area.
3. Create a 'permanent postdoc' position for those who enjoy just doing science and pay them well, create grants so the lab can have those positions for several years
4. Require each PI to have a code of conduct/ welcome letter document. It should be first required for a PI to be a good manager and leader, instead of a scientific visioner. Â Too much misconduct in science is excused by incompetence to be a decent manager/leader.
5. Increase postdoc independence from PIs—give us money for conferences and grants so we are not only depending on our PI budget and philosophy of 1 conference a year. Many of us need more conferences to build a network. I believe we are scientifically mature to steer our careers but we are limited by our PI often (as it cost money and our absence)
6. Universities obtaining NIH grants should be required to have a postdoctoral affairs office in each department. It should be run by dedicated workers who will build a community and they shouldn't be burdened with any administrative work. The goal should be to integrate the local community and facilitate good relationships and happiness across postdocs.
7. Impose a policy of mental health check-ups for each postdoc, grad student, and PIs yearly (1 obligatory session, up to 10 sessions covered on-demand—big tech companies have a great tool for that for their workers crafted precisely for situations they deal with within each day)
8. Improve transparency—require labs/departments to log when they hire ppl and when they fire them or when ppl leave on each department level and what was the reason. Ensure open access of these data

Proven or promising external resources or approaches

The Internet is full of resources. Even at [redacted for anonymity], we have a lot of them—just seems like ppl are not interested to get extra work done. TFaculty often does not recognize, that making their management skills grow is part of their job.

I really encourage you to talk to executives in big tech (Google, Facebook, Apple, Â Linkedin) about how they ensure well being of their workers. Just half of what they have could be so much progress for science. Especially the mental health benefits and offer of resources are very well crafted to the needs.

Response 645

Perspectives on the postdoc roles and responsibilities

I view it as preparation for a career as a professor—as such I believe the ideal postdoc position should come with the freedom to pursue high-risk high-reward projects, and plenty of mentoring and professional development opportunities.

Fundamental issues and challenges

The salary is atrocious, especially when compared to the cost of living in most major US cities. It is not enough to live alone in most cases (most postdocs I know have roommates, which is not the ideal living situation for most postdocs), let alone support a family. Most postdocs which I know are losing money every month of their postdoc, which is not sustainable. I also know a postdoc who got an abortion against her will because she could simply not afford having a child, despite the fact that she was ready to start a family. It is not unusual to hear such family planning scenarios. This is the opposite to the postdoc situation in many other countries (i.e., Europe, particularly Scandinavian), where the postdoc is the time when many researchers are beginning their families. This is simply not acceptable considering the amount of expertise and training which postdocs have coming into a position, and most people realize that and choose an alternative path that values their contributions. Even if one manages to recruit a postdoc to a position, the typical postdoc is trying to get out of there as quickly as possible because of the lack of job security coupled with embarrasingly low salaries, which make it impossible to plan for the future (save for a house, plan a family, etc).

Existing NIH policies, programs, or resources

1. Increase salaries! They should be at least doubled from the NIH minimum in major cities like Boston and San Francisco.
2. Improved paid parental leave policies, for both parents, paid by the postdoc fellowship. This is also fundamental to equality principles. At least 6 months of paid parental leave per parent.
3. Improved programs for affordable child care, for when parents have to return to work.

Proven or promising external resources or approaches

Look at what companies are doing and providing for industrial postdoc positions, which is already a huge step up from academic postdoc positions. For instance, AstraZeneca has a great industrial postdoc program.

Response 646

Perspectives on the postdoc roles and responsibilities

Research focused, further skill development, network and collaboration building, research outcomes

Fundamental issues and challenges

1. Not paying them enough money, postdocs can go into industry and double or triple their postdoc income.
2. Toxic academic environment (bullying, pressure, unsafe work hours, undervaluing postdocs).
3. Publish or perish culture—when excellence is measured through one metric (publication count) the metric will be gamed, and articles are written just for the sake on line items on CV.
4. Academic executives see funding as research, not research as research.
5. System must go back to what is important and meaningful about research, and that is impact. Publication is not impact, funding is not research and it is not impact.
6. Young researchers deserve better and they know this. If the above issues aren't changed, postdocs walk into industry that values them and their well-being.

Existing NIH policies, programs, or resources

As above.

Proven or promising external resources or approaches

Listen to postdocs and their lived experince. That should be enough evidence. The culture is toxic, postdocs are underpaid and undervalued. The system needs to change.

Response 647

Perspectives on the postdoc roles and responsibilities

A training opportunity beyond the PhD. Interestingly, I don't think there is much difference between a PhD student and a postdoc in a lab. Unless the postdoc has been working in the same laboratory for longer amount of years. I can conclude that a post doc looks like an elongated PhD with LOWER salary, and NO housing. Basically and underpaid extension of your PhD.

Fundamental issues and challenges

SALARY and HOUSING. PhD students are encourage to leave academia , or postdoc training in general because is UNDERPAID. No housing is provided and postdocs really struggle about housing and food. Starving and homeless are what most postdocs are afraid and that is why they tend to leave asap and go to an industry position, or PhD students have already crossed out the postdoc position by observing the hunger and housing issue that postdocs regularly have.

Existing NIH policies, programs, or resources

You need to increase the salary, make universities provide free housing for postdocs, and somehow give food stamps or food for postdocs.

Proven or promising external resources or approaches

Have a fund for socializing with postdocs so that they can network further with other faculty and apply for jobs.

Response 648

Perspectives on the postdoc roles and responsibilities

Untenable hours, suppressed wages, no career prospects

Fundamental issues and challenges

Salary, no work life balance, exploitation by PIs

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 649

Perspectives on the postdoc roles and responsibilities

It is pretty simple, if postdocs were just uniformly treated and valued like employees with a doctoral degree instead of as trainees that can be walked all over they would not be leaving academics to go to other jobs where they are given basic decency.

Fundamental issues and challenges

The fact that PIs can't use NIH grant funds to supplement the salary of a postdoc or pay for their employer sponsored portion of health insurance when they are on a training grant or F32 is problematic

Existing NIH policies, programs, or resources

Require institutions to continue to treat postdocs as full time employees when they get NIH funding, it is crazy that when I get an F32 I can lose my retirement and have to pay more for health insurance because the institution no longer treats me the same due to where my money comes from

Proven or promising external resources or approaches

No response

Response 650

Perspectives on the postdoc roles and responsibilities

Postdocs need to be paid more. They should be paid what they are worth, and that means matching industry salaries. I have several friends that went into industry after grad school and I know postdocs work longer hours and have more responsibilities than those starting out in industry. A postdoc needs to be a viable investment option. That will likely mean raising the salaries of assistant professors as well. At this point, slogging through a postdoc to obtain an assistant professor's salary is pointless.

We need to stop mandating that trainees change institutions at every step of their career. While my graduate school was a fantastic place to train, I would have been better off remaining in my home state where I had friends and family. This issue is magnified when starting a family. The bigger support system a trainee has, the more likely they will be able to continue their training. Changing labs and/or departments should be plenty adequate for proving that a trainee has the ability to perform in different environments.

Postdocs should not be treated as technicians. If the goal of postdoc training is to prepare them for running their own lab, the environment should reflect that. Every postdoc should be given at minimum 1 dedicated technician to supervise to learn how to delegate, mentor, and deal with conflicts. I spent hours

upon hours doing tissue culture as a postdoc when I should have been learning new skills and writing. The bulk of my time as a postdoc did not benefit me.

Fundamental issues and challenges

This does not only apply to postdocs, but all new parents should get a minimum of 6 months of parental leave. While reaching this seems impossible at this point, new parents at minimum should have increased flexibility when it comes to their work load. This may not only apply to new parents, this should also apply to anyone undergoing major life events.This does not only apply to postdocs, but all new parents should get a minimum of 6 months of parental leave. While reaching this seems impossible at this point, new parents at minimum should have increased flexibility when it comes to their work load. This may not only apply to new parents, this should also apply to anyone undergoing major life events.

There needs to be a greater push for free on-site day-care. It made the most sense for us for my husband to stay home with our baby, but many people don't have this luxury. If new mom's could directly breast feed their babies during the day that would go a long to way improve productivity and quality of life. Not to mention, the cost of day care is astronomical and unaffordable on current postdoc salaries.

Postdocs should have free rein to decide their hours and when they will work from home. At this point in their career, postdocs know what they need to get done and how they will achieve it. Again, this is to prepare them for an independent career.

Existing NIH policies, programs, or resources

Postdocs should not be assigned tasks that detract from their independent research without their approval. I certainly received some wonderful opportunities outside of my research that benefited me during my postdoc such as interacting with patient advocates and working with students, but I was also saddled with many technical tasks under the guise of "learning new skills" . Alternatively, postdocs should be compensated monetarily for these additional tasks if they are necessary. Bonuses are commonplace in industry and there is no reason they should not be part of the culture in academia.

Many postdocs have accumulated mountains of student loans during undergrads, with little chance to pay them off during grad school. One great incentive for postdocs could be to offer to pay off their student loans.

In general, the pace of research in this country should be slowed down. Continuously cranking out mediocre papers that may or may not be relevant to human health is running our scientists ragged without truly benefiting society. We need to get rid of the administrative bloat and allow scientists to spend time thinking and maintain work-life balance. If overhauling the training system and paying people adequately means funding fewer labs, I think that's a risk that is worth taking.

Proven or promising external resources or approaches

The fact that there is a 300 word limit on these boxes makes it quite clear that the NIH is not truly interested in understanding the full story. I recently left my postdoc and have a lot to say about my experience but there is not space for it. I included my suggestions for improvements in the boxes above.

Response 651

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary. The NIH minimum postdoc salary is incompatible with a reasonable quality of life, and is completely out of sync with the qualifications and expertise required for these positions. I sought a postdoc outside of the US–despite having NIH-funded offers in the US–for this single reason.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 652

Perspectives on the postdoc roles and responsibilities

For me, the ideal postdoctoral position would focus primarily on training professional development activities, learning to write grants, managing a team of scientists, developing novel projects and ideas, managing grants. I.e. preparation for a career as a PI, not simply yet another fancy lab tech

Fundamental issues and challenges

As postdocs we perform a lot of skilled labor with no benefits.We are exploited for our technical skills, ideas are often stolen and claimed by the advisors/PI, we do not get paid nearly enough under the guise of training, but no actual training seems to take place. Just exploitation.

Existing NIH policies, programs, or resources

There need to be more early career (small) grant options that postdocs can apply for independently, not fellowships. K grants should not require mentors, rather collaborators. Many gifted postdocs lose out on these opportunities due to not having supportive PIs

Proven or promising external resources or approaches

An increase in pay is a proven way to increase retention. Tracking of hours worked during the week should be made mandatory for those funded under NIH. Prevents exploitation where trainees are made to work 70+ hours a week with little pay and few benefits. Let’s not pretend this does not happen.

Response 653

Perspectives on the postdoc roles and responsibilities

Ideally, postdoc should be a relatively short (~2 years) training after a Ph.D. to gain extra training needed for running a lab. In practice, it has become a duplicate of the Ph.D. experience, both in training duration (~6 years) and training content (bench science, without any training in managing a lab).

Fundamental issues and challenges

It is a common lore in academia that you have to sacrifice all financial ambition in order to dedicate yourself to an academic career. However, the current situation is such that one not only has to forget about financial ambition, but they also have to be willing to sacrifice financial stability in order to pursue a postdoctoral career. Elite R1 universities happen to be largely concentrated in places where the cost of living is quite burdensome for postdocs earning NIH scale salary. Single postdocs cannot afford rent on their own. Postdocs with partners cannot afford to have children, because they are already rent burdened (unless their partner has a lucrative job). Meanwhile, peers of similar age groups who have chosen other professions after college are purchasing their first house. A reasonable person with this knowledge in hand would not and should not choose to become a postdoc, unless they are privileged enough to not worry about making a living.

Existing NIH policies, programs, or resources

NIH has staff scientists who are PhD scientists that do not run their own labs but do benchwork. Allen Brain Institute has similar career paths. These career paths are vastly different from postdocs, because there is no expectation for them to leave. In fact, they are encouraged to stay. In addition to job security, their pay resembles a living wage. In my opinion, every university should have these research faculty positions that are semi-independent, may work in one lab or across several labs, and provides good stability and income. Importantly, these positions should *replace* current postdoc positions–i.e., there should be no postdoc training expected before applying to these positions.

Proven or promising external resources or approaches

As mentioned above, I believe NIH staff scientist positions and Allen Brain scientist positions are good career paths that should be widely expanded and adapted in every R1 university. Many Ph.D. scientists who love academic research but has been pushed out of academia by the irrationality of subjugating oneself to a career path with low-pay, low-stability, and unclear future prospects, i.e., a postdoc career, would welcome this alternative career path. Postdoc positions should be shortened by 3-fold, and should concentrate on training Ph.D. scientists on lab management, grantmanship and mentorship.

Response 654

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The salary is laughable. How am I supposed to have a family on a post-doc salary in most parts of the US? How could I afford child care in most cities on the post-doc salary? The NIH sets the tone for how much post-docs can make, and honestly child-care is a major barrier for me deciding whether or not to do a post-doc after my PhD

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Improve child care. Every major research institue over a certain size should supply child card.

Response 655

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as a full-time position that allows for one to receive pertinent research training that will allow them move onto their independent careers. The postdoc should be viewed as more training, but should also be viewed as full-time employment with a full suite of employment benefits with commiserate pay.

Fundamental issues and challenges

Postdoc salaries are incredibly low given the wealth of experience (technical and "soft-skills") that one brings to any lab as well as how much work a postdoc is expected to complete within a short time period and actually contribute to a new environment that might be away from home. Additionally, current stipends are prohibitive to many graduate students wanting to become postdocs and favors those not from marginalized backgrounds and who can afford to continue on the academic path. There appear to be many sacrifices that one has to make to become a postdoc, such as family and financial security, on the path to an independent academic career. Postdocs are also not afforded protections like many graduate students and put them in a more precarious and risky position

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 656

Perspectives on the postdoc roles and responsibilities

I still view the postdoctoral role as the classical role of preparing to become an independent academic investigator since that is what I aim for. However, I understand that many don't share this view and suspect that there will be diverse perspectives/descriptions of what a postdoc means to others.

Fundamental issues and challenges

The pay is far too low! Especially in the high-cost-of-living cities where most want to perform postdocs (Boston, San Fran, etc). I know personally multiple postdocs who have left for industry because the NIH salary levels no longer provide adequate support for basic needs such as rent, bills, and groceries.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 657

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should provide a wholistic training that can be catered to the career track that the mentee is seeking. Overall the experience should be more like an apprenticeship (ideally under multiple individuals who hold the goal position that the mentee is seeking).

Fundamental issues and challenges

Postdoctoral training can be a black hole for some. They can spend years trying to generate enough data from dead end projects to publish enough manuscripts to make them attractive candidates for professor positions however, these are highly educated people putting a critical time of their life on hold while they could move into industry positions doing (likely) more impactful work and make three times more money/ better work life balance/and more opportunities for advancement. There is really no logical reason to stay in academia other than ones passion for new knowledge.

Existing NIH policies, programs, or resources

The time limit for post docs to obtain a k99 from was a hate limitation for me. I had 2 children during my postdoctoral work the second of which took me much longer to recover from. Although the NIH recognizes and allowed extra time for maternity leave, that allotted time was did not support me enough to balance being a new/young mom and get the publications needed to me a good candidate for the K99. An effort should be made to further limit constraints that hinder women in science.

Proven or promising external resources or approaches

Holding PIs more accountable for the success of their mentees would improve things drastically. There needs to be a more official yearly review process of both mentors and mentees and institutions should be responsible to step in when necessary to ensure success of the individuals training there.

Response 658

Perspectives on the postdoc roles and responsibilities

A stepping stone toward a career goal, whether it is a faculty position, an industry position, or elsewhere.

Fundamental issues and challenges

Extremely low salary that is not adjusted based on the location. Living paycheck to paycheck in my 30s, unable to consider having a family, is degrading. This is especially challenging for postdocs who did their PhD in an expensive city and didn’t get to save money while in graduate school.

Existing NIH policies, programs, or resources

Mandating extramural postdoc salary consistent with intramural postdoc salary, or even more salary. NRSA sets the standard for extramural postdoc salary. NIH needs take the responsibility and step up to improve postdoc experience.

I’d argue that this system is extremely discouraging for people from financially challenging background and is selecting for scientists from a wealthy family background. I very much hope that the NIH can offer a system with equity where any scientists can at least dream about becoming a postdoc and staying in academia. Academy needs an immediate action with equity.

Proven or promising external resources or approaches

No response

Response 659

Perspectives on the postdoc roles and responsibilities

A highly educated and skilled worker that is expected to work independently with pay that is commensurate with level of education and expected work load.

Fundamental issues and challenges

Overworked and poor salaries not keeping up with inflation, especially in high cost of living areas.

Existing NIH policies, programs, or resources

Increased salaries (>50%) to attract or retain post docs. Low salaries in high cost of living areas is detrimental to first generation postdoc or postdoc without familia wealth to offset poor salaries.

Proven or promising external resources or approaches

No response

Response 660

Perspectives on the postdoc roles and responsibilities

I think there is still tremendous value to have a post-doc, with learning a new topic and skills outside of the PhD and creating additional training for a career in academia and industry

Fundamental issues and challenges

Salary and benefits. Post-docs need to be treated as skilled labor positions. Right now, even the NIH salary scale starts just over 50k. This isn't enough to live in most locations in the US, especially if post-docs are trying to support a family and have childcare expenses. A mandate needs to come from NIH to raise the minimum salary to 65-70k and universities need to follow suit. With the current salary it just enough to get by, especially with ever-increasing competition for academic positions. Many just leave.

Existing NIH policies, programs, or resources

Mandated minimum salary. The creation of permanent scientific positons. Funding increases in grant size to accommodate increased salary. Better grant pay lines to enable growth.

Proven or promising external resources or approaches

No response

Response 661

Perspectives on the postdoc roles and responsibilities

For me, the postdoctoral position has meant the opportunity to further strengthen my research background and experiences as well as my track record of publications. My responsibilities are largely focused around project management and the generation of publications from datasets, though more will be coming soon related to data management and analysis. I feel my key need and responsibility in this position is to grow in the science and especially in transferrable skills so that I can contribute to the research body through my own work and through interdisciplinary collaboration in the future. I am learning to manage grants and funding in some ways, but in many ways I am relearning how to be a scientist and how to look at data. I am gaining more statistical training than I previously had and am being stretched in my writing skills.

Fundamental issues and challenges

I believe one of the key challenges inhibiting recruitment, retention and quality of life for postdocs in academic research is funding-related. I turned down a job where I would have made $10k more per year so that I could take this position, and I wouldn't have been expected to put in more than 40 hours per week for that job.

I believe a second and key challenge is related to finding jobs after the completion of the postdoc. While I can't speak for all areas of the United States and higher education, both a PhD and postdoctoral training

mean almost nothing when seeking a job in the current environment. There seems to be very little respect for science in the general population and a general mistrust of our work. There also seems to be a belief that we have 'book smarts' but no common sense or practical skills and abilities. While I and many others in academia know this to be false, we need to get the practical nature of our work out to the general population. There also needs to be a high priority placed on the acquisition of certificates, registrations, or other licensure during the postdoc phase in order to make certain that researchers completing this training and work have avenues to employment in both private and public sectors after their postdoc training. In my current field, I will have few opportunities for work after my postdoc until I complete an additional training that will cost me $10k or more to complete and an additional 6 months of full-time work where I will be unable to hold another job. I am fortunate to have a partner who can support me in this transition, but many others are not.

Existing NIH policies, programs, or resources

Additional funding for training and certification in health-related areas, especially those tied to supportive care such as dietetics and kinesiology would help to improve academic research career pathways. Also allowing dual-enrollment as both a postdoctoral research fellow and as a student in one of those certification/training paths to allow the utilization of resources more efficiently would be helpful.

Proven or promising external resources or approaches

No response

Response 662

Perspectives on the postdoc roles and responsibilities

Gain experience through conducting research in a supervised setting in preparation for an independent research career.

Fundamental issues and challenges

Immigration system makes it challenging to recruit students internationally, particularly when students are often now able to find equally good training opportunities in their home countries.

Existing NIH policies, programs, or resources

Pathway to citizenship for post-doctoral students, particularly those who end up staying in the US as faculty.

Proven or promising external resources or approaches

No response

Response 663

Perspectives on the postdoc roles and responsibilities

For me my postdoc training is about getting additional research experiences that I have not yet had to be able to set me up for an assistant professor job. Specifically, conducting research in a hospital setting/enrolling patients into research who are embedded within healthcare settings, as well as grant development and submission, which I have not had the experience of doing yet.

Fundamental issues and challenges

The primary reason is financial. All other issues (e.g., lack of diverse candidates, retention problems) likely stem from this problem. Postdoctoral training isn't inherently necessary for a successful career, so I believe many individuals bypass it completely for higher paying jobs (teaching, clinical, asst. professorship) or leave as soon as possible for other opportunities that can pay more. The NIH postdoctoral salary is not equal to its equivalent in the medical field (medical fellowships), which pay in the $70,000-$80,000 range. In many areas of the country, ~$55,000 is not sufficient relative to the living wage. Having a PhD/MD (or other doctoral level degree) and in some cases being a licensed provider, one might expect to be making more than what the current postdoc salary is set at.

Existing NIH policies, programs, or resources

Allowing moonlighting and seeking other sources of income if the postdoc salary is not going to be raised.

Proven or promising external resources or approaches

No response

Response 664

Perspectives on the postdoc roles and responsibilities

The postdoctoral position to me is a required stepping stone to achieve a higher position, be it a faculty position or position in industry. My view in grad school was that entering a postdoc means accepting a few years of low pay for an opportunity to gain a faculty position, and I could justify this decision by knowing that I would gain experience that would be applicable my future career. Now that I am nearing the end of my postdoc, I feel I've still gained applicable experience, but now that I am no longer seeking a faculty position, I feel that I've lost a few years of better salary and am in a worse position when it comes to job advancement on the industry side. Talking with my peers from graduate school, few even considered pursuing a postdoc because they could jump start their careers immediately in biotech or consulting, and often times graduate students are burnt out by the time they reach the decision that a postdoc is not an attractive option.

Fundamental issues and challenges

The pay scale for the expected workload is too low, and the perceived outlook on gaining a faculty position feels like entering a lottery. As a postdoc in my third year, despite the amount of outside teaching and mentoring I did and my publication record, because I was relatively unsuccessful in obtaining competitive fellowships (HHW, LSRF, K99), the prospects of a faculty position seemed untenable. I feel fortunate to have a supportive mentor and a thriving institution, but many of those in my position don't get the same type of support. I've seen several labs at my institution struggling to recruit postdocs, and I think the prevailing attitude from many who are running research groups and are no longer at the bench is that young researchers should be grateful for the opportunity to work in their labs. Without institutional change and with better, higher paying job opportunities, newly minted PhDs aren't going to flock to the postdoc position.

Existing NIH policies, programs, or resources

Current career advancement funding opportunities (e.g. K99) often reward trainees that have managed to publish within the first ~1-2 years of their postdoc and/or have been previously funded under another NIH opportunity. This has two detrimental effects on many candidates applying.

1. It reinforces those that have already had success, making it more difficult for those who haven't had early success.
2. The length of time required to apply and go through the review process makes it difficult to actually receive training under the program. In my particular case, I received great comments about the scientific merit of my proposal, but didn't yet have a publication in my postdoc, which was the primary detriment according to reviewers. The option for resubmission of the grant requires months for the next deadline and the review process, which pushed back the "training" period to the point where it was no longer worth it to resubmit. I've heard from several other trainees that the "training" period of these grants ends up in such a late stage of the postdoc that they're already in the process of finding jobs by the time the training period would even begin.

Proven or promising external resources or approaches

No response

Response 665

Perspectives on the postdoc roles and responsibilities

My roles include publishing, mentoring and training research assistances, facilitating/organizing study visits, supervising clinical services provided during study visits, and building my program of research.

Fundamental issues and challenges

Salary ranges are untenable. I have spent 10 years being underpaid for my educational level as a student. I now make $60,000 a year, am expected to work 50 hours per week, and my rent costs $48,000 per year. It is untenable to stay in academia when the cost of living far exceeds what the stipend will cover and working in private practice or industry pays much more fairly. Additionally, my university pays T32 postdoctoral fellows as contractors, meaning taxes aren't taken out of our paychecks. We are guaranteed benefits, as required by the university and the NIH; however, the taxes on our benefits aren't paid by the university. Meaning that my actual take home pay is close to $40,000 a year for 50 hours a week of work—a full $8,000 less than my rent alone. I cannot afford to get married, have a child, or progress in my personal life. I have limited savings, which consists of entirely leftover student loans from graduate school, which are dedicated to an emergency fund. Quality of life cannot be discussed until postdocs are compensated fairly enough to not qualify for food stamps. I am dedicated to my research career and lucky for the privileges that I have to have been able to make it this far in my research career being underpaid and taken advantage of. Remaining in research will completely depend on having my student loans covered through an LRP or similar and a fair increase in pay, benefits, and work-life balance that reflects the 25 years of education I have received. In speaking with my friends who have forgone research careers or post doctoral positions, the answer is simple—industry fairly compensates the decades of work and sacrifice required to complete a doctoral education; NIH does not.

Existing NIH policies, programs, or resources

LRP programs need to be expanded, more widely advertised, and more accessible. Postdoctoral salaries make it nearly impossible to pay off loans while also relocating to a new position and actually beginning a personal life that has been largely on hold for 6 + years of graduate school. Benefits during post doc are non-negotiable and the taxes on those benefits need to be covered, either by an increase in pay or by the universities seeking to retain scientists.

Proven or promising external resources or approaches

Industry provides a pay structure and benefits that make covering student loans and personal expenses (day care, food, rent) reasonable.

Response 666

Perspectives on the postdoc roles and responsibilities

I view a post-doc as a necessary training step toward an independent faculty position. Acquiring training and (more importantly) convincing others that you are qualified are the two main goals.

Fundamental issues and challenges

Independent faculty positions are virtually impossible to attain, making the need for a postdoc virtually pointless. The training may not match what is necessary for other jobs, so those employers might as well hirer younger workers and train them in lieu of training they would have received during their postdoc.

Existing NIH policies, programs, or resources

Forced retirement or lab size restriction (at retirement) are two angles to ease the problem of older PI's who wander the halls like senile ghosts. The NIH has fantastic resources already, so aside from salary increases, these are not entirely relevant. The problem is largely structural and financial.

Proven or promising external resources or approaches

The actual resources given to postdocs are excellent. This is not the problem (unless you are an organization trying to hire them for another job).

Response 667

Perspectives on the postdoc roles and responsibilities

Training to become an independent research

Fundamental issues and challenges

Pay is way too low. Not able to support family or pay off debts acquired during education

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 668

Perspectives on the postdoc roles and responsibilities

There’s not enough perspectives in academia following postdoc positions.

Fundamental issues and challenges

Salary is too low

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase our salaries.

Response 669

Perspectives on the postdoc roles and responsibilities

Postdoc to me was initially a way to develop my scientific vision and leadership to get me ready to run my own scientific team.

Fundamental issues and challenges

Salary are ridiculous.

Existing NIH policies, programs, or resources

Today postdoc mean nothing beside cheap labor for institutions. Most funding exclude non US citizen or Permanent resident which mean exclude the “MAJORITY” of Postdoc in US. Deconstruct the system and rebuild it.

Proven or promising external resources or approaches

More money will definitely help but not only. NIH funded labs should show that they pay all their Postdocs (independently of the nationality) a decent salary.

Response 670

Perspectives on the postdoc roles and responsibilities

Postdocs drive publications, which are critical for a functioning lab. We also train graduate students.

Fundamental issues and challenges

Federal government post-docs do not receive W-2s (we are paid in taxable grants and receive a 1095 instead) and this makes it difficult to do things required to maintain a family, like securing a loan to take out a mortgage or a car loan. It would be better for post-docs to be hired as Research Fellows or paid in another way so that we can do these things.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 671

Perspectives on the postdoc roles and responsibilities

I had a T32 post doctoral fellowship through NIMH. It was incredibly valuable as an experience, and set me up well for the skills that I would need as a tenure-track faculty member.

Fundamental issues and challenges

There were several extremely difficult, and it turns out long lasting problems about my postdoctoral fellowship. The salary was very low and was set by statute. It was too low to survive in the city where I needed to live for the postdoc, so I had to have a second job. Unfortunately, I learned later on that none of the time as a postdoc counted towards my loan repayment public service even though I continued to make student loan payments and was employed. So not only did I live in poverty and have to work two jobs in order to survive, but none of that time counted towards my loan repayment. I have advised others to carefully consider this balance when they decide whether or not to take such a position. The interest on my student loans continued to compound, I continued to make payments, but that time ended up putting me further behind.

Existing NIH policies, programs, or resources

The loan repayment programs are an excellent incentive and approach, but the payment schedule and structure needs to be modified to avoid unintentionally causing harm. Currently, payments are made quarterly, which allows interest to accrue that essentially equals the payments, so the LRP payments end up basically paying interest. While I was a postdoc, and then later, when I had one of the LRPs, the interest accrued on my large amount of student loans faster than I could make any payments to get it down.

My suggestion would be to freeze student loan interest while someone is in a post doctoral position, and for the LRP programs to make monthly payments rather than quarterly, which would allow the amount to actually have an impact. Or pay the total amount all at once, at the end of the year. In my case, the LRP program paid me significant amounts of money that had virtually no impact on changing my total amount of loans because of the way it was dispersed. If it had been dispersed all at once at the end, it would have wiped out a good portion of my loans.

Proven or promising external resources or approaches

No response

Response 672

Perspectives on the postdoc roles and responsibilities

I view it as a way to diversify my knowledge and act as a stepping stone to a higher, long term research position.

Fundamental issues and challenges

I am extremely concerned about balancing having a family and being a postdoc. I know people at NIH who have had to leave because the fact that they could only be in person for part of the week was unacceptable to the PI. I find this is a huge problem in research. We want more women in research, but realistically women are occupied with children for at least the first six months of their life. If after that the woman is unwilling to put their child into daycare, then she is not assisted in finding flexibility. This is a huge problem. We talk about inclusivity, but there is only one apparent option for female researchers, put your child in daycare or it’s unreasonable for you to expect us to help you continue your career. While I acknowledge that not every lab is like this at NIH, there needs to be more institutional guidance to PIs and postdocs about what their rights are when it comes to raising a family. It also needs to be made clear that women with young children need to have more flexible working conditions rather than forcing the woman themselves to just figure it out, which is how everyone I know has done it. NIH has an amazing opportunity to be at the forefront of creating inclusion in the workplace by advocating for diverse working hours and conditions for its female researchers. Finally, while I acknowledge men also need to spend time with their children, young children are generally not as reliant on men as women, especially when women are breastfeeding etc., so typically men are able to continue their work without as much need to completely change their life.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Expand and encourage grants for researchers reentering research after a break due to looking after family or other reasons: https://www.aai.org/Careers/Fellowships/Reentry

PIs should also be encouraged to hire people even if they have had a resume break, especially if they show they have kept up on the literature and developments in other ways

Response 673

Perspectives on the postdoc roles and responsibilities

Postdocs are apprentices to the principal investigator. However, the amount and quality of the training varies and is heavily dependent on the lab / principal investigator.

Fundamental issues and challenges

I am a PhD candidate who will be receiving the degree in 3 months. After consideration and a lot of conversation with industry scientists, I elect to not pursue a postdoc. A big drawing point of doing a postdoc or "staying in academia" is the so-call "intellectual freedom." However, a postdoc researcher is constrained by the direction of the principal investigator which I found to be more akin to a dictatorship. Positions after postdoc in academia are few, competitive and heavily depend on publication quantity and quality.

Existing NIH policies, programs, or resources

I suggest every Principal Investigator who has over 20 years of funding support should no longer be qualified to obtain a grant as the sole investigator. More support should go to enable the career of young investigators.

Proven or promising external resources or approaches

Postdoc should have a fixed time line (< 5 years), mentors beyond PI, union support, and a minimum wage that is enforced.

Response 674

Perspectives on the postdoc roles and responsibilities

The academic postdoc is mainly a way to become a tenure track faculty member. While there are some non-tenure track academic jobs, these jobs ultimately do not use many of the skills gained during a postdoc (such as grant writing and experimental design).

Fundamental issues and challenges

1. As a postdoc, you lose student status and enter the repayment period for student loans. At a postdoc stipend, this would result in needing to pick up a second job just to make ends meet. Because postdoc stipends are lower than comparable industry jobs, and postdocs are often in high cost of living areas, adding the burden of a student loan payment would be financially unwise.
2. After a postdoc, you have gained little career capital if a bid for a tenure-track faculty position does not pan out. Many industry scientists I've spoken to state that most postdocs have no relevance to the modern industrial biopharmaceutical landscape. This makes a postdoc not only low paying, but also high risk.

Existing NIH policies, programs, or resources

Instead of increasing stipends, add a certain amount of student loan repayment assistance to grants. Many industry companies are now adding student loan assistance as a recruitment perk, making an academic postdoc less appealing by comparison.

Proven or promising external resources or approaches

No response

Response 675

Perspectives on the postdoc roles and responsibilities

An opportunity to expand research and leadership skills by conducting self-determined research projects that dovetail from dissertation and establish a foundation of publications and grants that will carry the scientist into a research career.

Fundamental issues and challenges

1. Variation in experiences (i.e. T32 mechanism versus a postdoctoral position within an individual's established program of research, where self determination may be hindered)
2. Low pay

Existing NIH policies, programs, or resources

Increase the wage to keep up with inflation and understand that some potential post-docs have the opportunity to make significantly more money elsewhere.

Proven or promising external resources or approaches

Mentoring is key!

Institutions should consider post-doc professional development curricula (like a T32 generally has) so that post-docs not included in a research Fellowship may benefit from didactics, peer reviews, etc.

Response 676

Perspectives on the postdoc roles and responsibilities

It's a transitional role meant to prepare for the next thing. For me, that includes substantial exploration, skill-building, and networking, alongside building a reputation for research excellence and independence.

Fundamental issues and challenges

Being a postdoc is a pretty bad deal because the pay is low and the prospects of becoming faculty are lower. We are all severely underpaid relative to our skills, education, and value on the industry job market. Many of us are willing to take the pay cut now in order to become faculty later, but that deal is less and less attractive as the competitiveness of attractive faculty positions increases. I think that in terms of hours, pay, and working conditions, the postdoc needs to be a sustainable job in itself, not a sacrifice for the next thing which may not exist.

Existing NIH policies, programs, or resources

Higher postdoc salaries, with more grant funding (and modified budget guidelines) to reflect this. Better training and career development for non-academic jobs.

Proven or promising external resources or approaches

Higher pay, apart from making people feel valued, also helps smooth out life's other difficulties so that one can focus on research. Subsidized housing and childcare can help in expensive cities. The intensity of the PI-postdoc relationship creates opportunities for abuse, so it would be good if postdocs were less reliant on the capricious whims of one individual. This means supporting the creation of a network of mentors, supporting joint or institutional hires (instead of within one lab), oversight on postdoc management. There are very few other jobs where every aspect of your day and your future is dependent on a single person with no oversight.

Response 677

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are mutual agreements between a candidate and a number of PIs. The candidate will receive training and will perform research tasks. During this transitionary period, the trainee will get prepared for higher-level job opportunities.

Fundamental issues and challenges

The number 1 fundamental issue is postdoc pay and benefits. The current postdoc situation in academic institutions is demeaning. Trainees are better off in industrial positions where they can receive a living wage, maternity/paternity leave, retirement contributions, and organized paid time off.

Existing NIH policies, programs, or resources

Realistic adjustment to salary and benefits, reflecting inflation and living costs. Definition of scientists as project staff instead of postdocs.

Proven or promising external resources or approaches

No response

Response 678

Perspectives on the postdoc roles and responsibilities

Ideally, a post-doc should be a short term, single period launching pad to a productive, independent research career. That is not the case now. It is a lottery ticket of a multi-iteration game designed to keep wages suppressed with low probability of long term pay-off for non-stars.

Fundamental issues and challenges

Any PhD or ABD in this pipeline has outside options that pay two, three, four times as much with more stability and healthier boundaries than a modal post-doc job.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 679

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is a transitioning position that supposed to prepare us to be ready to the job market. Postdoc also is the last chance for me to decide whether I should stay in academia or industry.

Fundamental issues and challenges

When a postdoc has family/kids, the life cost is too high relative to the salary.

Work-life balance is really bad, no weekends, no boundary, but the pay is really low

Existing NIH policies, programs, or resources

Career awards like K-99 are restricted to postdocs graduated within 4 years. But most PIs would request postdocs to focus on research/papers rather than grant application at the first at least two years before you can have some publications. Postdocs without U.S. citizenship is put in a very bad position in pursuing independent careers. Wish there are more career awards targeted to non-citizen postdocs.

Proven or promising external resources or approaches

Raise salary base.

Emphasizing mentoring efforts when a PI apply grants, so they would not only focus on publications

Response 680

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 681

Perspectives on the postdoc roles and responsibilities

An academic postdoc is essentially an apprenticeship of 2-5 years to become an independent investigator.

Fundamental issues and challenges

Poor compensation in the countries most expensive markets.

Existing NIH policies, programs, or resources

The NIH can raise the recommended postdoc salary.

Proven or promising external resources or approaches

No response

Response 682

Perspectives on the postdoc roles and responsibilities

I am in a research postdoctoral fellowship. So, my primary responsibility is to conduct research.

Fundamental issues and challenges

Salary. The salary is very low, and prohibits people from minoritized or international backgrounds to accept a position.

Existing NIH policies, programs, or resources

A postdoc’s salary should be higher than what it is now. Also, the salary should be adjusted based on the region someone lives in.

Proven or promising external resources or approaches

It is a well known fact that getting paid more increases job satisfaction, and productivity.

Response 683

Perspectives on the postdoc roles and responsibilities

I was a graduate student who decided to move into industry after graduating despite initially having plans of being a post-doc. My initial impression of a post-doc was as a role that had increasing independence and responsibility to steer research projects as a stepping stone to running an independent research lab. This meant interactions with a supervising PI that were professional instead of infantilizing, some latitude to manage one’s own time and some autonomy in the scientific decision-making process. Unfortunately, what I observed in the lab as a graduate student were 5 overworked post-docs all of whom were regularly belittled by my PI at lab meetings, and whose projects were strong-armed into fulfilling my PI’s vision instead of their own.

Fundamental issues and challenges

The fundamental issue is that the role is a path to nowhere embedded in a zero-sum game. Only a single-digit percentage of post-docs end up as faculty, and faculty—realizing this to be the case—treat them as disposal, since they will soon be exiting the system anyway. The low survival rate is of course not due to lack of ability but lack of funding. Moreover, the pay is atrocious considering the intensity and difficulty of the work, so that only well-off individuals from privileged backgrounds can afford to embark on the tenuous endeavor in the first place. This dynamic largely precludes minorities. Instead of recognizing that poor economics is the source of academic woes, there is also now a misguided diversity and inclusion push, which unfairly funnels promising minority students into a toxic culture in which they cannot possibly thrive in due to financial constraints.

Existing NIH policies, programs, or resources

I left the academic system before I became too familiar with the NIH transitionary process. However, I do know that some senior post-docs in the lab felt largely dejected by the K99 application, as it seemed to really favor academic in-breeding. Relatively unproductive students who came from more famous labs and had references that were highly regarded in their field, did much better than more promising researchers who didn't have some advantages.

Proven or promising external resources or approaches

It would be helpful to have a database like Glassdoor that would serve as a rating system for PIs for prospective graduate students/post-docs to rely on. Despite casting itself as meritocratic, I can't think of any environment where there is such a poor correlation between aptitude/effort/output and career progression. One's career progression is largely dictated by the fickle whims of a single PI.

Response 684

Perspectives on the postdoc roles and responsibilities

A postdoc is a training role that should bridge the transition form graduate school to being a PI or leading industry scientist. It should be filled with mentorship from senior community members.

Fundamental issues and challenges

One fundamental issue is that postdocs are paid relatively low level wages even though they have a terminal degree in their field and could take an industry position for double the money and many fewer hours worked. Another issue is that postdocs often are treated with a double standard in their institutions, they're faculty/staff when it's convenient to the university but trainees when it comes to things like matching retirement benefits. After completing a PhD, most postdocs are already behind in saving for their retirement and then are further penalized when choosing to do a postdoc. Furthermore, the disintegration of the academic workforce, from the day we start graduate school we're told that it's nearly impossible to get a tenure track job and the only way to do it is to spend 5 years as a low paid and overworked postdoc that has no guarantee of an academic job at the end. Finally, it gets tiresome to move around every ~5 years uprooting family and support systems but the expectation is that to get a good job you make at least a few of these big moves.

Existing NIH policies, programs, or resources

The size of R01 grants greatly inhibits increasing postdoc salaries, even when our PIs would like to pay us more, there is barely enough money on one R01 grant to pay a postdoc/research associate and this greatly limits the number of people who can become postdocs or stay as postdocs.

Proven or promising external resources or approaches

No response

Response 685

Perspectives on the postdoc roles and responsibilities

When I moved to the US to undertake a post doctoral position. I was expecting to gain insights on improving my understanding of how to do science, grow my ideas, become more independent, and contribute to a scientific field.

Fundamental issues and challenges

I moved to industry because I no longer felt I was growing as a scientist. I was stifled, under paid, and left with no guidance, and this is in a lab at [redacted for anonymity]! While on a visa it felt like I had to work or else I would lose my status. My advisor did not know how to manage a lab and since I have left he has lost all his post docs and technicians. Industry pays better, I can afford to live in a major scientific hub on the east coast. The work life balance is so much better, I have time to see my family, relax. My science is so much better because I can think clearly. I have obtained more meaningful results in the 9 months of industry then 4 years of a post doc. Within the same field. Yes industry has more money, but the team is better, works better, they don't want to step on you because they want first author. The managers manage teams better, and my voice is heard. Those are things that can be done in an academic lab.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 686

Perspectives on the postdoc roles and responsibilities

I view it as a training ground to become a successful PI. My roles include coming up with a project, develop and test hypothesis, generate data, and publish results. Additionally, I am expected to take up leadership roles, train individuals, mentor students, and write grants and papers. My work also include communicating science to the community or to a wider audience.

Fundamental issues and challenges

One of the major issue is compensation. While, we are expected to work equally or more than folks in industry, our compensation is 2-3 times lower than that industry professionals are paid in the name of profit versus non-profit institutions. While, I understand PIs point on not having enough money to allocate higher wages to postdocs, it is important to allocate more grant money upfront to avoid any negative ripple effects. Being a postdoc definitely feels like a dip in quality of life, when you're no longer a student and you still are paid a meagre salary at the stage of life when you have or are thinking of starting a family. It becomes much more challenging for folks from low income background because it makes no sense for them to continue doing academic research when the alternative is a high paying industry job. Eventually, its not surprising that we end up reaching at a stage with very low representation of marginalized community at the higher levels because at this stage in life your responsibility precedes over passion and drive for science.

Existing NIH policies, programs, or resources

International student and postdocs are not eligible to apply for most of the grants up until K99. This leads to a lack in grant writing training that their peers have and are miles ahead at this time. NIH should remove these restrictions, especially when the driver of research in US are undisputedly the international students.

Proven or promising external resources or approaches

NIH can offer free grant writing courses and mentorship programmes for postdoctoral researchers. NIH must find means to have the PI accountable for their trainees.

Response 687

Perspectives on the postdoc roles and responsibilities

For me the postdoctoral position is the bridge between PhD and junior group leader. It is still a time of training, but more in the way of conducting independent research and taking on responsibilities that a PhD student may not necessarily do (i.e. instead of aiming towards a thesis—you're applying for independent grants/working towards first-author publications/ mentoring students at all levels). The postdoctoral position is crucial in the academic system, as well as important in shaping one's career trajectory.

Fundamental issues and challenges

The likelihood of obtaining a permanent position affects the quality of life of a postdoctoral trainee—there are so many postdocs and so few permanent position that it sometimes feels unrealistic to have both a decent quality of life and a decent chance of getting these jobs. In addition, postdocs are at a stage in life (late-20s/early to mid-30s) where milestones can occur for some people (buying property, marriage, children etc). These milestones are difficult to obtain when the salary of a postdoc is so low (especially after so many years of higher education). In addition, the expectation for postdocs to move every few years for a position is unrealistic if you have other people in your life that you have to consider, and so I can completely understand why many postdocs are not staying in academic research. They can move field and then get paid a fair wage for their research experience, as well as have the job security that one deserves at this stage of life. However, it's a hard decision to make when you've worked so hard to get to where you are now.

Existing NIH policies, programs, or resources

I'm new to the US so I'm not familiar with the NIH policies etc—however I think two things are important for enhancing academic career pathways. There needs to be more permanent scientist positions for people who want to stay in academia. but do not want to go down the PI route. I also think at the highly ranked universities in the US, there needs to be more recruitment of faculty based on teaching ability as opposed to research success. I understand why research success is important for group leaders, but I think having lecturer positions and PI positions sometimes separate allows for more postdoctoral job routes as well as an increase in student satisfaction and engagement.

Proven or promising external resources or approaches

Having a mentor system for postdocs is a great idea, but I'm unsure how that will help with finding a permanent position and improving working conditions.

Response 688

Perspectives on the postdoc roles and responsibilities

A transitional position towards PIs. Responsible for more independent research.

Fundamental issues and challenges

Low income and difficulty to find a faculty position.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 689

Perspectives on the postdoc roles and responsibilities

A postdoctoral research position is a training position in preparation for an academic job, in contrast to a research associate position which is a more long-term stable position. Postdocs are intended to be short and used to pivot into a new area or build new skills.

Fundamental issues and challenges

1. NIH postdoc (and predoc) salaries are WAY to low. Predoc salary should be $35K. Postdoc salary should be $75-100K. And both need to have benefits added on top of those numbers. It's frustrating NIH increased the salary cap this year but left trainees out to dry!
2. Postdocs are directly competing with industry jobs. Most jobs start at 100K+, with numerous benefits. Postdoc positions need to be able to compete with the benefit packages. Present NIH guidelines do not provide funding for parental leave. Most postdocs are at the age of having children. NIH needs to support parental leave directly, e.g., via a supplement or fringe costs.
3. F and K awards are too rigorous and too late to entice students to go into postdocs. Follow NCI and create more F99/K00 awards that transition students from predoc to postdoc. Lower the application barrier for fellowships. Lessen reviewer emphasis on coursework and grades by removing the transcripts from the application.
4. Simplify the visa process for postdocs. Why would any international students take a postdoc with the limited support they receive towards immigration? They can't even return home without fear of never getting back to the US. This needs to change to make postdocs more competitive

Existing NIH policies, programs, or resources

NINDS, NICHD, NIBIB, etc. Need to create F99/K00 awards to transition from predoc to postdoc.

NIH needs to increase payrates SUBSTANTIALLY

NIH needs to add parental leave

NIH needs to simplify VISA process for international students

Proven or promising external resources or approaches

https://www.cancer.gov/grants-training/training/funding/f99

More F99/K00 to provide students a secure transition into postdocs. Allow F32 applications to come earlier as well.

Response 690

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is meant to help PhD grads build out skills & record of deliverables (e.g., grants, pubs, products) for next career steps, whether in academia or industry

Fundamental issues and challenges

Salary—it is extremely low compared to private postdoctoral funding and industry positions. The T32 postdocs are also awful, in that most institutions count postdocs as trainees and NOT employees, disallowing them to enroll in employee benefits (even though the research they do benefits the university). In retrospect, I would have skipped a T32 postdoc and looked for other funding.

Existing NIH policies, programs, or resources

NIH could set better guidance for universities on 2 points:

1. The salary guidelines are a MINIMUM, and salaries should be adjusted for cost of living (even the military adjusts housing allowances for cost of living);
2. T32 postdoctoral trainees should be eligible for employee benefits;
3. The tax burden of T32 should be compensated for (since T32 postdocs are taxed on health insurance, etc., but that is not income going into my pocket)

Proven or promising external resources or approaches

Duke's policy on dealing with the postdoctoral stipend tax burden: https://postdoc.duke.edu/policies-and-forms/faq-duke-postdoctoral-policy

Response 691

Perspectives on the postdoc roles and responsibilities

The role of an academic postdoc is to develop the skills necessary to transition to becoming an independent scientist. Just as important, the postdoc should be acquiring the particular and specialized skills necessary for their future career goals, whether that be in academia or elsewhere.

Fundamental issues and challenges

The main challenge for me as a postdoctoral trainee is the monetary compensation. Although I understand this is a trainee position, postdoctoral trainees have highly specialized skills that come from immense training/education. I believe that postdocs are fundamentally not compensated enough for those skills. Also, I believe that the amount of time someone is expected to stay in a postdoctoral position is too long, especially when it comes to apply for academic positions. This furthers the compensation issue and ultimately creates a class disparity where only those who can afford to be a postdoc for an extended period of time are the ones applying for those positions.

Existing NIH policies, programs, or resources

I am happy that the NIH sets standards for postdoctoral compensation. However, I believe there should be an adjustment based on cost of living in that region.

Proven or promising external resources or approaches

No response

Response 692

Perspectives on the postdoc roles and responsibilities

A transition role into PI position where experiences in grant writing and mentorship are the key skills to acquire

Fundamental issues and challenges

Pay, living standard, lack of mentorship from PI, unrealistic and overemphasized publication record

Existing NIH policies, programs, or resources

NIH needs to support people and to offer more workshops on alternative career paths other than postdoc and academia, which would reduce unnecessary competition, and encourage more diverse choices of personal development.

Proven or promising external resources or approaches

Increase pay, increase funding and rights for Postdoc association

Industry partnerships: Partnerships with industry can provide postdoctoral researchers with opportunities to gain experience outside of academia and develop skills in high demand in the private sector. NIH could explore ways to facilitate these partnerships and promote collaboration between industry and academic researchers.

Response 693

Perspectives on the postdoc roles and responsibilities

If supervised under right manager and advisor, good way to gain more practical perspectives on applying to grants, utilize resources and in-depth training for specialized topics. But in most cases, it is a way to gain cost-effective and exploiting social hierarchy for advancing advisor’s research not much benefiting the trainee itself.

Fundamental issues and challenges

People do not want to do postdocs because it is portrayed as imbalance of work-life, low-pay and high stress which is mostly true.

Existing NIH policies, programs, or resources

Proper compensation, respect to post-doc's personal life and equal opportunity

Proven or promising external resources or approaches

No response

Response 694

Perspectives on the postdoc roles and responsibilities

It seems to be a rigorous training to prepare scientists for faculty positions, although many do not end up as PIs.

Fundamental issues and challenges

I think that the low salary (compared to industry jobs) is a big factor preventing recruitment. And low turnover to faculty position.

Existing NIH policies, programs, or resources

More grant and mentoring opportunities, higher salary.

Proven or promising external resources or approaches

No response

Response 695

Perspectives on the postdoc roles and responsibilities

Training position in which to carry out an independent research project aiming to start a line of research to follow up as an independent researcher after the postdoc. Specific responsibilities other than research include mentoring younger generations of scientists, teaching, and participating in peer review and publishing/presenting research in scientific journals, conferences and public engagement.

Fundamental issues and challenges

Non competitive salaries, unpaid extra hours, lack of benefits (ie retirement), lack of stability, limited opportunities in academia after the postdoc, extreme competitiveness leading to mental health problems. Occasionally difficulty to report/confront supervisors with abusive behaviours or unhealthy work environments.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 696

Perspectives on the postdoc roles and responsibilities

As a 5th year doctoral candidate currently seeking a post-doc position, a post-doc position is a transitional position meant to prepare me for independence in academia by becoming an expert in my research area. I also hope to gain skills in thinking independently and critically.

Fundamental issues and challenges

I am very concerned with the salary of a post-doc position. Because it is capped and does not flex with cost of living/location, I feel forced to consider positions only in areas with reasonable costs of living. For example, I have the opportunity to interview for a postdoc position at [redacted for anonymity], but I don't believe my 2-income family (husband and I) could live comfortably, nor would we be able to afford to start a family. Starting a family is also a concern. There are not reliable policies protecting people who become pregnant from discrimination, there is not guaranteed maternity leave, or affordable child care options, and I'm worried that any health care I can afford may not be a good enough health care plan to even cover the healthcare costs associated with pregnancy and birth.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 697

Perspectives on the postdoc roles and responsibilities

I think clear hours & time commitments should be set upon hiring. Obviously science experiments don't adhere to a 9-5, but is this a 40h/wk job or a 60h/wk job? Either is fine if we are told clear expectations upon hiring. If I come in late at night or on the weekend to prep mice or take time points, I should be able to leave early another day in the week with out guilt.

Fundamental issues and challenges

Clearly the biggest hinderance is salary. We have PhDs and are paid like those with B.S. If a PhD goes to industry their starting salary is $85,000.

Existing NIH policies, programs, or resources

Better advertisement of training programs. I was already in my second year when I found out about and applied to a K12 at my institution.

Proven or promising external resources or approaches

Subsidised child care programs would be extremely helpful.

Response 698

Perspectives on the postdoc roles and responsibilities

To me, a postdoctoral position is a training period in which the trainee prepares for an independent career in academic research. As the trainee should already be a proficient scientist, this period of training should include a focus on

1) Managing a research laboratory,
2) Navigating the teaching and service responsibilities at an academic institution,
3) Acquiring extramural funding, and
4) Building the preliminary data necessary for a research program.

Fundamental issues and challenges

As a postdoctoral trainee, I am in a difficult position of wanting to pursue my own research areas and establish my focus, while having to worry about where the money comes from to pay for the experiments. My focus is outside of the purview of my mentor, so it is not appropriate for me to have her pay for my experiments when they are not working towards the aims of her grants. Another difficulty is that the postdoctoral compensation is low, considering how the time commitment is often longer than 40 hours every week.

Existing NIH policies, programs, or resources

Placing a term-limit for postdoctoral fellows would enable them to progress quicker.

Proven or promising external resources or approaches

No response

Response 699

Perspectives on the postdoc roles and responsibilities

Postdocs are professionals who need additional training to show their ability to drive biomedical research forward with less input than they received during their graduate school careers.

Fundamental issues and challenges

- The availability of funding is an issue. With low funding rates, only large academic/research institutions are able to recruit postdocs effectively.
- The time spent as postdocs is too long with the average postdoc spending 7 years in training.
- The pay is low making it challenging to have a family and train at the same time.

These factors contribute to scientists choosing alternate career paths to stay away from the academic path.

Existing NIH policies, programs, or resources

Postdoctoral training should be planned in a manner similar to physician training. All postdocs could spend a mandatory 3 year training period to show they can do the science and publish papers. Additional years can be made optional for those wanting to write grants (R00, K awards, among others).

Proven or promising external resources or approaches

No response

Response 700

Perspectives on the postdoc roles and responsibilities

I see postdoctoral position as the bridge to faculty postion. Fresh PhD have enough exposure to research but at postdoctoral stage we learn how to be more independent in terms of writing the grants or manuscripts persay. This training is very crucial for the future for any researcher who wants to pursue research in their future be it academic or industrial research. Networking is another crucial part of any postdoctoral postion where a researcher should initiate the collaborations and build their own niche for the future research.

Fundamental issues and challenges

the first and basic challenge every postdoc faces is the salary differences. Not all the universities pay the NIH scale, whihc is really sad, as NIH is the authority who should keep close eye on this mater. Specially when a grant comes to review they should check the proposed salaries of the researchers going to join in the projects. Second major challenge in any postdoc researchers life is the transition to faculty postion. The fact is known to everyone the ratio of successfull transitions in academia. Due to these two major constrains the academia looses brilliant researchers even after putting so much efforts in their training. The time and resources invested in the postdoctoral training is immense, there should be policies to retain quality researchers engaged in the field.

Existing NIH policies, programs, or resources

There should be more scope for funding opportunities for researchers on Visas, this will nbot only help to retain them intersted in the acadmic research but also will be fruitfull for the NIH and universities to pursue hihg quality research.Their should me more opportunites to give administration training to postdocs which will help in their future PI roles. another crucial point is the human resource management training, this is the well known fact that not every PI is good in human resource management because they never got formal training for the same. There should be more focus given to these activities to groom the postdocs in prospective PIs.

Proven or promising external resources or approaches

If we consider the worklife balance, visa issues, better training for administration and grant writing. I think the training ecosystem will florish and evreyone will be benefited.

Response 701

Perspectives on the postdoc roles and responsibilities

Postdocs are the lynchpin of successful research labs and successful careers. The postdoctoral role offers a key time of training and development towards independence that sets researchers up for success in

running their own labs. They are often the drivers of innovation in the lab, supervising junior staff, and innovating methodologies.

Fundamental issues and challenges

Postdoc salaries have lagged far behind industry salaries. Especially since postdocs are often at an age where they are starting families, living at near-poverty wages is not an option. NSF postdoc salaries have better kept pace with these trends (NSF SPRF salary = $65,000 ; NIH NRSA salary= $56,484). Outdated family leave policies also make it difficult to retain postdocs, especially women and people from under-represented backgrounds.

Existing NIH policies, programs, or resources

1. Increase postdoc stipend base levels to at least the NSF standard: $65,000, with potential automatic supplements for those in high cost-of-living areas.
2. Increase family leave to 16 weeks rather than 8 weeks. Since leave time comes out of the budget of training and research grants, family leave also means a shorter time in training/research, which penalizes the postdoc taking leave. Grant "family leave supplements" to make up the difference in training & research time. (e.g. A postdoc has a baby and goes on maternity leave for x weeks--allow the PI of the grant that funds her to automatically supplement the budget with x weeks of salary)

Proven or promising external resources or approaches

No response

Response 702

Perspectives on the postdoc roles and responsibilities

When I stated I loved being a postdoc, loved my projects and everything. But over the years this changed, see issues below. On a personal level it was very hard as well, not being a resident or citizen I was mostly dependent on my PI's finding funding, if not I would have to leave the country, this was very stressful. I decided not to become a PI after seeing all the issues my PI's had with getting NIH funding, I just didn't want to put this pressure on my potential postdocs and myself. Since it's not just a job in this case you are involved in someone's living situation and potentially their whole family if they brought them over from a different country.

Fundamental issues and challenges

I believe the fundamental challenges inhibiting recruitment and retention are the huge disparities of benefits and wages in comparison to for example industry jobs. My University for example does not contribute to my 401K which puts me at a huge disadvantage compared to for example graduate students that move into an industry job right after completion of their PhD. Also wages are still too different to make postdoc positions a great choice. I love working in Academia but these issue make me want to leave. Also the possibilities for Postdocs to get promotions are so limited. Not every postdoc can be a PI and Instructor and Staff scientist positions are again not paid really well.

Also the NIH puts out yearly suggestions for wages, which raise on the minimum level as well as on the experience level. At my institution, I had to beg my PI to be moved up on the salary scale based on my experience though, and even then sometimes this is being questioned by admin staff. It's just not a great work environment.

Existing NIH policies, programs, or resources

- Make pay scale mandatory for all postdocs otherwise no NIH funding anymore for the lab
- Make universities contribute to 401K's
- New job opportunities for postdocs that want to stay in academia but didn't make it or don't want to be a PI
- More funding available for non-residents/non citizens (especially since more than 50% of postdocs do not fall into this category)

Proven or promising external resources or approaches

No response

Response 703

Perspectives on the postdoc roles and responsibilities

A postdoc is primarily responsible for conducting research that will allow them to pursue a career as an independent scientist, either at an academic or non-academic institution. To that end, they should have more independent autonomy over their research project than a graduate student, while still contributing to the overall themes of the lab of which they are a part. Additionally, postdocs should be allowed and encouraged to take the research project they develop with them, to pursue as they see fit as independent scientists later on. Supplemental to their research, postdocs should be expected to mentor younger students in the lab. Senior postdocs especially should be viewed as experts (not trainees), partly responsible for guiding the instruction of more junior members of the lab.

Fundamental issues and challenges

Postdocs should be paid a fair salary equivalent to someone that has successfully completed graduate-level education. Currently, postdocs are dramatically underpaid, considering that many of them are acting as field experts in their labs, contributing new skills and expertise to their labs which would not otherwise be possible. Additionally, postdocs are often neglected by their PIs in terms of mentorship. While postdocs are no longer trainees, they still deserve and require instruction on how to develop independent research programs or how to pursue careers outside of their current lab. PIs are an integral part to postdoc career development and can often make or break the success of postdocs following their tenure in the lab. It is integral that PIs be judged on not only their science, but also their mentorship capabilities when it comes to promotions/grant funding, as often that aspect of their role is neglected, resulting in poor working conditions for the members of the lab.

Existing NIH policies, programs, or resources

Payment, mentorship resources, career development resources, training/instruction for new fields of work/technology, financial literacy classes, grant writing seminars, basically a "how to" course for running an independent research lab, faculty interview advice/workshops, training in how to give a talk/how to teach, mentorship courses, teaching pedagogy training, DEI workshops (i.e. how to practice inclusive science, integrate diversity into the lab environment, and prioritize inclusive hiring)

Proven or promising external resources or approaches

No response

Response 704

Perspectives on the postdoc roles and responsibilities

I see the biomedical postdoc as a chance to learn how to become an academic PI without the responsibilities of managing people or finding funding. I am able to devise and execute projects with some guidance from my mentors

Fundamental issues and challenges

1. No health insurance coverage provided by the university for postdocs on fellowships
2. No opportunities to offer even slightly critical feedback to mentors
3. No integration into the larger university or department (no participation on thesis committees, limited access to graduate or student affinity groups, little interaction with faculty or other postdocs in the department)

Existing NIH policies, programs, or resources

Require universities that accept NIH funding to provide university-subsidized healthcare and childcare to their postdocs (even those postdocs on NIH fellowships) Prohibit universities from taking money out of a postdoctoral fellowship's research budget to use on their healthcare. Ensure that universities employ more academics than administrators

Proven or promising external resources or approaches

No response

Response 705

Perspectives on the postdoc roles and responsibilities

I consider postdoctoral training to be an opportunity to develop the scientific basis for my independent research program, acquire soft skills in management, budgeting, negotiation, and mentorship, and gain exposure to additional research topics and techniques of interest. When I was a graduate student, my PI encouraged me to apply for the DP5 award, but I declined largely because I felt that a postdoctoral training period would be to my professional and personal benefit. I do think that responsibilities are largely determined by the PI, and I definitely sought a position that would give me more experience in management and mentoring than in hands on benchwork simply because my eventual goal is to be a PI and I think practicing those skills now is key.

Fundamental issues and challenges

There are several major challenges to the traditional postdoc. First, there are very few prospects for eventual success as a tenure-track faculty member, which is problem difficult to address. Second, the payscale for postdocs is very poor considering the qualifications and skills which they bring to the table. In fact, my take home pay is only marginally more than it was in graduate school as a Ph.D. student because of increased taxes (no longer a stipend!) and cost of health insurance. This leads into my third major challenge in postdoc recruitment and retention which is categorization of postdoctoral trainees as neither fully trainee nor fully employee at many institutions. At this point in their career, a Ph.D. has the highest degree available and expertise in a particular subject with valuable experience and skills that are highly sought in various industries and markets, yet in academia they are excluded from many of the resources and financial "breaks" offered to student trainees (training, events, tax breaks, free health insurance) AND the benefits of full employment offered to any other full-time working member of the university (such as retirement benefits, reasonable health insurance rates, commuter benefits, etc). For example, I turned down a postdoctoral position with an top tier university because I could not afford the health insurance ($1200 monthly for myself and my child). I was able to get employee status elsewhere where I pay about $300 monthly for equivalent health insurance and I also receive retirement and commuter benefits—all of which are unusual for postdocs. What are postdocs—trainees or employees? Leaving categorization up to universities has lead to fuzzy definitions. These issues encourage brilliant scientists to look elsewhere for jobs that offer better salaries, benefits, and job stability.

Existing NIH policies, programs, or resources

Standardizing the definition of a postdoc to require universities to label them as employees would make a huge difference since this would qualify a full time postdoctoral scientist to receive employee benefits that improve quality of life. Limiting the number of years a postdoc can spend in such a position would be great (some universities already do this) with the one exception being that those who cannot acquire a tenure track faculty position within that timeframe should still be given opportunities to achieve this later on without being viewed negatively. Increasing the NIH payscale, which was recently done, helps as well, although I will also concede that most people choosing to continue in academia are not doing so because they prioritize good pay. While the pay will likely never be comparable to other career paths I do think it is possible and beneficial to increase this when possible.

Proven or promising external resources or approaches

I think that the fact some universities and hospitals label their postdocs as full employees makes a huge difference in recruitment and job satisfaction. I recently had a baby and was able to take full time employee maternity leave, which ended up being 13 weeks of leave (11 paid). I have retirement benefits. I save money every month by using commuter benefits. I pay a reasonable sum for health insurance for my family. Although I am not paid as much as I could be in many other positions and would certainly appreciate any increase in pay I could get, I am passionate about being in academia and very satisfied in my job knowing that I am doing what I love and still finding a reasonable balance between my career goals and providing for my family. I would be in a bad place if I had to choose between my career goals of staying in academia and making enough money to support my children, so I'm incredibly grateful I have

found the position where I am. All of that is made possible largely because I'm an employee and not a trainee (but not really a trainee) category.

Response 706

Perspectives on the postdoc roles and responsibilities

Postdoc provided me with the opportunity to get additional specialized training to prepare me for independent research that I was not able to obtain earlier/in grad school--I got training and mentored experience in developing grant proposals and conducting large NIH-funded grants.

Fundamental issues and challenges

Pay. The pay is fixed/typically non-negotiable and generally less than 50% of what private practice or industry jobs.

Existing NIH policies, programs, or resources

Increasing the stipend for T32s and other NIH set paylines to make the pay more appealing

Proven or promising external resources or approaches

No response

Response 707

Perspectives on the postdoc roles and responsibilities

An opportunity to develop my own expertise and independence as a researcher and expert. I stepped away from a higher-paying job that felt like it would not give me the same long-term opportunities as being a post-doc and gaining greater skills and recognition.

Fundamental issues and challenges

Pay.

Even on a non NIH-funded post-doc, my institution ties salary to the NIH scale. I took a pay cut to do the post doc, and did not get benefits like retirement contributions. Thank goodness it was only for 2 years. I would not have done it if it were for a longer time. After doing a PhD (no income), I am entering the workforce later than my peers and can't afford to sacrifice more years of earnings and retirement contributions.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 708

Perspectives on the postdoc roles and responsibilities

Postdocs are the scientific and creative engines of a lab. They plan, execute, and interpret the results of experiments. In most cases postdocs are the primary authors of grants which are often submitted without their attribution and are funded in their PI's names. In almost all cases postdocs also serve as the direct scientific mentors of junior scientists such as graduate students, undergraduates, and some technical staff. In many cases, postdocs take on classroom teaching roles, either to develop their own careers, or out of necessity to earn enough money to live off of. The idea of postdocs as extensions of one's scientific training has not been anywhere near true in the United States for decades. The US has some of the longest graduate programs in the world to receive a PhD, and at the ends of these programs, we essentially have scientists who are entirely capable of independently designing and running their own research enterprises with only a minimum of administrative support. However, due to the structures of academic research, most postdocs are forced to accept positions which essentially have all of the scientific responsibility of junior faculty without any of the rewards.

Fundamental issues and challenges

When I graduated from the top program in the world (at least in my field) I essentially had two options: accept a postdoc at a prestigious institution in a high-cost-of-living area paying the NIH minimum (54k a year), or accept a senior scientist role at a large biotech company (150k a year plus benefits and stock compensation equating to an additional >$75k a year). The choice was trivial to make. Until compensation of postdoc scientists (the term "trainee" is frankly an insult to the expertise of US-trained PhD scientists) reflects their value, academia will continue to lose talent to the private sector.

Existing NIH policies, programs, or resources

If the NIH is serious about postdocs remaining in academia, K grants need to be funded to greater degrees, provide for higher compensation for postdocs, allow for hiring or technical staff/compensation for graduate/undergraduate workers, and pay for administrative/other indirect costs associated with the funded research.

Proven or promising external resources or approaches

1. Fund the postdoc not the PI. Existing funding programs need to follow postdocs wherever they decide to pursue their research and should not be paid directly to the PI of a lab. Doing so restricts mobility, decreasing bargaining leverage, and continues to expose highly trained scientists to exploitation from PIs who have essentially become middle-management.
2. Increase NIH minimums by a minimum of 2x, with an additional adjustment for Cost Of Living. Biotech hubs are concentrated in High Cost-Of-Living areas in the country, leaving many postdocs with far less than a living wage.
3. Support efforts of postdocs to unionize. Collective bargaining is an avenue by which postdocs have a fighting chance of obtaining safe working conditions, fair compensation, and increased decision making power.

Response 709

Perspectives on the postdoc roles and responsibilities

Postdoc is the role in which I can focus on 100% of the research that I'm interested in. In the meantime, I can get more interaction with collaborators and funding agencies. I will learn from my PI how to run the lab and balance work/life.

Fundamental issues and challenges

1. Low salary, especially in [redacted for anonymity]. The rent, daycare, and living expenses in [redacted for anonymity] makes postdoc salary unsustainable.
2. Need affordable daycare and school for kids.
3. Need more opportunities with non-academia jobs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 710

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should be an opportunity to work in a well-known lab and gain experience in the chosen field of study. It should ideally be limited to a total of 3 years, sufficient time for the researcher to decide and pursue the future direction—research in industry, a faculty position in academia, something completely removed from research (such as scientific writing, patent, regulatory, clinical), or even a further degree (such as an MBA). During a Postdoc the researcher should be able to publish at least one scientific paper and take on a role in collaborations within and outside the lab. The researcher should also given the opportunity to practice public speaking and networking by attending scientific conferences.

Fundamental issues and challenges

The main problem is money (obviously). Even a Postdoc needs to have sufficient funding to scrape by. By the time somebody starts a Postdoc this person is in their early 30s which is a time where you want to start a family and are not willing to live like a student any longer. A Postdoc salary should be sufficient to cover basic expenses which varies greatly depending on the location. For instance you can survive on 60K annually in the Midwest, but not in Silicon Valley. With ample of Biotech jobs around it is not surprising that folks are quitting their role after only 1 or 2 years into their Postdoc as they get an attractive offer from industry. The second problem is increasing wokeness of the institutions in academia, even in STEM fields and the negative impact it has on Postdocs and other researchers in the lab. There are so many trainings required now by the DEI departments that it pushes people out. In industry you take a job and can easily work your way up very quickly (speaking from my own experience here) while academia is very slow to progress you in your career. The third main problem is today's publishing culture. Of course the PI wants you to publish in a top journal where the requirements are so intense that it is almost not doable. The young researcher spends long hours trying to fulfill all the requirements demanded by a top journal, thus sacrificing their health and personal life. On top of that the PI is required to pay top $ to get the paper published. Another problem is the long work hours required to gather enough data for publication. Folks simply burn out quickly that way.

Existing NIH policies, programs, or resources

More salary for Postdocs, needs to be adjusted to cost of living in the area. More realistic expectations when it comes to publishing.

Proven or promising external resources or approaches

more oversight over mentoring quality of the PIs. Not every excellent scientist is a good mentor.

Response 711

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

WIth regard to retirement benefits, many PhD students are not aware of the sacrifice that they are making when starting their programs. Giving up on five to six years of wealth building is already a tremendous detriment on scientists ability to one day retire. It is therefore shocking to me that postdocs, after making such sacrifices during their PhD work, are not offered retirement benefits at most institutions. In fact, at my institution, postdocs are specifically excluded from the generous retirement benefits that all other university employees enjoy. With postdocs taking longer and longer to complete, I am deeply concerned about the future financial well being of postdocs in the US.

We also cannot discount the effects of low wages for postdocs on recruitment and retention. At most institutions the NIH minimum salaries are viewed not as a baseline, but as a hard set payscale that cannot be deviated from. This payscale is weaponized against postdocs seeking a raise, and we are told that it is unfair for us to be paid more than other postdocs who are on this scale. Entrenched and senior scientists who have owned homes for decades and are shielded from the worst effects of inflation simply do not understand that a salary in the 50-60k range is not a middle class salary in modern times. This is enough to get by, but not enough to move into the stage of life where we can think about starting a family or owning a home, or otherwise build wealth. Given the skill sets that we have developed in our PhD work, it is unsurprising to me that so many postdocs are leaving academia for other positions that offer real salary and benefits.

Existing NIH policies, programs, or resources

Here are my suggestions for NIH to improve the situation of postdocs:

- Allow institutional allowances for F grants to be spent on retirement benefits for the fellow.
- FORBID institutions receiving NIH funds from excluding postdocs from university benefits that other staff receive.
- Improve pay scales and encourage well funded labs to pay postdocs more, perhaps some kind of matching system?
- Provide more incentives for postdocs to get fellowships, which are usually neutral or even financially detrimental for fellows (but not the PIs!)

Proven or promising external resources or approaches

No response

Response 712

Perspectives on the postdoc roles and responsibilities

training to perform independent research with high impact publication for career development.

Fundamental issues and challenges

1) Income is too low to recruit the best phd students.
2) To get an academic job (tenure track), a postdoc need to publish high impact journals (CNS level) despite the open access or Elife movement , so most likely need to join a HHMI or well-established reputable laboratory. These labs are most likely with a few dozens of trainees, the PI most likely provide limited mentorship but a lot of research resources. So many future PIs will run their labs in a similar format like their mentors, so proper postdoc training is hard to propagate.

Existing NIH policies, programs, or resources

We need to have a particular minimum salary limit to provide livable condition, especially since some of the locations are very expensive. And need to require the large grantee (mentors) to take training on how to mentor postdocs.

Proven or promising external resources or approaches

Should allow trainee to apply private funding on top of the NIH fellowship to supplement their research and salary.

Response 713

Perspectives on the postdoc roles and responsibilities

I have viewed my postdoctoral experience as a time to gain needed skills, establish myself as an expert in my field (e.g., through publications, presentations), and network in order to secure a PI position. I view myself as supporting my mentor’s work while separately pursuing and establishing my own line of research independent of my mentor. Early in my postdoc, I viewed my role primarily as a learner of materials and methods that I will use during my career. Now that I am more advanced in my postdoc, I serve in a supervisory role and provide guidance to the more junior members of the lab. I also have more administrative responsibilities on our projects (e.g., coordinating with study staff, budgeting, etc). This has helped me to develop administrative, mentorship, and “people” skills. I feel this has been a good pathway for development, particularly as I am interested in a PI position as the next step. My responsibilities vary widely depending on the week, but at this point, I see little difference between my responsibilities and those of my PI.

Fundamental issues and challenges

The biggest fundamental issue that I have faced, other than substantial COVID-related career setbacks, has been in channeling my postdoctoral position into a PI position. The job market is tough and securing a position is almost entirely luck and timing once you reach the PhD level. Postdocs are people too, and

many of them have families. The thought of moving everyone in my family for the third time in ten years for a job across the country exhausts rather than excites me at this point. With that in mind, the biggest issue I would say is the toxic competitive mindset that forces mentors and institutions into encouraging postdocs to seek employment elsewhere. Retaining talented postdocs as PIs and helping them to develop independence at the institution they received their training should be a goal. Think of it as someone getting an internal promotion instead of constantly being forced to look elsewhere to even be considered. This issue is especially frustrating as academic postdocs are not getting paid nearly enough. Seeing no opportunities for advancement while not getting paid enough is a poor combination, and many postdocs I know are leaving academia entirely because of it. I am strongly considering a non-academic next step myself, with my lack of interest in moving as the biggest motivating factor.

Existing NIH policies, programs, or resources

Grants or programs other than the K99/R00 to aid in successful transitions to a PI position should be available to postdocs from all backgrounds and institutions. So much of a successful transition lies in knowing the "right people" at the right time, which is getting harder to do with things moving to a virtual platform. Further, those from less privileged backgrounds or whose mentors have limited experience (e.g., early career mentors, those who have only worked in government) are less able to navigate the transition successfully. The K99/R00 is not an entirely opaque process either, with some well-scoring candidates not being awarded due to criteria that are not laid out in the RFA.

Proven or promising external resources or approaches

No response

Response 714

Perspectives on the postdoc roles and responsibilities

Postdocs are essentially journeymen, treated as high skilled, poorly compensated laborers with limited prospects for career advancement.

Fundamental issues and challenges

Pay is poor, most institutions deny full access to benefits, career prospects limited, no advantages gained in the role for careers outside of academic track.

Existing NIH policies, programs, or resources

Shrink gap between high level PI pay and postdoctoral pay. Force institutional compliance with a minimum benefits standard.

Proven or promising external resources or approaches

Maybe just let people leave.

Response 715

Perspectives on the postdoc roles and responsibilities

The postdoc is an opportunity to receive additional training not received during graduate school. This includes new research techniques, grant writing experience, teaching experience, mentoring experience, project design, etc. Postdocs are fundamental to lab success, generating publications, generating important data for grant applications, mentoring students, and other less appreciated tasks (e.g. managing IACUC or IRB protocols, lab websites and social media pages). People who provide such valuable work to the scientific community should be treated and compensated as such.

Fundamental issues and challenges

The postdoc salary and benefits are inconsistent with the postdoc's level of education and expertise. For someone with a PhD that is an expert in some field of science, they should be compensated well enough to afford to buy at least a 1-bedroom house, at least 1 car, and be able to support at least 1 other person or pet in the city or metro area where they work. The NIH minimum salary for postdocs does not reflect this level of compensation. In the U.S., cost of living since the pandemic began has rapidly increased, and the NIH has not acted swiftly enough to keep up.

Existing NIH policies, programs, or resources

All NIH grant applications should be simplified and streamlined, but the NIH consistently tries to make applying for an award more difficult and burdensome for the applicant. This is particularly challenging for those with the least grant writing experience, negatively affecting postdocs. This also disproportionately negatively affects those from disadvantaged backgrounds like under-represented minorities.

Additionally, to support postdocs, the NIH should create a postdoc supplement for ALL R level grants (including R00), allowing additional funding for 1-2 postdocs per award to cover cost of living expenses. This will allow labs to have enough funding to more competitively recruit and retain postdocs without compromising the quality of work of the original R award. Maybe you can call it a housing supplement to support paying a mortgage or rent, in urban areas.

Proven or promising external resources or approaches

Other agencies such as DoD and NASA provide higher minimum postdoc salaries than NIH does.

Response 716

Perspectives on the postdoc roles and responsibilities

As a postdoc my role is designing and conducting experiments that help answer complex questions in the scientific field. As a more senior member of the lab, I also see my role as a mentor to graduate students and undergrads.

Fundamental issues and challenges

The main fundamental hurdle for continuing as a postdoc is the cost of living. The salary of a postdoc has not changed in proportion to inflation and it is becoming increasingly harder to convince myself to stay in academia when there is a higher paying job in industry.

Existing NIH policies, programs, or resources

More training, and more resources.

Proven or promising external resources or approaches

No response

Response 717

Perspectives on the postdoc roles and responsibilities

Responsibilities include bench research, grant writing, lab management, science communication, establishing collaborations, mentoring junior scientists.

Fundamental issues and challenges

Low salary, bad work-life balance, no or limited sense of belonging in the institution, not enough tenure-track positions available

Existing NIH policies, programs, or resources

Increase payscale, increase funding for career development grants, favor industry-academia exchange. More funding for early stage R type grants.

Proven or promising external resources or approaches

No response

Response 718

Perspectives on the postdoc roles and responsibilities

A postdoctoral position uses our vision and passion to take them to the next level in academics. If someone is shining good in this then he/she would have a better life in future.

Fundamental issues and challenges

The fundamental issue with postdoctoral training in academia is the mentor-mentee relationship. Most of the mentor is not guiding the student in the proper way. Hence, this could restrict them from future opportunities.

Existing NIH policies, programs, or resources

NIH policies are good, but the institute and mentors implementing those policies are not so good. For example, the salary. The NIH has some postdoc salary regulations, but the institute and mentor do not follow them. They always wants the cheap labor to carryout their work.

Proven or promising external resources or approaches

The NIH must intervene in this salary dispute.

Response 719

Perspectives on the postdoc roles and responsibilities

A postdoc is supposed to be a time where you are mentored and are able to explore your research interests without being used and disposed of like a piece of lint. It should be a time where you are allowed to grow and not have to feel like your PI of the lab is competing with you.

Fundamental issues and challenges

Everything. Let's start from the actual science. You are not given the bandwidth to do actual research, rather you are used as free labor. Second, many mentors do not support the trainee at all, in fact, they compete with the trainee and make them write grants, etc. and not get any form of recognition. If I knew what I know now, I would have never been a PhD scientist and gotten into medicine and did a research fellowship. Lastly, you are constantly told false information about the glamor associated with being a postdoc, however, the vast majority of research is not repeatable and is nonsensical. Does not have any impact on the ordinary lives of John and Jane Doe.

Existing NIH policies, programs, or resources

Postdocs should be given the opportunity to apply for funding under their own name, and not under the PIs name. The latter has put me in situations whereby I have written multiple grants for the PI and we secured close to $5 million in less than 4 years, yet I am being paid at 0.5 FTE. When you let your grievances known to authorities like HR, ethics, compliance, etc. then you are put in a position where they cannot do anything because NIH deemed the PI as the only entity who is key personnel. Then what happened to the other key personnel in the grant application?

Proven or promising external resources or approaches

I think there should be a limit on how many postdoc positions in the country. NIH is not here to help facilitate better opportunities for these individuals. It is best to either go into industry or build a consulting company. The biggest thing NIH can do is to reset what a postdoc is supposed to be. Redefine that and then move forward with whatever plan you have. But as long as you have the good old boys club intact, then forget about any resources you want to put towards a problem that is not fixable. Money does not resolve anything, change the mindset.

Response 720

Perspectives on the postdoc roles and responsibilities

My personal view is that the academic postdoc is obsolete. Originally it was a short-term training position that prepared scientists for a lifelong career in academic research. Nowadays it is just a source of cheap labor for labs. The position is focused on executing the research plan of the PI/lab head and providing training and direction to graduate students, technicians, and other students. Unless the post-doc has independent funding, they typically will not be allowed to pursue their own research which defeats the purpose of the postdoctoral position.

Fundamental issues and challenges

My academic cohort of graduate students viewed postdoctoral positions as the backup plan if industry/government/other career plans fell through. Even then, the postdoctoral position was viewed as a temporary step while you retooled your CV or underwent additional training (i.e.science communication or data science) to pivot to the target career. The amount of work expected for the pay scale is horrendous. Benefits given to full-time staff are often not given to post-docs (i.e. 401k, discrepancies in vacation/sick time) which is demoralizing. There is a mental health crisis amongst postdoctoral trainees which forces those who can get out to do so. Those that remain are often international scholars who are constrained by visa issues or those who have niche skillsets that don't translate directly into industry. Even if the pay and benefits were adjusted to market rates, the academic environment itself is a problem. The publish or perish mentality makes having a work/life balance very difficult and it is an open secret that there are not enough permanent staff positions for all postdoctoral trainees to aspire to after their contract ends.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Forcing PIs/lab heads to mentor their postdoctoral trainees instead of assigning them experiments, and factoring in the trainees' career outcomes to the PIs performance review could shift the focus from getting the maximum output from trainees to restoring the training component. Right now, with the salary and benefits where they are, and the work/life balance as bad as it is, the only feasible way to retain postdoctoral trainees is to allow them to have a component of independent research. Many people would put up with the conditions if they were offered more freedom and creativity to pursue science that interests them.

Response 721

Perspectives on the postdoc roles and responsibilities

An hybrid trainee/worker position with definite roles: designing and executing experiments, interpreting data, writing research proposals and papers, collaborating with other scientists and institution while expanding the professional network, learning/understanding how to advance in their career.

Fundamental issues and challenges

Life quality in [redacted for anonymity] is bad. The life costs are incredibly high but the salaries do not match the costs of living. I am a recipient of two doctoral degrees with research experience at [redacted for anonymity] and must share an apartment with a roommate because I can not afford to live by myself. There is a little attention and support from the Institution on the professional growth of PostDoc, which struggle understanding what their next step will be. There is also a work overload, Postdoc often cover multiple position (management, technician etc.) and rarely take care only of their own project, wasting time and energies on less important tasks, for which they are, moreover, not paid. Extra time is not retributed, PostDocs rarely work only 8 hours a day and very often need to work on weekends too, without additional pay. Basically a PostDoc has a trainee stipend, but a 150% full time job with responsibilities and no pay.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 722

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The pay is frankly abysmal. Postdoctoral trainees have DOCTORATES. They can often find 6-figure salaries in industry or other jobs. Additionally, many high-quality educational institutions are in regions with very high cost of living (California, Boston, New York, etc).

For many, especially women, there is the consideration of major life milestones (marriage, starting a family). There is never a "good" time to do this in academia, but it's harder to do this when still expected to work long hours in lab for little pay.

While academia is generally considered a "labor of love," there is the issue that there are very little protections for workers. They are often still expected to work late hours/weekends or generally hold an unpredictable schedule. This is generally incompatible with the postdoctoral pay scale.

Also, the academic job market is historically very competitive. Many people who do go through the process of postdoctoral training are unable to find a faculty position. Even if they do, jobs are not guaranteed/stable unless tenure is achieved.

Many feel that they can receive better working conditions, a less stressful work environment, more stability, and better pay in a non-academic track.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

better financial compensation, especially in high cost of living areas. A single 32-year old with a PhD should be able to afford a one bedroom apartment near their institution.

Consider the sustainability of the current academic structure. If we continue increasing postdoctoral recruitment, are there academic jobs for them? If not, it's essentially promoting a pyramid scheme.

Response 723

Perspectives on the postdoc roles and responsibilities

Postdoc positions are generally required to obtain tenure track faculty jobs, and occasionally higher ranked jobs in industry and other sectors. Beyond this reality, I think postdoc positions can in certain circumstances be very beneficial to the trainee. During my postdoc I have learned a variety of new techniques and skills, and am working to build my future research program. I have also benefited from a relatively stable postdoc environment (good advisor, intramural NIH system, better than average salary) which is not true of all, or even most, postdocs right now. Without this, I do not think I could have the luxury of completing a postdoc. This is compounded by the fact that despite the tremendous service postdocs provide in furthering their advisor's research and science broadly, we are often viewed exclusively as "trainees" and are told we are "lucky" to have these positions. We are treated in many ways like students despite being highly trained and productive adults who can often make more and earn more respect in other non-academic industries.

Fundamental issues and challenges

There are several issues with the current academic postdoc system that are prohibitive to doing a postdoc, particularly for poor or marginalized people. These include, but are not limited to:

- Low pay relative to education/experience. Postdocs are highly skilled labor, and until recently were not making more than $50k a year
- "Trainee" vs "Employee" status. Many postdocs ([redacted for anonymity]) are not considered employees. Because of this, we are not eligible for retirement or contribute to Social Security/Medicare (which, when combined with graduate school can mean upwards of 10+ years with no retirement contribution during peak working years), are not eligible for other employee benefits, and often our income (especially if on a prestigious NIH/NSF fellowship) does not qualify for the Child Tax Credit or others that would offset costs
- High cost of living in most cities where postdoc positions are located. This compounds the low salary issue mentioned above, and makes it very hard for people with families, especially those without partners or with partners incapable of working, or those with caring or other responsibilities to make the necessary sacrifices to complete a postdoc. People who choose to do postdocs generally understand that we will make less than in industry, but this discrepancy can only go so far when basic needs can't be met
- Job availability in academia is terrible. Most people who do postdocs do not end up with an academic position, leading to years wasted at low salary/benefits when they could be pursuing new opportunities in other sectors
- NIH modular grant budgets are too low. Many PIs I know would love to pay their postdocs more to reduce the discrepancy but feel they cannot because the NIH modular budget barely covered salaries + costs before any proposed salary increases

Existing NIH policies, programs, or resources

In many ways, ultimately everything comes down to money. Most postdocs do not desire to be rich, but rather to do their work and to support their families and themselves. People say that this will mean fewer postdocs and smaller labs, which is likely true, but right now many people are leaving anyway for the various issues I described above. Thus, I think it is important to make life better for the remaining people who genuinely want to be postdocs and pursue academic careers, even if this means smaller labs. Nonetheless, I think that NIH needs to change policies to account for this. As mentioned above, grant budges need to be higher. It is increasingly challenging for PIs to make ends meet on one or even two R01s, even before proposed salary and benefit increases, especially because universities pass on the costs of mandated increases to the PIs rather than pay themselves. I think that if the NIH were to increase budgets and establish policy incentivizing or requiring institutions to match a certain percentage of the increase that we could start to get closer to postdoc sustainability. I think there should also be more support for PIs to make permanent or long term staff scientist positions for those who want to stay in academic science but don't want to be a PI. Finally, I think the NIH needs to address the trainee vs employee mentality —it is unconscionable that highly skilled individuals cannot contribute to retirement, lose tax breaks, and lack most benefits for the long periods required for postdocs to obtain the credentials necessary for a faculty position. Furthermore, postdocs who earn prestigious fellowships often find that they lose what benefits (like health insurance) that they might have otherwise had, making their financial situation worse.

Proven or promising external resources or approaches

No response

Response 724

Perspectives on the postdoc roles and responsibilities

Being a postdoc during the pandemic certainly opened my eyes to how many academics pivoted their work to make it suddenly fit into a COVID narrative, as that's where the funding was. Even I was asked if my research should take a COVID perspective, despite it being outside of my field of expertise.

Fundamental issues and challenges

I am currently earning another graduate degree while in my postdoc, and a popular discussion topic amongst my classmates is learning about non-academic careers. There's definitely concern about the competition for funding and the pressures that come with academic settings where you have to 'move up or move out'. Especially since I now have a child and am the breadwinner of my family, I am also looking for satisfying and meaningful careers with a bit less risk. We all work very hard and are not afraid of taking chances (especially for things we are passionate about), but the pandemic really opened my eyes to my true long-term priorities, and I want to strike a balance between career and other important things in my life.

The pandemic also affected how 'connected' I am with my department and institution. I will have completed this training almost completely in a remote setting, and it has affected my understanding of what it really means to be an academic. I don't feel prepared at all to apply for a job in academia (lack of realistic expectations of day-to-day work, lack of confidence to successfully get funding one day, a heavy dose of imposter syndrome probably), despite how successful I may look on paper.

Existing NIH policies, programs, or resources

Having gone through a traumatic birthing experience and an intensive recovery period postpartum, anything to expand the support given to pregnant people and new parents would be great (increasing parental leave, increasing support for child care). If it wasn't for the virtual setting due to the pandemic and an advisor who was very understanding, I probably would not have been able to navigate my peripartum experience in the way I did, and would have had to make different choices for how I cared for my own health and my baby.

I also would like to see the quality of advisors improved across the board. I feel like I got very lucky with the PI I work with, but I've heard many stories (especially with trainees who have been historically excluded) who struggle creating the necessary bond with their PI (or the institution at large) and the tension is reflected in their work. We are trained to write good science and how to navigate funding applications, but much less so in the human aspect of mentorship, collaboration, and community. Combine this with many of the empty promises we've seen regarding 'diversity, equity, and inclusion' and you've got a hot mess.

Proven or promising external resources or approaches

No response

Response 725

Perspectives on the postdoc roles and responsibilities

Ask research questions, design research plans, design experiments, run experiments and perform analysis.

Writing grants, papers, presentations and dissemination of the research

Fundamental issues and challenges

Salary is too low for the job ! (54-66) after 7 year is a joke, after all these years of studies and hard work to to get a PhD, starting that low is insulting, no wonder postdoc are going directly to industry!

No pension, no child care , no benefits (for 2 years) , considered as a trainee for 3 to 5 years (worse that a technician sometimes).

Technician with lower levels of study are better than us , in terms of salaries, benefits and life style (8-5 job) VS all the time +weekends most of the time .

No real career development, publish, grants then become a PI , nothing else (not everyone wants or have the skills to be a PI) .

Too many efforts for pennies and not being considered.

For info , me as well after 4 years I will leave academia , dont want to be a PI hence need to leave no other options (and want a real job too that I don't have to renew every year for working crazy and payed pennies)

Existing NIH policies, programs, or resources

PAY us more ! (compare with biotech, or pharma salaries and match) that will make a huge difference.

Give us benefits.

Job recognition.

Career development plan.

Proven or promising external resources or approaches

SALARIES, BENEFITS and recognition!

Match the same as in private companies then postdocs will reconsider!

Response 726

Perspectives on the postdoc roles and responsibilities

It's useless if your not trying to get a tenure track academic position and it means more years of being massively underpaid.

Fundamental issues and challenges

Pay.

Benefits (health care, retirement, child care, vacation, etc.)

Work life balance, past docs are often expected to work long hours and weekends when they could get a 9-5 industry job.

No postdocs lead to career advancement outside of academia.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Pay them what they're worth.

Response 727

Perspectives on the postdoc roles and responsibilities

Totally taken advantage of. Workhorses. Little (embarrassing low) pay.

Fundamental issues and challenges

Systematic view at the PI uses postdoc as workhorses and free (or low cost) labor.

Existing NIH policies, programs, or resources

Pay, career options, mentorship OUTSIDE the lab, consequences for toxic PIs.

Proven or promising external resources or approaches

No response

Response 728

Perspectives on the postdoc roles and responsibilities

It's a step between graduate and faculty in which one has more independence in driving a research direction and sometimes managing other scientists

Fundamental issues and challenges

Postdocs and time in postdocs is very long (used to be more like 2 years, now closer to 8 from what I can tell but I don't have data at hand) with no guaranteed position at the other end. The timing of postdoc is

often at a critical time, at least for women for getting married/having kids, and the postdoc is not a locationally stable position which limits either one's career to one location or choice of partner to someone not locationallu constrained. On top of this, postdocs are paid significantly less than industry positions available which don't have this locational instability or doubt of whether there will be a position at the end of it.

Existing NIH policies, programs, or resources

Resources for higher paid postdocs and postdoc to faculty transition within the same institution / city, more support for e.g. childcare and dependents since raising kids a postdoc salary is difficult

Proven or promising external resources or approaches

Childcare, pay, support networks outside of just their PI.

Response 729

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a process of attrition by which the academic structure winnows down the large numbers of trainees it produces who are interested in academic positions to the number of available long-term positions. I feel frustrated that it's required, even for those who aren't trying to switch fields. While I understand that part of the notion is "additional training", it's not as though new PIs begin their labs fully trained, and fully capable of managing all of the new and different responsibilities. It additionally creates bloat in academic labs, with giant famous lab heads garnering massive amounts of prestige and recognition for the discoveries and efforts of their many, mostly unacknowledged, trained workers (who have already gone through an entire PhD!).

Fundamental issues and challenges

The obvious:

1) Pay
2) Lack of recognition
3) No autonomy
4) Poor support for childcare at most institutitions
5) Uncertain job prospects
6) Fragility with respect to conflict with a lab's PI, especially on visa issues for international postdocs
7) The PhD is getting longer, so people are older still even when they start their postdocs
8) Cultural homogenization (the sense of who becomes an academic long-term remains very narrow, which does not encourage anyone who doesn't seem themselves conforming to that mold)

Existing NIH policies, programs, or resources

The first few to come to mind:

1) Increased minimum salaries across the board
2) Increased individual grant awards to help PIs retain postdoc trainees.
3) More equitable distribution of grants (helps new labs get off the ground, which makes starting a faculty position seem that much more enticing; discourages giant paper factories churning out irreproducible science behind the veneer of a famous PI, which pushes out potential scientists that are made uncomfortable by that style of work)
4) Require institutions to supply improved facilities and benefits to academic workers. These include, but by no means should be limited to, enhanced support for child care, prolonged parental leave, strong anti-bullying and anti-discrimination policies with demonstrable efficacy (none of these in-house solutions that just protect the university)
5) Broader selection of postdoc training awards, and an emphasis on diversity in the standard grant process (rather than specialized diversity grants).

Proven or promising external resources or approaches

Please please please don't let the people who put something about the success of the tech industry or pharma sway you. The magic and power of academia come from the ways it _differs_ from those industries; our goal should be to reduce the failings of our own institution and not conform to the toxic and transactional culture of corporate research. It's not bad that some people want to go to industry, but it should only have to be a decision on style, and not based on livability.

Response 730

Perspectives on the postdoc roles and responsibilities

For people wanting to be a PI in the future, postdoc is a training stage they must go through. For other people who like and want to continue doing scientific research, postdoc is the start of a career as associate research scientist. Postdoc is also a second chance at choosing a research focus, a lab group, a city, etc., for people who are unsatisfied with their first choice (grad school). Then naturally it follows that people who have given up hope in finding a space in academia would not consider doing a postdoc.

Fundamental issues and challenges

Career prospect. As I said to the first question, postdoc can transition into PI or associate research scientist in academia, or other jobs in industry. But the number of PI jobs is very small. The number of associate research scientist is also small and the salary source can be unstable depending on the situation. In the direction of transitioning to industry, there is limited support for postdocs, and the postdoc experience does not add additional value to PhD. Marketing postdoc as a training for growth when it is actually a career stagnation makes people feel cheated and betrayed.

Existing NIH policies, programs, or resources

Ask yourself how meaningful is this survey question. Do you expect people to actually read those poorly titled, poorly organized, lengthy documents?

Proven or promising external resources or approaches

Columbia University Zuckerman Institute Center for Theoretical Neuroscience, co-directed by [redacted for anonymity]. They offer a flexible reporting structure to promote collaboration and rapid project development.

Response 731

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are still PhDs and should be seen as equals. The collaborative nature of science should be emphasized in order to have postdocs seen as collaborators, not competition, not indentured servants, not graduate students.

Fundamental issues and challenges

Postdocs should be respected as fellow scientists, and paid according to their contributions to the team. Postdocs who are hired by a PI are often beholden to that individual, and must work unreasonable hours with little pay and often the expectation of predetermined results, with the fear of termination and/or deportation should they displease their PI. Many existing senior scientists do not respect postdocs as doctoral-level researchers, and the culture surrounding the postdoc experience must change.

Existing NIH policies, programs, or resources

The policy of a national salary cap on postdoc salaries is unreasonable and harmful. This policy should be modified to represent a minimum wage, with the encouragement for institutions and PIs to provide higher salaries at their discretion.

Proven or promising external resources or approaches

Continuing to educate existing PIs on the collaborative nature of the postdoc experience. While postdocs are still seen as trainees, they are still PhDs and should be seen as equals. The collaborative nature of science should be emphasized in order to have postdocs seen as collaborators, not competition, not indentured servants, not graduate students.

Response 732

Perspectives on the postdoc roles and responsibilities

Training to advance to independent academic research or industry research related job

Fundamental issues and challenges

extremely low starting salary, insufficient annual salary increase, strong limitations in training funding opportunities due to non-US citizen/resident status (despite doing PhD in the US and being 4 years in post-doc position), university restrictions on multi-annual contract (ie. need a new contract each year, meaning new expenses for visa processing every year).

Existing NIH policies, programs, or resources

Increase of the base salary and annual increases.

Elimination of US citizen/resident-based restrictions to training grants.

Proven or promising external resources or approaches

Adjust salaries and increases to current economic conditions

Adjust citizen-based restrictions in funding opportunities to current demographics of postdocs (e.g. 3/3 postdocs in my lab are non-US citizens/residents)

Response 733

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

A Postdoc position is a trap. The postdoc must do the work of several different people at the same time. The postdoc must do all the experiments alone, analyze the data, follow the literature, write the manuscript, write grants, direct summer students, etc. There are no other assistants to help with the experiments. The expectation to do at least 2 articles during the postdoc years is unreal. A highly qualified article's experimental and writing process is at least 2-3 years per article.

Several postdocs work in the same field in different labs but they have no time and energy to help each other and cooperate because all of them are overwhelmed, and burned out. The postdoc has to be a superhero and does several articles by themselves without any collaborations.

The postdoc has to apply for grants during this time, but you cannot apply for a grant without articles. This is a contradiction. There are much fewer grants than postdocs. After the postdoc years, there are much fewer carrier options. If the postdoc doesn`t get a grant, which is usual, there are much fewer research scientist positions at the NIH. There are fewer carrier options if the postdoc doesn`t want to be a PI, doesn`t have a world-changing idea, or just wants to work in the same field.

Existing NIH policies, programs, or resources

Most of the programs for US citizens or residents, so they are not available for a foreign researcher. This is discrimination.

Proven or promising external resources or approaches

No response

Response 734

Perspectives on the postdoc roles and responsibilities

A person with high-level training to do scientific research, training new students and produce high-quality scientific data to help the advancements of society.

Fundamental issues and challenges

Very low salary to a Ph.D level, specially when compared to industry.

High pressure for results which increase the bias.

Disbalanced work-life balance (actually much more work than life).

Existing NIH policies, programs, or resources

The salary cap should be significantly increased to match the level of expertise of these professionals otherwise companies will be always more attractive.

Proven or promising external resources or approaches

New programs with benefits for their families should be created, as well as work-life balance should be significantly improved.

Response 735

Perspectives on the postdoc roles and responsibilities

I view the postdoc position as a further training period and a stepping stone to a final, independent career position (PI, industry scientist, etc.). The postdoc should often design/build his or her own project from the ground up and have ownership over it. In turn, if moving on to a PI position, that project should go with the postdoc. The postdoc can be a mentor as well and should take on some leadership roles.

Fundamental issues and challenges

Frankly, no one values us or realizes how integral we are for quality science and data generation. Over the past year, my organization--The Mayo Clinic--has taken away my desk and my parking. They think I can perform biomedical research at home somehow. Mayo Clinic and other institutions chronically underpay postdocs, and culturally signal that they do not view us as members of their team. I have a K award and work 6-7 days a week. I have to analyze hundreds of GB of data. I have to do multiple daily welfare checks on my mice. How I'm expected to do that as they keep taking away my privileges (parking, desk/computer, etc.) is beyond me. If I do not get an independent job and get out of here by the end of the year, I will not work here for another year under my K. I will leave academic science. I have had T grant awards, 2 F grant awards, an OSNAP recognition, and a K grant in 10 years. I do not care if that personally identifies me. You need to know that the Mayo Clinic views postdocs as lower than dirt. They keep us on one year contracts so they can drop us as soon as we try to fight for better work conditions, better pay, and privileges afforded to postdocs at many other institutions. I do not understand it, because they treat graduate students like royalty. We are "research temporary professionals" and they have us sign documents attesting to the fact that we are expendable in their eyes.

Existing NIH policies, programs, or resources

For their indirects, institutions need to justify what they provide to graduate students and postdocs. The NIH should yank T32s from institutions that do not even let graduate students have a desk. Due to Mayo Clinic policy, we have had to convert half of our wet lab space into dry lab space for every lab member to have a space for their dedicated analysis computer–they are charging you for lab space under indirects being used as office space under their hoteling policy. This feels like fraud. We analyze terabytes of imaging data, which we cannot do on the Mayo standard laptop (8GB of RAM). They expect us to hotel to a desk somewhere in the building to do data analysis on this laptop. For this reason, we have had to convert half the labspace to dedicated desk space so we can run tower PC computers to actually accomplish our work. These concerns were completely ignored by admin over multiple months. This is a horrible culture that values MONEY MONEY MONEY and does not care about researchers. They only care about their public image and the NIH needs to investigate the Mayo Clinic's culture of profiteering as a non-profit at the expense of research trainees.

Proven or promising external resources or approaches

The institution needs to be given a standard form to fill out from the NIH stating what pay and privileges it provides postdocs. They need to justify why certain things can not be given, like a desk! They pay residents 50% more than us in the same role. An MD resident performing research can make $70k/year as a senior postdoc. I can make $55k/year as a senior postdoc with 3 years of experience (and I actually have training in research). The NIH needs to investigate why an MD with no research experience as a

postdoc makes more than a PhD with ample experience. They need to investigate why an institution in a town of 100,000 people, which owns most of the land, cannot provide its employees with parking or a desk. I could understand this at [redacted for anonymity]. I just don't get it here. They're being cheap and petty. Anyone with self-respect, and in this climate of postdocs leaving in droves, is simply going to continue to leave or enhance this trend if their solution is to treat us even worse year after year.

Response 736

Perspectives on the postdoc roles and responsibilities

Postdoctoral position as it stands now is to train the graduate student to become a Principal investigator. However, because of lack of regulations and guidelines, this fair position that gets heavily exploited by lab and individuals. Post-doc positions should be strictly caped at 5yrs. After 5 yrs any individual cannot be a post-doc position anymore (either on grants or on the ground in the lab). This initial 5 yrs of post-doc should involve mandatory grant writing training (both from NIH and from mentor) to prepare them for an independent position. Post-docs should have mandatory time/hours of work for own independent ideation/thoughts/project development of their own. Post-docs should receive mandatory training to supervise undergraduates, graduates, and technicians. Also, there should be a separate post-doc training position and program for non-academic training for those who wish to not go into academia.

Fundamental issues and challenges

Post-docs positions are underpaid, overworked, with no benefits and really prohibitive for having a family or maintaining a work-life balance. This is fine if it were a short training time of 3-5 yrs. Any more than that is mere exploitation. Generally post-docs are in the prime of their life in their late 20s and early 30s and are losing major income source. and family and work-life balance under current conditions where they are forced to stay as post-docs for extended period of time (much more than 5yrs).

Existing NIH policies, programs, or resources

Having permanent positions (higher salary based on experience, retirement benefits and other work-life balance resources) such as research associates or research scientists and having those funded through NIH grants for post-docs to transition into in academia if they life to do so.

Proven or promising external resources or approaches

No response

Response 737

Perspectives on the postdoc roles and responsibilities

The main responsibility of a postdoc is conducting research in order to establish oneself as an effective scientist capable of independent innovation and success. The precise research conducted exists in a grey area between

1) Research questions the postdoc develops independently and designs experiments to answer, and
2) Research the postdoc's PI/employer is willing to fund or currently has grants based around.

Fundamental issues and challenges

As with any career, the biggest hurdle to recruiting and retaining postdoctoral trainees is the imbalance between the cost of the work and the reward of the results. The majority of postdoctoral researchers have vast student loans that are most pragmatically addressed by pursuing whichever career pays the most. The current minimum pay for postdocs recommended by the NIH is far lower than is equitable for the level of education and amount of work conducted. To exacerbate matters, the current system of earning a living as a postdoc relies on a PI who has funding. This creates an unnecessary tension in the relationship between the postdoc and the PI by shifting the onus of responsibility for the postdoc's salary onto the PI. However, the true responsibility for increasing the salary and benefits, and thus "recruitment, retention, and overall quality of life" for postdoctoral trainees in academic research should lie with the institution which wants to improve these factors. Therefore, the biggest issues facing postdoctoral researchers is a lack of direct compensation from the NIH and other research-funding institutions.

Existing NIH policies, programs, or resources

To enhance the postdoctoral training ecosystem and academic research career pathways it is necessary to make said ecosystem and career pathways more appealing and accessible. This can be accomplished by vastly expanding the current funding provided to research and training, thus reducing the cutthroat environment of grant applications and reviews. Additionally,

Proven or promising external resources or approaches

The most effective approach to enhance the postdoctoral training ecosystem would be providing a generous, noncompetitive stipend to postdoctoral researchers and early career PIs. This would

1. Reduce the appeal of careers in higher paying, nonresearch-based industries,
2. Foster more collaboration between scientists by reducing tendencies to protect your ideas against your competition,
3. Increase innovative science by reducing the bias against null results, and
4. Ensure grants designed to fund research are actually funding the submitted proposals, rather than the common wisdom of "Propose the project you just finished so you can get the funding for the next project you're not sure will work". Risky science leads to greater leaps in our collective knowledge. By expanding funding and reducing the need for competitive research, the NIH would encourage more researchers to pursue and stick with postdoctoral, and eventually independent. research.

Response 738

Perspectives on the postdoc roles and responsibilities

I view it as a job. People describe it as postdoctoral training, but I spend a lot more time training others than receiving training myself. I work on a project that my PI and I agree on, and I know full well that if I went too far away from what he wanted, he would be dissatisfied and that would be reflected in my job stability. I am the primary mentor for a master's student, and although my hours are flexible the expectations are quite challenging since I manage his project as well as my own. I would say that my compensation is unreasonably small and in no way reflects the demands of my role or the training I undertook to get here.

Fundamental issues and challenges

It is not even close to being salary competitive. I am paid $60,000 per year in [redacted for anonymity] and I have my first child on the way. I have considered leaving early because the compensation simply does not allow the quality of life that a PhD scientist might expect. Obviously the other huge challenge is that there are far more postdocs than open faculty positions, which means people can stay as a postdoc for upwards of 5 years in biology. That is a very long time to stay in a role where you get paid poorly without any prospect of promotion, "training" for a job that you stand a high chance of not getting. A higher salary would go a long way to addressing this. This may sound greedy, but the fact is that unless you come from a wealthy family, you will worry about money constantly as a postdoc, which both detracts from your work and will fundamentally limit the accessibility of academia to those from poor or even middle income households.

Existing NIH policies, programs, or resources

Paternity leave, maternity leave, higher salaries. Also, the number of postdoctoral fellowships that non-citizens are eligible for is very limited, which is troubling considering the contributions that international scientists make as postdocs in the US.

Proven or promising external resources or approaches

No response

Response 739

Perspectives on the postdoc roles and responsibilities

A novice researcher who leads is own research with the help and advices of a senior researcher.

Fundamental issues and challenges

Big competition for getting fellowships. Even more in some countries.

Out of pure medical research related to human well-being, the money is hard to find.

Fundamental issues and challenges

Underpaid

Overworked

Underappreciated

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 741

Perspectives on the postdoc roles and responsibilities

The final training step on the path to becoming an independent academic principal investigator/professor or research scientist, but also useful for transitioning to industry or other roles. Postdocs are expected to be highly productive and independent, and take on mentorship responsibilities within the lab (e.g. training undergraduates and graduate students). They are (often but not always) a level above graduate students in terms of experience, professional development, and independence.

Fundamental issues and challenges

The fundamental issue is that postdocs are underpaid and often over-worked. There is a huge opportunity cost to accepting and continuing an academic postdoctoral position, because industry salaries for PhDs are often six figures. It is extremely difficult for postdocs, especially those who identify as women and are expected to play primary household roles, to start and raise a family.

Existing NIH policies, programs, or resources

Raise the minimum postdoc salary for NIH grants, provide additional child care resources/protections.

Proven or promising external resources or approaches

No response

Response 742

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as a transitional yet key role in gaining both additional scientific expertise and research skills needed to advance to a role as a principal investigator. It is a time to deeply dive into an area of scientific interest and also to engage more deeply with the scientific community at large.

Fundamental issues and challenges

I see the most problematic issue with life as a postdoctoral trainee right now is what is somehow referred to as the "leaky" pipeline. Postdoctoral trainees are largely guided towards roles as principal investigators at academic institutions, yet these opportunities are scarce. Thus, what (I think) was initially envisioned as a transitional role has extended in length for many. I think this creates a challenge because there is not a lot of space for upward mobility (i.e., raises or promotions) for postdocs within this extended transitional period.

Existing NIH policies, programs, or resources

I think the main thing that could help is creating incentives for postdoctoral mentors to encourage and support their postdoctoral scholars in exploring careers outside of the traditional academic path (e.g., biopharma roles, teaching at PUIs and K-12 institutions, working at non-profits). There does not simply seem to be enough jobs at R1 institutions (or equivalent) to support the number of postdocs. In addition, I think it would help to raise base pay for postdocs and create mechanisms to give postdocs raises over the course of their postdoctoral training. It would also be helpful if there was some mechanism created that would help postdoctoral scholars save for retirement (e.g., contribution matching to retirement accounts).

Proven or promising external resources or approaches

No response

Response 743

Perspectives on the postdoc roles and responsibilities

2-8 year research position in which the postdoc learns new technical skills and receives mentorship from the PI in how to write, submit and reply to reviewers of primary research papers and grant applications.

Fundamental issues and challenges

Limited opportunity for futher advancement in an academic research environment since research professorships are highly competitive and research scientist positions do not offer further advancement opportunities. The cost of living is high relative to the salary in many cities with postdoctoral opportunities (eg Boston, San Diego, New York City).

Existing NIH policies, programs, or resources

A grant offered after the F32 for longer post-doc stints or research scientist positions, create an "F33"!

Proven or promising external resources or approaches

Workshops for career advancement, grantsmanship, one-on-one mentorship from more senior scientists and networking.

Response 744

Perspectives on the postdoc roles and responsibilities

Postdoc is a job to carry out research independently in a lab. Like jobs in industry, academic postdocs receive training and gain experience for future management jobs (PI, senior scientist, directors etc).

Fundamental issues and challenges

Currently, postdocs are regarded as trainees but not staff. That means they receive very low salary compared to other "formal jobs". And as they are expected to research independently, often they don't receive adequate training. These days it's becoming increasingly competitive to publish high-profile papers (more work and more co-first authors required) so postdoc training can easily last for many years. It's hard to make a living with low salary for these many years.

Existing NIH policies, programs, or resources

Increase the base salary.

Proven or promising external resources or approaches

No response

Response 745

Perspectives on the postdoc roles and responsibilities

Postdocs play an integral role in designing, planning and executing biomedical research. They do smaller-scale versions of all of the responsibilities of a PI (planning projects and writing grants, manuscript writing and editing, mentoring and training of students and other lab employees), while also performing experiments, doing analysis, and generally being skilled research practitioners with *No response*

extensive technical expertise. They are therefore central to the productivity of many academic labs. At the same time, especially in light of the low pay and temporary nature of a postdoc position, postdocs also should have a responsibility to learn, grow, and seek out new skills to make the most of the position and prepare for their next career steps.

Fundamental issues and challenges

Cost of living is a huge issue for postdocs. Many people choose to do a postdoc in a high cost-of-living area for family reasons or other constraints, and many productive universities with lots of research funding are in high cost-of-living areas. However, NIH postdoc salary/stipend scales and typical university postdoc pay are insufficient for postdoc stability in these areas. The stipends would be OK if postdocs could feel confident that it was just a couple years and have high confidence of obtaining a more stable and higher-paying position afterward. However, the prospects for postdocs afterward are deeply uncertain and unstable right now, tenure track positions don't promise the stability and quality of life that they used to, and postdocs are spending longer and longer in 'temporary' positions. Moreover, these are also the years which would often be ideal time to start a family, which is often not affordable on a postdoc salary in a high cost of living area and is further complicated by the uncertain future employment prospects.

Existing NIH policies, programs, or resources

The F32 and T32 training mechanisms are great, but they should be expanded. Many universities set postdoc salaries based on NRSA scales, so dramatically increasing these would have cascading benefits. Similarly, many universities set childcare subsidy policies following the NRSA fellowship policy, which is only a small amount of money relative to the actual costs of childcare.

Proven or promising external resources or approaches

No response

Response 746

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a time to learn many new skills and establish oneself as an independent thinker.

Fundamental issues and challenges

I believe the biggest deterrent to doing a postdoc is the pay. In most of the country, the postdoc salary is barely a livable wage, especially if one has a family. The expectations of a postdoc are much higher than a graduate student, however, that is not reflected in the compensation postdocs receive. Further, at least from my view, most institutions lack support for postdocs. From what I have seen, PIs have higher expectations for postdocs in the lab to stay between 4-6 years if they can, which is not advantageous to the postdoc. Also, from the student trainee perspective, we see individuals that want to stay in academia completing more than one postdoc position—overall limiting one's ability to move beyond this position with poor pay and benefits.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 747

Perspectives on the postdoc roles and responsibilities

A postdoc is responsible for carrying out research in a lab operated by a PI.

Fundamental issues and challenges

Labs are often understaffed, leading to an increased burden of responsibilities falling on a postdoc, above and beyond their job descriptions, which are often loosely defined and prone to abuse. Postdoc salaries don't even meet the guidelines set by the NIH, forcing qualified candidates to choose other careers in order to support themselves and their families.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Postdoc support could follow a model similar to undergraduate training grants where postdoc applicants could apply to be supported by an agency such as the NIH or NSF, with funding grants to individual PIs reduced to cover the cost. This would allow more control over postdoc salaries and allow postdocs to choose lab environments that suit their needs rather than choosing labs with available funding.

Response 748

Perspectives on the postdoc roles and responsibilities

The role of the postdoc obviously differs between labs, and perhaps has changed since my first postdoc position in 2015 to my current assistant professor role.

To my mind, the postdoc is meant to be the engine room of scientific publication. Postdoc to me means the person in the lab doing the experiments and publishing the results without the need for a lot of technical training that students require. The whole point of the postdoc experience is to cash in on one's expertise, expand the technical repertoire and produce enough publications of sufficient quality to garner independent funding.

Personally, I view my productivity as a post doc (i.e., the peer reviewed publication—the only thing that actually matters) as the lead pipe that I will batter people with when it comes to evaluating individual performance and promise. Sadly it seems in the US that evaluations on postdoctoral funding is more dependent on the sizzle of a particular proposal, as opposed to wheter the individual is capable of actualising it.

Fundamental issues and challenges

I am of the belief that one reaps what one sows in this life. Students have become so mollycoddled that the postdocs they turn into exhibit a type of learned helplessness, Recruitment is the most difficult thing in any organisation or endeavour, and is being hampered by the reduced resilience of the PhD pool to some extent, but to an equal or greater extent by the socioeconomic factors that NIH has no control over. these include individual lab/university environments and the locations that these enterprises inhabit.

Ditto for quality of life concerns. As a cynic, I am putting the recruitment and quality of life issues for postdocs firmly in the court of the tertiary education institutes who employ them. Indeed, the whole point of these places is to educate the professional populace and to advance knowledge (which basically serves to launder the reputation of the institution charging the fees). Sadly, the majority of the money spent within these places is on a bloated administration and bureaucracy, which neither teaches, nor researches. University accreditation bodies are perhaps best suited to tackle this issue.

So, for recruitment, I think the NIH should ignore this issue, the weak will be winnowed away through attrition. I think the main goal of the NIH should be retention and possibility of advancement of postdocs who demonstrate the requisite temperament to succeed after the first few hurdles.

As a warning—in Australia, where I got my professional degree as a veterinarian and my PhD, the department has over 150 associate or full professors, ~150 PhD students and less than a dozen postdocs. I'm fortunate to be compelled by a burning ambition to do science, but in many places outside the US, science is a glorified finishing school for people going on to be dentists or doctors or physiotherapists.

Existing NIH policies, programs, or resources

The major advantage of the Australian environment was that students have a very broad base of expertise and capability. Even postdocs in the US have a reduced range of technical competencies (note I used competence rather than mastery) compared to previous eras or overseas postdocs.

I believe this lack of breadth in training and interest has led to the slowing of scientific progress (as less people are capable of integrating their findings into a whole organismal-level funding).

Personally, my darkest moments came when I have been coerced into "ghost-writing" multiple well-received grants (top 1%, 4% and 9th%) for a multiple PI-team. Indeed, I am competing in the same study section with these parasites yet cannot put my name on the grant in any meaningful way without forfeiting "New-Investigator" status. I am a firm believer that an intermediate category between PI and Co-I/personnel (which gives co-Ino credit, yet the overall proposal is benefited by their expertise—perverse!) would be ideal to identify postdocs instrumental in the intellectual development of a grant, without losing "new investigator" status.

In order to improve science overall and the postdoctoral ecosystem in the US, I would penalize all applicants (at all levels, even professors) remaining within their PhD institution. All this serves is to enhance groupthink, promote complacency, reduce competitiveness and blunt intellectual development. I understand that remaining within an institute is becoming de riguer more recently as the prospect of starting again in an unfamiliar lab is looked as a step backward by most postdocs, but experience in diverse environments will be of far more benefit than whatever one could achieve in the time it takes to acclimate to a new locale.

Proven or promising external resources or approaches

I am aware of the cultural cachet that European style programmes, initiatives and personnel have in the US. Sadly, science is not an endeavour of cachet, but of accomplishment and I daresay ignoring developments on the Continent regarding enhancing academia is wise.

I am afraid I know what has proven to be ineffectual, but fixing things is a whole different ballgame.

That said, and despite the negativity surrounding the struggles to independence, I can't see myself doing anything else other than biomedical research until the day I die.

Response 749

Perspectives on the postdoc roles and responsibilities

It is an underpaid job, not a learning opportunity. You use your time and skills to do what your supervisor wants you to do so he/she can get credits. The opportunities to learn and grow in the institution are scarce or null.

Fundamental issues and challenges

Lack of real appreciation. You feel used.

Existing NIH policies, programs, or resources

I don't have enough information to provide a relevant answer

Proven or promising external resources or approaches

I don't have enough information to provide a relevant answer

Response 750

Perspectives on the postdoc roles and responsibilities

To be trained as an independent professional researcher in the future, including scientific thinking, technology promoting, networking, grant writing and lab management.

Fundamental issues and challenges

1. Identification status: Several-year away from the hometown makes people feel sad. J visa updated yearly, which interrupts normal work.
2. Low salary here compared to that in the original country. Be valued by original country gradually, could find better positions there without overseas training.
3. Unfair treatment: Lower social position, postdocs do not eligible for lots of employee benefits.

Existing NIH policies, programs, or resources

No systematic program for the training: Did not treat postdocs as trainees like students have. Only need postdocs to do experiments and publish papers.

Insufficient guidance for further career development.

Lack of grants that eligible for non-citizen postdocs.

Proven or promising external resources or approaches

1. Visa for foreign postdocs. Now both of visiting scholars and postdocs. were signed with J Visa, so it's better to separate them. Visiting scholars have to go back to the original organizations, but postdocs are not linked with original organizations, most of them expected to stay here. It would be appropriate to sponsor them with H Visa but not J visa.
2. Provide grants specific for postdocs in the United States without identification limitation.
3. Value postdocs' contributions, but not let them feel neither fish nor fowl.

Response 751

Perspectives on the postdoc roles and responsibilities

As a postdoctoral research scientist in preclinical research, I am tasked with understanding the mechanisms of psychiatric disease using animal models and translationally-relevent paradigms. I believe the postdoctoral position is a time to develop my independence from my graduate school mentor, to learn how to properly engage pedagogically in the sciences, and to learn how to lead a team. I am leaning into the academic path and believe that it is my obligation to ensure I have enough training to be able to spearhead my own unique research direction while training the next generation of scientists as a Principal Investigator.

Fundamental issues and challenges

I do not get paid enough. It is a struggle. Especially in the city of Boston, living as a single person, I truly feel like I need to have side jobs and to pinch pennies. I truly think that the most comfortable individuals are in group-housing situations (either with several roommates or with a partner). Even so, the opportunities to save are abysmal. I look with envy at my friends in industry, knowing they work less than me, knowing they don't stay up at night wondering about the future. I love my job. But, I hate that I am not valued for my time, effort, and passion to the research that I do. When I tell people how much I make with a Ph.D. doing work at a premier institution on work that can have real impact one day, they do not believe me. I believe academia is the best place to get high-impact work done. But, every day I wonder whether I will be the one weaned out (as a woman and a self-identifying queer individual, this is especially raw for me).

Existing NIH policies, programs, or resources

More formalized training for postdoctoral fellows. It feels like it is just us figuring it out.

Proven or promising external resources or approaches

Increase our salaries and make an effort to make us feel like true contributors to society by acknowledging our efforts. Have efforts to formalize training in scientific communication and leadership. Be realistic to folks about job opportunities, the variety of them, the fulfillment one might be able to find outside of academia (if it exists for folks like me).

Response 752

Perspectives on the postdoc roles and responsibilities

Training but also critical valuable role to academic research productivity; mentorship to more junior researchers often delegated to post docs by PIs.

Fundamental issues and challenges

Salary, benefits (often treated more like student than employee despite having PhD—makes postdoc feel undervalued; staff with bachelors degrees have better benefits), parental leave and childcare support, moving support, social support, lack of job opportunities, inconsistent mentorship, lack of funding opportunities.

Existing NIH policies, programs, or resources

Salary, benefits, childcare support, longer parental leave support, increasing consistency in mentorship and treatment across programs.

Proven or promising external resources or approaches

Treat postdocs like valuable PhD-level employees they are not glorified students—the lack of respect and compensation is embarrassing and drives postdocs out of academia.

Response 753

Perspectives on the postdoc roles and responsibilities

The major component of academic postdoc position is of course research and paper publication. Very significant part is also the teaching/training of undergraduate and graduate students. In the spare times and if financial and time situation allows, travel conferences and collaborations with other groups or universities are an option.

The official description of a postdoc in academia is seen as a temporary trainee/intern—both by the academic and administrative staff.

Fundamental issues and challenges

1. You are a 'trainee'. Postdocs are the experts in the field, have the highest educational level they can achieve , design their own experiments, lead their own projects and very rarely actually have any part of their time spent by their own training. Further yet they spent significant time training others.
2. No stability and poor pay. Postdoctoral assignments are 1 year long. Along with very poor pay makes it a question of survival . how long you can 'afford' to waste doing a post doc before you reach financial and mental ruin? Sometimes it's a choice between food and a roof.
3. Lack of reward. The majority of grants are only possible through work carried out by graduate students and postdocs. Yet they are never considered for performance awards, never considered for merit raises or congratulated/thanked when a grant comes through based on their work.
4. Poor life-work balance. To succeed in a postdoc you give up your life for its duration both due to financial difficulties and the workload. Most postdocs work well over 50-60 hours a week yet are never allowed to get overtime pay (not even allowed to report having worked overtime). They can never complain about the work, after all they should be 'grateful' for the opportunity.
5. Visa uncertainty and J1 visas. International postdocs are even worse off as they rely on visas from their institutions. There is no negotiation power and it is a constant state of tiptoeing around, less you lose your support and your visa. Given that international postdocs have to uproot their entirely life to move for a 1 year contract at a time, this period is just a one big ball of mental, physical and financial stress and anguish.

Existing NIH policies, programs, or resources

1. There needs to be a shift in the way postdocs are viewed. They are not studying. They are not training. They are professionals carrying out their research and learning on the job like any other career there is.
2. There needs to be better monitoring for universities to follow NIH payscale rules. With payscale renewal in June, some universities do not recalculate postdoc pay until contract renewal (which could be in May) meaning a postdoc will always be paid even less than the payscale minimum requirement. WIth no negotiation power as a postdoc, there is nothing that can be done from their side if their PI refuses to change this.
3. J1 visas are a critical issue for postdocs trying to set up their life anew. They are 'student' visas, meaning postdocs are severely limited in their ability to support themselves. There is no opportunity to supplement income (which is needed with the poor pay conditions). It causes issues with international work/asset ownership—you have to give up everything when you move to get this visa yet you have to promise that you are not goping to use your postdoc as a way to get permanent residence (you are subject to 2 year home return rule)—this destroys their life abroad in your home country and prevents you rebuilding it here due to heavy visa restrictions. It's a catch 22. There needs to be a push to stop postdocs being viewed as students, as a cheap workforce, as a way to get expertise for free.

Proven or promising external resources or approaches

Any scientific journal in the last year reporting on the issues of postdocs! Numerous articles came out recently in science, nature and others describing the challenges and issues with the postdoc life.

Response 754

Perspectives on the postdoc roles and responsibilities

Its a lowly remunerated and highly vulnerable research job in an academic lab, in which the individual is required to perform high-end research and mentor graduate students. It is a high pressure job with many responsibilities. It has become a rite of passage for researchers wanting to open their own lab in the university.

Fundamental issues and challenges

VERY LOW Salary. Lack of human resources and protections in universities (specially for international post-docs). Subpar mentoring and support by principal investigators and universities. Lack of job opportunities beyond the post-doc level to do academic research.

Existing NIH policies, programs, or resources

Increase the post-doc cap salary required for hiring in a grant. Change the incentives for grant applications to require more professional opportunities.

Proven or promising external resources or approaches

Look at the Chan Zuckerberg foundation and the structure and purpose of industry based postdocs. Post-docs get payed better and the position is seen as a transition period (2-4 years).

Response 755

Perspectives on the postdoc roles and responsibilities

Postdoc is a training period for individual to be prepared to be independent and establish his/her own lab in the academy and/or join industry.

Fundamental issues and challenges

1. Salary is so low and cannot support the postdoc and/or his/her family
2. Some of the advisors are challenging postdoc trainees and lack the basic and fundamental ethics to help and support postdocs to develop their careers (in my opinion, this is a major issue in the academy nowadays, making postdocs leaving this toxic environment and gave negative impacts to prospective postdoc thus also avoiding postdoc training)
3. Lack of funding and financial support from appropriate agencies for postdoc.

Existing NIH policies, programs, or resources

Increase salary.

Increase funding to postdoc.

Train advisors to help current and prospective postdoc.

Proven or promising external resources or approaches

Mentoring and institutional environment could be a major key.

Response 756

Perspectives on the postdoc roles and responsibilities

The postdoc is a necessary step to reach faculty position—another few years of underpaid and overworked research project. I love research and the freedom that academia offers, which is why I'm fine with it. But defining postdocs as "trainees" is a misnomer—we are not trained to become PIs, and we are already trained to be scientists. The postdoc is an opportunity to show the skills we have learned as PhD students in our own project. It's a lot better defined in Europe, for that matter.

Fundamental issues and challenges

The root of all problems is the lack of funding—postdoc salary is ridiculously low for a highly educated and skilled workforce (especially compared to industry standards). There is also absolute uncertainty—the job market for faculty positions is ever shrinking, and the funding system does not allow for other long-term jobs such as research scientists. The combination of these two factors makes life as a postdoc unnecessarily stressful and very unattractive compared to industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Honestly, the best way to improve postdoc mental health and recruitment is to increase salary to allow postdocs to make a decent living, especially in bigger cities (postdoc salary should be better adjusted to the local costs of living). Someone with 12+ years of college education should not have to live with roommates to afford rent—this is insane. Allowing for stabler jobs by funding research scientists (instead of exclusively short-term, project-based funding) would also help retain postdocs, especially women. It would also benefit research—the amount of lost knowledge and know-how due to the constant rotation of personal in labs is staggering.

Additionally, forcing research institutions to have postdoctoral offices and associations to show that they offer a local network of resources and support would help greatly. The amount of administrative workforce doesn't have to be as great as for a grad school, but something similar would provide a modicum of protection against the feeling of uncertainty that comes with a postdoc.

Response 757

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low pay.

Demanding academic careers in largely a soft money environment with low pay.

Industry perks are more attractive with pay and life balance.

Existing NIH policies, programs, or resources

As a PI of a NIH T32 postdoctoral training program, the restriction for the gap in funding between allowed NIH trainee salary and departmental salaries for recruitment and equity to be funded only by non-NIH funds severely limits faculty being able to support trainees. Most faculty are largely funded through NIH funds and themselves and their departments do not have resources to cover the gap.

Proven or promising external resources or approaches

No response

Response 758

Perspectives on the postdoc roles and responsibilities

Ideally, the postdoc position represents an opportunity to extend one's scientific training, become a more independent researcher with the goal of becoming a principle investigator or other leader in science, and to contribute in a meaningful way to one's field through both scientific contributions and training the next generation of scientists

Fundamental issues and challenges

The most significant challenge facing postdocs is the mismatch between the postdoc salary and the cost of living (for example: https://doi.org/10.1038/s41587-023-01656-4). Many highly skilled postdocs are leaving academia because they cannot make ends meet on an academic postdoc salary. Most universities set their postdoc salaries at or slightly above the NIH minimum. This is nowhere near sufficient in many big cities. Childcare has become prohibitively expensive throughout the U.S. This issue has been brought to NIH's attention many times (e.g. https://postdocparentsforchange.com/postdoc-letter/). Several postdoc unions across the country have had to strike to earn raises to match cost of living increases (e.g. [redacted for anonymity] strikes in 2022-2023). Raising salaries and benefits would likely significantly improve recruitment and retention. If postdoc positions lasted 2-3 years, the salary issue would not be as significant. However, the average length of a Bioscience postdoc has increased by several years over the last few decades, largely due to increased competition.

Another consequential challenge is the lack of diversity in the scientific workforce. The NIH and many universities have publicly stated support for promoting underrepresented groups in science, but have done little in practice to materially change workforce diversity. A more diverse research group benefits all involved and produces more rigorous and more innovative results. Promoting diversity in science requires changes in many parts of society. However, the NIH and universities can help (see for example: https://doi.org/10.1016/j.cell.2021.01.011), and improving the financial situation of postdocs would have a significant impact. Salaries below the cost of living select for postdocs who can afford to work for low pay, and this often means people without dependents, who do not have student loans, and who may have the luxury of financial assistance from family members (see https://www.washingtonpost.com/business/2022/07/08/dept-of-data-academia-elite/).

Response 759

Perspectives on the postdoc roles and responsibilities

The role can vary a lot. To me, a postdoc is for preparing those who want to be independent researchers in the future. It is not always necessary from this point of view, we are doing postdocs only because the academic market is very selective. From the perspective of PIs, postdocs do contribute a lot to the success of the lab and their advisors, so PIs may prefer permanent or long-term postdocs but may be unwilling to pay them as much as research scientists.

Fundamental issues and challenges

International postdocs are stuck in the position because their visa (non-cap H1B) doesn't allow them to work in the industry. Because of their visa/immigration status, the postdocs are at high risk of academic bullying. Other than that I think postdoctoral life is not that bad if they have a supportive advisor.

Existing NIH policies, programs, or resources

The current grants for postdocs are so limited, especially for non-us citizens, which makes K99 very competitive. The K99 mechanism doesn't work for its purpose, because by the time a postdoc is qualified to apply, he is already good enough to find a faculty position somewhere, so staying for 2 more years just doesn't make sense. I think there should be a funding mechanism for junior postdocs that doesn't require postdoctoral publication or initial data and award the applicants based on the quality of the proposal itself.

Proven or promising external resources or approaches

Systematically, postdocs should be treated as employees, not trainees, they should have benefits (e.g., retirement) and promotion opportunities. Not all postdocs want to become tenure-track professors, there should be multiple career paths for them, such as the teaching track, or research track. This kind of system does exist in other countries, postdocs can be promoted to lectures or research scientists. This is basically lacking in the US system, so there are very senior postdocs (more than 8 years), whose only hope is to get that green card and move on.

Response 760

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low paycheck.

Poor employment opportunities.

No career follow-up.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 761

Perspectives on the postdoc roles and responsibilities

Spending 2 to infinity years trying to publish and write grants, just hoping that maybe someday a job comes along that you can apply for and actually get. Being a postdoc seems very hard, not because the work itself is hard, but because of the expectations and lack of support from within your institution You don't get the support of students or postdocs, you are expected to just kinda figure everything out.

Fundamental issues and challenges

The pay relative the amount of skill and expertise is abysmal. A main issue seems to be the lack of guidance, expectations, and the seemingly indefinite timeline. Doing a postdoc doesn't come with better chances of getting a job, it only seems to exist as a way to get paid until you find a job.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 762

Perspectives on the postdoc roles and responsibilities

After graduate school, Ph. D.s become independent researchers, this means that they will be able to join to an existing project with supervisor(s) and design their own experiments to provide more insights. Post docs are responsible for bringing in a new perspective for the investigation of the study.

Fundamental issues and challenges

The first problem is the pay for post-docs. Post-doc trainee salary and stipends are so much lower than industry jobs that a post-doc can get easily. The second problem is the lack of freedom that graduate students experience during their training, we basically lose our ability to think after many years without freedom of creation of perspectives to study. Finally, I want to point out the main problem for being a post-doc as an international Ph. D. During graduate school, international status is kept with F-1 visa and then if we want to find a job we need to do it before we finish our Ph. D. studies to keep our status in the US. We need to act faster, also we need a solid/non-ambiguous path to make sure that we will not be in trouble with our status in the US. Industry job path is easier and less painful for this for now. On the top of that, the post-doc fellowships and programs that Ph. D. student can apply often have permanent residency or US citizenship requirement, this becomes a problem when an excellent match between this programs/fellowships and student can not happen because of those requirements. If we want to keep those requirements, then we need more opportunities to apply for residency/citizenship.

Existing NIH policies, programs, or resources

I mentioned some of the policy problems in the fundamental issues sections.

Proven or promising external resources or approaches

No response

Response 763

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is in my view an opportunity to further develop skills, publication record, and collaborative relationships before applying for a more permanent position.

Fundamental issues and challenges

In many places, postdoc stipends are not sufficient to cover the cost of living. Additionally, with the small number of principal investigator positions available compared to the number of applicants and the irrelevance of postdoctoral training to most industry jobs, the chances of a postdoc leading to a better job than would have been possible without the postdoc are small. Thus, time spent doing a postdoc can feel like wasted time as it can incur a financial burden with no clear payoff afterwards.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

I think the development of more long-term but non-PI positions (e.g. "staff scientist") in academia and government would make the idea of doing a postdoc more attractive because it would widen the pool of available jobs that could benefit from postdoctoral experience.

Response 764

Perspectives on the postdoc roles and responsibilities

My department at a large biotech company sponsors both funding for academic postdocs located mainly at a university (those focused on research broadly relevant to our company) and jointly at our company & a university (projects closely aligned to our company interests). These postdocs gain immense experience in the 1-2 years we expect the position to be appropriate for recent PhD graduates. These postdocs are exceptionally strong applicants at our company as well as our peer group of companies. Keeping someone as a postdoc beyond 3 years is an indictment against a company or university -NOT the individual. If a postdoc has not been promoted or found other work of their choosing within 3 years the university and company has failed the person by not encouraging and providing opportunities for advancement.

Fundamental issues and challenges

We have never had trouble recruiting postdocs.

We pay at the same rate as a similar scientist position based on location. Postdocs that work at a company site are considered company employees with full benefits (we especially try to offer this to postdocs with families because universities nearly universally do not offer benefits that are helpful for families including childcare).

We accept and understand that a majority of the postdocs we sponsor will find employment at other companies that are our direct competitors. As a company we still gain immense value from the academic partnerships and hiring we do at the rates that we do.

Existing NIH policies, programs, or resources

Training options for specific relevant jobs should be emphasized. Those jobs in industry require leadership and teamwork. Both of which most university only postdocs lack. Postdocs should not be strictly at the bench doing experimental work.

Proven or promising external resources or approaches

Look to what large companies and startup companies do with young scientists.

Large companies have well developed training, mentoring, and other programs to keep employees happy. Startups try lots of ideas that should be explored.

Response 765

Perspectives on the postdoc roles and responsibilities

I was basically placed in a postdoc because I was told I needed it so that I would be competitive for future NIH awards, and it most consisted of self-directed learning of a new skill and figuring out how to navigate academia. I think a lot of people view a postdoc as a time to get papers from their dissertation published, which is great, but the pay is less than that of a clinician (I am a clinician scientist), so it was a bit disappointing to leave a clinical career for a PhD stipend for 4 years and then also have low pay as a postdoc. It wouldn't be sustainable if I didn't have the financial means to do that. To me, a postdoc was a temporary holding position to limit my responsibilities for a couple years before I started on faculty, and also limit my pay.

Fundamental issues and challenges

It was very hard for me to find a postdoc position. My mentor (NIH funded) is a documented bully, and harasser of women and didn't help me with navigating to find a postdoc within his network. I found other mentors who helped me a bit, but I didn't know where to look and couldn't find a consolidated resource where to find postdoc jobs. This meant that I was applying all over the place, to positions that already had internal selections picked out. I've seen other postdocs get kind of bullied into staying in that position for

longer than they should because the PI wants cheaper labor. There has to be better oversight for the intention to help postdocs grow and become independent or at least find the path they want, and not linger in a postdoc forever. At my school, we created a Postdoc Peer Mentorship Program (published in the postdoc journal—Journal of Life Sciences, https://doi.org/hkqh), which I think is necessary everywhere to ensure that postdocs, which is a separate class of employee that doesn't receive FULL benefits of regular staff/faculty (at least at my university), are protected.

Existing NIH policies, programs, or resources

There should be more information on

1. how to find a postdoc (too many people say Twitter! that is not sufficient!)
2. what to expect from a postdoc and
3. how to make a transition plan.

Proven or promising external resources or approaches

I think a peer mentorship program (see above), or near-peer mentorship program would be great. I also think an NIH hub for posting postdoc positions would be ideal.

Response 766

Perspectives on the postdoc roles and responsibilities

I think the academic post doc works more independently on research and is receiving continued training and mentorship compared to graduate students. This might mean developing their own line of research and/or applying for grants.

Fundamental issues and challenges

I think the most important issue for many students is pay. After receiving the highest level of degree possible and after years of work, it's difficult to justify accepting a post-doc salary that pays only minimally more than a graduate student stipend. In addition, many students are not aware of what kinds of opportunities actually exist for them within academia and research, particularly in the social sciences. Preparing to apply for an academic position (e.g., tenure track professor) requires an incredible amount of work and there are very few positions available. There is little flexibility around location or salary.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 767

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

LOW WAGES!!!!

The main reason why I am in academia is because I like the flexibility of hours and what I do with my day to day, but I am only able to afford it because I have a partner with a higher salary.

I decided to remain child-free mostly because I could not afford having a child.

The lab is also located in a small college town where people don't want to live for the little we get paid.

Existing NIH policies, programs, or resources

NIH min salary! We all get paid according to that table, even though it is the minimum, the institutions use it as the guideline.

Proven or promising external resources or approaches

Improve wages and people will come.

Response 768

Perspectives on the postdoc roles and responsibilities

I view the postdoc position as one in which the goal is to both develop a scientific platform and leadership skills necessary to apply for academic faculty positions and lead an independent scientific team in the future.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 769

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a research position created to ensure the steady supply of highly-trained scientists who will work for minimum wage (The NIH postdoctoral scale does not exceed my locality's minimum salary for exempt employees until year 3). While nominally a training role, the reality is that I execute the research project grants of PIs and have negligible input as to my research direction.

Fundamental issues and challenges

It's no longer a training position it's just a badly compensated job. Either the salary needs to be adjusted to be livable, or the position needs to fundamentally change to not be "do someone else's R01 aims".

Existing NIH policies, programs, or resources

As someone who's had two children during my postdoc with my wife, who is also a postdoctoral fellow, I would say that the current NIH parental policies can best be described as "[redacted] them kids". My wife, for example, was given the same K99 eligibility extension for COVID that everyone got and told that she could not add a childbirth extension to it, despite giving birth to two children. Because it would be unfair to allow people to stack extensions.

Currently child care for one child is approximately equal to take-home pay if you are paid on the postdoctoral scale and the NIH has made no attempts to address this.

While I am sympathetic to a lot of the problems faced by the NIH in administering a funding system this complex, the complete failure to support "trainees" who have families is a major reason for the pervasive diversity and gender problems. I don't think there is any desire to use existing NIH resources to address this, and it makes me think there is a leadership and policy failure that can only be resolved by turning over virtually all of the NIH leadership.

Proven or promising external resources or approaches

Please stop calling this a training ecosystem. It's insulting, to be perfectly honest.

Response 770

Perspectives on the postdoc roles and responsibilities

Often acts as more of a PhD with no increase in independence, respect, or responsibilities. This results in minimal benefits doing a postdoc and a substantial deterrent.

Fundamental issues and challenges

Low salary, mistreatment from PIs, and extreme hours without a worklife balance. If you pay qualified individuals far below the industry average and expect them to work worse hours, fewer benefits, and less independently it shouldn't be a surprise people don't want to do it.

Existing NIH policies, programs, or resources

Increase the required pay for postdoctoral researchers to say the least.

Proven or promising external resources or approaches

If you could prevent PI's from constantly overworking and mistreating postdocs that would also probably help

Response 771

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a position where one gains additional experience, methods training, and builds expertise as they focus on a research agenda for their future career. I view the postdoc as an opportunity to make a name for yourself in your chosen field of study. I believe the postdoctoral position is a useful precursor to a tenure-track faculty position that allows you dedicated time to publish papers, develop research skills, network with other scholars in your field, and develop grant writing skills. The postdoctoral fellowship can also be a time for early career researchers to "catch up" to peers, who were privileged to be in high performing labs. I had a baby during graduate school and it put me behind my peers in publications and thinking through my research agenda. I'm using a postdoctoral fellowship as "catch up time" to help me be more competitive on the academic job market. So I think in some ways it can help "level the field", if you are fortunate enough to get a T32 postdoctoral fellowship that has additional funding to support training needs. However, it does significantly depend on mentorship and having access to data and projects that you can use to write manuscripts and develop ideas for funding. Ideally, mentors should take mentorship of early career researchers seriously, have the time and knowledge to support early career researcher development, work through complex research questions and problems with us, provide advice and mock interviews for job searches, collaborate with us on our research AND their research, help us make connections with experts in our field, and provide opportunities for us to take on roles that will move our careers forward.

Fundamental issues and challenges

The stipend and the length of time are two challenges for postdocs. Asking someone to move for a one to two year position for $53,000/year and limited benefits (part of my training funds pay for my health insurance) is just not realistic. In addition, the lack of adequate mentorship and the work environment significantly affects the quality of life of postdoctoral trainees in academic research. I hear horror stories about the lack of mentorship, lack of training/support, toxic work environments, and work expectations for postdoctoral researchers. There are many stories of bad behavior by PIs that gets shared in whisper networks, but doesn't seem to impact funding or prestige. There are also problems with how we are viewed within the research system. Some PIs view us as productivity machines that should be churning out papers using data from the lab. Other PIs view us as "trainees" without substantive knowledge in our field or good ideas for how to do research. Both of these views are toxic. We are doctors (all of us will either have an MD, PhD, or both) and we are likely taking this opportunity because we need more time to develop as scientists and want to pursue careers in research. Finally, I think the lack of a clear career pathway within academia is really inhibiting recruitment, retention, and quality of life for postdoctoral trainees. We are all working so hard to compete for fewer and fewer tenure-track academic jobs and I think many people are over it before they even get to the postdoc stage.

Existing NIH policies, programs, or resources

Increasing the postdoctoral researcher base pay rate would be a big step in improving recruitment, retention, and quality of life. Most postdocs not funded by NIH set their base pay rates to similar levels, so by increasing this NIH would increase salaries for a majority of postdocs. Policies that encourage and support virtual postdoctoral researchers would be another great policy action for NIH. Allowing postdoctoral researchers and mentors to engage virtually in new and existing T32 grants would improve recruitment and retention. I also believe NIH should be tracking and assessing mentorship in some way.

NIH cares if researchers meet their study aims; however, it would be great if they also cared about mentorship quality. Specifically, evaluations of postdoctoral mentors through NIH systems would be ideal. This type of system would give NIH the opportunity to gather data on mentors and their skills to identify areas where mentors are lacking, offer training, and set expectations for what mentorship should look like on funded projects. It could also serve as a whistle blowing system for toxic and abusive PIs. If a PI is creating a toxic work environment or has legitimate allegations of abusive behavior, that PI should not be allowed to mentor postdocs (or students!) and should not be awarded NIH funding.

Proven or promising external resources or approaches

No response

Response 772

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

We're not paid enough for the amount of work we're expected to do. To get a tenure-track faculty position, one must have multiple first-author papers in high-ranking journals, independent funding, K-99 etc., and some teaching experience. And that doesn't guarantee getting a faculty position! It's just so much work, that is unappreciated, takes up LOTS of time (5-7 years), and is extremely underpaid! There's absolutely no reason for anyone passionate about science to pursue an academic career —it's a bunch of road blocks! not worth it. Besides the fact that we have families that we not only want to support but also want to spend time with (surprise!)

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 773

Perspectives on the postdoc roles and responsibilities

I received my Ph.D. at Princeton in 2019 and am conducting an F32-funded post-doc at WashU. Most of my graduate school cohort did not pursue a post-doc, and I perceived this a successful realization of the efforts spearheaded by the NIH to encourage graduate students to 'pivot from the Ph.D.' I made a very considered decision to pursue a post-doc in the research area that I found interesting, and challenging, and which I believe carries transformative potential for biomedicine (namely applying polymer physics principles to understanding protein function).

Fundamental issues and challenges

To elaborate from above, I challenge the notion that a decline in post-docs is, per se, a problem. An oft-quoted statistic, initiated by an RFI from 2011(https://grants.nih.gov/grants/guide/notice-files/NOT-OD-11-106.html), was "only 10% of trainees end up in academia—it is the alternate career" The spoken and unspoken interpretation of this was (and is): make a very considered decision before entering into a post-doc. If that model is working as planned, then having enough high-quality post-docs, who want to be post-docs, to meet the needs of the biomedical research enterprise seems like a success. Still, there are a few specific issues pertaining to the prompt:

There is a clear economic inhibition in high-cost-of-living coastal cities where research excellence is concentrated.

The remuneration and lifestyle of non-post-doc careers are hugely attractive to exhausted graduate students planning their next step

Existing NIH policies, programs, or resources

Exceptionally remunerative transition awards from grad school to postdoc (e.g. 100k a year as a starting post-doc)

Deliberate and earnest conversations with students about the unique benefits of a post-doc relative to the perceived benefits of other career opportunities (e.g.'s life satisfaction, mission-driven work, building one's independence, etc.)

Simplify the F32 grant.

Proven or promising external resources or approaches

The granting mechanisms, while byzantine, are hugely helpful to a high-caliber post-doc at risk of disillusionment. Specifically, they are a necessary counter-weight to the HHW, JJC, HHMI, etc. very-low-odds-reward-absurd-ambition-and-prestige grants that many post-docs feel they must obtain. The NIH could telegraph that their awards are the bread-and-butter of a career.

Response 774

Perspectives on the postdoc roles and responsibilities

Independent research under the supervision of the PI, developing skills for future career goals and mentorship to junior lab members.

Fundamental issues and challenges

Complete lack of stability or postdoctoral support, the lack of consistency in mentorship and complete lack of childcare support. Childcare costs comprise almost 40% of my salary where I live.

Existing NIH policies, programs, or resources

Pay postdocs more in general, subsidize housing and childcare, or provide childcare for postdocs near where they work. Also increasing parental leave and support for productivity during parental leave.

Proven or promising external resources or approaches

No response

Response 775

Perspectives on the postdoc roles and responsibilities

The postdoc is intended for people who want to eventually become professors or faculty members. It is not meant for people who want to go into industry or other private entities. Postdocs are for universities to retain or recruit their exceptional students to eventually replace the old faculty.

Fundamental issues and challenges

Money and abuse by professors towards students. As a 3rd year PhD student at my university, I've been constantly berated and belittled by my professor, an endowed and tenured professor. I've constantly been told that I wasn't smart enough, and that I had deceived my professor to get into the program. On top of these words, I've been physically harassed by this same professor. When I moved to my new professor, I was told that I have $0 for research and conferences, despite being at a top-tier R1 university. I'm using stolen equipment from my past employment to do research. If a university cannot properly support their PhD students, how can they properly support their Postdocs? A PhD is supposed to be a training program, however I haven't received any specialized training in the past 3 years that I've been here.

Existing NIH policies, programs, or resources

More money for postdocs, and better mechanisms to defund professors that abuse their students.

Proven or promising external resources or approaches

Unionization of graduate workers. Speak with the unions at UC, MIT, Harvard, Emory, Johns Hopkins, etc etc etc. They'll tell you how the real situations are at their universities and tell you how to better the research ecosystems. Don't listen to the universities themselves.

Response 776

Perspectives on the postdoc roles and responsibilities

The 2-year T32 postdoctoral position that I held was essential to my development into an independent investigator. I published dissertation manuscripts, wrote my K01, and gained new mentors/colleagues who have expanded my research opportunities. I just received my first R01 and I am certain it is due to the additional training and time that I had as a postdoc to plan my career. My mentors were the key to the experience and they were exceptionally altruistic compared to other postdoc mentors. They focused on my career and development, not their own to-do list that they hoped I could help them tackle.

Fundamental issues and challenges

The pool of available mentors who are "in it" for the right reasons is too small, and that is the main challenge holding back greater recruitment, retention, and quality of life of postdoctoral trainees. It is so common to hear a faculty mentor talk about "their postdoc" who is working on essential aspects of the mentors' own research projects, with seemingly no attention to the postdoc's career goals. This situation is well known among PhD students, who want to avoid it, and rightly so. The low rate at which postdocs transition into faculty positions (while their mentors continue to rack up the funding in part due to the hard work of postdocs), is a sign of failure of the mentors. Poor retention of postdocs is a natural consequence.

Existing NIH policies, programs, or resources

There need to be higher expectations and greater accountability for mentors' practices and postdoctoral fellows' outcomes. Rather than setting a cap on the number of years that a T32 postdoc position can be held and also requiring repayment if the postdoc leaves, perhaps NIH should provide greater oversight for mentors' timelines for successfully helping postdocs submit grant applications and transition to faculty positions. There is very little reward within academic institutions for mentoring a postdoc well. A policy to reward mentors in some way would also be helpful. At the very least, the postdoc should not be penalized for poor having a bad mentor and needing to leave early.

Proven or promising external resources or approaches

No response

Response 777

Perspectives on the postdoc roles and responsibilities

Post docs to me are a position to go if you do not receive a tenure track position after undergrad. It feels like a step to take if you aren't ready to be a faculty member.

Fundamental issues and challenges

Issues:

This isn't training. We have full PhDs. It feels like an extension of grad school.

Low salary

Lack of health care.

Lack of benefits.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 778

Perspectives on the postdoc roles and responsibilities

As a postdoc we are the main drivers of projects, investigations, grant proposals, and even responsible for oversight and training of other lab members including technicians, undergrad and grad students and summer outreach. Without us, the system doesn't work, and yet we are treated as trainees? We are the reason why discoveries are made or fail and yet you treat us like the help that can easily be replaced. A good postdoc makes a project and you all know this, and yet you hire someone after years of hands-on training and treat them by rights, salary and benefits as if they are just starting out. I have never been mentored as a postdoc and yet the NIH suggested salary is tied to this fact. We bring expertise that is irreplaceable in a lab and yet we are not compensated for it. There is no way upward as the old white boys club continuous it's hold on PI positions. Minorities are required and invited to serve in endless committees addressing issues of inequalities and yet nothing is enforceable and nothing is done. Academia is stuck and flawed in a 100 year old view thinking it can exist on prestige and requiring passionate workers to ignore the fact that they are mistreated.

Fundamental issues and challenges

Poor mentorship, no opportunity to advance and become independent, biased NIH funding structure that awards old and established white males for useless science and ignores innovative and fresh approaches since the decision makers are all in it together. Poor pay and the title of a trainee is disrespectful and nt representative of the load the postdoc is carrying.

Existing NIH policies, programs, or resources

We don't need more training, endless courses, another webinar telling us what grants there are, none of this is helpful or leads to anything. The solution is simple—respectful and adequate pay as if we were the professionals we are, matching industry. And fully anonymous NIH grant submission process, it's not that hard, others are doing it too.

Proven or promising external resources or approaches

Australia has adequate pay and anonymous grant submission. NASA in most RFA's doesn't distinguish for the position of the applicant and also has anonymous submission in many areas.

Response 779

Perspectives on the postdoc roles and responsibilities

My postdoc is a time for me to get up to speed with processes and procedures at my institution, network, and write grants.

Fundamental issues and challenges

The fundamental issue is salary. During my PhD program, I worked as a research coordinator to pay for school. I earned $60,500 annually. My first year as a postdoc, per the NIH salary ladder, I started at $53,000. I won't reach my pre-PhD level for several years. Even the staff I work with make more money than me. It's not sustainable and it's demoralizing to earn a degree, land a postdoc at an amazing institution, and then not feel like I'm being compensated for my work. The only reason I took the postdoc was to move my daughter closer to her grandparents.

Existing NIH policies, programs, or resources

I applied for an F32 but maybe I should have gone for a K? Resources on how to decide between the two would be helpful.

Proven or promising external resources or approaches

I really like the NINDS podcasts—it's so helpful to hear the voices and opinions of other postdocs. I will likely never apply to NINDS so it would be nice if other institutes had podcasts. I also received pilot funding through a P50 which has been great. It felt like an easier, less competitive process to get my first NIH grant.

Response 780

Perspectives on the postdoc roles and responsibilities

As a current postdoctoral fellow at an academic institution, I view academic postdocs as a period of specialization within a specific field, additional training, and opportunities for teaching, mentoring, and supervision. Within my field of clinical psychology, it is also a period when you can receive supervision for licensure and become licensed, which is needed for many future academic positions.

Fundamental issues and challenges

Overall, I think that in my field, postdocs can be really helpful to kickstart an academic career and be competitive on the job market. At present, the main issue that prohibits individuals from completing a postdoc is low pay which is generally consistent with the NRSA stipend. This leads to people going on the job market earlier, which I think is long-term potentially detrimental to their career. Additionally and perhaps most importantly, I think the low pay also impacts the diversity of the academic workforce because high socioeconomic status trainees (who may not have as much debt, etc) may be more likely to be able to do a postdoc at present. Another challenge for my specific field within Clinical Psychology is the number of moves that a trainee needs to potentially make to be competitive applicant on the job market between Clinical Internship and a postdoc.

Existing NIH policies, programs, or resources

In terms of policies, I think one thing I think about is early stage investigator policies. There are lot of grant opportunities, awards, and policies for early career investigators. These are really helpful, but it might be helpful to have more support for these initial stages post-PhD specifically (e.g. the first 3 years) when postdocs are occurring. There is a pretty big difference between a first-year postdoc and someone 10 years post-PhD.

Proven or promising external resources or approaches

No response

Response 781

Perspectives on the postdoc roles and responsibilities

Further training on techniques that I did not have the chance to explore in more detail during my PhD.

Fundamental issues and challenges

SALARY TOO LOW!

Existing NIH policies, programs, or resources

Paths/opportunities are pretty well-defined. Noncompetitive salary is the only issue I face and as a result I will likely be leaving academia.

Proven or promising external resources or approaches

More NIH visibility on social media platforms (Twitter, Instagram, LinkedIn etc) could be useful.

Response 782

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is to learn research methods and what additional skills are necessary to achieve their career goals. The career goals could be for research in academia or industry, or for teaching biomedical topics in academia, or both. The additional skills should include administrative skills, writing skills, and interpersonal skills. As part of the process of postdoc training, they do research with mentors and write papers, supporting productivity for themselves and their mentors.

Fundamental issues and challenges

Perception that an academic research career is not viable or desirable, largely because of the difficulty to maintain sufficient funding under conditions in which universities rely almost entirely on NIH to pay faculty salaries.

Low salaries compared to industry, especially in locations that have higher costs of living.

For a long time, the quality of academic life with flexibility of intellectual pursuits was an attractive tradeoff of the difference in compensation, but the quality of academic life has degraded significantly, with increasing administrative burdens falling on faculty more junior.

For junior people, the burdens of pursuing diversity goals are falling disproportionately on female faculty and people from under-represented groups, often with no compensation.

To sum up, the pay is low compared to industry, and the stability of academic careers has degraded a lot. They see this from the way their mentors live and work.

Existing NIH policies, programs, or resources

Peg postdoc training salaries to the costs of living in various locations, analogously to reimbursement on the government web sites for per diem and travel expenses.

I think that the rest is up to academic institutions to change how they function (start paying faculty salaries and make sure that work on diversity is compensated and recognized for promotion.) Currently many universities pay faculty on the back of the U.S. taxpayer.

Response 783

Perspectives on the postdoc roles and responsibilities

I view being a postdoc like being an apprentice/journeyman in science. The goal is to become more independent and take a more significant role in coming up with scientific ideas, writing papers, and writing grants.

Fundamental issues and challenges

I think there is a lot of gaps to be filled for the postdoc to professor pathway. There is a distinct lack of support for postdocs at an institutional level, where most job training for postdocs is run by other postdocs rather than at the department/school level. There is opacity for the hiring process that makes putting together a successful package complex at best.

Pay scale is impressively poor in comparison to almost any other job for the amount of training, with poor benefits and culture being entirely dependent on the PI of the lab. Job security is close to at will, again dependent on the PI, with less than poor job prospects without a significant move. It is likely one would have to move to another state to continue any training or get a professor level job, with little guarantee when any hiring decision is made.

Funding is a complex issue that has unclear benefits (and the unclear tax liability is a headache that should not be the responsibility of the trainee). I had an F31 as a graduate student, and F32 as a postdoc, which I was very fortunate to receive. The timing of the F32 essentially pushed me out of eligibility for the k99/r00, and my current institution will generally not support any other transitional NIH grants. I find that most of the interviewees for professor jobs in my area often have funding, either a the k99/r00 or similar training/early career grant.

Existing NIH policies, programs, or resources

I think more transitional funding in the postdoc to professor stage and either sincere encouragement or requirement for institutions to provide support for these grants.

Proven or promising external resources or approaches

No response

Response 784

Perspectives on the postdoc roles and responsibilities

I see my postdoctoral training as a part of a learning process. My experiences in this training will definitely help me build my career. I am yet to decide between choosing academia or industry for my future. Learning newer techniques and doing challenging experiments has been a part of my training.

Fundamental issues and challenges

1. The biggest issue is the PAY. More of my friends are drifting towards industry after completing their Ph.D just because of the pay disparity. The increase living cost is not helping people to stay in academia with such a low pay during postdoc.
2. Being an international scientist in the US is worse. I always have to worry about my visa status and on top of that we hardly have any fellowships to apply to. The NIH must have some fellowships reserved for international postdocs specifically.

Existing NIH policies, programs, or resources

Please have some fellowships reserved for international postdocs

Response 786

Perspectives on the postdoc roles and responsibilities

Post-doctoral positions are two-fold, in my opinion. They are first and foremost a research scientist position, where you get to use the experience, skills, and knowledge built up over the course of undergrad/graduate education towards solving scientific questions, with a degree of independence above and beyond that of a student. Responsibilities on this level may/should include supervising those more junior (i.e. techs, grad students, undergrads etc), planning and executing experiments at a high level, engaging with the bigger picture of a project, and providing a strong foundation of expertise and experience for the lab to benefit off of. Ideally post-docs should be treated like junior colleagues, and paid accordingly for their expertise and service. However, given that these positions are temporary and intended to build towards a more independent role, post-docs should be well-supported in developing skills towards more senior scientist roles, eventually reaching the point of being capable of running a research group independently. This requires that they receive periodic guidance towards independent leadership, high-level project design (at the level of a full group, not just a single project), financial decision making and so on.

Fundamental issues and challenges

1. First and foremost, compensation of post-docs is well under where it should be for their expertise, training level and roles they are usually fulfilling. Postdocs should be paid well above the affordability level of a city, at the level of an industry postdoc or entry level doctoral researcher. Many of my colleagues opted out of post-doctoral positions because they were not at a stage of life where taking a pay cut for additional training was worth it when their other goals include building a family, buying property, etc and other positions would appropriately compensate for their expertise such that they could both have a great job and afford to achieve their other goals. Many of these people would have been more willing to pursue a post-doctoral position if the pay did not require putting off these other goals.
2. The pressure on post-docs to be constantly thinking about next steps from the moment they step into their position, coupled with the precarity of job opportunities and funding available makes the job difficult to enjoy and be present in and imposes a lower quality of life. To some degree, this is the 'price we pay' for additional training and is somewhat inevitable, but more available resources for considering next steps, a higher likelihood of success after post-doc and career development planning would alleviate these stresses.
3. Transitioning from PhD to postdoc can be challenging, especially without strong guidance which can be hard to come by. There seems to be a bit of an unwritten curriculum regarding how to seek out post-doc positions, successfully apply for them, and choose the right fit, and then negotiate the transition.

Existing NIH policies, programs, or resources

Transitional awards from PhD to Postdoc, such as the F99/K00 award are fantastic mechanisms for retaining postdocs and providing support and a clear pathway into the next step. Expansion of these types of mechanisms will be fantastic but should come with appropriate support for navigating the transition, which some do not as they stand currently. For example, the NCI F99/K00 comes with an extremely stressful and difficult to navigate transition process that is at best inconvenient and at worst harmful for awardees. Specifically, the requirement that awardees transition to their post-doctoral position 2 weeks following their thesis defense and completion of hard thesis requirements is nearly impossible to accomplish and incredibly stressful for all involved. A period of AT LEAST 6 weeks should be the expectation. It is absolutely critical to the success of these grant mechanisms, and their awardees not to impose additional rules and/or restrictions on training and timelines, especially those that add stress to an already difficult process. PhDs must be supported in taking a brief break following completion of their degree before they jump headlong into their postdoctoral study; anything else can impose/exacerbate major burnout during a vulnerable period. The transition between PhD and post-doc often comes with expensive long-distance move, and allowable time periods should take this into account, encouraging new post-docs to settle their lives (sign leases, pack, transition families) NOT designed to be at a period concurrent with finishing thesis revisions, publishing papers and completing other soft requirements such as attending graduations. As the current F99/K00 transition works, it comes with major financial, logistical, mental health and academic consequences that are detrimental to grantee health and wellness, and take away from the benefits to this grant mechanism. NIH should restructure this program with the post-doc transition in mind.

Proven or promising external resources or approaches

No response

Response 787

Perspectives on the postdoc roles and responsibilities

1. Design and perform experiments within scope of lab/PI interests.
2. Acquire data that is mutually beneficial to PI and postdoc, e.g. can be used for papers that help both post-doc with career and PI acquire funding. Write papers and grants.
3. Train students.

Fundamental issues and challenges

Biomed academic postdoc is an extremely marginalized position. Pay is low for expected education and work hours (often more than 40 hours/week).

Most universities do not keep good track of postdocs and do nothing to protect them, unlike graduate students, who have a committee and graduation date. There is zero accountability for PIs regarding postdoc outcomes. E.g. if a PI has multiple 8+ year postdocs, and has never or rarely had a postdoc reach their goal of a tenure track position (eg they all end up going to industry as a backup), there is no easy way to find this out and the university and NIH do not know or care. Postdocs are often promoted to "Investigator" or "Research Assistant Professor" with zero tangible benefit, but this makes professors look good and obscures postdoc outcomes.

When I was a postdoc, almost all of the postdocs I knew (15+) were deeply unhappy with their situation, even the ones who were competitive on the job market. This unhappiness was unanimously because of their relationship with their PI.

The currency for success for postdocs and PIs is different. The #1 factor for finding an independent position for postdocs is first author papers in prestigious journals. Without these, you have almost no shot. However, PIs only need middle-tier papers, along with preliminary data to get grants and tenure. PIs are in many ways incentivized to NOT help postdocs find a new position, and instead keep them around as glorified technicians. I have personally witnessed many PIs who have postdocs focus their time and energy on small projects that will benefit the PI (e.g. getting preliminary data for grants) while avoiding focus on putting together a big story for a high impact paper.

It is obvious to everyone at this point that the job market for tenure track positions is extremely competitive, with many searches seeing 100-300+ applicants.

If intent is going into industry, there is minimal if any benefit in doing academic postdoc. Some data even suggests it is a waste of time and money in the form of lost income.

Existing NIH policies, programs, or resources

Maintain a public record of postdoc outcomes for universities and PIs. Track the number of years as a postdoc/investigator/research professor is supported by NIH, under what PI and university, and outcome. Mandate university and PI accountability for postdoc outcomes.

Proven or promising external resources or approaches

Again: Maintain a public record of postdoc outcomes for universities and PIs. Track the number of years as a postdoc/investigator/research professor is supported by NIH, under what PI and university, and outcome. Mandate university and PI accountability for postdoc outcomes.

Response 788

Perspectives on the postdoc roles and responsibilities

It's a training position where you get to practice multiple other aspects such as mentoring, managing and finances of a lab.

Fundamental issues and challenges

Low pay and high expectations from PI to work. No clarity in the future for a respectable academic job outside of being a PI. PI jobs almost impossible to get for an average postdoc.

Existing NIH policies, programs, or resources

Promote more scientist positions that are paid better—with clear policies on vacation days and expected work hours. Should not be under the mercy of the PI alone.

Proven or promising external resources or approaches

Mentoring

Response 789

Perspectives on the postdoc roles and responsibilities

Ideally, the postdoc position would be a temporary, short-lived position (maybe 1-3 years?) where a Phd-level scientist could hone certain skills for a future as a tenure-track faculty member at a university. These would include grant writing, developing course materials and delivering lectures, and developing the beginnings of a research program. As highly skilled scientists, what we give in return is a highly productive member of a lab that can advance the PI's existing projects and mentor graduate and undergraduate students.

In reality, the postdoc is an ambiguous position in both responsibilities and time course. Because of the "temporary" nature of the job, we are not treated as full employees of the university: this means no performance based raises, little oversight on even yearly inflation-based raises, worse healthcare than the graduate students or undergrads, and almost always no matching retirement plan. I worked extremely hard and succeeded during my PhD to land myself in a well-funded, established lab at an Ivy league institution. My university seems to have almost unlimited budgets for construction and recruitment, but somehow they are comfortable with giving postdocs the bare minimum while we carry research programs on our backs. Depending on the individual lab, postdocs take on massive responsibilities for the maintenance of the PI's lab and research program, and are left with little time to develop their own independent projects. This goes on for years, with no guarantee of a tenure-track position at the end of the road.

This is why postdocs are quitting in record numbers. My peers are in all the top research institutions in the country, and we all echo the same sentiment: to the outside world we are highly trained, accomplished scientists worthy of well-paying, stable, supported jobs. To the institutions we work at, we are "just trainees".

Fundamental issues and challenges

The number one issue is base salary and benefits. Realistically, labs will always feel tight on money and resources. That is the nature of funding these days. When given the freedom to do so, institutes will choose to pay the minimum allowed, or in some cases, even less. The base salaries need to be set by NIH and there needs to be a serious push to force NIH-funded institutions to adhere to the payscale. The NIH needs to raise minimums significantly, as well as significant % raises for each year of experience. It is appalling that NIH postdocs are paid through the IRTA stipend scale, which both allows for a range of salaries at each level as well as overall much higher salaries, but this model is not extended to NIH-funded grants at academic institutions.

Further, institutions must designate postdocs as full-time employees. The average age of a postdoc is 33—this is the age where people need to be seriously planning for their future—investing, saving, building a family if they choose. These are all impossible with the current postdoc compensation packages. If universities would improve the health insurance available to postdocs (for example at my institution, move us to the health insurance that residents, or even graduate students, are given), and provide some matching retirement, postdocs could view this time as an investment in their future career, rather than a financial blow that they may never recover from.

Finally, there needs to be mandatory COLA for postdocs in particularly high-cost areas. Many of the most prestigious institutions, with the most successful labs, are in areas where postdocs can't afford to live. Adjusting salary based on this factor would improve postdoc well-being and ultimately retention.

Existing NIH policies, programs, or resources

Set higher payscales for postdocs funded on NIH grants, and have even higher payscales for NRSA fellows and institutional training grants to incentivize postdocs to pursue these. Implement policies where NIH-funded labs must adhere at least to the minimum of these scales. Further, offer adjustments to the budgets of existing grants when raises are set, so that particularly junior faculty do not feel the financial burden of paying postdocs to a higher scale. Add on funds to these fellowships for independent research—so that the postdoc can order reagents or equipment solely for the development of their independent research program. Open up the eligibility of NRSA's to international postdocs, whose work is such a valuable part of American science.

Proven or promising external resources or approaches

Ways to improve postdoc recruitment, retention, and outcomes: Enforce mandatory training plans set at the start of the postdoc, outlining the mentorship structure and plan for the next 3 years. Put policies in place to support postdocs with families—particularly women. The postdoctoral period often coincides with child-bearing years, and women should not be carrying the burden of expanding their families and furthering their research career without adequate support. Subsidize childcare, extend eligibility requirements for fellowships and transitional grants, increase salaries across the board so that a choice doesn't have to be made between a family and a career. Provide more structured training, both for postdocs and the PI's that mentor them. The scientists of the future need to be well-rounded, versed in many techniques, and flexible in their research. Provide postdocs with tools to make them successful for the future.

Response 790

Perspectives on the postdoc roles and responsibilities

A postdoc shod an opportunity to establish independence while still benefiting from direct advisement.

Fundamental issues and challenges

Money. Simply put, salaries are unsustainable.

Existing NIH policies, programs, or resources

The NIH minimum salary needs to dramatically improve, and additional freedoms need to be given to PIs to supplement postdoc pay.

Proven or promising external resources or approaches

I stayed at my job specifically because my PI was able to give me additional funds.

Response 791

Perspectives on the postdoc roles and responsibilities

Training and preparation for faculty position. Whereas graduate school is more about learning scientific skills, postdoc is more about apply these skills (and learning more skills) to work more independently. Many postdocs also have at least a general idea of the type of research they want to pursue as a PI, so the postdoctoral training helps us define our research program and accumulate other experiences and skills (e.g. mentoring, teaching, networking) for being a PI.

Fundamental issues and challenges

Compared to non-academic jobs with similar requirements on education and experience levels, the salary and benefits of postdoc positions are very unattractive. This severely limits the postdoc workforce to people who can afford to receive sub-optimal pay for a significant proportion of their career (e.g. people who do not have student loans or debts, have few or no dependents, or those who have other sources of income). Aside from salary, the difficulty of obtaining work visas or resident status also limits the US's access to international postdocs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 792

Perspectives on the postdoc roles and responsibilities

Postdocs are semi-independent to fully independent researchers who work with PIs to develop projects along lines of mutual interest. There may be some skill development in the new lab but I would not consider it a training position

Fundamental issues and challenges

Problems:

1. Poor pay and benefits. When industry is paying significantly better/providing benefits it makes it challenging to want to pursue a postdoc. Postdocs in Boston should not be making 1/2 to 1/3rd of what their newly graduated peers do in industry.
2. Quality of life is dependent on PI so there is very little consistency wrt workload, work life balance, vacation time, etc
3. Poor outlook on number of academic positions. As a grad student I get the feeling that every year the standards for who becomes new faculty go up while the available positions stay stagnate or go down. Having to work for years after achieving a level of education most of the world never will just so you have a chance to get an academic job is disheartening.
4. Poor outlook on work as a young academic scientist. Universities are constantly raising the pressure on their young faculty meaning they work long hours and are constantly stressed. Hard to justify becoming a postdoc just so that you can then be mistreated by a university for X year until you get tenure.
5. Lack of control of life plan. Postdocs don't know when they will finish, where they will go, how their partner will be able to join them in the new location, whether they will be heading to another postdoc or a faculty position, etc. this makes planning for the future nearly impossible and makes the whole process of being a postdoc seem highly anxiety inducing.

Existing NIH policies, programs, or resources

The NIH needs to mandate postdoc time off, sick days, and adjust the minimum pay scale to the living wage on a per city basis. And to enforce these policies they should withhold funding to universities and labs that do not meet these minimums.

The NIH and other funding agencies should also increase the sizes of the awards they provide to allow professors to afford to pay their staff higher wages.

Proven or promising external resources or approaches

No response

Response 793

Perspectives on the postdoc roles and responsibilities

This should be classified as a trainee position, not as a traditional employee. I think of them as grad students who dont have a thesis/dissertation to write. They are here to learn and publish to advance their goals.

Many institutions are classifying postdocs as employees and therefore are subject to minimum salary requirements, payment of fringe benefits that exceed the NIH cap. It is hard to fill in the shortfall as investigators are caught in between a rock and hard place. Clarification from NIH that they are trainees would help in solving this problem. OR NIH should raise the cap on postdoc salaries.

Fundamental issues and challenges

See above. Also, low salaries, and lucrative employment market makes it hard to recruit top quality postdocs. Therefore, only non-US postdocs are available to me which poses additional problems such as visas, language, communication, and also different "culture" of conducting science.

Existing NIH policies, programs, or resources

See above.

Proven or promising external resources or approaches

Increase salaries, especially in high cost of living areas such as Seattle, classify them as trainees, not employees.

Response 794

Perspectives on the postdoc roles and responsibilities

A chance to acquire new skills, learn the culture of a different lab and institution, make connections, have more independence and control over projects and create an independent identity. Above all, having a period of time to focus purely on research with no other responsibilities.

Fundamental issues and challenges

Financial security was my main concern as a post-doc. I was lucky to get an F32 (on my second attempt) back when success rates were over 40%. The stipend level was not high, but it was supplemented by my PI. The F32 gave me a sense of independence and recognition of my abilities as a scientist. I think this is a critical mechanism and the success rate should be higher. But cost of living varies widely and F32 stipend levels often need to be supplemented.

Existing NIH policies, programs, or resources

Allow F32s to be supplemented from federal sources.

Proven or promising external resources or approaches

No response

Response 795

Perspectives on the postdoc roles and responsibilities

My original understanding was that a postdoc would a be a period of research intensive focus with the goal of finding a research focus and mastering research and writing skills necessary for starting a successful independent career. Hopefully this would include exposure to writing grants, the admin side of running a lab, and training mentees. However, the reality has been less research time replaced with more admin time as PIs struggle to handle the increasing number of admin and bureaurocratic items passed on to them that they have to start handing off more and more lab admin jobs to postdocs and down the line.

Fundamental issues and challenges

There seems to be at least 2 fundamental issues:

1. Funding issues from the top down and
2. Increasing bureaucracy.

Regarding funding, modular grant amounts have not kept pace with inflation for decades and is simply insufficient to fund even small research questions and groups. Grant success appears to require the "flashiest, newest" technology, when a cheaper traditional method is better suited for answer the questions proposed. There simply isn't enough money to do the research and pay postdocs what they are worth and could receive in industry. Postdocs are often classified as "temporary" or "consultants" and have little employee protections, and often no employee benefits extended to other staff in academic institutions. New NIH policies on data sharing require more data storage space, yet Universities are tightening their IT regulations that act in opposition to this without providing affordable alternatives or assistance (monetary, technical, nor otherwise).

Regarding increasing bureaucracy, PIs are increasingly being required to do more paperwork and justification of every decision and work under tighter regulations, by both the grant and academic institutions. This takes so much of PIs time, that they have less time to provide guidance and mentorship of their lab, often requiring they delegate admin and mentoring needs to their postdocs or senior graduates students.

Another major issue is the bipolar treatment of postdocs like infantile trainees or having them held to impossible standards based on what is convenient/easier/cheaper.

Existing NIH policies, programs, or resources

There appears to be no mechanism, or at least enforcement, of trainee stipend levels beyond when first hired. So if the NIH adjusts stipend levels, those of us already in labs are stuck at previous levels

(sometimes with minor raises if the department admin allows, but it's never as much as we should jump from year to year, and it doesn't seem to matter if the PI has budgeted for it).

Policies requiring significant expense or expertise need to provide necessary funding allocations and resources to allow labs to comply. Protection of federal grantees from academic or other institutions policies that are in opposition to NIH policies.

Proven or promising external resources or approaches

Better pay and gaurantee of benefits (maternity/paternity leave, insurance, retirement plans).

Response 796

Perspectives on the postdoc roles and responsibilities

To me, the existence of the postdoctoral position is largely to build an independent research program. At the start of a postdoc, you are likely already an expert in your field, so this time is meant to generate enough data to begin writing grants for your academic position (if that is the path you choose). A postdoctoral scholar may use this time to gain new skills either for industry or academia, but in my experience it seems rare to make large leaps across fields without some strong foundation in a nearby field.

Fundamental issues and challenges

There are many fundamental issues with the position of postdoctoral fellow, so I will list them.

- First and foremost, the very title of "trainee" is offensive. We are experts in our fields, and should be treated as such.
- Accompanying this belittling title are limited benefits (no retirement, no job security, rarely receive a set vacation allocation, etc)
- To go along with our limited benefits, we are paid at a level far below our degree and our skill level (lab technicians often paid at a similar level w/o degree)
- Often postdocs have an academic career in mind, but those positions are increasingly difficult to acquire.
- In many cases, work-life balance is poor, with expectations to work well over 40 hours every week.

These factors coalesce into the current situation of poor recruitment, retention, and quality of life of postdocs. Why should I accept poor pay, work-life balance, and limited respect all for a job that is becoming increasingly difficult to acquire? The reward just isn't worth the sacrifice.

Speculating, perhaps my PhD program providing exceptional information regarding non-academic jobs has helped inform my view of just how bad a deal a postdoc is. This issue may be recent, solely because postdocs of old were just dealing with less information.

Existing NIH policies, programs, or resources

At a policy level, the fix is relatively simple. Making the postdoctoral fellowship a competitive position from the perspective of pay, benefits, and respect. Assuming we are not going to solve the issue of too few open tenure-track positions, something else is needed to entice and retain talented scientists.

Obviously this will significantly cut into the budgets of PIs, so there would need to be larger-scale changes that need to occur (increased funding for the NIH/science, changes in project expectations, etc).

There are a range of cultural issues that persist that need to change to make academia a more welcoming place, but those will take longer and are hard to change at the level of broad policy.

Proven or promising external resources or approaches

Look to industry for inspiration. Many of my peers in graduate school made the shift to industry, and they all report being happier than they ever were in graduate school. There are other challenges of course, including job security. Unfortunately, postdocs also don't have any job security, are paid less, and are given less respect than industry scientists.

Everything else equal, an academic postdoc could be an enticing position, if only we compensate these postdocs in a manner consistent with their skills.

Response 797

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is a "must" for any individual who wants to become an independent investigator. It is the rare exception that I have found during my time as a faculty member, mentor, and PI of a T32 that I encounter someone who is ready to jump right to writing R-level grants at the time they complete graduate school or residency. This 2-3 year period allows them to develop their ideas and networks, collect pilot data, and understand the intricacies that go into running a research study and program.

Fundamental issues and challenges

Money Money Money—the salary levels from the NIH, particularly for MD's, are paltry, and the money for medical insurance is less than adequate. The single biggest barrier to individuals choosing a T32 postdoc is financial.

Existing NIH policies, programs, or resources

The level of funding for both stipend and insurance reimbursement needs to be dramatically reimagined and increased to start to shift people back towards academic research and postdoctoral research positions.

Proven or promising external resources or approaches

We have not encountered many issues in our T32 once we recruit applicants (mentoring pairing is a process that occurs during the application process to ensure a good fit and adequate seniority and experience in the mentor; we have balanced T32 requirements of all applicants with an individual's experience to provide a good mix of fellowship and independence). The challenge is recruiting. Although beyond the scope of this survey, I believe we are nearing a point where the financial model for academic research needs to be rethought out. From discussions with young graduate students and residents at conferences, the greater uncertainty of meeting one's salary requirements if they choose an academic position is negatively impacting them even before they find out about the meager amount of stipend and insurance support they will receive as a T32 fellow.

Response 798

Perspectives on the postdoc roles and responsibilities

As I began my postdoc position, I viewed it as primarily an opportunity for additional, specialized training in preparation for a tenure-track research faculty position. At the end of that training I realized I would not be competitive for a faculty position, and began to view a postdoc as a form of temporary employment like an internship that might lead to a more permanent position. At this point, I sought opportunities to branch out into science communication, leading to my current role as a science editor working at a university.

Fundamental issues and challenges

By now it is no secret that there are far more postdoc positions available than new faculty positions available. Knowing that odds do not favor the tenure-track faculty path, many will either seek an alternative path after graduate school, or as soon as they can while doing a postdoc. Another issue for those that want to go into industry is that having the additional postdoctoral experience can make them less likely to be hired in industry, where an older person with very specific training, strong opinions, higher expectations and no experience in industry is not what HR is looking for.

Existing NIH policies, programs, or resources

The postdoc training period continues to be a great path for those who do go on to tenure track positions. Reduce the number of postdoc positions to align better with new faculty positions, and increase the number of NIH/NSF-funded research support staff positions available for Ph.D. graduates (e.g., research scientist, project manager, science editor, lab administrator, etc.). This can be encouraged in the budgets of new awards given.

Proven or promising external resources or approaches

No response

Response 799

Perspectives on the postdoc roles and responsibilities

As a stepping stone to the "next thing." I typically see it as a requirement to go into academia post-PhD. I expect to be conducting semi-independent research while also doing some career exploration. Post-docs at the institutions I've been at have typically been in a sort of liminal space where they're not faculty but they're also not students.

Fundamental issues and challenges

Pay–it is really hard to accept a job with such low pay when industry pays 3x more. Clinician scientists (MD, PT, OT, etc.) have a lot of debt from their clinical training as well.

Existing NIH policies, programs, or resources

Making the loan repayment program more accessible.

Proven or promising external resources or approaches

No response

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

I do think we need a new Post-doc program with the goals of the Postdoctoral Research Associate Training (PRATIn) Program that instead of being restricted to the Intramural program is directed to the Extra-mural community (PRATEx). A combination of a new PRATEx program to train multiple post-docs at an MSI/RI partnership would go a long way toward increasing representation in the professoriate. The PRATEx in combination with MOSAIC could be a big winner. We have had good success with the IRACDA participants applying for K99 awards.

Proven or promising external resources or approaches

No response

Response 800

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is an essential role for moving forward science and train new students to understand and maybe practice research in the future.

Fundamental issues and challenges

Low salary is definetely a challenge for mantaining a decent quality of time. Most often Postdocs works extra hours and they are not reflected in the salary. Also, insurance coverege is very bad. No pension.

Existing NIH policies, programs, or resources

Increase of NIH minimal postdoctoral salaries and strict roles on the working hours to maintain a healthy work-life balance

Proven or promising external resources or approaches

No response

Response 801

Perspectives on the postdoc roles and responsibilities

I initially felt as if the postdoc role was meant for additional specialization/skill development and to build my CV with academic achievements (publications, grant writing experience, etc) that I didn't receive in graduate school and that would help me be competitive in academia.

Fundamental issues and challenges

First issue is that postdoctoral positions are not very well paid with the salary cap limit often times forcing postdocs to pursue other career options. Additionally, many postdoctoral positions (including T32s) have become exploitive -meaning that they have become less about helping the postdoc develop additional skills/training and more so about just having someone help out with a research study or see clients in their clinics (i.e., an over-qualified research coordinator or an NIH-funded clinician).

Existing NIH policies, programs, or resources

Would be helpful to have guidelines that limit what can/can't be asked of postdoctoral trainees or at the bare minimum how much of their time should be allowed to working on other people's projects vs. their own career advancement. Require PIs and centers to submit yearly progress reports that not only report on research products and/or things that the trainee "will do" but rather has done—please also include a monitoring of how much time is being spent on research coordinating and track how often postdocs are meeting with PIs. Clarify clinical activities allowed on T32s—currently many T32s are requiring postdocs to see clients in their clinic (with no research relevance) because of the vagueness in what clinical work is/isn't allowed. Directly solicit feedback from postdocs at minimums at the exit of every postdoc (instead of postdocs having to submit their feedback to their PI/training center who then uploads it). Do not award funding to sites with a pattern of negative feedback.

Response 802

Perspectives on the postdoc roles and responsibilities

A post doc is someone learning new techniques to investigate and analyze a topic but most importantly developing an interest in specific fields of science and finding what he really likes and would like to pursue in the future.

Fundamental issues and challenges

As someone who is not a US citizen or a green holder, I would say that this is the most fundamental issue in my opinion. It is really hard to apply for these positions especially when coming from a developing country.

Existing NIH policies, programs, or resources

I do not have knowledge about that to reply.

Proven or promising external resources or approaches

I do not have knowledge about that to reply.

Response 803

Perspectives on the postdoc roles and responsibilities

A postdoc feels like a step of additional training before moving on to your actual career. For the traditional academic track and some other careers, it's necessary (in my opinion); for many others, particularly non-technical paths, it is not as important. It should help prepare scientists to work independently, be good mentors (and able to follow evidence-based mentorship practices), critically engage with the scientific enterprise, etc.

Fundamental issues and challenges

Insufficient pay and benefits (a postdoc can delay the time until you can make a "real" salary, get retirement benefits, etc.). Pressure to publish in high impact journals to be competitive for jobs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 804

Perspectives on the postdoc roles and responsibilities

I am in the first year of my postdoc. While it is extremely unstable, I am finding ways of enjoying the instability—e.g., by assuming a very flexible work schedule, traveling a lot, enjoying the lack of teaching duties. However, I am only able to find these enjoyments because

1. I have very supportive hands-off mentors,
2. I do not have a partner or children who depend on me financially, and
3. I am funded by my own grant through a private foundation.

I have my own research program that is independent from my advisors, and view the postdoctoral years as a time to publish more and advance my research program in a supportive lab environment.

Fundamental issues and challenges

As a non-US citizen, I am not eligible for most NIH and NSF postdoctoral awards, except for the K99 and the Early Independence Award. Given that I have been a relatively highly independent researcher through graduate school (i.e., meeting with my advisor approximately once a term, establishing my own research program and work schedule, procuring my own research funding and stipend through graduate school), it is disheartening that it is difficult for me to retain my independence due to the lack of awards for international scholars.

Additionally, applying for a US work visa is both stressful and costly. In the past year, I have spent $1000+ of my own grant money on visa costs alone, when these funds could be directed towards research.

Existing NIH policies, programs, or resources

Please expand the eligibility of less competitive NIH postdoctoral awards to non-US citizens.

Proven or promising external resources or approaches

No response

Response 805

Perspectives on the postdoc roles and responsibilities

I think a postdoc represents the opportunity for additional training as a researcher. In my doctoral lab, my research focus was very narrow and with only one technique. This postdoc offers training in new techniques and fields. In addition, I felt that I wasn't sure if I wanted to continue in academia following my experiences in graduate school, and postdocs offer an opportunity to experience academic research elsewhere to help me make that decision.

Fundamental issues and challenges

Without question, the single most important is pay and benefits. Inflation is soaring and the NIH, which sets the standard nationally, still sets postdoc pay at $54k, which is absolutely ridiculous. New postdocs have just spent the last ~5 years of their lives barely making a living wage (a whole other problem), and need to begin to financially recover from that so that they can have an actual life. The expectation that we

postpone marriage, home ownership, having children, etc to complete our training is completely unreasonable.

Other very important factors include support for our fellow trainees who are foreign nationals, maternal and paternal leave, and extreme workloads to stay competitive for the incredibly few faculty positions available.

Given the scarcity of faculty positions to move on to after postdoc, there need to be clear pipelines, training programs, and support for postdocs who wish to transition to industry positions.

Existing NIH policies, programs, or resources

Increase the base salary for postdocs by at least $20k. Pretend I wrote this one 1,000 times over and over. Academia is losing postdocs to industry because of this.

Training programs and resources for those who wish for transition from postdoc to industry.

Proven or promising external resources or approaches

I think the real probability of attaining an academic faculty position after doing a postdoc should be reported annually by NIH.

I also think NIH is uniquely suited to facilitate a national network of postdocs. As trainees between graduate students and faculty for a very short time, it is difficult to maintain communication between active postdocs to create a community of support and resources.

Response 806

Perspectives on the postdoc roles and responsibilities

The postdoctoral position to me is an additional training period in which you build skillsets, publish papers and attempt to obtain grant funding to become more marketable within the academic space with the goal of obtaining a trenure-track position.

Fundamental issues and challenges

Currently, there have been multiple postdoc roles created attempting to draw in applicants from underrepresented backgrounds, but aside from the research question and hoping for the applicants research expertise to help with the project postdocs do not take into account the different challenges that many potential applicants from underrepresented backgrounds face when taking on a postdoctoral role, such as low-pay, continued high uncertainty, high cost of moving for a short time frame, etc.,. Many potential applicants from these backgrounds come from lower socioeconomic backgrounds making the continued time for making salaries as a “trainee” a larger deterrent, especially as many of us have gone through multiple years of PhD training in which we have earned low stipends and have not had a chance to earn 401ks or other means of gaining financial stability that is necessary. The lack of improvement in these areas make postdocs seem very undervalued. While I have focused on recruitment of postdocs from underrepresent backgrounds, I think this is still true for all recruitment as the current financial challenges in becoming a postdoc are creating a space in which those who are privileged enough to withstand these challenges will be able to stay within academia.

Existing NIH policies, programs, or resources

The NIH postdoc salary cap must be increased and verbiage must be changed within PI grants that allows them to use funding to increase postdoc salary if they have the funding.

Hybrid work environments for postdoc training should also be expanded as it is not feasible to take on the cost of moving for a short period of time, especially for post-docs that are offered in high cost of living areas.

Proven or promising external resources or approaches

There have been multiple publications currently that have discussed the barriers to becoming a postdoc, I think these papers really highlight some of these challenges and offer some helpful insights:

doi.org/10.1038/d41586-022-02781-x

doi: 10.1126/science.caredit.add4693

doi: https://doi.org/10.1038/d41586-020-02029-6

Response 807

Perspectives on the postdoc roles and responsibilities

Academic postdocs should, in theory, provide independent research experience with the purpose of PhDs becoming successful independent scientists. This may include starting their own academic lab or moving to industry to head a project, but I believe should not be a landing spot for PhDs who want to stay research track and do bench work without becoming a PI.

Fundamental issues and challenges

The essential issues for postdoc recruitment and retention are job prospects and pay. Many people don't even want to attempt postdocs because the outlook for becoming a faculty member and PI of their own lab is extremely poor. There are simply too few available faculty positions and most of the grant money goes to large, old, well-established labs while prospective and new PIs struggle to receive funding and other opportunities. Additionally, the starting postdoc salary being set below $60k is, frankly, a joke. Cost of living is soaring across the country, and for such highly trained scientists who have received PhDs to make less than their non-academia peers made directly after undergraduate degrees demonstrates that the NIH does not value postdoctoral fellows. The NIH sets the base salary, and many institutions follow the bare minimum as a result. The combination of these factors leads newly graduated PhDs to quickly realize their years of training is not financially valued, and even if they undergo 4-5 more years being underpaid as a postdoc, they very likely won't find funding or job opportunities to become a PI. This is a direct reflection of the value the NIH places on postdoctoral fellows. All of this is not even to mention the poor work life balance associated with academia as a whole. So why stay in academia? No financial incentive, no work life balance incentive, no opportunity incentive.

Existing NIH policies, programs, or resources

Pay postdocs significantly more. I would even say that postdocs should not be classified as trainees, as they are essentially full-time employees in labs and often work far more than 40 hours in a given week. Trainee classification limits the benefits and pay that postdocs can receive as part of their employment. Provide more grant money to young investigators and award more K awards.

Proven or promising external resources or approaches

No response

Response 808

Perspectives on the postdoc roles and responsibilities

Conducting research under the guidance of the lab's principle investigator. Since this is officially designated as a training position, the individual should receive training on new techniques, models, forms of data analysis, etc. with an explicit plan for how this will happen laid out by the PI. The postdoc may be involved in subsequently training or providing mentorship for graduate students and other lab members.

Fundamental issues and challenges

The NIH recommended minimum is what most institutions seem to use for their starting salary regardless of the cost of living for the city they are in. This is unacceptable. This is not a livable wage for someone like myself living in a major city with an infant and full reliance on daycare (no family nearby). Parental leave guidelines need to be spelled out explicitly and should guarantee at least 12 weeks of leave. Postdocs are just not competitive with the salary and benefits offered by industry.

Existing NIH policies, programs, or resources

The F31 childcare subsidy needs to be increased. $2500 covers 1.5 months of daycare for a single child in my city.

Proven or promising external resources or approaches

Yalcin, E., Martinez-Corral, R. & Chugh, M. Retaining postdocs by recognizing their worth. Nat Biotechnol 41, 296-298 (2023). https://doi.org/10.1038/s41587-023-01656-4

Response 809

Perspectives on the postdoc roles and responsibilities

The postdoc position is important for additional training to gain both scientific expertise and independence after PhD training. It is also a crucial period for professional development, networking and learning administrative skills needed to run a lab. My training during my postdoc has spanned multiple areas including benchwork, graduate student mentorship, grant writing and budgeting, equipment purchasing and maintenance, networking, classroom and laboratory teaching, and presentation skills.

Fundamental issues and challenges

The two major hurdles postdocs currently face are

1. financial insecurity and
2. instability in long-term career planning.

Pay for postdocs is low relative to other job opportunities given our training and skillsets. This is especially difficult given the life-stage many people are in when they enter their postdoc. Many are at a stage where they would like to get married, buy a house, save for retirement and have children. All of these steps require financial independence. Childcare availability and costs has been a major hurdle in my training. Even for major universities that offer on-site childcare the cost of such care is prohibitively expensive and not realistic on a postdoc salary. Postdocs often earn too much to qualify for any university subsidies that may be available to graduate students (for housing and childcare for example) but too little to comfortably pay for these expenses and save. Few institutions offer retirement programs and/or retirement matching for postdocs, even when they offer retirement matching for staff who earn a similar salary. Historically, low pay during the postdoc was temporary (2-3 years) before moving to a faculty position. But for many fields longer postdocs (5-6 years) are the new reality. This is in part due to high expectations for publications and an extensive CV needed to be competitive for a faculty position. Finally, the limited number of faculty positions means that postdocs are taking a financial hit for a job they may never get. Also, many postdocs are on 1 year contracts which limits long-term planning and makes our position dependent on ever-changing grant funding. Long-term career and life planning is also inhibited by the expectation that postdocs will most institutions/cities for their faculty position. This disadvantages people who depend on their local community for support (with childcare for example).

Existing NIH policies, programs, or resources

Some postdocs lose benefits when they receive independent funding. NIH fellowship should require that the institution provide healthcare, vision, dental, and retirement matching for postdocs on any independent fellowship. Fellowships should also allow PIs to budget for salaries raises that match or exceed yearly cost-of-living increases. Large NIH grants (like R01s) should offer more flexibility in how PIs pay postdocs. For example, when I received a non-NIH postdoc fellowship, the funds did not fully cover my healthcare benefits. These shortfall is normally covered with discretionary funds. Since my PI was more junior, and only had a single R01 the discretionary fund "bank" for the lab was small and we needed to negotiate with the department and college to help cover that shortfall. We were effectively punished for earning additional independent funding. NIH should allow PIs to budget for those types of costs when the goals of the trainee fellowships are in line with the overall goals of the R01. Earning independent funding (even from a private organization) helps stretch the dollar value of the R01 and is good evidence for scientific and mentoring excellence in the lab. NIH grants could also allow PIs to give "bonuses" to reward postdocs who go above and beyond to help move the lab forward. Finally, NIH should provide financial support for postdocs to stay at their current institution when they move into faculty positions. Universities lose institutional knowledge, and postdocs are hindered in maintaining long-term collaborations when they are forced to move for a tenure-track job. If the NIH actively supported postdocs staying in the same place, more departments would be willing to consider hiring their own trainees. This provides both financial stability and long-term career planning.

Proven or promising external resources or approaches

The NIH MOSAIC program which provides additional mentorship to postdocs as they transition to faculty is a great start. Similar efforts could be applied in other trainee fellowships as well. Additionally, trainee feedback should be an important component of grant renewals (R01, etc). If a PI is proposing to mentor graduate students and trainees as part of their research program, the NIH should be evaluating how

successfully they have done so. This feedback should come directly from the trainees and should not be determined by evaluating the types of positions trainees have moved onto. This would incentivize PIs to create a non-toxic work environment and improve overall quality of life for trainees. Moreover, trainees fellowships should be incentivized to favor small lab with fewer postdocs since those PIs can provide more high-quality one-on-one mentoring than labs with many, many postdocs.

Response 810

Perspectives on the postdoc roles and responsibilities

Additional training in a field other than their original training to enhance their likelihood of success in their career. However, this tier of training appears to be disappearing in many if not all fields of research.

Fundamental issues and challenges

The fundamental challenge is that graduates can now get positions in industry at 3-5 times the rate of a postdoc salary. We are losing postdocs every month to pharmaceutical industries, among others. However, unless NIH starts to increase the overall budgets of grants, it is hard to justify increasing the salaries of postdocs. A complete overhaul of the entire budgetary system really needs to be done in order to accommodate the changes to the economics of academia, including MUCH higher costs of reagents, personnel, etc. Postdocs want all the benefits they can get in industry and if we cannot supply those, this tier of training will disappear.

Existing NIH policies, programs, or resources

NIH should supply additional funding for postdocs for all grants (R21, R03, R01, etc). Otherwise, it is challenging as an investigator to hire postdocs.

Proven or promising external resources or approaches

At many locations across the U.S., postdocs cannot afford to live (nor can graduate students) with the current stipend levels. Some investigators have had to add additional funding to support these tiers of training, however, most investigators cannot afford to take that route. Changes must be made in order to preserve this important tier of training or it will disappear. Those making decisions about this need to be a diverse group from all areas of society and levels of income so as to represent similar living conditions around the country for those just starting in their careers.

Response 811

Perspectives on the postdoc roles and responsibilities

Depends on the lab. But typically a pillar of the lab who is independently driving a major project within the lab. With huge responsibilities regarding training and mentoring students and other trainees.

Fundamental issues and challenges

Many. Namely: it is a temporary position, putting you in line to be considered for faculty positions. Unfortunately, grad students have become aware that post docs are not guaranteed a faculty interview, as they are competing with 100-300 other candidates, and when they get one they are still competing with another 4-10 others for ONE position. That is a huge risk. Most people are unwilling to take such a huge time and effort commitment when it is unlikely that they will ever be able to get a job at the end. And more importantly they can just get a job immediately after graduation in industry. This risk is made even less attractive due to the low compensation, the increasing bar of what is considered a competitive postdoc (ie multiple CNS papers, K99 funding, etc.) and the absence of any other options for postdocs to fill in academia outside of becoming an assistant professor. You end up with people who made a huge sacrifice compared to their peers who did not due a postdoc in terms of a delay in earning a livable wage, a delay in starting a family, and delay in progressing their career. There are very few other industries where a 40 year old be considered “early career”. There is also a HUGE bias towards postdocs who were trained in “elite” schools in terms of funding (k99 and other funding agencies) and acquiring academic jobs. So there is no incentive to even pursue a postdoc if it’s not in one of these elite schools. Inflation has pushed so many people to prematurely end their postdoc careers. 300 words is not enough space.

Existing NIH policies, programs, or resources

Increasing the budget allocated for postdoc funding. Especially the K programs. It is too small and thus clearly biased to benefit a few trainees at "elite" schools. Finding a way to increase the minimum NIH suggested postdoc salary. Finding new programs that specifically target and fund postdocs at schools that exist beyond the coasts would be nice.

Proven or promising external resources or approaches

No response

Response 812

Perspectives on the postdoc roles and responsibilities

He is almost an independent scientist with full responsibility to run complete research project (with exception to worry less about funding).

Fundamental issues and challenges

Post doc Salary is really a shame for those who choose it especially in expensive cities (Boston, California, NewYork).

Science learning will never end, So PHD qualified scientist should be paid a fair salary according to their qualification, skills and degree, not a stipend.

Existing NIH policies, programs, or resources

I hope NIH can increase and impose a minimum postdoc wage or tax exemption as they are a main participant in advancing solutions in the biomedical field.

salary should be adapted according to the living expenses of the living state/city

Proven or promising external resources or approaches

Consider tax exemption, state/city wage adjustment.

Response 813

Perspectives on the postdoc roles and responsibilities

I view post doctoral position as a time when we learn to develop our own ideas and become more confident as a scientist and as a person.

Fundamental issues and challenges

I think there are several challenges and flaw in this system.

1. First and the most important issue and challenge is less salary. Even after finishing PhD, most of the Post-docs are getting lesser wages compare to any other employee of the university system with negligible salary increase over the years with increase experience (2-3.5%). For example, a HR of the department is getting more salary than a Post-Docs. The salary amount paid to Post-docs is not enough to get a good living when inflation is rising very sharply. This is one of the main reason why so many Post-doc are losing enthusiam doing science and staying in academia.
2. Several PIs get an R01 and hire people from their own country which leads to harrasment and abuse in these type of lab. NIH should monitor these type of labs and notify them about this. I myself faced abuse and harrasment in this type of lab.
3. Several PI does not help people for career development.
4. Very few options for funding are available for International post-docs, except K99.

Existing NIH policies, programs, or resources

Postdoctoral fellowships such as T32 and F32 give no guarantee that the postdoctoral trainees will continue a path in academia. The T32 and F32 programs (PA-21-048, PA-23-048) should end. Instead, the T32 and F32 grants should be reallocated to K99/R00 grants (PA-20-188) or other K-level awards to accelerate the transition of postdoctoral trainees to independence.

Proven or promising external resources or approaches

1. Increase grant amount.
2. Give more grants to young PIs.
3. Monitor the nationality of people hired on any grant. RO1 PIs should hire people of diverse background, sex and nationality.
4. Provide industrial training opportunities to all Post-docs which can help them to make their own products while working in academia.
5. Fire those PIs who harass PhD and Post docs.
6. Train all the PIs to be a better mentor not just a manager.
7. Allow Post-docs to apply for RO1 grant. This will reduce the burnout and transition to companies.

Response 814

Perspectives on the postdoc roles and responsibilities

It's a time to learn to drive a research on a small scale, learn to write papers and grants, and start steering your long term career goal.

Fundamental issues and challenges

Low wage, bad mentor practices regarding using them to do their work with little or no acknowledgement, not much help/orientation to get to the next stage (faculty) due in part to being cheap labor. Faculty jobs are very hard to get, which makes many valid researchers migrate to industry.

Existing NIH policies, programs, or resources

Require a clear plan to help the postdoctoral fellow become faculty at their institution or elsewhere, and ask for accountability to mentors/institutions.

Proven or promising external resources or approaches

No response

Response 815

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as one which I still learn new things and expand my career but am also acknowledged for having a PhD and am seen as someone who knows what they are talking about (because I have earned my PhD) and should be taken seriously. A postdoc is more than a graduate student and should be treated as such. As someone who expands their knowledge on scientific techniques while learning how to manage a lab and important mentorship skills necessary for the next stage of their career.

Fundamental issues and challenges

Unfortunately, many academic institutions don't view postdocs as employees and as such don't give postdocs the resources that staff at academic institutions receive. Many PhDs (PIs, research scientists) view postdocs as "glorified grad students" and don't take their ideas seriously. They give postdocs trivial work instead of challenging them and expect postdocs to work 12-16 hour days to earn their respect. Academic institutions also don't give postdocs full benefits, like dental and vision insurance, a retirement plan, nor any PTO. The pay is also minimal compared to other careers. There is no work-life balance for postdocs at academic institutions.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase postdoc pay, allow them to feel supported and like they are apart of the academic institution. Make it easier for junior investigators to get grants and not have it solely be political. Academic

institutions need a better onboarding process for their postdocs and higher ups need to understand that postdocs are people too and don't deserve to be exploited.

Response 816

Perspectives on the postdoc roles and responsibilities

I view it as necessary to refine bench skills and to learn how to bring in grant money. The main issue is that the research that drove us to earn a PhD is never the research we end up doing. It's always a case of doing someone else's work to make it to the post-doc but then you never get to do the work you set out to di because you have to start on a different path. Frustrating and a waste of good time.

Fundamental issues and challenges

The pay is a serious issue. For post-docs in high cost of living cities, the NIH and the schools do NOT pay enough. We lose the dignity of being an adult, often times living with roommates in share houses. It's undignified and frankly. you guys can [redacted] off for treating people that way.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 817

Perspectives on the postdoc roles and responsibilities

The academic postdoc position is an opportunity to seek further training and explore additional research topics after the PhD. By completing the PhD, the trainee has demonstrated that they have the learning skills to tackle one hard scientific areas from end-to-end and develop rigorous methods to solve a critical issue. In the postdoc period, the trainee again launches into this process—however, with more skills under their belt. The postdoc period really shows how the trainee can tackle a new issue or set of questions, potentially in a different topic area than their PhD. Their holistic ability to start a new postdoc project and bring it to completion highlights their abilities for either a future industry or academic job.

Fundamental issues and challenges

As a PI, I find there are fewer domestic trainees available to hire as postdocs. I believe that we need additional PhD students to be graduated. In turn, this is going to require either additional F31 fellowships or additional modular R01 support to PIs to train more PhD students. This is critical to increasing the number of trainees. The [redacted for anonymity] has just increased the salary ranges for PhD students and postdocs, and I recommend NIH increase the salary caps for students and postdocs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 818

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a transitionary period between being a graduate student and becoming a tenure track faculty member. During this period, you may work on many projects tangential to your graduate research and continue to hone your technical skills. You become an even more confident independent researcher following a PhD. A postdoc is primarily focused on performing research and perhaps writing fellowships or grants to prepare for a tenure track role.

Fundamental issues and challenges

From the perspective of a graduate student who sought to become a tenure track faculty member upon enrollment in graduate school, this is no longer my first choice route. Fundamental issues that influence my decision on pursuing an academic postdoc include but are not limited to: low pay, competition for tenure track faculty positions, uncertain career prospects, uncertain grant funding available should I become a PI, publish or perish environment of academia, and uncertain fellowship funding options.

I am a first generation college student that got into research later than most of my peers. I had no mentors early on and did not start on my publication record until graduate school. After seeing many faculty candidates at my college and others paraded around by their long track record of publications and fellowships, I feel I am no longer competitive for a tenure track faculty position. I have seen my PI with a 7th percentile score on an R01 wait in limbo for more than a year to know it was funded. I received a 17th percentile score on an F31 application that would historically be easily funded, but due to a large increase in the number of applications seen it will not be funded. While becoming a tenure track faculty still would be my first choice if I had control over these mechanisms, it is clear that I am no longer a competitive candidate judging by how current candidates are introduced at seminars.

Many have shown that doing an academic postdoc does not increase your earning potential when moving to industry vs. going straight to industry out of a PhD, and also that there is a steep opportunity cost of doing a postdoc. It does not make sense to do a postdoc if obtaining a tenure track position is unlikely.

Existing NIH policies, programs, or resources

Increasing fellowship opportunities for graduate students and postdocs will increase the competitiveness of many candidates. Mechanisms must be in place to where an increase of funding in a certain area of research does not lead to an influx of professors being hired at universities, then again driving down the payline of the funding opportunity. Indirect costs for universities must be capped at a certain amount so as not to drain the funding pool for universities that have more leverage to negotiate with the NIH. Salaries that can be paid off of grants must be capped at a fixed amount or as a low percentage of their salary.

While many of the mentioned proposals do not directly affect postdocs, they indirectly affect who will pursue a postdoc in the first place. If I was a competitive candidate that could obtain fellowship opportunities and know there would be realistically obtainable R01 funding once a PI, I would do an academic postdoc. If this was not the case but the pay of an academic postdoc was commensurate with what a comparable industry position would offer, I would pursue an academic postdoc. Given that neither of these scenarios are true at this moment, I do not plan on pursuing an academic postdoc.

Proven or promising external resources or approaches

No response

Response 819

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is primarily a research position but should also provide opportunities for other forms of career development (mentoring students, gaining teaching experience, etc). It is best for people interested in academia as a career; I don't think it provides much for people wanting to go into industry after a Ph.D.

Fundamental issues and challenges

1. PAY. I could easily make $20k+ more in industry than I do now as a postdoc. For reference, I have one child in daycare, and the cost per year is ~$20k.
2. Lack of credit received for mentoring students, managing lab activities, etc. All of this credit goes to the PI for the most part. I feel like I'm being treated as a lab tech when I already have a Ph.D.
3. The difficulty of getting a tenure track job. Given the amount of money I could make in industry, the only reason to do a postdoc is to continue on the academic career path. With tenure track jobs becoming harder to find, why should we put ourselves through postdocs where we're underpaid and under-appreciated when there's no guarantee (or even high likelihood) of a permanent job at the end?

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 820

Perspectives on the postdoc roles and responsibilities

To me, the postdoctoral position is a academic stage where I can deepen my understanding in the filed of my research interests after the graduate study. It is also a career stage for me to make preparation to become an individual investigator, to learn how to apply for research grant to start my own lab in the future.

Fundamental issues and challenges

As long as the NIH postdoc salary guidelines still exist, the decline in U.S. postdoctoral trainees in biomedical research will continue. There are some institutes, mostly in California, which pay higher salaries than NIH's guidelines to their postdocs, but almost all of the employers, regardless of for-profit or not-for-profit status, just pay their postdocs following the NRSA Stipend Levels. According to the data from U.S. Bureau of Labor Statistics, the NRSA Stipend Levels are not competitive at all, and "you get what you pay for". In addition, as most of my peers started their postdoc right after getting their PhD in their late 20s or early 30s, it is also the time when they got married, had their first child and started to feel the financial stress due to the increasing expense of family, which resulted in early termination of their postdoc stage. The graduate students also know this kind of situation very well as they learn from their postdoc colleagues about their poor quality of life, which might partially explain why more and more new PhDs nowadays choose not to be a postdoc, especially in the field of life sciences. Therefore, I am not surprised to see any further decline in both quality and quantity of postdocs in biomedical research in the next decade if they are underpaid.

Existing NIH policies, programs, or resources

1. The NIH postdoc salary guidelines (NRSA Stipend Levels) should be modified to make the salaries competitive.
2. Nearly all of the NIH K-series grants require U.S. citizenship or permanent residence, while there has been a long waiting line for foreign postdocs to get their permanent residence, which discourages foreign postdocs, even those who got their PhD from a US-based university, to continue their academic development in this country.

Proven or promising external resources or approaches

1. Solve the currently existing problems reported in this Request for Information (RFI) as soon as possible.
2. Collect and review the feedbacks from postdoc community more frequently in the future, respond in a dynamic, efficient but not bureaucratic way.

Response 821

Perspectives on the postdoc roles and responsibilities

A postdoc is no longer a training position that is used to learn how to be a professor. It is a required position where you are given slightly more responsibility than you had as a graduate student but are placed under extreme pressure to publish for your PI. If you are interested in receiving training in how to be a PI, then you will need to take an additional postdoc to gain that experience as a senior postdoc, which means even more time working with long hours with little pay. There are few incentives to take a postdoc, beyond the requirement to complete one to get a decent job out of grad school.

Fundamental issues and challenges

Pay is too low.

Existing NIH policies, programs, or resources

Change the maximum amount that can be paid to a postdoc out of grants. Cost of living is variable across the country. And while you are at it, change the stipends that can be given to graduate students.

Proven or promising external resources or approaches

No response

Response 822

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should be an opportunity to further training and meet certain training goals. However, this is often accomplished through research production and/or clinical work, meaning that while the postdoc is indeed learning and growing professionally, they are also contributing to the academic community, providing essential input/work, and generating new ideas.

Fundamental issues and challenges

Issues that inhibit postdoctoral trainees' quality of life is predominantly practical ones. Postdocs are not paid sufficiently and sometimes are not even offered essential healthcare benefits. The lack of livable circumstances surrounding academic postdocs are actively repelling graduates. How are postdocs supposed to grow in their personal lives at all with poor salaries and benefits? The mentorship that academia provides cannot be the end-all be-all.

Existing NIH policies, programs, or resources

Pay more

Proven or promising external resources or approaches

Pay more

Response 823

Perspectives on the postdoc roles and responsibilities

A post-doctoral research position is an opportunity to gain additional specialized training for scientists who want to pursue academic or industry careers. It is an opportunity to gain further inroads of expertise after one's PhD while establishing a name for one's self via research and other intellectual contributions.

Fundamental issues and challenges

Post-docs are not acknowledged for their critical contributions to research. Post-docs are paid poorly, without cost of living adjustments for expensive research hotbeds. Post-docs often write grants and peer review for their advisors without seeing any credit for the work. There are often implicit expectations by senior faculty that post-docs work very long hours (more than 70 hours/week), even though the low pay does not justify these hours. Post-docs must delay settling down and starting a family due to the low pay and transient nature of the research. With the explosion in new technology, post-docs must keep abreast of more skills than ever, resulting in longer post-docs and further delays in settling down and starting a family. Post-docs are in a position of powerlessness where they cannot advocate for themselves if they are treated poorly by their advisor (no human resources or consequences for poor treatment by advisors).

Existing NIH policies, programs, or resources

1. Pay post-doctoral researchers more and account for high cost of living in certain research hubs (Massachusetts, California)–the NIH minimum is an outdated model that encourages professors to pay their post-docs poorly. I want to do a post-doc, but I simply cannot afford to do so in today's environment (especially when I can be paid >$100,000 to start an industry position).
2. Assign funding to post-docs rather than their research supervisors to help reduce transient nature of post-doctoral research (similar to recent changes in Princeton's funding model). I have seen countless post-docs dismissed mid-project, just because their advisor ran out of money.
3. Streamline the grant submission and review process so universities spend less on administrators and can provide a better research experience. There is so much bureaucracy in academia right now which slows down research and contributes to uncertainty in the post-doc job market.
4. Acknowledge post-docs for their unheralded contributions to science–for example, all individuals who contribute to a grant should be listed as an author on the grant, as opposed to just the PI. Encourage publishing agents to incorporate post-docs into the peer review process.
5. Clearly define expectations for post-doctoral researchers to prevent bullying. Is the expectation a 40-hour workweek, 60-hour workweek, or something else? Clear expectations and financial compensation commensurate with those expectations would help reduce the high rate of burnout.
6. Clearly define academic bullying and take allegations seriously. So many post-docs experience bullying, but they cannot speak up about it without harming their career prospects. A clear definition of bullying, a hotline for allegations, and consequences for perpetrators of bullying would help prevent post-docs from being bullying.

Proven or promising external resources or approaches

Industry and national labs pay post-docs much better than NIH guidelines, so perhaps increasing the NIH guideline (with a cost of living adjustment) to be equivalent with those rates could improve retention. Help post-doctoral student feel valued by acknowledging post-docs for their contributions to grants, peer-review, etc. Increase funding for T32 awards, and perhaps modify these awards so that post-docs are considered as PIs, to help increase independence in funding. Provide clear expectations in terms of work hours and intellectual contributions for post-docs.

Response 824

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are the bread and butter of academic research. They have so much expertise from the 5+ years of graduate school and often are very driven to do the work necessary in any research lab. They work hard, long hours not only on their own research, but also mentoring and training junior lab members (staff and graduate students) on various necessary skills in the lab. The best postdocs are often jack of all trades, able to perform any benchwork, with many model systems.

Fundamental issues and challenges

The simple reason being compensation. Postdocs are not compensated enough for their time. While postdoctoral positions are considered training positions, it is simply absurd to require individuals in their late 20s into their 30s having obtained a graduate degree to earn a mere $50k a year. Postdocs are often required to pull long hours, with no overtime, and little benefits that would provide a better quality of life. Several institutions do not even offer 401k for their postdocs, which means these individuals are even further behind on their savings for retirement. $50k is the starting salary of someone with an undergraduate degree, when institutions opt to pay their postdocs such a low salary, it is essentially conveying the message that postdocs are just "glorified graduate students". It is no wonder that several PhD graduates go on to work in industry to try to recoup their lost years of money making during graduate school. Additionally, several postdocs end up being in this training position for 5 or more years, as they continue to seek that high impact first author paper to allow them to be a competitive candidate for a tenure track position. There are few positions available, as few tenured and aged professors choose to retire. It is common to observe several aged faculty continue to manage their labs well into their 60s. If there is a lack of positions (and grants) due to these aged professors taking them all, how are we to

expect PhD graduates to be motivated to stay in a postdoc position where their future as a tenure track investigator is uncertain.

Perspectives on the postdoc roles and responsibilities

More research time .

Fundamental issues and challenges

More funding and higher salary is needed

Existing NIH policies, programs, or resources

More funding and more salary please.

Proven or promising external resources or approaches

More funding and more salary please.

Response 826

Perspectives on the postdoc roles and responsibilities

A postdoctoral role is one where I can

a) learn a new set of skills and research methods (or a new set of theoretical perspectives for my field),

b) Become increasingly independent and

c) Apply for and get a desirable position in academia or industry

Fundamental issues and challenges

The main burden is cost. The cost of living is so inflated in many University cities that PhD graduates are forced to make difficult decisions about joining the industry workforce and starting a family, purchasing a house, building savings, etc., or delaying aspects of their personal life to pursue uncertain futures in science. This is often particularly untenable for women, who cannot delay starting families as long as men, or for low-income individuals who do not have savings or family resources that can help them absorb the costs of a postdoc. The long duration of so many postdocs, the uncertainty of the job market, the low pay, all combine to make starting a postdoc a risky decision. Industry options are much more appealing and plentiful than they were even a decade ago, and PhD programs continue to enroll many more students than could possibly get academic positions. However, it comes down to cost. I chose to do a postdoc, but my salary level feels (frankly) disrespectful given my level of expertise and length of experience. My colleagues in industry make anywhere from 4-8 times my salary. I can barely justify my current salary level given the sacrifices in both long and short-term stability, and the fact that I have had to move to start this job and rebuild my personal support network in a new city. I decided a priori to only do a two-year postdoc because I am unable to afford to stay in the field longer. The biomedical sciences are filled with well-trained early career scientists who have looked at the data and made decisions accordingly: postdoc positions are a financial risk.

Existing NIH policies, programs, or resources

Raise our salaries to account for inflation and the cost of living. Further limit the length of postdocs to stop ‘academic inflation’. Expecting people to have done two 2-3 year postdocs before landing academic positions is untenable. The prospect of moving 3-4 times in your late 20s and early 30s is daunting and not possible for many people.

Proven or promising external resources or approaches

No response

Response 827

Perspectives on the postdoc roles and responsibilities

Unnecessary training for people who are already highly trained without the possibility to advance in academia. the general hope of postdoctoral training is generating novel knowledge that can be translated bench-to-bedside.

Fundamental issues and challenges

Low salary (i.e. industry offers three times the salary)—having the highest degree not being able to support family of 2, can't think of having two postdocs and a child! Horrible health insurance, personal time off, sick days—all that in every postdoc contract is a lie and a joke. Expected to work 60-80 hours a week, no paid overtime, not even recognized overtime—it is treated as "normal" and "acceptable". Expected to be available 24/7. Overworked and underpaid, treated as disposable with no job stability. Again—being paid 120-150 k a year might help retaining the postdocs.

Existing NIH policies, programs, or resources

Universities all over the US are accepting foreign students into graduate programs, with no opportunity for grant and funding applications—how does that make sense? Being a graduate student, paying taxes and not being able to get early career awards that would motivate or propel someone's career. Holding PI's responsible—i.e. PI who hasn't promoted or helped advance a single postdoctoral fellow in 20-30 years of career should be held accountable. Majority of postdoctoral fellows are internationals, and afraid of retaliation if they speak up.

Proven or promising external resources or approaches

None that I am aware of.

Response 828

Perspectives on the postdoc roles and responsibilities

A Postdoc position is an opportunity to grow in-depth expertise, learn grant writing, and gain a supervising experience in a research area to help you become an independent researcher.

Fundamental issues and challenges

Money, Money, Money. During long PhD years, we have suffered from a notoriously little, inadequate, and inequitable stipend. Even after having a PhD degree, postdoctoral trainees suffer from significant financial stress due to a small compensation. Especially, due to inflation, the current NIH postdoc salary is ridiculously little. This little compensation prevents scholars from the disadvantaged group from pursuing academic careers.

Existing NIH policies, programs, or resources

Money, Money, Money. The current postdoc salary is ridiculously small. Postdocs are seriously underpaid and need a side job to pursue their academic careers.

Proven or promising external resources or approaches

Money, Money, Money, Money! Stable financial support can help postdocs from disadvantaged groups can work for their dream academic job.

Response 829

Perspectives on the postdoc roles and responsibilities

I believe a postdoctoral position is an opportunity after graduate school to continue learning and acquiring new skills. However, I do not believe this position should be viewed as a "trainee" as currently is the case

in most academic settings. A postdoc carries the bulk of the research being done in the lab, trains new students/researchers coming in, writes grants, and publishes papers.

Fundamental issues and challenges

There are a number of issues in the postdoc culture which leads PhDs to not pursue one entirely or leave the position early. The first issue is salary. It is not enough or anywhere near competitive with other positions. Additionally, when the issue of pay is brought up (at least in my experience) I am stonewalled with responses such as "you don't choose a career in academia to make money" or "you should do this job because you love science, not for money". This is incredibly frustrating and breeds contempt. There are more and more universities raising the minimum postdoc salary to $65,000, which is a good starting point. The second biggest issue is benefits. Universities label postdocs as "trainees" to purposefully get away with not giving them the same benefits as employees. Postdocs either do not get a 401K/403b plan entirely, or if they do they do not receive the employer match. This sets our retirement savings back years. We also do not receive other benefits such as life insurance, health-savings accounts, the ability to open other investment accounts etc. Finally, another issue is the unwillingness to increase our pay. My institution states they pay us the NIH stipend levels. However, that is only true for half the year. Example, the NIH just raised the postdoc stipends for 2023. My institutions response to that was "we will bump you up in July when everyone else receives their yearly raises". Meaning in reality we only make the NIH stipend for 6 months and the other 6 months we are paid below NIH levels. Overall, universities need to stop treating postdocs as expendable "trainees". Many young scientists feel postdocs are not respected by the universities they work for and compensation is too low.

Existing NIH policies, programs, or resources

A big issue is my opinion is the NIH grant system towards postdocs and early stage investigators. Reviewers are often too critical and harsh on early stage investigators attempting to receive grants to fund their labs. Additionally, too critical of the postodcs applying for F32 from these same labs. Stating reviews such as "the PI is too early stage and has not trained enough postdocs". How is an early stage investigator supposed to get money to recruit and train postdocs if the funding agency will not fund a grant? Or how is a postdoc supposed to stay if an F32 is not funded solely because the PI is young. It should not be a criticism to be a young investigator or to be a postdoc in a young investigators lab. Instead the NIH should award this and want to promote young investigators towards a successful lab.

Proven or promising external resources or approaches

No response

Response 830

Perspectives on the postdoc roles and responsibilities

A post-doc is a time for more specialized training in both the laboratory setting as well as for training to be a future independent investigator. A post-doc is a staff member in the lab with more responsibilities and subsequent independence than a graduate student. Post-docs should serve in a mentor position for the graduate students and undergraduates in the laboratory setting. This should be a mentored position where the mentor/supervisor supports the post-doc in generating data that can be used to support future independent projects.

Fundamental issues and challenges

1. Pay is low, benefits are often horrible and/or non existent, and post-docs are often over worked and not supported.
2. Universities fail to treat post-docs as staff or students. They are given the bare minimum of support if any. Often, post-docs are punished by removal of benefits, such as health insurance options, when they receive grants.
3. Post-docs are often highly encouraged to take on extensive responsibilities that they have not necessarily received training for.
4. Often there are no offices for post-docs to take their issues to. Basically, post-docs are somewhere between staff and students and often receive none of the benefits of either.

Existing NIH policies, programs, or resources

The F award system does not provide enough funding for most post-docs to keep their university benefits.

Funding opportunities for post-docs currently request grades from undergrad and graduate school which may not accurately reflect the success of a post-doc and are often used as easy ways for post-docs to be scored lower for funding.

Awards are highly competitive and make it difficult for anyone not at the massive R1 research institution to get funded. Perhaps there could be changes so awards are scored differently from differentially supported institutions.

Proven or promising external resources or approaches

More post-doc associations are necessary. There needs to be a centralized system for post-docs to get improved wages, improved benefits, and more training for academic or alternative positions.

Response 831

Perspectives on the postdoc roles and responsibilities

Post doc is part of the overall training required to become a PI. Being a PI is my goal. However, being a postdoc is more than a full time job and hence has to be compensated as such.

Fundamental issues and challenges

1. Poor institutional decisions. For example, during my 7 year postdoc, we gradually lost desk privileges and parking privileges. I live in a very cold state making it impossible at times to commute to work and while there I have no place to sit and work. Contact worry whether I would get my work done. Additionally when we get grants, institutions still does not ket us have the salary allowed on grant despite us getting the grant. So we have no way of improving our lives.
2. Low salary compared to the super stressful demanding job. I often worked over 100 hours a week just to have average metrics. No appreciation from PI or institution or really anywhere. I was postdoc the end of my 20s and into my 30s and I live paycheck to paycheck and barely afford necessities.

Existing NIH policies, programs, or resources

1. Salary should be improved from NIH side.
2. There has to be more accountability for bad PIs and bad institutions. Institutions shouldn’t be rewarded for taking basic necessities away from their postdocs.

Proven or promising external resources or approaches

Some form of PI and institution audit by NIH. More grants for early postdocs. More resources for postdocs to see the NIH review study sections.

Response 832

Perspectives on the postdoc roles and responsibilities

I think it was a process that made me more mature as a scientist. It was also the process to get papers and grants for the next step. A good opportunity to go one step further from what I already learned during PhD and develop a niche for my future independent career.

Fundamental issues and challenges

It really depends on the research groups, but the key issues that I see, from the lab I am in and neighboring lab is that:

1. PIs would take whatever postdocs came up with, take all the credit, and do not give postdocs anything. They take the ideas from postdocs and methods they developed to start companies, or present in front of various audiences, claiming all the credit without even properly acknowledging the people who actually came up with the idea and did the work. Lack of fairness really inhibits recruitment, retention, and quality of life of postdocs;
2. Some PIs lie a lot, often choose to say things that are most convenient to them in a situation, at the cost of quality of life of postdocs. PIs would always consider their own interests first, disregarding postdocs' career goals or quality of life;
3. Unlike students, who have the university to back them up in situations that would normally favor people who have power, postdocs have no one to back them up. In situations that are unfair for them, there is nothing much they can do;
4. Many postdocs are from foreign countries, which makes it harder for them to turn to anyone when in need. Some PIs also use the status of postdocs (i.e. being able to legally stay in the US) against the postdocs to get what they want from the postdocs;
5. postdocs are lowly paid, they are struggling to make a living, especially for those who are single (without a partner) or married and have kid(s). Standard postdoc salary barely covers daycare for a kid;
6. No one really knows what national policies or resources that would help postdocs out.

Existing NIH policies, programs, or resources

Not aware.

Proven or promising external resources or approaches

Not aware.

Response 833

Perspectives on the postdoc roles and responsibilities

I see academic postdoc as an opportunity to build and establish myself as a scientist who can do rigorous science and publish well. Also I see it as a training period where I am mentored by my PI to excel at mentoring, writing papers and grants. One should learn more about the administrator stuff.

Fundamental issues and challenges

Postdocs are largely underpaid and overworked. My personal life is suffering because of the work load and we are not payed enough so we live on the line of poverty in cities such as Boston, SF. (and we have Phds)

Existing NIH policies, programs, or resources

Open more training grants for the international students!

Proven or promising external resources or approaches

No response

Response 834

Perspectives on the postdoc roles and responsibilities

It is the bridge for training me as a independent PI.

Fundamental issues and challenges

1. Low salary means a lot of inconvenience and difficulties in life, distracted from focused research
2. International visa issues. J-1 is so hard to keep the career going and most schools only support H1B after you have used up 3yr OPT and 5yr J-1.

Existing NIH policies, programs, or resources

1. Increase postdoc salaries to make sure all postdocs can get the lift they deserve
2. Give international researchers more conveniences on visa status

Proven or promising external resources or approaches

No response

Response 835

Perspectives on the postdoc roles and responsibilities

I see this as a stepping stone to a tenure-track faculty position. It's an opportunity to learn more and broaden my expertise, but not a particularly welcome one. It feels more like the result of an exploitative system that produces more PhDs than there are jobs, and forced low-wage work for highly skilled people for many years while their peers in other fields establish their careers, set aside savings for retirement, and comfortably start families. My role is technically to learn and pad my CV so I am a better applicant for faculty positions, but this wasn't necessary in most fields ~30 years ago, when it was common to go straight from graduate school to tenure track. I am reluctant to accept that this is just another step in the career path rather than the result of universities taking on far too many graduate students for the cheap labor.

Fundamental issues and challenges

Money. I live in [redacted for anonymity] and have been making between 55 and 70 K for 3 years, and have wound up in nearly 40 K of high-interest credit card debt because it is simply not possible to live in [redacted for anonymity] on that salary and maintain any reasonable quality of life. But I also was not going to live in a smaller university town as a mid-30s single gay man, where community would be small, dating pools even smaller, and feeling uncomfortable in my own skin would probably be an issue. Other issues that I see as more inherent to the career choice and not necessarily something that can be addressed are the constant anxiety about work–every moment that I am not working is a moment longer that I fall behind my peers and potentially delay getting a tenure track job by another year if I miss this year's job cycle. I virtually never stop working or thinking about work.

Existing NIH policies, programs, or resources

Funding. The NIH should mandate cost of living adjustments for grantees and for postdocs paid off of federal grants. I'm not sure whether it's ethically problematic to pay postdocs in [redacted for anonymity] $60K given that I am choosing this career path, but it certainly contributes negatively to my mental health and quality of life. Meanwhile I know postdocs in small cities in the midwest who are saving–and even buying houses.

Proven or promising external resources or approaches

No response

Response 836

Perspectives on the postdoc roles and responsibilities

The postdoc role is one of advanced training in the context of advancing independence and responsibility. Training implies a mentor providing education and opportunities.

Fundamental issues and challenges

Work-life balance is increasingly important to graduate students, and they want things to improve after they graduate. A postdoc is seen as a step too far into an exploitative lifestyle. I've also encountered a

number of graduate students that do not want to do a postdoc because they do not want the responsibility of funding themselves by writing grants, now or ever.

Existing NIH policies, programs, or resources

The NIH has many requirements for institutions to be eligible to receive PHS funding. A similar requirement could be made by the NIH for institutions to have Postdoctoral Affairs offices that guarantee postdocs are receiving mentoring and growth opportunities, and have reasonable expectations for their work. Like an IACUC, this office would ensure that no postdocs at an institution receiving PHS funding would be exploited.

Proven or promising external resources or approaches

No response

Response 837

Perspectives on the postdoc roles and responsibilities

My view of the traditional role of the academic postdoc is that it is meant to serve as a means for a recent PhD recipient to gain additional research experience that serves as the foundation for developing an independent academic research program. Thus, I don't think the responsibilities of the postdoc should focus on purely conducting research for their mentor. While this research should fall under the umbrella of the research program of the mentor, thus contributing to that research program, it should also seed for the development of a research program that can be carried autonomously by the postdoc in their next position.

Fundamental issues and challenges

The major challenge inhibiting recruitment, retention, and and quality of life of postdocs is the mismatch between the number of postdoc positions (both filled and unfilled) and the limited number of available academic positions that postdocs have specifically been trained for (faculty positions). The fact that there has been a glut of postdocs that were very unlikely to find positions as faculty in recent decades, coupled with the fact that mentors often treat postdocs as a primary source of cheap labor for their own research, has led to the expectation that completing an academic postdoc is essentially training for a non-existent job. Given diminishing prospects for the ability to apply postdoc training to get a faculty position, it seems logical that recent PhD recipients would be less inclined to choose that path. This has especially been the case in recent years because of the increase in the number of industry postdocs, which are a more attractive alternative if one does not intend to get a faculty position because they offer better pay and benefits as well as more realistic career opportunities.

Existing NIH policies, programs, or resources

Most existing NIH **policies, programs, or resources**appear to be designed around the traditional academic career path (PhD > postdoc > faculty), and changing these would not get at the root problem that there are simply not enough opportunities for postdocs to develop an academic career as faculty. To address the root problem, policies or programs would need to shift drastically to provide greater support aimed at increasing the number of opportunities available in academia for postdocs once they complete their training (more faculty or scientist level positions). Alternatively, if postdoc training were to be expanded to include non-traditional training opportunities beyond what is expected for academia, it could potentially be more attractive for recruiting candidates who want to keep their options open because they may not be able to get that faculty position. Right now, it seems like doing a postdoc is like playing the lottery for a faculty position; if you win, that's great, but if you don't, it feels like your wasted your time. If you want to improve the postdoc ecosystem, you need to change that ecosystem to increase the value of time spent regardless of whether someone wins or loses the faculty lottery.

Proven or promising external resources or approaches

No response

Response 838

Perspectives on the postdoc roles and responsibilities

Postdoc is a time for training and exploring novel avenues to leverage towards your (hopefully) future laboratory. It is a highly challenging time, as you transition from an expert, newly minted PhD into a whole new area. Comfortable moves and postdoc's really are not the point, but the barriers to success are much higher than the barrier to going into industry.

Fundamental issues and challenges

While postdoc is supposed to be about training, lately it has taken on a role that is highly labor exploitative and little hands-on training from PI's. Being 'risky' in project direction is not incentivized, because negative data or a lack of an early publication is a huge problem (tied in with time to publication have sky rocketed). Major challenges include poor mental health, long hours (>60 hr a week), and lack of financial stability. This is why many postdoc's are running to industry ASAP, where expectations are clear, hard work is rewarded regardless of the scientific result, and they are paid a living wage. Even F99/K00 and K99/R00 are going into industry because of the lack of support.

Existing NIH policies, programs, or resources

NIH postdoc salaries are not sufficient. Many postdoc's are forced into Boston/SF/etc. because this is the only way to be competitive for R01 institutions, but these areas are also the MOST expensive areas to live. NIH should require more than one mentor per postdoc.

Proven or promising external resources or approaches

St Jude recently promised higher postdoc salaries to help spur on retention and hiring.

Response 839

Perspectives on the postdoc roles and responsibilities

Postdoc positions are supposed to be a way to get additional training/expertise in a chosen field of study. Instead, they are usually long-term, underpaid positions of skilled labor. Because of the bottleneck in academic positions, and increased time it takes to publish, postdocs are stuck trying to publish (usually multiple) papers before they can be "competitive" enough to go on the academic job market.

Fundamental issues and challenges

The fundamental issue is the long-term nature (5-10 yrs) of a position that was designed to be short-term (1-3 yrs). The low pay, lack of benefits and lack of stability (knowing what comes next, or even how long one will be employed in that position) make it an incredibly stressful position, and moreover it usually coincides with a time in which people are trying to start families and settle down. Thus it is fundamentally incompatible with most people's life-stage, and is particularly difficult for women who are navigating trying to start their families and have an increased need for stability, income and health care benefits.

Existing NIH policies, programs, or resources

Existing NIH policies are woefully inadequate to meet the needs of postdocs, especially when it comes to salary, childcare benefits, health insurance, and retirement planning. They are also inadequate when it comes to maternity and paternity leave. A large expansion of these programs is needed. However, the biggest issue is the low salary and long tenure. Unfortunately, simply raising postdoc salaries without raising grant amounts is not a realistic solution (an entire modular R01 cannot go to the salary and benefits of a single lab member other than the PI.), especially if postdocs continue to be long-term positions.

Proven or promising external resources or approaches

Some institutions (both in this country and other countries) have staff scientist positions that are not paid for off of an individual PI's grant. Creating special NIH grants given to institutions to specifically fund highly paid staff scientists may solve many problems at the same time. By creating a competitively-paid "research" career track within academia, we will retain talented scientists who would otherwise move to industry. Labs would benefit from a highly-skilled and stable workforce, that would not be paid out of their individual grants. These positions would be filled by PhD students who wish to stay in a "bench" position

for the long-term, or by postdocs who quickly realize they do not want to become a PI (or who completed a short postdoc to gain the relevant skills for a particular staff-scientist position). Postdoc positions could go back to being true short-term training positions. For many, they would be used to gain a technical skill for a staff scientist or industry job (rather than amass a publication record). Labs wouldn't mind, because most of the stability would come from their staff scientists. Only those postdocs that truly wanted to stay on the PI track would stick it out for longer tenures—but the pressure on the academic job market would be reduced since fewer postdocs would be vying for these jobs.

Response 840

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is, to me, an apprenticeship. As a postdoc, you connect yourself with an established scientist who you work under in exchange for training and preparation for becoming a scientist. My role in the lab is thus one of a high-level/independent trainee, where I am distinguished from techs/postbacs/graduate students by the amount of experience I have (both in terms of general knowledge and skill) and by my ability to build on active work in the lab through that work. My role for other trainees is as a mentor and supportive figure, which I have learned through observation and trial and error since there is limited formal training available for postdocs (or graduate students) on how to effectively mentor.

Beyond daily tasks in the lab, my responsibility is to ensure that I am getting the adequate training and preparation for the next step in my career. That involves balancing benchwork, writing (grants, papers, CVs, and other materials needed for apps), mentoring, teaching, networking, continuing education (in research methods, computational skills, ethics, philosophy of science, statistics, etc), and exploring career opportunities. As such I hope to use this period of time to ease out of grad school burnout and see if I can see myself continuing in academic science or another scientific career.

Another responsibility is scientifically distinguishing myself from my mentor, particularly if I anticipate continuing as an academic scientist. The amount of training and aid that a postdoc can expect from a mentor in this regard is extremely dependent on the mentor in question (with some mentors putting effort towards setting postdocs up with a question to take with them and others making it an "in your own time" effort that must be done in addition to ongoing lab projects).

So, the postdoc is an apprenticeship.

Fundamental issues and challenges

The age at which the postdoc starts is a critical period of life. This is when people start families, parents get older, and previously dormant health issues become more of an issue. As such, it's a time of reflection on life goals and what values we hold as people. There are key factors and values at play that prevent people from choosing to start postdocs and make academic-track positions less desirable in the present climate:

1. Funding. Postdoc positions do not offer competitive salaries, particularly for scientists with computational training. International postdocs are subjected to even lower (read: criminally low) pay. We are told that "it's not about the money" when we consider postdocs, but if you are trying to make science an equitable, diverse field, then lack of generational wealth and familial financial support absolutely prevent students from being able to take these lower-paid positions.
2. Academia is perceived as a poor working environment. There is an over-reliance on volunteerism, poor responsiveness by institutions for policy infractions (i.e. harassment and discrimination), and an overwhelming culture of "kill yourself for the science" that has students burned out before they even receive a phD. Leaving academia (postdocs included) is seen as salvation for many students. Having optional "mental health awareness" sessions is not the same as promoting mental health.
3. Funding. Yes, it's in here twice. Grant funding (a microcosm of the wider peer-review problem) is obtuse and luck based. There is an understanding that, starting as early as grad student level, you will not succeed if you do not get grants. The only response concerned students get for this is "you don't need to worry about this yet".
4. Isolation. Postdocs enter systems/labs alone. This leads to social isolation which worsens mental outlook.

We need well-rounded training at all levels.

Existing NIH policies, programs, or resources

Build more clarity into the grants system. Put in oversight for reviewers to ensure that their responses reflect the grant itself and give reviewers adequate time to properly read through and assess the merits of a review (honestly, the NRSA is way too long. No one can read a whole NRSA in a short period of time and not go cross-eyed, let alone a handful of NRSAs).

Build in more training that spans the breadth of the skills that scientists need to have throughout their career. Training in mentorship, communication, financial planning, how to pick a paper to publish in, more detailed/comprehensive/regular statistics refreshers. Give people the skills to bolster their mental health in practical ways (I appreciate that meditation seminars exist, but they feel like someone slapped a band-aid on a gaping wound and said "that's probably good enough"—requiring people to come to an hour long seminar in the middle of the day is counter to the culture of "kill yourself for science". If you want to combat the mental health problem, combat the culture)

Require compensation for time. Volunteering is lovely when it's a choice, but academia relies too heavily on students, postdocs, and faculty giving freely of their time. If a person is going to spend a 60 hour week reading and reviewing applications for a grad school app cycle, they deserve compensation for that. If a group of graduate students is volun-told to spend months planning and executing a program-wide event, they should be compensated for that. The amount of volunteerism required for success in academia is predatory and is foisted even more heavily upon underrepresented communities.

Foster the creation of postdoc associations and their inclusion within the academic environment.

Proven or promising external resources or approaches

I went to a talk in the fall where someone from Stanford was discussing holding postdoc interview "days" where postdocs could come in and interview and meet one another as a part of that process. That sort of program could help foster a sense of community within incoming postdocs. To that note, setting up cohorts of "onboarding postdocs" would be helpful. Cluster hiring can be particularly beneficial for underrepresented communities, but even having a short orientation shared between a small group of postdocs would be an excellent way to add social support to the early stages of postdoc-ing.

Response 841

Perspectives on the postdoc roles and responsibilities

It should be a temporary (1-2 year) time period whereby phds gain experience in a new lab before they go on to become independent scientists. It should not be the "postdoc treadmill" we have now whereby institutions view postdocs as cheap labor and pass them around for many years with no stability and no clear upwards career path

Fundamental issues and challenges

Postdocs are NOT trainees. Postdocs are TRAINED scientists. They are fully qualified to carry out research. Stop treating them as trainees, and start treating them as valuable employees.

I am a postdoctoral "trainee" at the NIH and I receive no formal training whatsoever. I'm left wondering what exactly I'm in "training" for? When I complete my postdoctoral years I will not leave with a qualification, which you'd think I'd get if I were "in training" . A medical student completes their training and becomes a doctor. A law student completes their training and becomes a lawyer. Postdocs complete their "training" and become—.well, a postdoc somewhere else.

I carry out the tasks of a staff scientist. The only difference is that by calling me a "trainee" I am paid half that of a staff scientist, I have no employment benefits and I have no stability.

Existing NIH policies, programs, or resources

Increase remuneration for postdocs. Postdocs are paid at least less than half (but often much less than half) what they are valued at by industry standards

Proven or promising external resources or approaches

One approach might be to remunerate postdocs according to market value, as is done in industry

The UK employs postdocs as temporary staff. While salaries are still lower in UK academia than UK industry, employment comes with benefits that people care about: salary (not a stipend, which makes thing like loans/mortgages hard to get), employer-contributed pension plan, time off, vacation days—normal things that we should expect from a job

Response 842

Perspectives on the postdoc roles and responsibilities

I personally see the postdoc phase more as a transition phase than a training phase, you have already proven that you are able to conduct (up to a certain point) independent scientific work because you went to grad school or (in some European countries) actually didn't even do any course work, but just a research project on your own. In any case you got a PhD before which means you should have somewhat of an idea what you are doing. As a postdoc you can use your previously acquired skills and learn some new skills (mostly on your own, so you are not necessarily a trainee because nobody trains you in anything besides yourself) to put them into a research project of your own (if you didn't end up in one of the papermill labs for which you are just a less expensive technician). To me, the postdoctoral phase basically it is a career phase where an academic scholar spends time in the lab and works through their own projects and tests their ideas to find out in which direction their future lab would want to go (research interest wise) and where you can pick up some more skills, develop collaborations, etc. By doing all of this you should learn to lead a lab or group of your own in the future, how to write grants and how to teach your future students how to do things. Although all of this you apparently have to learn via osmosis because there is no official training. Which is totally fine, but then don't call it a training position! If you are lucky your institution offers some courses or workshops about leadership or grant writing or on how to navigate the faculty job market. They are sometimes, more sometimes less useful.

Fundamental issues and challenges

My quality of life has decreased on all levels, but especially financially since I started my postdoc. Even though my institution raised the minimum salary for postdocs I can't profit from that because I am on a scholarship which comes from a different country. They want to supplement it but they can't find a way to really do that and even if they would, it would probably get me into a whole different set of problems tax-wise. I am on a J-1 which has to get renewed every year in my home country but I can't fly there that regularly because it is too expensive. If I don't renew my visa I can't travel and if I would have to travel home for e.g. a family emergency I would be stuck there until my visa is renewed which takes over 4 weeks and my PI wouldn't be happy with that. I pay half of my salary for rent although I live over an hour away from campus in a not exactly save area of town. I can't save any money because there is not much left at the end of the month, I can't accumulate credit history here because I wouldn't get a decent credit card to even start doing that. That means I can't get a loan for a car or anything else. It would be entirely impossible to have kids or raise a family under these conditions. Nobody expects industry salaries. But if it would be possible to have at least a little bit of financial security (rent, food, basics) I am sure that would boost the productivity in science way more than any other of the big NIH or other initiatives because folks would spend less time worrying and more time thinking about their projects.

Existing NIH policies, programs, or resources

Don't make a permanent residence a requirement for the K99/R00 award!! The majority of postdocs in the US comes from abroad!!!

PAY US MORE $$

Proven or promising external resources or approaches

I think all of those should be improved! But mostly the salaries. Institutions could save all the money they spend on "mental health awareness workshops" and just pay us more, I guarantee you, mental health will automatically increase when salaries increase. Working environment: I do not even have an office and I am using my private laptop (which is ten years old and about to kick it) for everything. Give people contracts which allow for more than 1 year of visa. I have to renew my driver's license every year because it is tied to the visa, this costs a lot of money. Many credit institutions see that you are here "temporarily" and don't work with you then. Mentoring: yes please! Lots of stuff on paper never happens in real life. Training: sure I would love that! Most people I know at our institution are doing 6 year plus (sometimes ten year long) postdocs which is insane for a "trainee" position. It simply is not that. They are basically

running the lab and are small PIs under a big PI. They are not trainees. I am not at a small university. It is one of the big R1 institutions.

Response 843

Perspectives on the postdoc roles and responsibilities

As a postdoc, you pursue a research project in line with your PI's lab interests but is of your own conception and driven with your forethought, ideas, and mainly by your hands. Your responsibility is to produce reliable research that furthers scientific knowledge and hopefully produce an influential journal article. You are still learning but you also have an obligation to mentor and teach students or technicians.

Fundamental issues and challenges

After having 5 to 6 years of intense training to gain a Ph.D., a postdoc is not fairly compensated for their training or knowledge in academia. I received a minimal pay increase, changing from a graduate student stipend to a postdoc salary—with no relocation assistance. Then after getting a prestigious NIH grant, I lost my employment status with my academic institution, causing a loss of critical employee benefits, including a downgraded health plan, no eye insurance, complete loss of sick and vacation accumulated leave (without any compensation), and total loss of any 401K contributions. Not to mention the NIH set salary does NOT account for the cost of living in the city you are employed, nor does not adjust due to inflation.

Existing NIH policies, programs, or resources

Increase the minimum salary to what a Ph.D. makes in the biotech industry. Force the academic institutions to still consider postdocs as employees—so we can have the same benefits as administrative secretaries with no advanced degree. Give extra living assistance for postdocs who live high cost of living cities. Give MONTHLY childcare benefits that adjust depending on the cost of living to postdocs with children. A one time $3,000 assistance barely covers one month of childcare in Boston.

Proven or promising external resources or approaches

Create a human resources department that postdocs can go to away from their academic institutions so they can report mistreatment from their PIs and not depend on their academic institutions for further action. As long as a PI still brings in large grants it is highly unlike the academic institution will discipline the PI in any meaningful way. If the NIH would step in and withhold grant awards to the PI there could be real consequences for PI abuse of postdocs. Ultimately you need to increase postdoc pay and increase PI accountability for postdoc treatment.

Response 844

Perspectives on the postdoc roles and responsibilities

Unclear what roles and responsibilities are, much of the power is set in that by the lab head rather than the institution and even when there are institutional rules they are often at the discretion of the lab head (paid time off, etc.) Without a specific program like graduate school checking in to ensure that one is making adequate progress is difficult. Although I am a permanent resident, postdocs as opposed to graduate students and faculty seem to be much more likely to be employed on a visa sponsored by the university which complicates the role of postdocs. It is my impression that many on visas see one primary goal in their postdoc lab to be changing their residency status. At my institution there is little support for training of postdocs other than providing resources to do bench science. I view postdoc training as an opportunity not only to do research in a different environment than my graduate research but to continue training in other skills for my future career, which will vary by person (continue teaching, interaction with biotech companies for those who plan to pursue a career in industry, understanding grant writing and other aspects of the faculty job for those seeking an academic faculty track, etc.)

Fundamental issues and challenges

Postdoc pay is low. While higher than in graduate school, the low pay of graduate school and postdocs generally being old enough that life events that had been put off due to finances being harder to keep putting off as one continues to get even older as a postdoc. By this I mean student loan repayment (as one is no longer a student), starting a family, or even just wanting to construct an independent adult life

and save for retirement. Given that other jobs will pay more it is a difficult sell to pursue a postdoc if too many of these financial burdens just cannot be put off any longer.

Existing NIH policies, programs, or resources

widen timeframe of K99 eligibility. Providing more leeway for life events affecting graduation time of K99 eligibility. Training grants for graduate programs do a lot to help keep departments paying attention to the training they are providing their graduate students, from the focus on average graduation time and publication rate to the requirements for presentation within the department. I wish there were ways that NIH funds can be leveraged to similarly check in on institutions training of postdocs.

Proven or promising external resources or approaches

No response

Response 845

Perspectives on the postdoc roles and responsibilities

Opportunities to broaden experience, skills and toolkit; mentorship from the PI particularly in aspects of the job that are not often directly trained.

Fundamental issues and challenges

Lack of funding (for both salary and research budget), toxic or neglectful advising, expectation of that postdoc work independently to the extent of running projects with little support or mentorship (extractive/cheap labor), short term contracts often necessitating moving every 1-2 years.

As a graduate student looking for postdoc opportunities, I have found that (perhaps due to the rich-get-richer funding mechanisms in the US), the labs/PIs that have funding are often overcommitted and unable to provide meaningful support (or have actively toxic working environments), while lots of labs/PIs who are interested in postdocs don't have the funding. The funding mechanisms that graduate students/postdocs can apply for themselves are limited and highly competitive, but then don't actually provide sufficient funding for both research and life needs, including benefits.

Existing NIH policies, programs, or resources

More funding for postdoc fellowships, with stronger monetary support for both salary and research expenses. In particular, the NIH salary minimums are often used as caps by other institutions, and this limits cost of living adjustments and more.

Proven or promising external resources or approaches

Cohorts of postdocs/other community building. Clear mentorship expectations or connections to outside mentors. Other professional development (e.g. teaching, lab logistics, etc.). More awareness and resposniveness to toxic advising/mentoring/lab situations.

Response 846

Perspectives on the postdoc roles and responsibilities

My view on the postdoctoral position has evolved ever since I started my postdoc training. Initially, I thought a postdoctoral position was just about being trained in performing and analyzing experiments and learn as many technologies as possible, and at the end of the training to choose a field of study and go from there. Nowadays, and after some struggles, I am much more educated in what the position implies. I understand now that a Postdoctoral training is meant to be a transition whose purpose is to fully prepare us (make us competitive) for an independent career in an academic setting, to significantly contribute with our field. I know now that a Postdoc is not meant to be just the hard-worker who executes wonderful expensive experiments; but that also needs to have the proper training (through courses and healthy peer-discussions) to conceptualize those experiments and projects, to actively seek for fundings for those projects, to have their ideas criticize and/or validated among their peers and mentors, and to expose their ideas without being shut-down.

Fundamental issues and challenges

In my opinion, issues inhibiting recruitment include:

1. low stipend, not even not competitive, just simply low stipend. Undeniably, postdocs' salary doesn't compensate for the amount of effort the position requires. Also, postdoc salary increase is not always respected depending on the institution and/or PI, and merely taken it as an "inspiration". And
2. in some institutions, extra health expenses (health insurance) not including in our already-low stipend.

Issues inhibiting retention include the lack of postdoctoral training from PIs. Some well-experienced PIs look at postdoctoral fellows as, in the lack of a better word, machines, meaning that they only see a couple of hands ready to work; and other types of PIs will leave their postdoctoral fellows to be entirely independent, neglecting the training they stated we would have when giving us our appointment. In my experience, there is a group of PIs that are indeed interested in providing a good postdoctoral training to their postdocs and they should be more incentivize.

Existing NIH policies, programs, or resources

I think international postdocs (non-citizen) should have the option to apply for other grants opportunities and awards, other than the K99. Grants and training opportunities are extremely limited for international postdocs who don't hold a permanent visa status or a citizenship.

Proven or promising external resources or approaches

No response

Response 847

Perspectives on the postdoc roles and responsibilities

I view the postdoc position as a way to get more experience as an independent researcher and develop my own future research program. I view it as a shorter term position (4-5 years), before I am ready to go on the job market with the intention on staying in academia.

Fundamental issues and challenges

My biggest issue is currently related to salary. Although I am part of a postdoc union that has increased its salary recently, it is still not high enough to pay all of the things that I need to pay for (bills/loans/etc). To save extra money I currently commute 1 hour+ each way to work in order to put more money towards my student loans. I could live closer but I would a minimum of 2-3 roommates and I think that it is a little absurd that with an advanced degree the only way I could afford housing in the city that I am employed in, is to have roommates.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase the minimum postdoc salary that the NIH sets.

Response 848

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Pay: the NIH should adjust the pay according to the cost of living, especially in high cost of living areas. Fair and equal treatment: domestic and foreign postdocs should be treated equally. Foreign postdocs have to deal with visa and immigration issues, and some labs take advantage of their vulnerable status.

Recruitment: a lot of PhD graduates have an options to go into industry or government for better pay and benefits. Not all universities provide great benefits for postdocs, and they should be relatively similar across all universities to improve retention and overall quality of life.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

The NIH should have more career events and workshops for postdocs, provide some small scholarships and professional development opportunities for foreign postdocs.

Response 849

Perspectives on the postdoc roles and responsibilities

The postdoctoral fellowship position is proposed as further training to prepare researchers for the PI career track; this is dishonest at best and downright exploitative at worse. Most postdocs are treated like more skilled graduate students that can complete projects faster and don't need additional training. The training aspect is not mandated nor is it clear how postdocs need to be trained before they are ready for the PI track. This is a cheap labor hack that the NIH is supporting that abuses vulnerable and highly skilled people. The postdoc shortage is a manifestation of these exploitative and abusive policies.

Fundamental issues and challenges

1. The Fundamental issues and challenges really all boil down to compensation and life stage. Postdocs and graduate students are at the age where they are trying to get married, start families, buy houses, and start saving for retirement; but, academia makes this nearly impossible. Not only are there no mandated holidays, hours, or family leave, but the pay is abysmal. Industry will hire a PhD with no postdoc experience starting at 90K. The only way for academia to recover is to have pay parity with industry.
2. In addition, there should be an academic career track that allows a postdoc to continue working in the lab as a research scientist after they're done with their postdoc that does not require them to advance to the PI career track. If a scientist is good at doing bench science, make a position that pays them 90K to continue doing it instead of forcing them to sit in an office doing something they're not good at—i.e. writing grants, writing publications, teaching classes (which we are not all trained to do), running departments, etc.

Existing NIH policies, programs, or resources

The NIH pay scale needs to be the minimum mandatory, not an option that institutions can elect to follow. If an institution refuses to match NIH pay scales—REVOKE FUNDING. Stop supporting the exploitation of labor under the guise of training. Postdocs need salaries that are on par with what they can make in industry. Until there is a meaningful effort to address the pay issues, the postdoc shortage will not resolve.

Proven or promising external resources or approaches

Look at industry for salary scales.

Look at industry for benefits.

Look at industry for work life balance.

Response 850

Perspectives on the postdoc roles and responsibilities

After being a postdoc for a handful of years now, this postdoc position means absolutely nothing to me but as a means to get my US Permanent Residency. I have totally lost my love for science and sometimes regret ever doing my PhD.

Fundamental issues and challenges

Extremely poor salary as compared to work load specially in high cost of living areas.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Existing NIH policies, programs, or resources

K99 TIMELINES!!!!

So many postdocs I know are actually hindered in their transition to independence because of the slow pace of K99 review timelines. For example, I applied for a K99 Feb 2021 with a proposed 9/1/21 start date, got my 10 score May 2021, and then didn't receive an NoA until June 9, 2022! With my score in hand (and radio silence from PO all summer despite numerous enquiries) I embarked on the job market fall of 2021 in order to secure a position within the expected two year window to start 9/1/21 as I proposed. I then received a job winter 2022 and had to delay the job one and a half years until June, 2023 for the required K99 training window that didn't begin until, I reiterate, the NoA came THIRTEEN MONTHS AFTER A 10 SCORE. I know my experience is not an isolated incident. Postdoc timelines are simply too uncertain and rapidly changing for such an important mechanism to be so

a) slow and

b) prescriptive.

You can be prescriptive if rapid and adaptive, but the current system is broken.

Proven or promising external resources or approaches

No response

Response 852

Perspectives on the postdoc roles and responsibilities

Career preparation, clarification of career goals, (ideally) improved work-life balance, pay, and workplace climate.

Fundamental issues and challenges

Stigma towards taking time out of the lab to teach/pursue career development opportunities

Stigma towards taking time off to have fun, having boundaries

Limited institutional investment in creating community among postdocs

Limited spots in programs aimed at addressing these issues (ie IRACDA)

Limited or no institutional oversight on how postdocs are treated (for example, I knew of a lab where all were expected to work extremely grueling hours and treated poorly, PI was a longterm employee and faced no consequences from university for inhumane treatment of postdocs)

Academic culture thriving on making feel insecure and inadequate, creating workaholic environments, competition for underfunded grants without enough spots to really support people, emphasis on individualism over collaboration, etc

Existing NIH policies, programs, or resources

Expand IRACDA (including bigger cohorts in existing programs and more programs) and offer similar fellowships for additional career paths if possible

Assess and change the climate in academia. People who treat postdocs badly, and people whose mentorship style is cruel, should not be in positions of power regardless of how rigorous or "excellent" their research is.

Normalize self-care, not just in the form of little workshops about it, but in the form of top-down embracing of reasonable work hours and less constant pressure

Proven or promising external resources or approaches

I think across the board in academia there's too much normalization of the idea that academic work has to be grueling, feedback has to be delivered without tact or compassion, everyone has to be working on their own, etc.—as long as these issues remain, academia will continue to have diversity, equity, and inclusion issues, because a culture that thrives on stress will have a more difficult impact on people who are already stressed about being the only person who looks like them in a room full of possibly hostile power figures.

Cultural reforms need to happen, and creating more funding opportunities or programs, etc., without addressing culture and climate, will always only be a bandaid.

Response 853

Perspectives on the postdoc roles and responsibilities

Postdocs should be receiving additional training as their primary role. If they are expected to have 100% of the skills right away, that's a Research Scientist.

Fundamental issues and challenges

Payment and hours. If someone offers you better pay, treatment, and more reasonable hours, why wouldn't you take them up on the offer?

Existing NIH policies, programs, or resources

The pay scale is way too low, especially considering the density of roles in Boston, NYC, San Francisco, and DC, none of which are cheap markets.

Proven or promising external resources or approaches

Let's be honest, these issues have been around for years and will continue. The question is when will the NIH decide to actually address them. You shouldn't need this survey to tell you what the problems are.

Response 854

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as a transitional launchpad towards an independent academic career. Admittedly, however, the stiff competition for academic positions makes it feel like an otherwise unnecessary training period to boost one's credentials for the job market.

Fundamental issues and challenges

Low pay. This is linked to a demoralizing outlook on future career prospects, low self-esteem, family conflict, and perpetuation of systemic inequalities. Postdocs without external financial support (spouse, parents, etc) are often forced out of the system.

Existing NIH policies, programs, or resources

Increase in minimum salary requirement/NRSA guideline

Proven or promising external resources or approaches

No response

Response 855

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 856

Perspectives on the postdoc roles and responsibilities

Postdoc are only required/useful if you plan to stay in academia

Fundamental issues and challenges

Cost of living vs stipend. Industry salary for scientist I, no postdoc experience needed, is over 2x higher salary versus postdoc stipend.

Postdoc experience does not make someone a more interesting candidate for an industry position in R&D. Industry experience is more relevant for hiring.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 857

Perspectives on the postdoc roles and responsibilities

I love being a postdoc research fellow and being a physician-scientist is my goal since I started medical school. I've been learning a lot and discussing important topics in responsible conduct in research, but I also see this being applied at the institution I work at. For me, this postdoc is an opportunity to learn more about clinical research and be trained to produce meaningful clinical research in the near future that can impact patients' outcomes. I'm an enthusiast in clinical research and finally, I have access to an excellent program.

Fundamental issues and challenges

The main challenge is the wage. Postdoc requires almost exclusively dedication and the wage is not compatible with the one clinical physicians earn (it is less than one-third). Is is difficult to recruit and retain physicians to be trained as physician-scientists if their earn in not enough to maintain a minimal house income. Most of the physicians i know that wanted to become a postdoc gave up when they discovered the salary.

Existing NIH policies, programs, or resources

I don't have an opinion on this question.

Proven or promising external resources or approaches

Publication of vacancies on Twitter and LinkedIn. Increase the salary of physician-scientists training to be closer to the ones that are in clinical work. When doing research gets less compensation than clinical work you lose young investigators that finished their residency especially because they carry the burden of loans from medical school (that's not my case but I know many in this situation).

Response 858

Perspectives on the postdoc roles and responsibilities

I think having more clarity to ensure academic postdocs have sufficient time to develop their own program of research would be important. I view postdocs as junior colleagues whom I am collaborating with to support their transition to their first career award and eventually independence. I am concerned some colleagues treat them as economical lab managers.

Fundamental issues and challenges

Salary and benefits have not remained competitive with other potential opportunities. In addition, developing a clearer pathway to stability would probably greatly increase the likelihood someone would pursue an academic postdoc.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

I’m unsure but do think some sort of assessment of organizational culture would be important for improving local procedures.

Response 859

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low salary.

Existing NIH policies, programs, or resources

Fix the stipend levels published by NIH.

Proven or promising external resources or approaches

Double the salary.

Response 860

Perspectives on the postdoc roles and responsibilities

The role of the postdoctoral fellow is to :

Do guided research which lead to independence

Develop a project that they can take with them to start a lab.

Take advantage of grant writing opportunities

Become aware of interpersonal interactions that are critical in running successful research

Attend meetings to meet other reaserchers in the field and become known to the scientific community.

Fundamental issues and challenges

Industry pays more.

Being an academic is not an easy 9-5 job that can be done from home.

Many graduaate students and postdoc fellows continue to prolong the undergraduate experience as a default pathway.

Many graduate students and postdocs are not given a sense of passion and sense about following one’s interests in academic research.

Many postdocs see the degradation of the tenure system and the emphysis in making money for the univerisity through amount of grant funding their mentors are supposed to bring in.

Existing NIH policies, programs, or resources

Raise the module grant levels to give postdocs a competative pay.

Eliminate postdocs from grants and have them be paid separately from the PIs grants through a NIH funding mechanism.

Proven or promising external resources or approaches

Most universities have instituted, grant writing programs, how to get a job programs.

Many universities give full health benefits to postdoctoral fellows.

Response 861

Perspectives on the postdoc roles and responsibilities

Postdoc is a research scientist position, not a training position. Exploring and expanding one's research program.

Fundamental issues and challenges

Postdocs are not paid enough (which disproportionately affects people who come from low income backgrounds). I make more money as a part time research analyst than I do as a postdoc (though I shouldn't need to supplement my income!). I have also heard that NIH postdocs are not paid the same rate as the postdoc salary standards released by the NIH (they are paid more). I think this is an injustice. Postdocs also need family support, especially if we aim to retain female scientists.

Existing NIH policies, programs, or resources

Standards should be set to be more inclusive—enough pay for people living in expensive cities under a recession, and enough for people to have families.

Proven or promising external resources or approaches

None that I know of.

Response 862

Perspectives on the postdoc roles and responsibilities

Postdoc was a training period and opportunity to do exciting research and interact with other smart people. This period was supposed to prepare us for the next career step, but I think most people get less guidance and/or support to successfully move to the next step.

Fundamental issues and challenges

1. Salary. No wonder why most a
2. American PhDs avoid doing postdocs and transition fast to companies. Most postdocs in US are from poorer countries (even worse, those individuals are even recruited with even lower salaries that do not fullfill NIH standards even if they are actually paid by NIH funds). It's almost offensive to postdocs how you can end up being below mean American salary (particularly in expensive cities that salaries are not adjusted to cost of living) when their educational status is 2SDs above the mean. PIs and Insititutions should be reviewed for following minimum recommended postdoc salaries. With codt of living skyrocketing and Postdoc salaries not significantly changing, postdoc in US has ended up almost slavery.
3. Dependence on getting grants. Research Intitutions provide minimal support to PIs and postdocs. We are all relying on grants that is extremely difficult to get. This increases the stress of all parties and reduces retention.
4. Quality of life is poor. Postdocs are extremely dependent on PI's personality. Although I have been lucky on that respect (which is part of the reason I survived longer in academia), many PIs act as slave drivers (require postdocs work 24/7, even they know they are underpaid).
5. Career prospects very poor.
6. Mentors are not supportive.
7. NIH doesn't have many grant options for non American postdocs.
8. Visa conserns for international postdocs.
9. Almost impossible to have family during postdoc. No support from American system for families.

Existing NIH policies, programs, or resources

There is a dire need to establish requirements for minimum postdoc salary. I think PIs that do not respect that should be banned from NIH funding. Salaries need to be also adjusted to cost of living at least per State, right now only CA seems to consider that. E.G. MA is so much more expensive than FL. If PIs follow NIH guidelines, a postdoc in FL might be ok, but in MA will be almost poor, struggling to find a house or daycare they can afford.

Proven or promising external resources or approaches

Provide training to PIs on what their mentees need as well as to postdocs.

Response 863

Perspectives on the postdoc roles and responsibilities

When I started my post-doc, I viewed it as an opportunity to gain more training and exposure to different ideas, to prepare me for a professor position. While last year I was successful in receiving multiple tenure-track R1 professor offers, looking back, I honestly regret my decision to do a post-doc at all. I did not have support from either my institution, department, or my mentors, did not receive any clear training, and was constantly battling antiquated NIH policies and procedures. I think post-doctoral positions should be eliminated in favor of permanent research positions.

Fundamental issues and challenges

Number 1, the salary. It has not kept pace with inflation, and it is laughable to compare it with how a PhD is valued for research positions in industry, and there is no consideration for different costs of living. This is also an equity issue because it impacts the decision to pursue academia for individuals from lower socioeconomic backgrounds. Number 2, the lack of support or accommodation for dual careers (two-body situation), this is also an equity issue as this is especially and disproportionally important for females in science. My partner and I were both post-docs at institutions separated by a 5 hour plane flight. Number 3, the job security (or lack thereof). Each year, I lived in suspense as to whether my contract would be renewed. Post-docs should be given multiple years of guaranteed funding, not exploited as temporary labor. This is an equity issue also especially for international post-docs on visas.

Existing NIH policies, programs, or resources

When I earned an NIH post-doc fellowship, my salary decreased and many benefits were eliminated. These polices should be changed: First, I earned the fellowship 1 year and 10 months into my salary, so I did not receive the an annual raise at the appropriate time (Proposed change: receive annual raise the month eligible). Second, I was not eligible for retirement benefits or matching from the university, and I lost the employer retirement contributions that I was not vested in (Proposed change: continue to be eligible for university retirement as an employee). Third, my PIs tried to make up the difference, but they were not allowed to use money from a federal grant (Proposed change: allow supplemental funding from NIH grants, so a fellowship salary is a floor not a ceiling). Fourth, I had to learn how to pay estimated taxes because I was no longer considered an employee, even though I was still employed by the university (Proposed change: post-doctoral fellows should be categorized as employees). Fifth, my health insurance was taken out of the money that was supposed to be used for training (Proposed change: standard this across universities). Finally, an importantly, international post-docs should be eligible to apply for all federal funding. The treatment of international scholars in the US is abysmal, especially considering the disproportionate proportion of scientists who live on a precarious visa status and many of whom were prevented from seeing their families for years during Covid, and how much international scholars overall contribute to science.

Proven or promising external resources or approaches

Increasing the salary (and taking into account cost of living differences), transitioning from post-docs to permanent research staff. Universities should also be required by NIH to have actual HR for post-docs, so that there is independent accountability and support.

Response 864

Perspectives on the postdoc roles and responsibilities

There is very little support for postdocs in academia. Its not uncommon especially at elite institutions for them or mentors to demand more work from one postdoc than is allowed, reasonable, or feasible. Many often hire one postdoc to fullfill 2-3 positions because we are cheap, smart, and as easy to take advantage of. Yet theres nothing we can do given our vulnerable position, especially if we aspire to stay in academia. It truly doesn’t pay mentally, emotionally, or financially for anyone to stay in academia. But those who do, stay because they are passionate about the work despite negligible support. Anyone with a doctoral degree in another industry or doing clinical work is paid more than double what postdocs make. It’s unfathomable how affluent institutions underpay postdocs, especially in expensive cities, where the NIH stipend isnt enough to afford rent and basic expenses. But these institutions thrive on exploitation: arguing they cannot pay postdocs more because it isn’t allowed by NIH. Its also unreasonable for nih to have a national postdoc stipend when the cost of living varies drastically all over USA. Not to mention the current standard is incredibly low for our experience, expertise, student loan debt, and years of lost wages pursuing advanced degree. This makes it even harder for minorities who are already struggling to get into or stay in academia to survive and prosper. And it’s even worse for women, esp women of color. who want to start famililes but know it will sig hurt their career & they cannot afford to on a postdoc salary. This takes a Detrimental toll on their well-being as starting a family on postdoc is done after already postponing as long as possible for our careers and now at a critical point when fertility is vulnerable.

Fundamental issues and challenges

Nih needs to stop providing institutions with so much money or require them to supplement a percentage of costs and benefits for their researchers for getting so much money. institutions offer little to no recognition or additional salary support to postdocs who bring in funds and pay their own salary. So not only do we work for free and they get paid to have us they are happy to keep exploiting us as cheap labor knowing the difficulties we experience daily in this role and how vulnerable we are. Instead of caring institutions continue to demand more and it only gets worse if we are successful in obtaining grant funds or publications, yet still we are never compensated for that success. And if we are not successful then they threaten to let us go for someone better especially elite institutions. This is enough to drive someone to their breaking point so it is really no wonder why recruitment and retention is such an issue. In addition, neither Nih nor individual institutions actually keep mentors accountable to their mentee’s or check in with postdocs about mentor or dept abuses, so postdocs have no where to voice hardships or concerns they are experiencing on top of fears of retaliation or being blacklisted from academia. This is all made worse

and exacerbated by unlivable wages, little to no financial support for childcare or access to in-house childcare service if available, and adequate healthcare benefits at reasonable costs. Childcare for one is $2000 a month minimum all over USA. Yet NIH provides 2000 for an entire year and doesn't require institutions to supplement childcare cost for their postdocs when paid so unreasonably low. Research assistants with bachelors make almost the same salary or sometimes more than postdocs. It's unacceptable and shameful.

Existing NIH policies, programs, or resources

There needs to be more accountability or institutions. It would be ideal if we could have a third party that worked as a liaison between an NIH and institutions to make sure researchers and mentors are held accountable and oversee institutional abuses / exploitations. NIH should also implement a system to obtain confidential progress reports from postdocs that are completely independent from the institution so that they can disclose any issues they may be experiencing there or with mentors. When such issues are reported, there also needs to be a way for those matters to be handled justly, responsibly, and confidentially so that the postdocs do not have to fear retaliation from either a mentor or institution as postdocs are in a vulnerable position of power and must be protected from retaliation. Possible entities that exist to protect postdocs include postdoc unions. NIH should require institutions, especially large institutions who frequently receive NIH funds, to allow postdocs to unionize and reasonably negotiate.

Proven or promising external resources or approaches

Postdocs Unions, 3rd party liaisons to work with postdocs to communicate institutional issues to nih, nih should perform confidential check-ins with post docs independent from the institution to obtain information about ongoing issues

Response 865

Perspectives on the postdoc roles and responsibilities

Advanced research training; carrying out projects with high level of independence and skill; providing training to more junior lab members; writing grants; writing papers; generating data to support PIs grants.

Fundamental issues and challenges

Low pay, minimal accountability for progress, lack of community, not valued by institution.

Existing NIH policies, programs, or resources

Increase RO1 modular budget so postdocs can be paid more.

Proven or promising external resources or approaches

Postdocs are relied upon to keep labs running and successful. Right now, most of our formal training is geared towards remaining in the academic system and assumes the goal is to become faculty. However, there is a problem of numbers. Firstly, there are many more postdocs than faculty positions available, and secondarily there are not necessarily suitable academic jobs such as senior scientist positions. If the system does not want to lose the talent & value of postdocs have developed during their training, a viable career must be made available. Otherwise, we are all going elsewhere where we will be valued commensurate with our skills.

Response 866

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The fundamental issue I've seen with the retention of highly skilled postdoctoral fellows is compensation. The average time in a postdoctoral fellowship that is needed to land a position at a top-tier institution is 4-6 years. In that time, a highly skilled researcher in industry could move up the ranks and be making between $150-$250k per year. Alternatively, if institutions stick to the NIH stipend, by the end of that time, the postdoc would make 1/3 to 1/4 of that while likely working more hours. Because being a

postdoctoral fellow often coincides with having children and buying a home, postdoctoral fellows often have to make the choice between an academic career and a family. If you look at the cost of living in major cities such as Boston or San Francisco, housing and daycare for young children (not including food or other expenses) can cost north of $80k per year. This makes it almost impossible for postdoctoral fellows to live off of their stipend without going into debt. When faced with the choice of financial stability and independence or debt, most people would choose the stability. While academics will never make as much as their industry counterparts, postdoctoral fellows have to start being viewed as the highly educated and skilled workforce they are, not the work horses of academia to be pushed aside.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 867

Perspectives on the postdoc roles and responsibilities

I treasure my current postdoctoral academic research position so much. To me, it is a way to transit from PharmD to clinical pharmacology. I was trained with clinical knowledge during pharmacy school, meaning to develop the ability to clinically judge which drug is best for the patients based on their clinical picture. However, as I was going through pharmacy school, I realized my interest is more on the base level sciences (i.e., molecular and cellular interaction). Sure, there are different industry roles for pharmacists as well, but they just don't intrigue me. To be honest, this is really the only field that interests me. In short, I view this fellowship as a learning opportunity that will get me a Clinical Pharmacologist role in the pharmaceutical industry.

Fundamental issues and challenges

What inhibits recruitment can be lack of marketing and promotion. I actually didn't find out about my current post-doc fellowship until the end of the application cycle. It just didn't pop up on my search. It was made known to this fellowship through connections. Another problem was that I thought I must stay in academia if I get a academia research fellowship. I guess I wasn't well informed of the career path that follows.

I cannot speak to the retention much. If anything, perhaps better dental insurance, but that is at the institution level.

I think quality of life of the post-doc trainees around me is quite good. Nothing is wrong at least. It is all up to how much the trainee would like to learn. I know I can make myself as busy as a Director in terms of time contribution to work, and I can also make myself as chill as the polar bear in the North Pole. I'm keeping myself very busy now because I know what I learn here will be foundational to my future career. This is precisely the time to sacrifice some level of quality of life, as tolerated, in exchange of a solid foundation moving forward.

Existing NIH policies, programs, or resources

Perhaps set up policies for academia research fellows to allow for summer internship. I'm trying to get one now, but there's conflict of interest as to who should be paying me (NIH, the company offering internship, or both). Each party has their own rule, so they are trying to figure that out.

Response 868

Perspectives on the postdoc roles and responsibilities

Doing good translational research in order help the community/society.

Fundamental issues and challenges

As a family man, it is very hard to run my family with current payment.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase the pay for research people

Response 869

Perspectives on the postdoc roles and responsibilities

In my perspective, it is a position which prepares you to be an assistant professor. As an academic postdoc, one should learn how to manage students from all levels (undergraduate and graduate) in the laboratory, to give a course to be ready for the upcoming professorship position, and to learn the budget management for a project.

Fundamental issues and challenges

In academic research, there is no such thing like private life. You either need to work in the laboratory or think about what you are going to do next. I believe the fundamental issue is the mentors who treats postdocs as data producing machines rather than mentees to teach how to survive in an academic environment. Another important problem is the salaries. They are extremely low. In Boston, I could not rent even an average apartment with my salary, which was devastatingly unfair for a person with a PhD. At the same time, my friends with an industrial postdoc/scientist salary could rent an apartment easily. This salary gap creates difficulty to retain academic postdocs.

Existing NIH policies, programs, or resources

I have a J1 visa, but my salary is paid by NIH. The current application is that after I am done with postdoctoral training, I am supposed to go back my home country, work there for 2 years, then I can come back unless I have a J1 waiver. I just do not understand the idea here. I am trained with US taxpayers` money, but after my training ends, US does not want me to stay and contribute to the US economy/academia. Instead, the visa rules require me to go back to my home country. To my opinion, "2 Year Home Residency Requirement" is not beneficial to US. Please exempt NIH-paid postdocs from the "2 Year Home Residency Requirement" for J1 holders. To my opinion, it seriously damages research career pathways of international postdocs. We have all our connections in US. If we go back, how we are suppose to keep our connections here for 2 years and come back.

Proven or promising external resources or approaches

Please be in contact with your postdocs during the postdoctoral training and after they move to another position. This is my 3rd year as a postdoc, but first survey about improving postdoctoral training. I truly appreciate this effort, but please have these surveys more often.

Response 870

Perspectives on the postdoc roles and responsibilities

Opportunity to diversify scientific experience.

Fundamental issues and challenges

Poor salary, Lack of proper immigration support for international postdocs, no retirement benefits, poor healthcare options, lack of faculty positions, industry jobs don't necessarily need post doctoral training.

Existing NIH policies, programs, or resources

Financial grant support for international trainees, competitive salaries, immigration support.

Proven or promising external resources or approaches

Relevant exposure to jobs industry jobs via internships, immigration support, financial incentives.

Response 871

Perspectives on the postdoc roles and responsibilities

I think that postdoctoral fellowships are a way for Universities to ensure they have expert labor at reduced cost. I think that if done well a postdoc can be an opportunity to grow independent research and secure initial funding to make the leap into the next stage of one's career but often this is not necessarily the case because mentors don't know what they should be expecting of postdocs nor providing good guidance to help them transition to independence.

Fundamental issues and challenges

Postdocs are underpaid for their level of expertise. It is also frustrating that scholars who have years of professional experience outside of their doctoral program are treated as the same (i.e. starting at 0) as someone who went through academia without ever having other professional experience.

There are also a very broad range of postdoctoral experiences that are highly dependent on the mentor's capacity to provide appropriate guidance and strategic career support. Mentors rarely receive training in how to mentor or support postdoctoral scholars and are thus do not necessarily have appropriate expectations nor able to provide strategic career advice. I don't understand why we assume in academia that because one has a PhD you know how to mentor or teach. For example, postdocs should be encouraged to pursue independent funding but also could benefit from writing research proposals in collaboration with mentors to learn how to do well. Further I think that some mentors don't understand how to treat postdocs as they are used to having students and thus treat them as non-independent trainees—it feels quite insulting to be treated as if I don't also have a PhD or expertise in my field. My understanding of a postdoc is that it is for building your capacity to do research.

Existing NIH policies, programs, or resources

I would love to see specific funding opportunities that are intended for collaborations between postdocs and faculty mentors. These could provide financial support and incentives for more engaged mentoring AND provide specific guidance about the roles of postdocs and mentors. It would be great to see something where they expectation is that the postdoc would take a leadership role on part of the project. I know that K99's may be one option for this but it would be great to see something where they mentoring is also valued and incentivized. Further, there is a lot of confusion about what funding mechanisms postdocs are eligible for. Some think only training grants when in reality other postdocs have gotten R21s and R03s, further some PIs don't think that postdocs can be named Co-Is on projects. It feels quite disheartening to be underestimated constantly.

Proven or promising external resources or approaches

I wish I knew of some. Paying postdocs more, setting standards about mentoring and valuing postdoctoral expertise would be a great start!

Response 872

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The pay is way too low and completely prevents postdocs from supporting a family at an age where many people expect to start a family.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 873

Perspectives on the postdoc roles and responsibilities

Postodcs are highly qualified scientists. They are deeply specialized professionals with both technical skills and profound knowledge on their area of expertise. They perform original research, write manuscript to share their work with the scientific community, train technicians and grad students and are at a driving force for scientific discovery in the USA and around the world.

Fundamental issues and challenges

Little respect and recognition. Risible pay for highly skilled work. No pension and family support! Poor HR support at many accademic institutions. Poor mentorship and enabling of abusive behavior by too many Professors. Foreign postdocs depend on their PIs for their J1 and H1B visa and are often abused and taken advantage of. Many PIs have a high turnover of grad students and postdocs in their lab but department heads overlook these behaviors. Focus ison publications and skewed notions of prestige rather than on good quality science. How can a single parent survive on a postodc salary ?

Existing NIH policies, programs, or resources

Double blind review process. Remove PI and institution name from first round of review. Old boys club gets preferentially founded over innovative proposals from less recognized institutions. Same goes for hiring. Stop equating impact factor with quality. Increase salaries or the best talents will keep moving to industry where besides better salary ypu also get HR that considers you a full fledged employee(Genentech has a postgrad program and the pay range is 120-170k).

Proven or promising external resources or approaches

Better HR support, penalize or fire abusive PI, offer proper benefits. Facitate lab switch within institution.

Postdocs are not “students” they are workers and these reference the same benefits as every university employee. Better support for foreign postdocs.

Response 874

Perspectives on the postdoc roles and responsibilities

Highly skilled worker

Fundamental issues and challenges

Low salary

Existing NIH policies, programs, or resources

Increase pay minimum through NIH

Proven or promising external resources or approaches

No response

Response 875

Perspectives on the postdoc roles and responsibilities

The postdoc is a training position: postdocs gain more independence, acquire new skills, and build their individual reputation, all while working under the mentorship of an established scientist. In a practical sense, the major responsibility of a postdoc is to produce independent research for publication in scientific journals with their mentor as a co-author. The scientific output of the postdoc community is a major driver of new discoveries in academic science, which go on to produce new science funded by new grants built on the previous work. Historically, the purpose of postdoctoral training been to facilitate the transition from graduate training to an independent career as an investigator at a major research institution. Today, only a tiny fraction of postdocs will ever start their own laboratories as independent investigators. This reality creates a serious conflict between the stated goals of postdoctoral training (including by NIH) and the reality of the lived experience of postdocs in the U.S. The overwhelming majority of postdocs will use the position as a transition from their academic PhD training to the professional workplace. Thus, one has to

conclude that the typical postdoctoral experience is a mentored research phase, where postdocs produce new scientific research and acquire new skills that set them up for a professional, non-academic career.

Fundamental issues and challenges

Postdocs are highly educated, skilled workers. They have acquired the highest academic credential (a PhD) and obtained technical and knowledge skills at a high level during their graduate training. Despite these qualifications, graduating PhD students who enter postdoctoral training are compensated far less than peers who pursue private sector employment. In many cases, an academic postdoc will be paid less than workers with only BS degrees just starting biotech careers out of college. Postdocs are also beginning a new phase of their training at a pivotal life stage where it is possible and desirable for them to start families. Low pay in the academic postdoc track is the greatest threat to the future of the postdoc position.

Existing NIH policies, programs, or resources

NIH should embrace and incentivize the reality that most postdocs will not become independent faculty investigators. Current funding explicitly or implicitly prioritizes the rare outcome of achieving independent positions, while neglecting the much more common outcome of accomplishing private sector employment. NIH should dramatically increase the minimum stipend levels for postdocs paid through research grants (e.g., R01) as well as fellowship awards (e.g., F32 and K99). NIH should also allow supplementation of fellowship awards with federal funds--currently, this is a major source of inequity, where fellows are routinely compensated less than their peers as an unintended 'punishment' for their accomplishment of winning a fellowship. Finally, an absolutely essential change is to increase the direct costs per R01 award. Without an increase in R01 award dollars, it will not be possible to support higher compensation of postdocs, as the R01 is the major source of funding used to pay postdocs in academic labs.

Proven or promising external resources or approaches

I am not aware of any.

Response 876

Perspectives on the postdoc roles and responsibilities

Fundamental issues and challenges

Lack of money

Existing NIH policies, programs, or resources

Increasing money

Proven or promising external resources or approaches

Funding and money

Response 877

Perspectives on the postdoc roles and responsibilities

The postdoctoral training is a transition stage towards a faculty position. During this training, an individual is expected to contribute in projects. He/she is supposed to improve his/her research skills in order to become an independent researcher.

Fundamental issues and challenges

Postdoctoral position has a key role to carry on a project from scratch. Once the project is approved, the 100% workload comes on postdoc shoulder. The PI only writes and submits the project proposal which is also based on the preliminary data generated by a postdoc.

Now, the key issue is recruitment is the short term contract and yearly renewal. The puts a lot of pressure on postdoc and he is always insecure about future. Furthermore, this short term contract give a chance to PI to misuse postdoc like work overload, off hours work, night shift experiment.

These things impact the postdoc's mental and physical health.

There is not a good salary package offered to a postdoc. In fact, postdoc run the whole project.

Existing NIH policies, programs, or resources

It is kindly recommended to consider the yearly contract policy of the postdoc's appointment. A postdoc should be appointed at least for the period of 5 years. In this five years, he could get enough time to establish himself as an independent researcher.

Secondly, there should be a pay rise for the postdoc as I said, they are the one who involved physically in projects and fulfill the project goals.

Proven or promising external resources or approaches

There are few things needs to consider in order to improve the postdoc training ecosystem.

1. Appointment of a postdoc for at least 5 years
2. Including some teaching courses in the postdoc training
3. There must be a pay rise, because postdoc salary is just equivalent to a phD scholarship.
4. There should be extra resources and training for postdoc apart from only doing research.

Response 878

Perspectives on the postdoc roles and responsibilities

Increase their breadth of knowledge in the area of inquiry while refining their skills in research. Enhance grantsmanship skills.

Fundamental issues and challenges

Salary is much less than practicing in a clinical environment. If the postdoctoral positions were open to allowing individuals to reside elsewhere with some onsite visits, pool of recruits would be bigger. To retain postdoctoral trainees, mentors must be encouraging and have soft people skills. The postdoctoral trainees should not be treated as a general research assistants. Family and personal development should be encouraged.

Existing NIH policies, programs, or resources

Consider enhancing the Early Stage Investigator resources.

Proven or promising external resources or approaches

If the postdoctoral positions were open to allowing individuals to reside elsewhere with some onsite visits, this would help individuals residing in rural and less urban areas. Allow for collaboration between universities.

Response 879

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Having competent mentors for postdocs is extremely critical, and I believe that the NIH may not have much authority to address this issue.

Existing NIH policies, programs, or resources

In my opinion, it is crucial to require Principal Investigators (PIs) to create and implement comprehensive training plans for their mentees, while also reporting on their progress to funding agencies in their annual reports. Unfortunately, many PIs tend to exploit postdocs as a means of securing their own success, without showing genuine concern for the postdocs' development and career prospects.

Also, it is just as crucial to cultivate exceptional next-generation scientists as it is to conduct groundbreaking research. Unfortunately, in academia today, it seems that only postdocs working for well-established researchers will have the opportunity to become future Principal Investigators (PIs). Merely publishing research in prestigious journals seems to be the primary factor determining one's success, rather than the quality of the training they receive. As a result, many postdocs are simply investing time in training that will not contribute to their future academic prospects.

Proven or promising external resources or approaches

No response

Response 880

Perspectives on the postdoc roles and responsibilities

Postdoc is the continuation of the PhD training, with the goal of developing independent research skills, leadership, scientific communication skills, etc. Thus, the academic postdocs should be able to:

1. Carry out research projects relatively independently;
2. Supervise or train students;
3. Commute or present their work to the bigger scientific audience.

Fundamental issues and challenges

Two main issues:

1. Low salary, as compared to industrial job with the same degree/capability requirement.
2. Competitive job market. There are very low percentages of postdocs that can continue to academia because of the overcrowd job market.

Existing NIH policies, programs, or resources

Provide more postdoc fellowships or training grants; organize some conference (with specific research area focused) to bring postdocs together to exchange ideas and experience.

Proven or promising external resources or approaches

No response

Response 881

Perspectives on the postdoc roles and responsibilities

I did my PhD in India , and my postdoc offered me a ticket to emigrate to a country where I could do cutting age research and rub shoulders with stalwarts in the field . I was also fortunate to have a mentor who was invested in my success, was a good person , and supported my aspirations, including becoming a mom during my postdoc.

Fundamental issues and challenges

I was very satisfied professionally during my postdoc . However, financially, I knew it was just not sustainable to continue on a meager postdoc salary , specially without free childcare. If I was offered 100k+ wages , and some stability in my job , such as a 2-3 year contract , I would have been happy to stay in my postdoc lab as a Staff scientist for longer . Also , can we please stop calling postdocs trainees?

Existing NIH policies, programs, or resources

1. Increase salaries to reflect the amount of skilled work and hours that postdocs put into the world of research. In my opinion ,if postdocs were paid 100-150k, they would not flock to the industry.
2. Have paid time off that is defined.
3. Have an annual review where the postdoc reviews the lab environment so PI is aware of unfavorable circumstances

Proven or promising external resources or approaches

No response

Response 882

Perspectives on the postdoc roles and responsibilities

A postdoc position is advanced training that goes beyond didactic knowledge and wet lab bench skills. It is a stepping stone to prepare a trainee for an eventual job. It should involve management experiences, of personnel and of projects. This is to gain experience useful in academia and also in industry. It should have grant writing experience, teaching etc that is tailored to the career goals of the trainee, but also those skills that the trainee/mentor see as lacking.

Fundamental issues and challenges

I've seen retention become an issue when there is a disconnect between the trainee and mentor expectations of what the postdoc position is.

Postdocs are expected to move for work, uprooting family and spouse careers, but aren't provided moving expenses or bonuses like people often do when they get a non-academic job.

Postdocs are staff that don't always get full benefits that other staff receive at the same institution. For example, my institution offers employer matching of how much we put into our retirement accounts. This is not the case for postdocs.

We are encouraged to seek funding but how we are taxed and how the funding affects our position is institution dependent. This makes it hard to know what will happen when you accept a fellowship. For example, both myself and my husband received institutional T32 grants. Nothing changed for me in terms of salary and taxes because I am an employee. For my husband, his institution switched him to an independent contractor making him now responsible for taxes on all payouts of the T32 including health insurance premiums. This means his taxable income went from 60k to 72k but his salary certainly wasn't 72k.

International postdocs aren't allowed to apply for fellowships. They have no credit to use to apply for housing and are at the whim of institution provided housing or egregious guarantor schemes. This is a great hardship to some international postdocs.

Existing NIH policies, programs, or resources

In general the NIH website is very confusing especially once you get past the first few welcome pages. I applied to the wrong funding announcement (an older one) because it wasn't obvious which was the current one. Most postdocs don't traverse the NIH website or use the resources until they are grant writing. Our postdoc association doesn't even give info on relevant NIH resources. Again, I think because the information is hard to access.

Proven or promising external resources or approaches

If somehow NIH could more clearly dictate the role of a postdoc to employers (full staff benefits, equal benefits) like how they do minimum salaries that would be great. It's hard to change a culture where many people see postdocs just as glorified grad students. When that's the culture, of course people are going to accept better paying and stable positions elsewhere vs a 3 year stint in a new town that they will then have to move again. Constantly moving every few years is hard on people.

Response 883

Perspectives on the postdoc roles and responsibilities

Postdoc job is not considered as a real job. This is just a transitional one to two years to get more experience or a publication.

I have done four postdocs in four different institutes: I am very against it! Because this is a very low paid difficult job dealing with difficult people and dealing with difficult projects. I personally discourage people from going to this path to do a postdoc, when there are a lot of private companies they can go and earn some money and good life and be a good scientist as well.

Fundamental issues and challenges

$

If there is no money how do you expect people to do a job for you?

This is a real issue this is very important to consider if there is no investment for a job why do we expect people to do and do a very low paid job? Why should we expect smart (IQ EQ, and hard working, dedicated) people choose a job? Just for their fun or being enthusiastic about science/working for a low paid job? No, this way you don't get the best ones.

Whatever you invest you will gain profit. Spending 2 years of your precious life at an age that you can be the best in your career working for only around $53,000 per year in an expensive city does not mean much. The only reason I did four postdocs was to get green card. Simple. If you are American then why do you need to do postdoc?

The second issue is Visa policy.

When you cannot recruit people from inside because those people they have freedom to go to other sectors and work and earn more money, the easiest option is to bring educated a smart people from outside. I know a lot of Iranian educated medical doctors and PhDs who want to escape Iran and come to the US for an imaginary better life. But they cannot come here easily because of the Visa policy. Right now they are 100,000 smart educated Young enthusiastic to science people from Iran who wants to come to this country even they can be self-funded, they don't need even money, the only reason they want to come here is to escape the theocratic dictatorship that makes their life like hell. Why not allowing them to come here? This is just an example.

Existing NIH policies, programs, or resources

Invest more $ and job security. There is no job security for a postdoc. As a postdoc I could go to a lab and be fired in the next week. This has happened to me. This only reason is enough to discourage people from going to this path. There is no job security as a postdoc. As a postdoc, you have to work with people who are eccentric sometimes and who have issue themselves as an narcissistic boss or antisocial people who are in science and academic institutions and because they can earn money and bring funding (God knows how they produced data or fake data) then institutes keep them around but it doesn't check on them if they treat their employee or postdoc well. There are many of them around. Noone care how they treat postdocs as much as these narcissistic antisocial OCD bosses (some are highly intelligent-but defenitly with real diagnosed psychological disorders) can secure funding. There is no job security for a postdoc. Postdocs are treated as slaves under such bosses. Simple. That is why it is better to import desperate highly educated smart people.

Proven or promising external resources or approaches

Invest $. Care about postdoc life! It is not complicated if you are serious about it.

Response 884

Perspectives on the postdoc roles and responsibilities

I see postdoctoral position as another training mechanism added on top of graduate work. While I was able to attain critical thinking, application, and certain technical or experimental skills, I still felt I was not fully equipped or skilled in any manner to perform or apply any of the newer or innovative techniques. The reason for this was that my PhD laboratory was in a very niche field with only certain techniques that are applicable to this field. For instance, we didn't do any CRISPR or genetic techniques or applications in order for me to be competitive to apply for a transitional grant (ie K99).

Fundamental issues and challenges

Salary is not sufficient, no paternity leave, no retirement funds/opportunities are available to postdoctoral researchers at certain institutions. Child care is expensive—institutions should have them heavily discounted. In addition, we don't have access to certain software to do research—PIs are not willing to pay since they are costly—institutions should up front the cost of adobe or SigmaPlot for example.

Existing NIH policies, programs, or resources

I had to go do another postdoc after 2 years of my first postdoc because of my family relocation. Even though I was able to publish a first author paper and acquire NIH postdoctoral funding, I had to restart my research in a new environment (second postdoc) and lost my ability to apply for the K99. I do not regret leaving my first postdoc. My major regret is that I couldn't apply for a K99 in my new lab since I transitioned to a new research field. I wish that NIH can make exceptions to the K99 if we restart a new postdoc in a new field. K99 eligibility could be extended to 6 years instead of 4 years. This may attract more researchers to give them chance to enjoy the research instead of rushing to collect data and publish within 3 years prior to submission.

Proven or promising external resources or approaches

The major issues are established mentors who are verbally abusive, non compliant to work-balance life, and using excuses that they can't provide competitive and higher stipends or salaries when they openly brag about the large amount of available NIH fundings. We need mentors who are supportive of our personal and family hours as well as encourage/support us to attend seminars and explore careers outside of academia if we feel that research may not be a fit post-graduate school due to life circumstances. Again, I view postdoctoral training as another method to learn and acquire more skills since we couldn't acquire them in graduate school as PhD students. Some established mentors only treat us as "specialized or skilled technicians" not as trainees. Established PIs/faculty should also be reviewed on their ability to train and retain postdoctoral trainees—this could be a major determining factor for their NIH grants—maybe better scores for track record of training and "retaining" postdoctoral trainees for a certain length of time.

Response 885

Perspectives on the postdoc roles and responsibilities

Prior to thinking about the postdoc scenario, one needs to look into the positive upbringing of PhDs.

1. All master's PhD be allowed parental presence for their wellbeing.
2. Get a rise in yearly stipend as postdoc 0 to 7.
3. Get full travel funds for all conferences.

To ensure unlimited postdocs.

Response 886

Perspectives on the postdoc roles and responsibilities

Post Doctoral Research

Fundamental issues and challenges

Nothing

Existing NIH policies, programs, or resources

Not Applicable

Proven or promising external resources or approaches

No response

Response 887

Perspectives on the postdoc roles and responsibilities

A postdoctoral TRAINING position should serve two (sometimes overlapping) purposes.

1. Development of an independent academic vision for a research laboratory, contingent on acquiring both unique skills for approaching a problem as well as teaching, writing, speaking, mentoring, accounting, and management competencies required for running a research group, securing funding, and distributing findings to the public; and
2. Accrual of in-demand skills that make a candidate marketable for careers in industry or government or for staff scientist and teaching positions in academia.

Fundamental issues and challenges

Almost none of the above mentioned factors are included in the majority of postdoc positions. In general, PhDs are hired to perform specific tasks laid out by mentors project-based funding mechanisms, and arbitrary requirements for "high impact, first author publications" box many qualified scientists out of independent funding and ultimately job prospects. Chaining postdocs to specific PIs and institutions for an amount of time it takes to publish can trap postdocs in unproductive environments they cannot leave for fear of job loss and sometimes actual poverty. That a PI's recommendation holds so much sway over future prospects is an inherent power imbalance.

Existing NIH policies, programs, or resources

1. Decouple ESI status from terminal degree. Instead make it shorter and link it to the beginning of an independent position: this will make postdocs less afraid to deal with life and family events and make it easier to transition into a successful independent career.
2. Create R01-equivalent grants that intentionally favor labs interested in real mentoring plans. Maybe follow up with the mentees to actually gauge whether mentoring is being provided?
3. Maybe don't include postdoc (or grad student) funding as a part of project grants at all. Favor funding through training grants and individual fellowships (that encourage moving between multiple labs).
4. Don't let labs that have a ridiculously high number of "mentees" claim that they are actually providing mentoring.
5. Provide more direct funding for what many postdocs actually end up as (in many cases by choice): Staff Scientists
6. Past performance as a metric of future success is an illusion created by biased review processes at every level. We need to create a system that doesnt continue to disproportionately reward privileged children of past professors who went to elite coastal universities. New strategies for holistic fellowship reviews should be adopted. Undergraduate grades should not factor in to any discussion of a postdoctoral fellowship, for example.

Proven or promising external resources or approaches

I think you should just trust what new faculty and current postdocs tell you in the survey.

Response 888

Perspectives on the postdoc roles and responsibilities

Postdoctoral researchers are integral to the scientific research process, responsible for designing and executing experiments, analyzing data, and disseminating research findings. They also contribute to grant writing, mentor students, and manage lab operations.

The postdoctoral position provides a unique opportunity for researchers to expand their skill sets, deepen their understanding of research methodologies, gain a broader perspective on their field, and expand their professional network.

In addition to these benefits, the postdoctoral position serves as a launching pad for a career in academia or industry. It provides an opportunity to develop an independent research line, distinct from that of their PI, and prepare to establish their own research lab.

Overall, the postdoctoral position is a valuable tool for enhancing scientific knowledge, acquiring new skills, and positioning oneself for future success in research institutes. Through the postdoctoral position, researchers can build on their academic achievements, develop as independent researchers, and advance scientific knowledge for the benefit of society.

Fundamental issues and challenges

1. Lack of career prospects: There is a limited number of tenure-track faculty positions available in academia, which can create a sense of uncertainty and instability for postdoctoral trainees who have invested many years in their education and training.
2. Limited funding: Postdoctoral trainees often rely on grant funding, which can be limited and competitive. The current funding climate for research in the United States is challenging, with fewer resources available for scientific research.
3. Inadequate compensation: Postdoctoral trainees are often paid less than they would earn in other professions, which can create financial strain and make it difficult to afford basic needs, such as housing and healthcare.
4. Lack of mentorship and support: Postdoctoral trainees may not always receive the mentoring and support they need to succeed. A lack of mentorship can make it difficult for postdoctoral trainees to navigate the complexities of academic research and to develop the skills and knowledge they need to succeed in their careers.
5. Work-life balance: Postdoctoral research can be demanding, with long hours, tight deadlines, and a heavy workload. Balancing work with personal responsibilities, particularly families, can be challenging
6. Lack of institutional support: Postdoctoral trainees may not always receive the institutional support they need to succeed, such as access to resources and facilities, training and development opportunities, and career counseling.
7. Limited diversity and inclusion: There is a lack of diversity and inclusion in postdoctoral training programs, which can create a sense of isolation.
8. Operational disconnect: There is no mechanism exist (or if available they are less effective) which could bring all postdoc at one platform and train them to get skilled over the period of 3-4 years to get the competitive positions in academia. No special conferences or workshops have been initiated by NIH to train the postdoc for the future.

Existing NIH policies, programs, or resources

1. NIH could expand and improve the several programs by increasing funding for individual awards, providing more support for mentoring and career development, and enhancing the program's emphasis on diversity and inclusion. NIH can modify and expand the programs to include additional eligibility criteria and increase the amount of funding available.
2. Offering more opportunities for resubmission: Starting research at new place is stressful and often time consuming for Immigrants. NIH can provide more opportunities for resubmission of unsuccessful K99/R00 grant applications. This can help to encourage persistence and increase the chances of success for immigrants and non-immigrant students. NIH could simplify the application process and provide more resources and guidance to help immigrants and non-immigrant students navigate the process.
3. NIH could expand and improve the diversity and inclusion supplements to provide additional funding and support for immigrants and non-immigrant students and make then eligible for more funding programs.
4. Providing more support for international students: NIH could provide more support for international students who may face additional challenges in securing funding and navigating the visa process. Extending
5. NIH could increase transparency in the grant review process to ensure that immigrants and non-immigrant students are evaluated fairly and objectively.
6. NIH can provide more support and resources for non-native English speakers, such as translation services.
7. Offering more workshops and training: NIH can offer more workshops and training sessions to help immigrants and non-immigrant students develop the necessary skills and knowledge to apply for the K99/R00 grant program
8. Visa requirements: Immigrants and non-immigrant students may face additional challenges in securing the appropriate visa required to work in the United States, which limits their eligibility for the K99/R00 grant program. This need to be addressed at the administrative levels.

Proven or promising external resources or approaches

By leveraging following external resources and approaches, NIH can enhance the postdoctoral training :

1. Professional societies and organizations: Professional societies and organizations, such as the National Postdoctoral Association (NPA) and the Association of American Medical Colleges (AAMC), provide resources and support for postdoctoral trainees, as well as advocacy for policy changes and best practices in postdoctoral training. NIH should collaborate them to setup annual workshops.
2. Career development programs and workshops: Career development programs and workshops, such as those offered by the Burroughs Wellcome Fund and the Howard Hughes Medical Institute, provide training and mentorship opportunities for postdoctoral trainees to help them develop the skills and knowledge they need to succeed in academia or other career pathways. Opportunities like these need to be made available to all postdocs in the USA.
3. Online resources and communities: Online resources and communities, such as the Future of Research and the Academic Mental Health Collective, provide information, support, and advocacy for postdoctoral trainees, as well as opportunities to connect with other postdocs and share experiences and best practices.
4. Funding and grant opportunities: Funding and grant opportunities, such as those offered by the American Association for Cancer Research (AACR) and the American Heart Association (AHA), provide financial support for postdoctoral trainees to pursue their research and career development goals. More such opportunities need to be linked to the NIH's extramural grants to maximize the impact.
5. Industry partnerships and collaborations: Industry partnerships and collaborations are needed to provide opportunities for postdoctoral trainees to gain real-world experience and build valuable professional connections outside of academia.

Response 889

Perspectives on the postdoc roles and responsibilities

Post-doc is a privileged position to do outstanding science under the guidance of several mentors (one specific research mentor) to develop into an independent scientist.

Fundamental issues and challenges

Current is cost-of-living, including housing and childcare costs.

Future (actually current) is availability of jobs in my area. Due to family constraints, I cannot move across the country (and have been doing so for the last 20 years as a physician-scientist). I continue to be told that I need to pursue the low paying job in hopes that an academic role will open up; all the while tightening the funding and grant structure making it near impossible for people with families to do research and live in areas where we want to live. Instead, we continue to support an archaic system that says to put your science above all else; this is both ludicrous and bad for science. The Federal Government needs to better support policies that help scientists with families.

Existing NIH policies, programs, or resources

K-award system; better child-care support; an understanding that living in places like the San Francisco Bay Area, Seattle, Boston, Washington DC are prohibitively expensive and that we are losing outstanding scientists due to an archaic system that supports only a few powerful labs, and does not select the 'best science,' or the 'most promising' in many cases, but those of us willing to give up a tremendous amount to stay in academia.

Proven or promising external resources or approaches

Better funding for early career awards; stricter commitment standards by universities for multi-year contracts (e.g., places like Harvard and Stanford retain post-docs or Instructors on year-to-year contracts with the promise of something more). A real 3 year contract would actually make a huge difference.

Response 890

Perspectives on the postdoc roles and responsibilities

It feels like a waste of time for anyone that doesn't want to be a professor. It's just more of the same after the long road of grad school. And for a third of what I could make in industry? With no guarantee on when it ends? Unless I specifically want to be an academic researcher constantly begging for grants, why WOULD I choose an academic postdoc over jumping into industry immediately?

Fundamental issues and challenges

They aren't paid nearly enough and they aren't treated like an actual employee. They're treated like glorified grad students.

Existing NIH policies, programs, or resources

Give a benefit over industry. Get money funneled to pharma companies to instead be put into postdoc specific grants

Proven or promising external resources or approaches

Grad school departments invite speaker's constantly. Maybe send people to do their best to convince people towards academia

Response 891

Perspectives on the postdoc roles and responsibilities

The postdoc is primarily a position from which to develop an early career fellowship or faculty/research scientist job application.

Fundamental issues and challenges

Pay is the number one issue above all. Current salary ranges do not compete with the entry-level salaries of many technical college graduates with Bachelor's degrees. Pay increases are not adjusted for inflation if they occur at all. Postdocs do not even cost labs as much as graduate students at many institutions.

Existing NIH policies, programs, or resources

To provide a realistic outlook on the academic job market, institutions should be required to publish forecasts for the number of academic positions they will hire in the next 5-10 years in each department.

Proven or promising external resources or approaches

No response

Response 892

Perspectives on the postdoc roles and responsibilities

Postdoc must be a training for independence. And we know training without practicing is pointless. There must be mechanism, e.g. leading research projects, applying for funding, to allow practicing independence. Right now, all universities only "teach the theory", but at the same time, job requirements look for "experience".

Fundamental issues and challenges

For retention: postdoc salaries are ridiculously low. Postdocs are the main driving force in the billion-dollar research industry. It's unbelievable how low they're paid.

Also important: matching expectations and what they're provided with (see my comments about independence).

Existing NIH policies, programs, or resources

Higher salary, and eligibility to apply for funding and leading research projects.

Proven or promising external resources or approaches

More salaries. It's proven to help with retention.

Response 893

Perspectives on the postdoc roles and responsibilities

From my experience; being a postdoc means being a PI of a very small lab without full independence and without teaching responsibilities. We oversee our own research while we mentor junior members of the team to a certain capacity like a PI. We also write grants like PIs do, albeit with a limited focus and a limited timeline. Our scientific scope is narrower than a PI's because we primarily focus on our own research and our tenure is limited.

Following are my responsibilities as a post-doc (which I believe apply to my colleagues as well);

Research responsibilities: These for me include performing experiments, analyzing data, reading papers relevant to my research, presenting my research at conferences, finding immediate research questions and thinking about the best ways to address these questions, optimizing new experimental methods, writing papers. The most challenging parts of my research responsibilities are finding interesting and novel research questions which I can address and performing/optimizing experiments which are new to me and my immediate research environment.

Mentoring responsibilities: As relatively senior member of our research team, I frequently help students and other members of the research team to optimize experiments and analyze data. I also give advice on their research projects, their career paths and other topics (i.e. how to forge collaborations, how to prepare an efficient presentation for a conference).

Other responsibilities: Forging and maintaining collaborations, writing grants, volunteering for outreach activities, attending to workshops and talks.

Fundamental issues and challenges

1. Financial obstacles: postdoc salaries are often a fraction of industry salaries. After going through graduate school, which also doesn't pay well, having an extended postdoc is a massive financial burden. During this time, we also often do not get proper retirement or health benefits, which adds up to the
2. Limited academic prospects: Academic job market is extremely competitive and it seems almost impossible to get an academic job. Therefore, pursuing a postdoc seems like an unfavorable option and postdocs want to transition to academia as quickly as possible.
3. Limited resources: As I elaborated above, childcare, healthcare, mental health and retirement benefits are almost nonexistent in several institutions for postdocs, which is making postdoc life more difficult.
4. Visa issues: For many international postdocs, visa issues limit the duration of postdoctoral training, cause financial problems and added stress.
5. Unfair standards for productivity: The personal struggles we go through, the bumps in the road during our training or our scientific potential are mostly overlooked. Mostly, we are reduced to impact factor of our papers and the grants we manage to secure. However, the postdocs coming from big labs with lots of resources have an unfair advantage compared to postdocs from small institutions with little resources.

Existing NIH policies, programs, or resources

1. Salary increases could help with retention.
2. NIH could enforce institutions to provide necessary benefits for postdocs.
3. Initiatives to help postdocs gain independence earlier (i.e. K99-like grants) would help to limit the duration of postdocs and assist successful postdocs to become more independent.
4. In addition to grants like F32 and K99, NIH could provide small grants that postdocs could apply to fund their research expenses, which again would help with independence and also level the playground for postdocs from smaller labs. Alternatively, postdocs with existing grants (i.e. F32, K99) could be allowed to request additional funds just for research expenses.
5. Pay cap for grants could be lowered, and the eligibility window for postdoc grants could be extended. Given that many postdocs last longer than 5 years, the eligibility window for these grants are relatively small and push the postdocs to publish very early.

Proven or promising external resources or approaches

I am personally excited about the MOSAIC K99/R00 program. I think initiatives like these could improve the experience of postdocs by providing them a support network.

Response 894

Perspectives on the postdoc roles and responsibilities

I co-wrote a grant while I was a graduate student based on an app that I created. It was rejected, in part because I was listed as a co-PI. We resubmitted the grant with me as an unnamed postdoc, and it was accepted (our personnel score was much higher without my name on the grant). I declined the position and left for industry because I could not afford the postdoc paycut. I am still working on the grant on the side because it was my passion project, and I am the only one who can write the code to update the app. But, I could not afford to move somewhere new for two years for $55k a year when I make 2.5x that in industry. I can not uproot my family for something temporary that would not provide high-quality benefits and parental leave. To me, this postdoc position would have been a full-time job that required a high level of expertise in a particular field, and I deserved to be compensated as a co-PI. I feel that I was pushed out of academia by other academics.

Fundamental issues and challenges

Low pay, low respect, need to relocate family somewhere temporarily, doesn't lead to better employment prospects afterwards. Industry treats us better.

Existing NIH policies, programs, or resources

Pay postdocs a living wage. Don't pretend that we are still in need of additional training—we have PhDs. We can continue learning while earning enough money to pay our bills. Allow postdocs to work remotely if possible so that they don't have to uproot their family for 1-2 years. Include 3 months parental leave minimum.

Proven or promising external resources or approaches

Pay postdocs a living wage. Provide a minimum of 3 months parental leave. Demonstrate that doing a postdoc leads to better employment prospects afterwards.

Response 895

Perspectives on the postdoc roles and responsibilities

Both graduate students and postdocs do not earn enough for the work that they do. I chose to go into industry without a PhD over a job in academia because I could be paid a respectful wage with a bachelor's degree doing as interesting work as I could have in academia without sacrificing years of my life with subpar pay.

Fundamental issues and challenges

Pay and respect for work-life balance.

Existing NIH policies, programs, or resources

Improving pay for postdocs and encouraging universities to pay graduate students a fair wage.

Proven or promising external resources or approaches

Look to industry for what a person's wage potential is. Postdocs should be competitive for the years of experience the person has.

Response 896

Perspectives on the postdoc roles and responsibilities

A view a postdoctoral position not only a place to get specialized training from a mentorship team to further our careers, but also one in which we are productive and contribute significantly through research, clinical, administration roles.

Fundamental issues and challenges

there are much more profitable and balanced (for work/life) options out there that are easily accessible. The route of a traditional postdoc will be archaic

Existing NIH policies, programs, or resources

It needs much more money to provide for stipends, but also to fund research. Why would a postdoc elect to enter a the ultracompetitive (as quoted but individuals at the NIH) world of applying for grant funding for an expected rejection (at least for the first time around)? It's not a very rewarding ecosystem for postdocs thinking that this could be their lives as academics.

Proven or promising external resources or approaches

The pressure of external jobs that offer a better "reward" systems (e.g., money, respect, work/life balance) are postdocs biggest threat. The prestige and the specialized training that drive people to postdocs is something people care less and less over time.

Response 897

Perspectives on the postdoc roles and responsibilities

The postdoctoral role is a mentored training position designed to help foster the skills and competencies necessary to thrive in a variety of jobs, both inside and outside of academia. It typically involves some combination of scientific research, interaction and communication with the scientific community,

mentorship of other trainees in the lab setting, classroom teaching, and institutional service. At its best, the postdoctoral position is mutually beneficial to the principal investigator of the lab and to the postdoctoral fellow: The postdoc conducts high quality research and service to the lab, while the PI oversees the mentored growth of the postdoc toward their personal and professional goals. At its worst, the postdoc becomes an unwanted, but necessary step toward career goals marked by long and difficult working hours, unclear expectations, lack of clear mentorship, and numerous other problems that have been documented elsewhere.

Fundamental issues and challenges

1. Perceived lack of ability to negotiate salary and other job benefits. The fact that institutions adhere to the NIH recommended salary is likely the single largest factor inhibiting recruitment of high-quality postdocs. It does not take into account cost-of-living for the geographic setting and thus is simply too low to be a compelling draw for individuals who already have achieved a PhD. The evidence for this is clear in the large-scale migration of PhDs to industry positions where salaries are substantial.
2. The personal/professional costs, both in time and in finances, of completing an academic postdoctoral position are high alongside the difficulty of securing a tenure-track job. The hopelessness that faces even talented postdocs for competing for tenure-track academic positions is substantial.
3. Many (but not all) postdocs have observed/experienced a major work-life imbalance in their PIs, and decide not to follow in that path, therefore seek employment elsewhere.

Existing NIH policies, programs, or resources

1. One example of poor policy surrounding the incentive structure for quality postdocs to continue in academic science is the financial incentives around fellowship awards. After being awarded an F32 fellowship, my personal salary did not change and I was removed from the retirement contribution system from my employer (since I was no longer technically an employee as my salary came from Federal Funding sources.) By being removed from the retirement contribution system, I've lost out on the 50% match contribution, a substantial loss for my retirement savings, early in my investing life. The NIH should alter policy to better incentivize talented individuals to compete for fellowships (like the F32 and K99) by not only covering their salary and helping the lab financially, but also providing additional salary for these individuals. Otherwise, as in my case, their is actually a financial incentive to not apply for fellowships as it weakens my retirement savings.
2. The NIH salary guidelines should scale with geographically-based cost of living. A flat rate is not equitable, nor is it fair to those living in high cost-of-living areas.
3. Postdocs should be allowed to negotiate salary, working hours, benefits, and other aspects of their positions. This would grant postdocs more power and make the position more attractive as it would better fit their personal and professional needs. The NIH could do a better job of branding postdoctoral training a professional role (not merely trainee) in which individuals should be granted bargaining power and additional priveleges. As it stands now, it's more similar to completing another PhD, albeit with a slightly higher salary.

Proven or promising external resources or approaches

No response

Response 898

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is essential for developing an independent research program, but it need not be as long as it is now.

Fundamental issues and challenges

With a modular grant with significant effort for a PI and 100% effort for a postdoctoral fellow, there is not much left over for the research, itself.

Existing NIH policies, programs, or resources

There should be many more fellowships and K99R00 awards. An individual postdoctoral fellowship was critical in my career development.

Proven or promising external resources or approaches

I was pleased to see that postdoctoral salaries would be increased.

Response 899

Perspectives on the postdoc roles and responsibilities

Postdoctoral Training is an excellent opportunity to perform research from a trainee and a leader perspective. In addition to research, the training is useful to learn management and acquiring funds for future independent research.

Fundamental issues and challenges

There are many concerns but I would like to highlight a few of them:

1. Funding opportunities for international postdocs are really low which is a real struggle in Science. This makes the scenario highly competitive leading to either leaving academia or compromising for roles.
2. The salary is also another major issue. At postdoc level, majority of fellows have family responsibility and the salary is not sufficient for childcare and living expenses especially after the inflation.

Existing NIH policies, programs, or resources

The K99/R00 should be expanded till 5 years of postdoc experience as in the fourth year majority of international postdocs with J1 visa struggle with waivers and other visa related issues.

Proven or promising external resources or approaches

No response

Response 900

Perspectives on the postdoc roles and responsibilities

I view postdocs as largely independent scientists who work in collaboration with a mentor to gain additional expertise in their subject matter, or to gain a new perspective on their subject, prior to ultimately leading a research group on their own. I think this role comes with increased mentorship and responsibility, and frequently involves helping advisors mentor or teach younger students.

Fundamental issues and challenges

Postdoc salaries are abysmal compared to any other job that highly qualified phd holders could take up after graduation. This is particularly true for people that choose to go into industry but even public sector jobs pay more with way higher job security and long term prospects than a post doc. For example, the NIH minimum last year for a new post doc was on the order of 53,000$ a year I believe. In my field (psychology/neuroscience) common route that people take after graduation include data science type roles (where the starting salary is approximately 150,000 a year), or government policy roles where the starting salary is around 90,000$ a year. Either of these choices provide more flexibility on location, longer term job stability, and significantly higher pay than a postdoc. Currently, doing a postdoc means spending 4+ years in undergrad, 5+ years earning very little as a phd student, and then committing ~3 years to earning still very little during the time in one's life when family and childcare and housing costs frequently rise. For anyone not from a family that could support them financially this is virtually untenable.

Existing NIH policies, programs, or resources

The NIH minimum postdoc salaries need to be raised by a large amount. This year they were not raised even by enough to match inflation, much less to match any type of wage growth seen in other sectors. This increase needs to be helped by federal funding agencies increasing the amount the provide for postdocs in grants, not keeping the grant amounts the same and requiring faculty to pay postdocs more from the same amount of money (this is an unfair burden on faculty members).

Proven or promising external resources or approaches

Pay postdocs more

Response 901

Perspectives on the postdoc roles and responsibilities

Responsibilities include the design and execution of a project that could ultimately result in both publications and an early career award grant. Mentorship of junior members in the lab is also an important component.

Fundamental issues and challenges

In all of academics there are no fixed hours. People work very hard with a major reward being discovery and sharing knowledge. As this is an intense process and a labor-intensive one stress around being able to support oneself financially and perhaps a Family should not be added to the mix. Unlike 40 years ago most post docs do not have a stay at home wife caring for their Children and home responsibilities. Most post docs are balancing work and family life just like the faculty. Raising the minimum salary for postdocs is a great initiative but without putting the money into grants like r01s there's no way to pay for this

Existing NIH policies, programs, or resources

Increase of minimum wage for postdocs while concomitantly raising the standard budget for grants

Proven or promising external resources or approaches

Many private foundations have fellowships that both provide an increase salary for the postdocs as well as networking opportunities

Response 902

Perspectives on the postdoc roles and responsibilities

A postdoc should be treated more like junior faculty than senior grad students.

Fundamental issues and challenges

1. Lack of academic positions/funding beyond postdoctoral position.
2. Perception of zero value to pursuing a postdoctoral position if thinking of eventually moving on from academia.
3. The value the government and academic institutions put on postdoctoral positions is too low especially when compared to positions in industry.
4. Industry is now allowing for more intellectual freedom in R&D work making the assertion that "all you do when you work in industry is work to boost profits" false.
5. Postdocs are often ignored or treated as disposable in the academic departments in which they work.
6. Postdoc fellowships are at a time in life (late 20's-mid 30's) when stability is valued over job satisfaction.
7. The role of a postdoc is ill-defined and varies greatly from place to place; there is substantial risk in taking a postdoc because a factor as simple as not agreeing with your PI can seriously hinder your career.

Existing NIH policies, programs, or resources

1. Increase salary funding; postdocs (at least in my field of neurophysiology) have considerable training that is worth a great more than the NIH minimums.
2. Promote a new mechanism (which isn't the F31) that funds postdocs to pursue academic research without having invested months or years in obtaining preliminary data for a F31 that might never get funded; something like the Dutch NWO talent programme which funds investigators and not projects.
3. Boost the role of postdocs in grant-funding decisions; why can't postdocs take on a more serious role in academic research beyond the bench.

Proven or promising external resources or approaches

The NIH needs to take on the role of supporting its postdocs with more than just the occasional, and often elusive, F31. The institutes we work at will always support their faculty over their postdocs and its time we had a group (like the NIH) to support us in that same way. Ultimately NIH needs to fund PIs that are good mentors, not just good grant writers.

Response 903

Perspectives on the postdoc roles and responsibilities

I believe that a postdoc is meant to be a training opportunity. It's a chance to build preliminary data and skills that I will carry to my own lab. This means taking on a leadership and mentoring role in the lab. We are not simply research staff that generates data for our PIs (though sometimes PIs treat us that way).

Fundamental issues and challenges

1. Salary and benefits: All of my colleagues from my PhD program that went to industry instead of an academic postdoc position make about double my salary or more. At this stage in my life, I am ready to settle down, buy a house, start a family, etc, but I'm unable to do that on a postdoc salary. I'm not able to save money to buy a house or start a family. Leaving academia for those personal goals is appealing. I also have no mechanism at my university to save money for retirement. Most benefits available to employees/faculty are not available to postdocs. We are treated as trainees or employees depending on what is convenient for the university, but this means missing out on all of the benefits of either (even something as simple as commuter benefits).
2. Non-research activities: Most postdoc fellowships available punish you for teaching or pursuing other non-research activities such as service or outreach. These activities are critical for our careers, but we are not allowed or encouraged to pursue them. Sometimes this is built into fellowships (>75% research) but other times it is the reviewers themselves who take points off based on the professional development done outside of research. There also aren't widely-available resources to teach us how to run a lab (i.e. lab finance courses, management courses, etc) which sometimes makes us feel like we're not ready to move on.
3. Community: Graduate students have a community and activities that unite them. Postdocs don't really have the same network. It's hard to find and meet other postdocs with similar goals, which can make you feel alone. Having postdoc "cohorts" may help this.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 904

Perspectives on the postdoc roles and responsibilities

The academic career has been always appealing to me in spite of the known fact that the paid salaries are always lower compared to industry jobs. The curiosity to understand the process in life which can help in the discovery of a drug for any disease or health complication in the future is exciting and allows us to enjoy our work. The postdoc position is very crucial for training to become an independent researcher and learning to administer a laboratory as well as plan and execute experiments on our own. The role helps in writing grants so that we can eventually upgrade to early career scientists and explore the field using our expertise. Currently, as a postdoc, we have to maintain the lab funds, ordering of reagents, perform experiments and communicate the results to the supervisor as well as the collaborators and other scientists in the field at conferences, and train graduate students to gain interest in the field, write protocols, write grants to obtain extramural as well as intramural funding to the lab to sustain salary and funds for reagents. It is a lot to handle as a postdoc but this rigorous training helps in shaping us to become future independent scientists and have our own funding and lab to explore science.

Fundamental issues and challenges

The Fundamental issues and challenges in recruiting and retaining postdoctoral trainees in academic research are the low salary paid, the low amount of funding available, and the increasing expenses due to inflation. The lifestyle of a postdoctoral fellow has been plummeting due to the steep increase in the price of general necessities in the market with no appreciable increase in our salary to balance the inflation. Anyone would prefer to work in a field where their hard work is compensated with a respectable salary and benefits. However, that transition has failed to occur in academic research which is forcing the good quality postdoctoral trainees to divert towards industry jobs and be able to sustain a minimum lifestyle and support their families.

Existing NIH policies, programs, or resources

The existing NIH policy should consider increasing the postdoctoral trainee's salary on a national scale and implement every institute and university in the USA to follow it. The increased salary should compensate for the inflation and will surely provide a better lifestyle which will not make a postdoctoral fellow think about sacrificing their dream job and joining an industry just to sustain their livelihood. The NIH should also consider providing a training platform for the postdoctoral trainees to write extramural grants to become early career research scientists and have more open positions for grant funding. The crunch and high competition in obtaining grants and funding is another factor that forces postdoctoral trainees to leave the field and join the industry as they don't have the stress to obtain funds for their survival in the job.

Proven or promising external resources or approaches

The increase in postdoctoral trainee salaries overall in the country will surely improve their recruitment and provide job satisfaction and will prevent their diversion to industry jobs. The working environment will also get better with the increase in funding and removal of stress in the personal financial life of the trainees to make the work environment energetic and a place where one would like to come and work.

Response 905

Perspectives on the postdoc roles and responsibilities

Advanced scientist but still during a period of training. Has good understand of biological systems, theoretically and experimentally. During the postdoctoral time will improve skills both experimentally and theoretical and identify a research direction that follow for an academic career. Ideally by year 4 will apply for a K award.

Fundamental issues and challenges

The major issue is the salary, which is not competitive with industry. The NIH $250k/year does not help even we want to pay more. Impossibility to apply for fellowships for the non-domestic postocs. this is really a major issue, as a lot of the international postdocs are very good and competitive.

Existing NIH policies, programs, or resources

increase the R01 from $250k/year, increase the salary for postdocs, allow international postdocs to apply for fellowships. Make sure that fellowships do not go to the same groups that already have T32 awards.

Proven or promising external resources or approaches

All these depend on the following:

increase the R01 from $250k/year, increase the salary for postdocs, allow international postdocs to apply for fellowships. Make sure that fellowships do not go to the same groups that already have T32 awards.

Response 906

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as sort of a stepping stone, and a way to gain further expertise before starting one's own laboratory. I do think that it's essential to expand one's research during the postdoctoral phase.

Fundamental issues and challenges

There are several issues. One is the fact that post-doctoral positions simply do not make enough money compared to industry positions. This means that many people who might have done a post-doc leave for

industry. Second, is the lack of support from universities for post-docs when they obtain grants. Many institutions take post-docs off their retirement and insurance benefits if they obtain NIH grants such as the F32. This means there is a serious disadvantage to obtaining one financially, despite the upside on the professional level. For individuals without large family support or other means, this results people who might have applied deciding not to simply based on the fact that they will lose the benefits that normally come with a postdoctoral position. Third, the issue of overwork. Personally, I have achieved a better work life balance in my post-doc, but many post-docs I know are pressured by the PIs to work insane hours and produce results despite not having access to the resources they need. This results in a disillusionment with the academic field. Overall, I think this results in many people seeking work outside of academia. I have recently observed that many labs, even prominent ones at highly sought after institutions, are unable to obtain and retain postdoctoral scholars.

Existing NIH policies, programs, or resources

Yes. My primary concern is the fact that when researchers obtain NIH grants, they lose out on the benefits the university provides them. This is a serious disadvantage to obtaining a grant, and I'm not sure why this became something that was widely accepted in the scientific field. I know I was actually relieved when I did not receive an F32 for this exact reason.

Proven or promising external resources or approaches

I think asking for responses from postdocs is a start. I think actually enforcing certain guidelines on universities when postdocs obtain grants would be another step. Universities do not have much accountability in my understanding for the outcome of what happens after postdocs obtain grants, i.e. do they actually go on to academic positions, are they successful, are they supported with what they need? All of the burden is on the postdoc/grant obtainee, and little on the university, yet they benefit both financially and from the prestige that comes with this. There needs to be more accountability of the universities in providing a support network.

Response 907

Perspectives on the postdoc roles and responsibilities

I view it as an opportunity to increase my knowledge base of a different field prior to starting my independent career. I also see it as an opportunity to increase my skills as a mentor to younger scientist prior to running my own lab.

Fundamental issues and challenges

The biggest challenge in recruitment/retention/quality of life of postdoctoral trainees in academic research is the amount the postdocs earn on a yearly basis, especially in areas where the cost of living is so high. On standard post-doc pay, it is very difficult (if not impossible) to pay for a one bedroom apartment in an areas such as Boston or San Francisco. Upon earning a PhD, postdoctoral trainees who are single and living in the higher cost of living areas should not require having a roommate(s) in order to pay their monthly bills.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 908

Perspectives on the postdoc roles and responsibilities

I was a post doc for almost 5 years in [redacted for anonymity]. The Role of postdoc to me is a training for me to become an individual PI. But this is not the case from my experience. PI are just treating postdoc as a slaves to get the job done for their lab. Treating immigrant postdoc due to their visa as a slaves more prominent here in USA.

Fundamental issues and challenges

The main issue which need to be addressed.

1. Give some decent salary (70000$/annum atleast) for postdoc. They are highly educated individuals. If you need quality you need to pay.
2. Treating Immigrant postdoc as a slave due to their visa issue is highly prominent. Those are should be monitored with internal and external fellows.

Existing NIH policies, programs, or resources

1. Salary policies should be modified.
2. Some policy should be made to help, how the postdoc are trained to get into their own academic position.

Proven or promising external resources or approaches

No response

Response 909

Perspectives on the postdoc roles and responsibilities

Great opportunity to work on developing specific skillsets and networks, but it comes at a significant financial opportunity, social, and emotional costs as well. Positions must be chosen wisely so as to not negatively impact one's career. The recent trends towards increasing numbers of postdocs required for true return on investment in one's careeer are concerning.

Fundamental issues and challenges

The academy is driving many self-starters away because it is a highly politicised monoculture which enforces conformity to its increasingly bizarre views—often in area's completely unrelated to one's work. This was completely unacceptable until recently. Having done a postdoc in the UK, it's absolutely shocking how bad the academy behaves in the US. Researchers there are laughing at us. The job is hard enough, and this serious cultural overreach makes it near impossible to focus on one's work. This cultural shift also significantly impacts international students, frustrating and confusing them and leading them to pretend to comply for fear od losing opportunities. Often cultural ideas are enforced by the people who hold unrestricted power over the futures of early career scientists, and they abuse this power with veiled threats and a smile. It's disgusting, and really not as bad in industry—people and their views are treated with privacy and respect. Many of my colleagues from across the political and social spectrum have spoken to me privately about how they're glad to have left such a toxic environment, and how bad it's gotten in the last 6 hears or so. It's not that people don't want to work hard—we just don't want to work with tyrants who bin us on immutable characteristics on a daily basis.

Existing NIH policies, programs, or resources

Stop enforcing political and social views in the workplace. You know you do it, but when people leave, you don't listen to the reasons why. Remember that the loudest voices are rarely the most numerous. Either adjust your policies, or accept that people will continue leaving for places where their merits are truly valued over their perceived virtue on social and political topics.

Proven or promising external resources or approaches

Conduct honest political and social climate surveys, without loaded questions, and actually to ALL perspectives (yes, even those you don't personally like) without judgement. Then remember, when adapting policy, that silencing a minority, even a tiny minority, chills the entire culture. They manage to keep open debate alive in the UK, so it can be done.

Ultimately I don't believe the academy will take the necessary actions to save what remains of rationalism, which is why I'm leaving. Good luck.

Response 910

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

There are two basic problems:

1. pay for postdocs is too low and
2. academia is a pyramid scheme.

The pay for a post-doc at our institution is almost criminally low for someone with so much education in a place with such a high cost of living (and we do pay above NIH salary scale). Post-docs only make slightly more than research assistants with a BA (42k vs 60k). For people in their late 20s and early 30s, you can't support a family on that, especially working the hours that are typical for a post-doc. But, from the other side, paying postdocs more eats into budgets, so the standard R01 budget would need to increase. The second issue is that there will not be academic jobs for all the postdocs at the end. (There simply cannot be, since there are generally multiple postdocs per lab. The number of academic positions is not expending exponentially). So from an individual's perspective, does it make sense to toil for years at low pay, only to have no payout at the end? If you're going to end up going into industry because you can't get an academic job, why not just go earlier?

Existing NIH policies, programs, or resources

Improve pay scale. Allow budgets to increase each year to account for salary increases. Administrative supplements for high cost of living areas to allow higher pay scale.

Proven or promising external resources or approaches

No response

Response 911

Perspectives on the postdoc roles and responsibilities

A postdoc is a training position in which young scientists can explore new research areas, refine their research skills, and expand their academic/professional network to prepare for a career as an independent scientist and to become more competitive on the academic job market.

Fundamental issues and challenges

Recruitment: in my experience PhD candidates "apply" for postdocs by reaching out to potential advisors that are in their PhD advisor's academic sphere. More concrete recruitment efforts by "hiring" parties such as reaching out to university graduate listservs or posting on job websites or linkedin would likely increase recruitment, especially of high quality candidates from "less-prestigious" universities or with PhD advisors who are not as well-known.

Retention/Quality of Life: reducing postdoc isolation by building a more cohesive postdoc community

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increasing scientific engagement and networking amongst postdocs with similar research interests through internal, informal meetings/symposia perhaps on a regular schedule.

Response 912

Perspectives on the postdoc roles and responsibilities

Research, write grants, training, and publishing/presenting/disseminating

Fundamental issues and challenges

My salary was 47,000 at [redacted for anonymity] with a new family and I had a mentor who did not allow me to network with others. She wanted everything to go through her or be about her projects. It was hard to learn the skills I wanted to learn (and was hired to learn). A lot of the postdoc became me working for "less" on her research projects and not networking (as I had expected to do). It was not a good experience and I then joined another government fellowship, which guaranteed me a career in their

organization and paid me twice my original postdoc salary to be trained. I have not recommended a postdoc to similar scientists, and encouraged them to find fellowships that are more targeted and will serve as a pipeline into their career.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Ensuring that mentors feel connected to other similar students to ensure that they can recognize a problem/oppression; opportunities to transition from mentor to mentor as needed; and generally, more accountability across the postdoc experience. For example, if one supervisor is training their mentor and forming a faculty member or industry expert vs. someone who is asking their postdoc to work nonstop to improve their faculty portfolio.

Response 913

Perspectives on the postdoc roles and responsibilities

I got my PhD degree from China, and then came to US to have postdoc training, hoping to get improvement on research training, have novel insights into my research field, and pulish high quality papers. And based on my discovery to establish my own lab in either China or US.

Fundamental issues and challenges

This is my eighth years working as postdoc. I worked as postdoc in [redacted for anonymity] from 2015. At 2020, I relocated to [redacted for anonymity] to continue my research on retinal development and disease. It is frastrated that I cannot get a position so far, although I get serveral first-auther papers (Journal of Neuroscience, Cell Reports, iScience). The biggest block is that I cannot apply for NIH fundings without permenant resident identity.

Existing NIH policies, programs, or resources

Have some more fundings for foreigners works in US. So that postdoc could have more freedom on doing research, but not totally obey the mentors.

Proven or promising external resources or approaches

Have a survey on the postdocs' satification to their mentors who are supported by NIH.

Response 914

Perspectives on the postdoc roles and responsibilities

Gaining expertise on handling scientific projects at individual level. Get upgraded with the recent scientific techniques and application. As much as possible share the knowledge to the students and colleagues.

Fundamental issues and challenges

Its situation specific. Funds are the major hurdle. Project timelines, and its interference in getting deep in the topic.

Existing NIH policies, programs, or resources

Increase in the Post doc fellowship.

Proven or promising external resources or approaches

Improving post doctoral .

Response 915

Perspectives on the postdoc roles and responsibilities

The roles and responsibilities are unclear; a lot of people are unresponsive and gatekeep certain roles.

Fundamental issues and challenges

Pay your postdoctoral trainees more. They are all going to industry since they can make over $90k annually compared to $45k.

No one can afford to live on $45k.

Existing NIH policies, programs, or resources

Pay your postdoctoral trainees more. They are all going to industry since they can make over $90k annually compared to $45k.

No one can afford to live on $45k.

Proven or promising external resources or approaches

Pay your postdoctoral trainees more. They are all going to industry since they can make over $90k annually compared to $45k.

No one can afford to live on $45k.

Response 916

Perspectives on the postdoc roles and responsibilities

The postdoc is a woefully underpaid position that (ideally) allows a scientist to gradually transition from a mentored position (Ph.D. student) into being a truly independent researcher. This change happens gradually because a postdoc is given a significant amount of intellectual freedom and resources while not being immediately bogged down by the administrative aspects of a leadership position (i.e. constantly applying for funding, serving on committees, etc.). Additionally, postdocs still do receive formal mentoring, including career advice, and can use the time to become recognizable experts in their sub-field.

Fundamental issues and challenges

1) Salary,
2) Salary,
3) Salary.

Postdocs are highly trained individuals who are typically at the age when one hopes to begin "settling down" in personal life, having kids, beginning to save for retirement, etc. The current academic postdoctoral salaries are not commensurate with the amount of training/education required for it and are typically insufficient to support a family in almost any major city in the country.

Existing NIH policies, programs, or resources

More funding for postdoctoral salaries, higher minimum postdoc pay scale.

Proven or promising external resources or approaches

No response

Response 917

Perspectives on the postdoc roles and responsibilities

A transitional role for a professional with an advanced degree which gives independence to the scientist and treats them as professionals (not "students" or "trainees")

Fundamental issues and challenges

Low salary and benefits, uncertainty about the future

Existing NIH policies, programs, or resources

Higher salary, better support for parents, specifically for NIH—treating postdocs as employees (both in terms of benefits and giving them paid parental leave during their first year if they convert to a research fellow position as currently they are not eligible for PPL)

Proven or promising external resources or approaches

Look at Europe—better work conditions overall

Response 918

Perspectives on the postdoc roles and responsibilities

I houh I would e doin he same thing as PhD. Focusing on one project and develop myself on it. However, the reality is not the same. I am working actively on six different projects (they each has different focus) and non of them are going to be my first co-author. I don; think staying in academia is helping me to improve myself. I could do the same thing in industry with a higher pay.

Fundamental issues and challenges

The pay is not enough. I have a roommate which I passed the age to have one. I want to have my place and be able to afford the things that I want to have.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 919

Perspectives on the postdoc roles and responsibilities

I view my postdoc as a training opportunity in preparation for a tenure-track assistant professor position.

Fundamental issues and challenges

The pay given to postdocs is too low and too inconsistent across the nation, not reflecting different costs of living in different cities. These positions should be more equivalent to staff scientist positions in terms of pay and benefits (ie full employee status). It is ridiculous that a person with a PhD should not be compensated for it.

Existing NIH policies, programs, or resources

Support for women having children, including funding for a technician during the pregnancy / birth year. This should be more widely available and normalized as an expectation of support from the NIH for anyone qualified.

Proven or promising external resources or approaches

Higher salaries for postdocs is the only way

Response 920

Perspectives on the postdoc roles and responsibilities

I see my postdoc as an opportunity to apply my previous acquired knowledge to a new set of projects and an opportunity to acquire new knowledge. Not only involved directly in research but also in navigating the path to independence to become a principal investigator (PI). This task comes with many obstacles since English is not my first language but also because the research system harbors its own complexities. For example, awards and positions are not granted by one research council but from different research institutions either through individual grants or institutional efforts, each with its own recruiting criteria, requirements, and eligibility.

Fundamental issues and challenges

1. Complex immigration policies add to everyday burden of not knowing how long we can stay; how difficult it will be to transition to the next type of visa and if that will be even possible. All this relying only on the willingness of each institution's Human Resources department to make this process easier (or even harder).
2. Scarce salary for the high level of training we have compared to positions in industry or even jobs that do not require any skillset. This is even worse in areas with expensive living costs. It impacts motivation and willingness to pursue a career in academia.
3. Job insecurity: we rely and depend exclusively on the PI that hired us, their grant situation and willingness to maintain the postdoc position available. For international postdocs this is even worse: termination of our postdoc position means we must leave the country, without the possibility to apply what we learn along the postdoctoral experience in the US.
4. Uncertain career prospects:
5. very few PI positions available; for international postdocs it's even harder to obtain training grants and fellowships that would make us more desirable for PI positions.
6. Transition to other career paths seems murky and unclear. For example, industry requires a skillset we are not trained for (language, structure). Additionally, it's even harder for international postdocs to apply due to harder immigration policies in the non-academic sector.
7. Lack of unionization: if postdocs make the research enterprise possible, we need to be heard consistently, not only when things go awry. This will enable all interested parties to correct the pathway before the system loose track and will be much better for the future of science in the country.

Existing NIH policies, programs, or resources

Since more than 50% of postdoctoral fellows are from outside the US, the system would benefit from allowing foreigners to apply to all the NIH grants and awards. Not only K99-R00 seems to be the only opportunity we have but it is a very tough competition at a very high level. Other foundation awards are scarce and highly competitive as well. Smaller grants and career development awards for earlier stages (first-third year postdoc) would benefit the community to improve training in grantsmanship and slowly build a successful track to finally apply to the K99-R00 at the end of the postdoctoral experience.

Proven or promising external resources or approaches

Our salaries are directly paid by NIH grants to the PIs. Why don't create a unified job search and application engine for all postdoc candidates? This would make it easier to apply to different positions in diverse institutions that are funded by NIH. As it is today, research institutions impose requirements that are difficult to navigate and eligibility-recruitment is a black box. Like other research councils around the globe, the selection process would be more transparent and accessible if there were centralized committees that evaluate all the applications and grant the positions to the best qualified individuals. This would not only help find the most suitable candidate for the project but also make clear expectations on both sides to look for the best fit in the triad: postdoc, PI, institution. The committees would be formed by PIs and advanced postdocs in different areas of research from funded institutions.

Response 921

Perspectives on the postdoc roles and responsibilities

A training step toward achieving an independent status, opportunitygain additional technical and scientific information and training, gain experience in teaching, administration of grants, training of grad students, and communication skills oral and written. All of this can be done in a 2-3 year period.

Fundamental issues and challenges

Salary and benefits. Inability to have funding to support the training experience. While postdocs can write grants they are generally not equipped to get a k99 in the first year or two if postdoc. That means if they do get this, they are pushing a 4-5 year training period. This puts them off a career in academia.

Further postdocs who become pregnant and are on a training grant should be allowed to take the full 3 months of federal leave. Currently they are only allowed 8 weeks. NIH level salary should be a required

minimum. There are postdocs in some very expensive cities like SF or NYC being paid below NIH levels. There should be some flexibility in this salary

Should have opportunities to work on training beyond research-things related to leadership and independence.

Existing NIH policies, programs, or resources

Be careful about requiring too many programmatic level training. If you do require travel for postdocs, please appropriately recognize this-plane tickets are exorbitantly high and not everyone lives next to a hub or on the east cost. My last 5 plane tickets cost 900-1200 and thus you need to consider appropriate travel expenses.

Proven or promising external resources or approaches

No response

Response 922

Perspectives on the postdoc roles and responsibilities

As an NIH funded scientist, a postdoctoral relationship is symbiotic, I train and mentor the postdoc and they perform experiments, learn how to plan studies, address hypotheses and write papers. This benefits us in that it advances my research program and helps them develop their own

Fundamental issues and challenges

People can graduate from college and get jobs as consultants. Postdocs need to go to grad school and even as fellows make less than those consultants. There is little to no job security, unlike other lower paying/high education jobs which are driven by the person's passion, eg school teachers have unions and guaranteed salary. This is due to the "soft money environment" that academic researchers rely on. Industry has higher salaries, but is also not 100% stable and allows less autonomy and creativity.

Existing NIH policies, programs, or resources

The recent pipeline issues is due to the impact of the low NIH funding rate. I have been constantly funded by NIH since 1993 as a PI. When the NIH funding percentile was in the 15-20 range and for several years after, it was not difficult getting postdocs I presume because they saw a future in research. With funding percentiles now being less than 10 in many institutes, most excellent / innovative grants remain unfunded.

Proven or promising external resources or approaches

Improving job stability and a future where the postdocs could envision successful careers in research. Personally, I think NIH should receive income from in any and all patents baed on data generated by NIH grants. That would significantly increase the budget and perhaps alleviate some of the fiscal concerns.

Response 923

Perspectives on the postdoc roles and responsibilities

To me it means a position of training to become an independent primary investigator while using advanced skills to run a project in the lab. It should include programs where we are trained on writing grants, managing lab members, conducting other (unknown) administrative duties that professors have to do, managing funds and teaching and/or communicating our research (written and oral). It should also include running our project as independently as possible because that training has presumably happened in grad school; so less spoon feeding in research, more in other aspects of running a lab.

Fundamental issues and challenges

Toxic culture—most PIs think postdoc trainees can be "used" as technicians to run experiments more efficiently for them to submit grants or papers. There seems to be no respect of us as scientists who can spear-head a project, think of experiments and of course be allowed to make mistakes.

Lack of professional development—most PIs don't enjoy the concept of trainees taking time out of daily experiments to participate in professional development activities that will actually train them to run a lab

Lack of privacy—Post pandemic PIs have figured out a way to constantly keep in touch with trainees (through apps like slack) and that completely shuts out the concept of privacy. We are expected to answer immediately to any message from anyone in the lab on slack as opposed to the time it took to reply to emails pre-pandemic. We are judged if we don't respond immediately because the assumption is we can see the message as soon as it is being sent.

Implicit bias—Organizations keep talking about DEI initiatives but on the ground postdocs don't feel that difference. Women and minorities have to still work twice as hard to convince PIs that

1. they know how to do experiments
2. their data is believable. I have seen female postdocs are critiqued much more thoroughly than male counterpart whose raw data are never questioned

Existing NIH policies, programs, or resources

NIH needs to send people over to labs to watch what is happening and interview postdocs confidentially. Our biggest problem is no-one is watching us in action and trying to judge our situation from forms we are filling over so many years now. Additionally there is no guaratee of anonymity and that we will not be attacked professionally for speaking up. I think by now there is a ton of evidence that there is no point is asking for statements of research integrity/inclusivity etc from PIs. they write those without ever implementing them in the lab. Improve our working conditions if you wish to retain us. Simply giving us more money is not going to change anything.

Proven or promising external resources or approaches

No response

Response 924

Perspectives on the postdoc roles and responsibilities

I completed a T32 Postdoctoral Fellowship. As I see it, postdoc is a time to gain more specialized skills in research and grant writing, and perhaps above all, it is the time to write the training grant that will launch an independent career.

Fundamental issues and challenges

I completed a T32 Postdoctoral Fellowship. The biggest problem is that postdocs end up not being wanted by the academic job market after postdoc. The very departments that take postdocs don't want to keep us as permanent, K-funded investigators. They force us to write K99/R00 grants instead of traditional Ks, so we will stay for two more years only as a postdoc and then go elsewhere for permanent employment. Even if we do manage to get funded in a department, they often sign us for one year contracts at a time, constantly reminding us that we are not wanted permanently, that we must continually prove our worth in funding. For postdocs, who are seeking their first secure job after years of graduate school and associated poverty, this lack of permanent job opportunities is devastating and causes us to look at other industries.

Existing NIH policies, programs, or resources

The stipulation that academic departments provide jobs for us even if our K grants aren't funded was almost such a deal breaker that I was not allowed to submit a grant. Although I see how this policy was intended to protect postdocs, it actually just made me into a worse burden than I already was in the department's eyes.

Thank you for providing a humane 8-week paid parental leave policy and livable wages for postdocs.

Proven or promising external resources or approaches

I wish I had ideas here, sorry.

Response 925

Perspectives on the postdoc roles and responsibilities

My PhD is in the social sciences, as is my postdoc research. Postdocs are not required in my field, but I chose to do one because of the pandemic--I didn't want to go on the job market when it was so uncertain

or commit to a permanent job via zoom. I was additionally interested in a T32 because the early pandemic was (necessarily) isolating and I was interested in being part of a community/cohort. My postdoc peers have been one of the greatest strengths of the T32. We have varied clinical/social science training and work with different faculty on different projects. But we have many shared interests and they're an outstanding resource and support system. I'm working on projects with multiple postdoc peers.

The postdoc has been a great choice for me intellectually. My mentor is outstanding. I appreciate that being on a T32 means my time is funded, rather than attached to a predefined project. I am responsible for the research project I've committed (which I defined) to and to be an engaged member of my postdoc cohort. I do not have outside responsibilities to other people's research unless I choose to collaborate. I think of the postdoc as a job, despite not being paid a professional wage. I anticipate that my next job will be a TT position, and this is how my training program/mentor treat me. My postdoc position is oriented to how this time is preparing me for what I want to do next. I'm at a major research institution and my mentor/department/institution are very experienced in developing new scientists —it's quite evident to me that I am getting a master class in becoming a successful independent researcher and I feel very fortunate.

Fundamental issues and challenges

FUNDING. FUNDING. FUNDING. FUNDING!!!!!!!!!!!!!!!

I cannot emphasize enough how inadequate the NIH postdoc salary is. I live in an expensive city on the east coast so I moonlight doing clinical work on the weekend to make ends meet, otherwise the postdoc would be impossible. Mathematically it is not possible to live on a postdoc salary in my area without a partner or roommates or a second job. Money is a tremendous source of stress that affects my daily lifestyle, well-being, and professional performance.

I am genuinely happy in academia and in my postdoc, however money is the #1 reason I'd need to leave. I started the PhD after previous grad school and 5 years of work experience. With the PhD + postdoc, I've now spent 7 years on a graduate stipend--and while I've made it work in the moment, it has been impossible to save responsibly. My financial future is precarious since I have spent prime earning years unable to prioritize retirement savings, etc. Being in a health field, I'm acutely aware of financial insecurity among older adults, especially women. Unlike physicians, professor salaries are not transformative and I'm cognizant that my long-term financial security may force me out of academia one day.

The current NIH postdoc compensation is INCOMPATIBLE with improving science. We know the structural economic inequities in our society as well as the deficiencies in the composition of the scientific workforce. The NIH must put its money where its mouth is when it comes to improving the pipeline of people who are underrepresented in science. Targeted resources are great but lifting the baseline is crucial because we know that the resources to navigate systems is not equally distributed--improved compensation needs to be automatic and clearly signaled. Science cannot afford to continue losing all this talent.

Existing NIH policies, programs, or resources

SALARY is far and away my 1st-Nth priority. Nothing else comes close.

Within existing resources, I do wish some of the T32 training funds were more flexible. With a PhD and prior master's, formal coursework is not an area where I need development--I wish those funds could be allocated to support my research projects or the (paltry!) conference travel budget. I appreciate that automatically making the funding flexible might dissuade people from taking courses who want/need to, but I wish there were some criteria for an exemption for people in my situation where the tuition money will go unspent because this is genuinely not a training need.

Finally, a rate limiting factor in my work and among my social science colleagues is having to deal with IRB processes designed for clinical trials rather than our research. I completely endorse the careful protection of human subjects, but there is a strong mismatch between the oversight a clinical trial needs vs. an observational study with secondary data. I deform my research studies to get through the IRB--e.g., it's prohibitive that an interview-based study where I can physically bring myself to multiple locations (solely for participant convenience!) is evaluated in the same way as a multi-site clinical trial. This issue is common to peers across the country. I wish the NIH would consider distinguishing types of science/risk when setting RCR/IRB policies. Doing minimal-risk research, in my PhD I was able to conduct multiple (exempt) studies using my time as the only resource. However, the discordance between the university IRB and medical center IRBs is startling. Medical center IRBs require so much more compliance that even

submitting an application is a full-time effort that assumes a research team is supporting the work. This is a huge issue for postdocs and early career researchers. Please help!

Proven or promising external resources or approaches

I'm at a very large research university with affiliated clinical organizations. I receive frequent communications from the postdoc office at the university and the health system about workshops and other activities. The TT market in my field is pretty robust and my mentors are very engaged so I don't require most of the institutional support that is available to me. But I am glad it exists and hope that the NIH invests in these structural supports for trainees —I think clear organization-level commitment to trainees is essential and filters down to how we are regarded and treated in the workplace.

Response 926

Perspectives on the postdoc roles and responsibilities

I think that the academic postdoc is an extremely important role, particularly transitionary for early-career researchers who plan to continue on in academia. Not only is postdoc experience becoming more and more often a requirement for getting tenure-track positions, but I think that it is an extremely valuable position/experience that really helps to build upon graduate school experiences to transition individuals to higher-level positions.

Fundamental issues and challenges

I think the primary issue with recruitment, retention, and overall quality of life for postdoctoral trainees is the compensation. Postdocs work long and hard hours after receiving an advanced secondary degree, and many times we are being paid less than entry level jobs in industry that only require a bachelors degree. That, combined with the fact that postdocs are often for short durations requiring an uprooting of the individuals life before and after, makes the positions often untenable to trainees who may need or want to support a family. I think this is the primary reason that academia is bleeding scientists into industry roles instead, even if that may not be the individuals preferred role.

Existing NIH policies, programs, or resources

Improved pay and parental leave, along with policies regarding relocation would be helpful. More communities within universities for postdocs to be a part of would also be an essential element towards improvement.

Proven or promising external resources or approaches

No response

Response 927

Perspectives on the postdoc roles and responsibilities

I view it as a training position that is mixed with faculty requirements. It's a weird dichotomy whereby the university picks and chooses the times when you are faculty vs. a trainee. You only get some of the faculty benefits, but when it comes to paying for things or money savings, you are definitely viewed as a staff/student and have to pay. There are countless of faculty benefits unused by tenured professors, that would save big money for the underpaid postdocs that we don't get to receive the benefit of (e.g., discounted train fares, staff parking).

Fundamental issues and challenges

There is no cost of living adjustment for the NIH minimum for postdoc salary. Unfortunately, most postdocs are at large R1 institutions in major cities where cost of living is high. You essentially cannot do a post doc unless you live below the poverty lines or have a spouse financially supporting you.

Existing NIH policies, programs, or resources

Pay them more and view them as faculty.

Proven or promising external resources or approaches

No response

Response 928

Perspectives on the postdoc roles and responsibilities

The postdoc should be the launching stage for my career as a faculty member, it would require the right mentorship and opportunities

Fundamental issues and challenges

Very low salary, high discrepancy of treatment between fellows receiving a stipend and officers receiving a salary, and poor mentorship/leadership training

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 929

Perspectives on the postdoc roles and responsibilities

Being a postdoctoral research fellow means getting additional specialized training and trying out being more independent than the graduate student. Primary responsibilities for a postdoc fellow are to participate in mentors' research studies through data collection, analysis, and publishing, as well as planning for how they are going to shift into their own independent program of research. Depending on whether a postdoc is part of a training grant or funded through a mentor's study, the postdoc might also have responsibilities around taking coursework or seminars, mentoring undergrad or grad students, or project management responsibilities.

Fundamental issues and challenges

I think the biggest problems with recruiting and retaining postdocs are around salary and the temporary nature of postdoc. It is really hard to want to move across the country for a year or a few years, when you're likely going to have to move again, and grad students don't usually have a lot of money to do that. On top of it, postdoc salaries are woefully low when you consider what someone can make if they go straight to a permanent TT position or industry job. People don't want an extension of the austerity of grad school life—they want to make the money that having a PhD should provide. Additionally, people want to move on with their lives, by getting married, having kids, buying a house, or any other life goals, and that is challenging when you're living somewhere temporarily or not sure when or if you will be staying there.

Existing NIH policies, programs, or resources

Number one is increasing minimum salary by at least $20k. Number two is providing relocation stipends. Number three is requiring universities to treat postdocs as employees, even those on training grants, so that their pay can be treated as earned income and they have access to all the benefits of the university (e.g., retirement saving accounts, housing support in expensive areas) that aren't accessible to stipend recipients. Number four is increasing support for childcare/family care expenses. Finally, some minimum requirement of protected time for all postdocs to be able to work on their own projects (e.g., 20%) for those funded through faculty grants or other funding that currently doesn't include or require protected time.

Proven or promising external resources or approaches

There are several universities in the country that have done all of what I mentioned (not necessarily all of them at the same university). Additionally, offices of postdoctoral affairs are useful (we have one at [redacted for anonymity]).

Response 930

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is another stage of research training that is en route to an independent career either as a principal investigator or staff scientist. It should clarify a trainee's ability to manage a project, refine

experimental techniques and thought, and in part manage others working in the same laboratory while receiving guidance from more senior scientists. It is also a mid-career professional position, meaning that postdocs also have high competence, many years of training, and keen scientific understanding that make them semi-independent and invaluable scientific workers. They are the backbone of almost any lab in terms of equipment management, reagent management, safety guidelines, and so on. The fact that postdoctoral fellows are so integral to function of any one laboratory is in part an issue for science due to the nature of the postdoc as a transitory position. The lack of long-term lab members aside from PIs for many labs is something NIH should take into consideration, and the crisis in replicability can in part be traced to the high rates of turnover in science.

Fundamental issues and challenges

Salaries for postdoctoral researchers have fallen in real wages for at least the past 20 years, meaning that mid-career professionals, often with family obligations, are working in under-compensated positions for long hours. Postdoctoral fellows need to be making commensurate with mid-career professionals in similar fields. Likewise, there has also been a falling rate at which faculty positions are opening (and those that exist are increasingly precarious in terms of funding and appointment), as well with staff scientists. Because the purpose of postdoctoral training is to expand and develop an independent research career, the lack of academic appointments is seriously discouraging to anyone considering a postdoc (due again to the long hours and poor compensation). NIH should invest in programs that will allow for more senior positions to open—both principal investigators and staff scientists—and also investigate why the rate of faculty hires has decreased relative to the production of PhDs, especially in a time when universities have more resources than ever. It is also important to the structure of science that there are opportunities for advancement in publicly-funded scientific research for new doctoral researchers. We are in a moment of corporate capture of not only science & scientific knowledge (e.g., publishing), but of scientific labor into the growing biotech sector, and the NIH should resist this incursion by making sure there are ample academic and public-sector positions for mid-career and higher scientists who want to continue doing science which will enter the public record, rather than end up as proprietary information.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Postdoctoral fellows absolutely need higher wages, doable through grant funding. Likewise, promoting the hiring of staff scientists through grant funding is also crucial.

Response 931

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The NIH stipend level for postdocs is low for [redacted for anonymity] standards. This limits the retention and quality of life for postdocs applying for fellowships specifically. By not allowing fringe benefits, this limits the health benefits a postdoc can request from the institution as well.

Existing NIH policies, programs, or resources

The F32 fellowship should be expanded to include higher wages and fringe benefits to not switch benefits and to allow for greater retention.

Proven or promising external resources or approaches

No response

Response 932

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position to be refining your independent skills as a scientist in your field. This can, and likely should, include learning new techniques/approaches/skills along with extensive further

development of your independent thinking/ideas and ability to (and confidence in) conducting scientific experiments, troubleshooting, and problem solving independently. The postdoctoral position should also include exposure to things that will be critical for success as an academic scientist running an independent lab: mentoring students, writing grants, interfacing with administration for purchasing, giving talks/attending conferences, and building a network of colleagues.

Fundamental issues and challenges

The two primary issues I think are impacting postdoctoral trainees are

1. pay, and
2. the uncertainty of success in an academic track and high level of competition for available faculty jobs.

The current first year NIH postdoc salary is equitable to the average entry level human resources position with no qualifications or advanced degree (according to GlassDoor). With a substantial rise in cost of living across the country the current salary caps for postdoctoral trainees puts significant limits on standards of living, particularly for trainees in bigger or more expensive cities. While some cities provide a bump to postdoctoral trainee salaries due to cost of living, the bump is often not enough to make a significant difference in actual quality of living, and often has to come out of alternative PI funds that aren't the primary grant the postdoc is paid off of. Additionally, as a postdoctoral trainee academic institutions do not match or even contribute to retirement savings, and with an increase in number of years in postdoctoral positions before going on the faculty job market (for my field at least) most postdoctoral trainees are dealing with low pay and the possible inability to substantially save for 5-7 years instead of 2-3 years during a key window for saving for retirement. If the ability to succeed in academic science is uncertain given issue/challenge #2, dealing with years of financial insecurity may not be worth it.

Secondly, when observing colleagues go through 3 rounds of applications to 20+ available positions and still not have an offer, it is easy to be concerned about your own ability to succeed on the job market and consider alternative career options outside of academic science.

Existing NIH policies, programs, or resources

Given the increase in number of years spent in postdoctoral positions (at least in my field), an increase in the age and year-since-degree requirements for some transition grants would be helpful. Increasing postdoctoral salary would also be helpful.

Proven or promising external resources or approaches

No response

Response 933

Perspectives on the postdoc roles and responsibilities

To me, the academic postdoc represents an opportunity for a scientist to define the scope of their future career research and begin to make an impact on their chosen field, alongside the sponsorship and mentorship of an experienced scientist working in that field (their mentor). While I believe that most of those who begin a postdoc are already skilled scientists as a result of their PhD work, I also see the postdoc as an opportunity to learn more about the ins-and-outs of actually running an academic lab, including obtaining funding, navigating politics within academia, leading and mentoring others, managing a budget, etc. It is also an opportunity to refine skills and learn new scientific techniques. Thus, the roles and responsibilities of an academic postdoc are to define scientific questions and execute complicated research projects designed to address those questions on a relatively independent basis, and to obtain funding for these projects (with guidance and input). Mentees should of course also aim to provide benefit to their mentors, in the form of: helping with other projects, mentoring students, managing the laboratory, communicating science, and representing the laboratory at conferences and in publications.

Fundamental issues and challenges

1. One of the primary challenges for postdoctoral scientists is salary and benefits. A highly educated scientist with a PhD needs to be able to afford to live comfortably, support their family, afford healthcare, and comfortably save for retirement. With current inflation, a salary of $50-60k is really not going to allow someone to accomplish any of these key factors. Further, this low salary supports the notion that these are "trainees"; inexperienced and not capable scientists. Overall, salary and benefits in industry (commonly >$100k for an entry-level PhD Scientist with a myriad of competitive benefits) are much more supportive to quality of life.
2. Oftentimes low salary in academia is justified by some notion that one should have to suffer before they attain the coveted tenured faculty position, but that the eventual success is worth it. Nonetheless, the amount of available faculty positions just keeps dwindling while we crank out thousands of newly minted PhDs each year. Now, people are stuck in postdoctoral positions for 5-12+ years and unable to get a faculty position. Career opportunities and opportunities for advancement are essentially none.
3. A more fundamental issue to the enterprise of academia itself is an utter lack of diversity, professionalism, accountability, and mentorship standards. Despite the increase in trainee diversity, faculty and leadership across the board remains woefully full of white males. In academia there is rampant sexism, racism, abuse, and unrestricted competition. Even in circumstances that are not overtly illegal or abusive, many mentors are never taught how to mentor, how to lead a lab, how to manage conflict, etc. which results in serious challenges to wellness and mental health in trainees. There are usually no metrics to measure performance of mentees and mentors, no clear expectations and performance metrics, and no easy way to resolve these challenges.

Existing NIH policies, programs, or resources

1. Raise postdoc salaries and consider cost-of-living. Continue to raise salaries annually in line with inflation. Provide actual benefits (retirement, healthcare, parental leave, mental health care).
2. Stop considering postdoc as a "trainee" and start treating them as capable scientists. Provide more clear career advancement opportunities outside of tenured faculty positions. New scientist positions within academia tied to raises.
3. Build systems to incentivize good behavior and stop rewarding abusive behavior. Stop giving grant money to scientists who are abusive just because they are publishing exciting papers. Stop relying on CNS papers to determine career success. Build more measurements of true success.
4. Train mentors.
5. Build performance review systems.

Proven or promising external resources or approaches

No response

Response 934

Perspectives on the postdoc roles and responsibilities

When I joined this position, the postdoc position was a stepping stone for a faculty position.

However, exposure to the biotech industry, interactions with individuals from the industry, and the higher monetary compensation (very important for an immigrant like me whose parents cannot provide financial support) has made me desire to explore a career in the industry. However, due to the discrimination against persons of Indian origin in the US immigration policies, I am stuck in the academic world which allows me a basic immigration stability. I have an amazing mentor and I am enjoying the science in my current position. But in my career trajectory, the position predominantly means a shelter from the immigration policies.

Fundamental issues and challenges

Postdoc salaries are extremely low. Similarly qualified individuals can make at least two to three times the salary in industry.

Existing NIH policies, programs, or resources

NIH postdoctoral fellowship (T32) eligibility criteria severely limits international postdocs who are performing research in the US. A significant number of these postdocs have obtained their PhD in the US, carry out their postdoctoral work in the US, and are aspiring to build a career in the US. Due to discrimination in the immigration policies, highly qualified from India cannot obtain a permanent resident status (a green card) for decades. In light of this, the eligibility criteria should be revised.

Proven or promising external resources or approaches

Proven approach: Higher monetary compensation attracts and retains better candidates.

Response 935

Perspectives on the postdoc roles and responsibilities

To me a post-doc serves 3 primary functions. First, It is a chance to diversity an individual's technical portfolio, knowledge areas, and network. Second, one should grow from "a pair of hands" to the leader of research directions. Third, it's a time to pursue development in non-lab-based areas—anything from teaching, leadership, and mentoring skills to experience with roles in industry, regulatory, government, and/or advocacy—if that fits with an individual's desired career path/goals.

Fundamental issues and challenges

Many undergraduate students see a graduate degree leading only to an academic position and do not understand the opportunities in industry, government, and non-profit sectors for people with PhDs. Thus they never enter/complete graduate school to become a post-doc. Those who do complete graduate school understand how competitive faculty positions are to obtain and may not even really want one. Also, academia simply does not pay as well as industry (or so the perception is) Thus, there is limited value to them to do a post-doc. They'd rather go ahead and pursue a job outside of academia. As for quality of life, I think we need a cultural shift where the post-doctoral period is seen more as a junior colleague than an advanced graduate student. Often the expectation/perspective is that this is a life-period of working extraordinary hours even more so than as a graduate student. This is a potential burn-out issue in general and particularly problematic if a post-docs has children. It's much more likely for post-docs to have children. We need to better respect their work-life balance rather than expecting them to work even more hours than a graduate student. I think it's very doable while maintaining productivity, but it's a mentoring and cultural shift.

Existing NIH policies, programs, or resources

I'm not well versed in what is already established, but I appreciated the move to support childcare. Programs that supported supplemental training (teaching, industry, government, NGO) would be particularly valuable to those not interested in pursing a traditional faculty position and entice them to do a post-doc.

Proven or promising external resources or approaches

Mentoring and a optics change would be huge. People within and outside of academia need to see value in a PhD beyond academic institutions. I think it's there, but many just aren't aware. Those of us who stayed in academia don't have great connections to those that left so we can't adequately educate our students. Nor can we provide experiences like shadowing or internships which would ultimately help them pursue those paths. They're kind of having to do it on their own. Many companies are only now starting to see the value of a PhD educated individual. They come with different critical thinking skills. Albeit, I see the industry hesitation on "ownership". In a PhD or post-doc an individual is in charge of a project from start to finish—it's their baby. Industry does not work that way and has difficulting determining who is going to be fine being a step in a larger process and who needs that academic model of carry through. So perhaps a different training experience would be more appropriate for post-docs intending to leave—which means the mentors need to be retrained to manage this different process when needed.

Response 936

Perspectives on the postdoc roles and responsibilities

Postdocs are the back-bone of research labs. They bring invaluable expertise, knowledge, and independence that PIs rely on to build a productive and thriving research environment. At the same time, there is a training component. A postdoc is a temporary position, and the expectation is that the experience will help improve some of the skills that are important for becoming a PI.

Fundamental issues and challenges

The pay is too low. This is the fundamental issue. Any other conclusion made by NIH would be embarrassing. Sure, there are other improvements that could be made. But, relative to an increase in pay, their general impact is so minor that I do not want to mention them. They are often tools that are used by institutions to pat themselves on the back without actually addressing the fundamental issue. I could only do a postdoc because my spouse makes a higher salary. Without this, doing a postdoc and starting a family would be mutually exclusive options.

Existing NIH policies, programs, or resources

Pay us more and adjust salary by cost-of-living. Support more permanent senior scientist positions. Limit the size of labs so that more funding and more tenure track positions are available.

Proven or promising external resources or approaches

No response

Response 937

Perspectives on the postdoc roles and responsibilities

Essentially, Postdocs are the ones that are driving the scientific discovery process and shouldering the workload,

While being not only underappreciated and ridiculously underpaid, but also being trained towards future academic positions that do. Not. Exist

It is almost as if we are being tricked into believing we could become a PI in order to make us work harder. In this respect, I feel taken advantage of by my PI who gets the discovery credit for very little money input while living of the extensive hours and sacrifices that postdocs made.

I fundamentally regret my decision to undertake a Postdoc. The opportunity costs for not taking an actual industry job over those 5 years are hundred(s of) thousands of dollars.

Now I have

Zero relevant industry experience,

Zero savings,

An expired visa and

Zero clue how to move forward.

Fundamental issues and challenges

Poos academic job prospects

Poor pay

US-Visa battles (repeatedly)

Work-life balance

Existing NIH policies, programs, or resources

Pay us a salary we can live on.

Provide training skills beyond the academic job market

Provide resources for well-being

Proven or promising external resources or approaches

National Postdoctoral Association

Local Postdoc committees at universities

Surveys conducted by scientific publishing groups (e.g. Nature and AAAS)

Response 938

Perspectives on the postdoc roles and responsibilities

The purpose of postdocs is for recent PhD graduates to develop the skills to become independent investigators. It should be viewed as similar to residency programs for recent MD grads.

Fundamental issues and challenges

SALARY. I don't understand why the most brilliant minds in the world don't understand this. Recent PhD grads can easily get a position in industry where they make 2-3 times the postdoc salary. In addition, individual institutions do not even follow the NIH payscales for non-NIH funded postdocs. At my institution when I was a postdoc, there were full time postdocs making $15,000 less than the NIH minimum. NIH should mandate that any institution receiving NIH funding must pay all postdocs on the NIH scale.

Existing NIH policies, programs, or resources

Make institutions receiving NIH funding commit to and prove that all postdocs are funded on the NIH scale.

Proven or promising external resources or approaches

My institution (Big 10) doesn't have a postdoctoral affairs office or coordinator. HOW?

Response 939

Perspectives on the postdoc roles and responsibilities

Postdoc is in my opinion the necessary step to transition to independence, thanks to the guidance of a mentor. The guidance should span from discussing experiments and idea conception, to inspiring on how to become, in turn, a good mentor. In my opinion it should prepare the scientist transitioning from graduate school to future independence in academia or in government, to seek opportunities for writing, reviewing, presenting and teaching.

Fundamental issues and challenges

Surely the biggest issue is salary. Postdocs are highly skilled scientists with years of experience and training, and mostly in academia, the quality of life is greatly affected by the large amount of time spent on working at experiments, proposals, presentiations, teaching, which is not corresponded by a salary which would allow to manage better working and off time, childcare, and so on. Medical insurance should cover way more than it currently does, because with the high level of intense work and stress postdocs face, they should at least receive mental health care at no cost, and preventative medicine as well.

Existing NIH policies, programs, or resources

The situation for international postdocs is very difficult, with almost no possibility to apply for postdoctoral fellowships (very few allow non US permanet residents/citizens to apply) and so with more difficulties in tailoring a competitve CV. This would be for sure an area of improvement that NIH should consider.

As an international postdoc, I have perceived many times an ignorance in the bureocracy that takes for an international to be able to move to the US and stay in the US, and not enough care of ensuring an equal treament to internationals vs US citizens and permanent residents when it comes o opportunities.

Finally, resources for postdocs to transition to independent investigators are really needed. When getting a career transition award or directly a job as faculty, there are really no resources for the new investigars on how to become good mentors, lab managers and leaders. NIH should consider this additional level of training (and should make sure that it is available also for internationals with no permanent residence).

Proven or promising external resources or approaches

No response

Response 940

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Poor compensation for postdoctoral researchers reduces recruitment, limits retention, and negatively affects quality of life.

The current hiring practices for tenure track positions require lengthy postdocs for most fields, as generally the longer the postdoc the longer the CV/publication record/funding. The K22 (5 years eligibility post PhD) and K99/R00 (4 years of eligibility, then a K99 period in the postdoc lab) encourage long postdocs, because the most competitive applications are from postdocs nearing the end of the eligibility window. I don't foresee the length of the postdoc prior to tenure track position shortening in length, so making those 5-7 years more bearable would be a worthy investment.

Existing NIH policies, programs, or resources

Compensation for postdocs should be improved, but this is complicated by the NIH budget lagging inflation over the last many decades, and the absence of increases in the modular budget amount.

A fundamental issue is that many universities use the NRSA extramural stipend guidelines for their postdoctoral salaries. The NRSA salary levels are so low that the NIH pays its intramural postdocs more. Of note, the NRSA stipend levels have no adjustment based on location, an exception to the locality pay adjustment available to nearly every other federal government employee. Whether nor not the NIH intended NRSA stipend payscale to be used by universities, the reality is that most adhere to those salary levels, meaning many recent PhDs will pursue other jobs.

Proven or promising external resources or approaches

No response

Response 941

Perspectives on the postdoc roles and responsibilities

A vehicle for additional training for the post-doc to develop expertise in a research niche to allow them to launch into their next job, be it academia or industry, etc.

Fundamental issues and challenges

The salary is #1. These people are in their early thirties and are highly trained. Making $50,000 per year is insulting. Especially when they can go to industry or consulting without a post-doc and make nearly double.

Existing NIH policies, programs, or resources

NIH salary minimums for postdocs should be increased but there has to be a commensurate increase in NIH R01 budgets or PIs won't be able to afford them anyway.

Proven or promising external resources or approaches

No response

Response 942

Perspectives on the postdoc roles and responsibilities

To me a postdoc is a highly knowledgeable person, that can independently conduct experiments, manage projects and advise other trainees on methods and background information. The postdoc training is to

learn how to conduct independent research, learn about the strategies in terms of publishing, project management and teaching as well as deepening or expanding the understanding of the field.

After a postdoc the person should have all the tools in hand to move to a position where they can conduct independent research (faculty, group leader etc) in industry or academia.

Fundamental issues and challenges

The salaries of postdocs (but also for graduate students) have not kept up with the increase in inflation and prices in general. Especially science hubs have a high demand for housing and the cost of living is high (Bay area, Austin, New York, Boston, Cambridge etc). While industry has adapted and offers competitive salaries based on the cost of living in the area, faculty is limited in what they can offer postdocs.

Post doctoral training is inherently insecure, there is no degree at the end and no clear path to success. In a world that feels more and more uncertain (inflation, wars etc), a stable job in industry might be more appealing to many.

With the cost of living rising so much, many have put off life goals (buying a house, vacation, paying off debts, having children) to after they graduate. Entering again into a situation with low pay and uncertain payoff seems daunting.

Postdoctoral training usually involves moving far away from family and friends and in times where the world feels very unstable and suddenly very large again (Travel bans during the pandemic for example), many might decide to stay closer to home and forgo additional training.

Existing NIH policies, programs, or resources

The biggest part would be an increase in salary, possibly tied to the location/local cost of living. Or a grant where people can apply if they do live in one of these high cost areas.

Not sure what the NIH has in terms of family leave/family support, this definitely needs to be expanded.

Proven or promising external resources or approaches

What is the outlook for a postdoc? Re-frame postdoc position from a loosly defined training to more of a pre-faculty or pre-group leader position. This can include courses on teaching, leadership etc. So even if the science doesnt work out, there where still tangible skills gained. Also if they do move on to be faculty/group leaders they already have some management skills and are not thrown into the cold water.

Response 943

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The most significant issue is the salary limit and lack of provisions for postdoctoral trainees with families or other social commitments.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 944

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a training position to prepare recent PhDs for a career in academia. It is a period in which the postdoc should be able to cultivate a research direction that will allow them to start their own lab, independent of their PI’s. While the postdoc’s research should complement and support the

PI's, they should also be granted some independence/distinction from their PI's personal research goals. I.e. a postdoc should not simply be cheap labor for PIs.

Fundamental issues and challenges

Postdocs are second class citizens in academia. We are not provided a salary that matches our training level, making it very difficult to support ourselves (especially when many of us live in academic/biotech hubs like the Bay area, Boston, and NYC with extremely high costs of living). This is not necessarily the fault of institutions or PIs. The NIH has not raised their funding levels commensurate with increased costs of living, or, more generally, with how much postdocs should be paid for their level of education/training. Thus, even when institutions raise the minimum salary for postdocs, PIs don't have the funds to support this and end up having to hire fewer postdocs. Postdoctoral fellows are in an even worse position. Fellows bring prestige to institutions and alleviate their salary costs from PI's grants. Yet, fellows are not considered employees—rather, they are "independent contractors". This causes fellows to be taxed on funds that go to paying their health insurance costs (this is NOT income) and end up in a higher tax bracket, paying more taxes overall. Further, they often lose benefits because they are no longer "employees". This distinction between postdocs on a PI's grant and postdocs with fellowships is a ludicrous, technical detail that hurts fellows. Postdoc fellows are doing the exact same work they would be if they were still supported by the PI's grant, but somehow they are no longer employees? This could be fixed across all institutions, if the NIH were to alter guidelines for how NRSA fellows are treated (important note: some private fellowships already do this, so it is not "impossible").

Existing NIH policies, programs, or resources

NIH policies regarding fellows should consider them employees of their host institution. NIH should increase the minimum salary of postdocs, and perhaps needs a sliding scale based on local cost-of-life metrics. I understand this may need to come from Congress—the NIH needs more money, generally, to increase grant funding lines.

Proven or promising external resources or approaches

No response

Response 945

Perspectives on the postdoc roles and responsibilities

Starting point to become independent.

Fundamental issues and challenges

Salary.

Unable to focus on projects that are interesting to me.

Existing NIH policies, programs, or resources

I don't know much about policies.

Proven or promising external resources or approaches

No response

Response 946

Perspectives on the postdoc roles and responsibilities

As a PI, I see a postdoc as someone who is learning some new skills and concepts to supplement those obtained during the PhD in order to assemble a research path for their subsequent career.

Fundamental issues and challenges

Quality of postdoc life is much improved since my postdoc, when the pay had us living single, in group housing shared with roaches. Postdocs now have families. However:

1. The main problem with the postdoc experience is that there is no longer a reasonable expectation of a good job at the end. Universities are hiring adjuncts to teach 5 courses per year, with no job security and little opportunity for research. Companies are only hiring postdocs who have green cards or are citizens. So increasing postdoc pay is not a solution.
2. A second problem is that journals now want 5-10 person-years of work in a paper, whereas the postdoc needs a paper in 1-2 years.
3. As a result of these dim prospects, bright science students switch majors long before considering a PhD. Although at an Ivy League University, I see no American or Japanese postdoc applicants, few European (typically in the HHMI labs), and progressively fewer from China. Those from India are often weak or misrepresent their credentials. Central and South America have been good.
4. In general the quality of postdocs has gone down, particularly with regard to curiosity and critical thinking. So I don't think we need to fund more postdocs. We need to improve the selectivity and then training in the position.
5. If the postdoc is really a training position, we need to consider the trainee and his/her future rather than the PI's need for labor.

Existing NIH policies, programs, or resources

In the absence of being able to improve job prospects, a solution would be to return to the days where a PI spent time in the lab, assisted by a couple of grad students and postdocs rather than 10-20, instead of writing grants and filling in regulatory paperwork. This could be done by increasing the percent effort that grants can pay the PI to 40% and requiring universities to cover at least 20% of PI salary. This would

a) be better use of the many years of training that were spent on the PI, improving the thoughtfulness going into the project;
b) reduce the amount of PI time spent writing grants and NIH funds spent reviewing them; and
c) reduce the number of mediocre postdocs who go on to compete for grants by proposing safe projects that generate data but not new knowledge.

Proven or promising external resources or approaches

No response

Response 947

Perspectives on the postdoc roles and responsibilities

I view it as a job, not a training experience. Most postdocs are hired to work on a particular project due to their existing expertise. They deserve adequate compensation for their work, recognition as employees, and regular professional development opportunities.

Fundamental issues and challenges

Salaries are too low. Moving is expensive, especially for a temporary appointment. We should not stigmatize people for remaining in a specific geographic area, recognizing that it is destabilizing to move multiple times in the decade preceding a "permanent" job placement.

Existing NIH policies, programs, or resources

Raise NIH minimum salaries for postdocs. Allow fellowship recipients to benefit from existing federal funding related to their research (for travel or topping off salaries).

Proven or promising external resources or approaches

No response

Response 948

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as one designed to improve training and prepare a postdoc for a future career in academia or industry. I believe that being a postdoc means that you will receive mentored guidance on how to develop your own scientific research plan, implement it, and use said plan/experiment/data to generate a research plan for yourself moving forward to write grants, apply for industry/faculty jobs, etc. This is done within the context of the mentor's research so that there is some overlap, but enough new ideas that the postdoc can branch off into their own research while providing useful data and publications for their current mentor. It should be a mutually beneficial relationship between mentor and postdoc that covers both the present and future of both scientists.

Fundamental issues and challenges

While postdoctoral pay is an issue (particularly in expensive areas to live), issues extend greatly beyond this. Postdoc mentors do not benefit from a postdoc doing research to generate an independent grant. This means that the postdoc will leave and no longer produce for the mentor. This becomes a problem as work done for the postdoc's interests is unlikely to generate a new grant for the mentor, and possibly a lower impact/no publication that would benefit the mentor. The current wages also mean that even later stage postdocs do not make as much as a research scientist/research assistant professor, but likely produce as much or even more data for the mentor, leaving little incentive for the mentor to encourage the postdoc to leave. While it is understood that a mentor should be consistently encouraging a postdoc to acquire skills/data to move on, that is often not the case due to the aforementioned benefits for the mentor in keeping a postdoc. This often coincides with limited grant opportunities for postdocs as well. Speaking as a non-clinician, K01 grants are useful to both parties early on, but may not provide the postdoc with research on which they can build future grants as the K01 is connected to the mentor. More importantly, the K01 isn't even offered by many institutes of the NIH. This extends to the K99/R00 as well, depending on the mentor, postdocs have a limited opportunity at this grant (4 years) and not much else after this award. Only a few institutes offer the K22 grant, therefore if a postdoc does not have research that fits into those 2-3 institutes, they are left to fend for a job without any grant opportunities as a postdoc, but likely little on which to convince hiring committees of receiving a faculty job.

Existing NIH policies, programs, or resources

I believe that expanding grant opportunities would go a long way. For example, as an non-clinician eye researcher, I can only apply for K99/R00 grants as a postdoc. They do not offer a non-diversity/special interest K01 or a K22. This leaves very little opportunities in that field for non-clinician postdocs. I believe creating grants that provide both the mentor and postdoc with benefits would also help. For example, it could be included in the K01 that the postdoc must receive ownership of their project, preventing the mentor from possibly not allowing the postdoc from moving forward/out of the lab with it. Perhaps a mentor would receive additional funding if they have a postdoc who receives a K99/R00 or some other career transition award so that they too benefit (especially if a mentor has a postdoc that receives a faculty job). It's also possible that raising postdoc salaries (especially for later stage postdocs), will force mentors to allow/greatly encourage postdocs to receive transition awards due to budget constraints.

Proven or promising external resources or approaches

I am not sure if there are any current promising resources. I believe that postdocs are receiving good training and mentoring on the scientific level, but it is severely lacking in career trajectory impact. Job satisfaction would certainly be improved through increase pay, but outside of this, postdocs need more protection of ideas and opportunity to leave the postdoc for improved academic roles. It is widely understood that a postdoc who accepts a non-tenure track job has difficulty getting independent grants funded, as review committees will attribute the ideas to the mentor/PI not the research assistant professor/recently "promoted" postdoc. Therefore, funding mechanisms need to reflect that and provide postdocs/young research assistant professors/scientists with opportunities to secure independent funding. Without these mechanisms, there will continue to be a decline in postdocs for career paths that provide increased pay and job security/promotion opportunities. While the NIH is unable to directly alter faculty hiring practices, they can provide more/better opportunities for postdocs to acquire independent funding and protection of postdoc's ideas/future research so that a postdoc cannot be restricted (either inadvertently or, unfortunately, on purpose) by a mentor, and allow talented postdocs the best chance possible to advance their career as an independent scientist.

Response 949

Perspectives on the postdoc roles and responsibilities

Further training in an area of specialty or related methodology.

Fundamental issues and challenges

I'm a Latinx woman who just accepted a faculty position. Prior to that, I wanted to apply for a K99 to stay at the institution where I'm completing my pre doctoral residency. I was told I couldn't submit a K99 without a doctorate and after emailing several POs, was told there were no exceptions. I had already obtained an R36 and have 90 publications and the work required to obtain an F32 compared with the compensation was not something I could afford.

Existing NIH policies, programs, or resources

1. Higher salary for postdocs.
2. Change submission requirements for K99. Why couldn't I submit a K99 at the institution I was planning to stay at for postdoc?
3. Offer a predoc + postdoc training grant—the F31 & F32 individual mechanism is highly inefficient.

Proven or promising external resources or approaches

No response

Response 950

Perspectives on the postdoc roles and responsibilities

I have staffed my lab with foreign postdocs for nearly 40 years. I have had only 2 US postdocs in that time (they did not apply). I believe I have hired over 50 people over the years. I have had some wonderful people and I very much enjoy the interaction with them. They also bring skills that are not in the lab. My view is that it is a mutually beneficial arrangement. I give them the opportunity to learn new skills they want to learn (I ask) and also the opportunity to move forward in their careers by showing productivity during their time with me. During this time, most have been able to publish well with me, and no matter what they choose to do next, this shows they can take a project from the beginning to the end.

I expect independence from them in setting up and interpreting their experiments and I believe a postdoc with the right skills for the lab should be able to create a starting protocol from the literature.

Fundamental issues and challenges

In 2022, I realized that it is no longer possible to recruit foreign postdocs who can work independently and be productive. I had one postdoc who was extremely bright but essentially hated bench work; she just didn't do it, for nearly three years. After she left—someone actually hired her without my recommendation—I hired two others who I found totally lacked basic research skills, and I let them go within months (both immediately found other jobs, since I brought them over to this country). There is clearly a place for everyone, but I myself can't work with highly dependent postdocs who cannot absorb new information, ie don't read our publications or new ones in the field.

I now staff my lab with college graduates who perform very well as technicians; I do not expect postdoctoral level engagement. While I know I have only a few years before they leave for grad or med school, these people do have the passion, the intellect, and the work ethic that I expect. But the high turnover will be costly for me in terms of training time.

Existing NIH policies, programs, or resources

NIH needs to increase the size of grants to increase postdoctoral salaries to be competitive with industry: at least 70K to start and finishing at 90K. This would draw people back to academic research.

NIH AND host institutions also need to realize there is a place in research for the semi-permanent research staff—research assistant professor—who should start at 100K. Again, grants have not increased in size over time to accommodate this.

Proven or promising external resources or approaches

I think the yearly mentor reports in the grants (also required by my university) adequately address the mentoring aspect. The working environment is difficult to control as it varies from lab to lab. Job satisfaction usually relates to productivity, personal interactions—and also salary. It should be possible to have children on a postdoc salary.

Response 951

Perspectives on the postdoc roles and responsibilities

Cheap Labor exploited for their love of science.

Fundamental issues and challenges

Recruitment: Money. There is no other reason why fresh PhD holders want to not join an academic postdoc.

Retention: Working hours are non-existent. PIs are not always supportive of the Postdocs growth. Cannot afford a livable wage, especially if the postdoc is the sole earner of the family.

Quality of Life: Postdoc salary is barely enough to pay rent for a 1 bedroom apartment in a class A or class B city in the USA. weekly outings, movies and other social activities are out of the question unless they are free/paid for by the University or the PI.

Existing NIH policies, programs, or resources

Mandatory increase in NIH stipend amounts for Postdoctoral fellows to $80,000 plus benefits as the baseline. This is the amount industries are paying a postdoctoral fellow or junior scientists in their labs.

Removal and banning of J1 Visa programs that employ foreign postdocs at lower than NIH stipulated salary wages, especially when their grant is being funded by an NIH grant. This allows for a fair pay for all postdocs removing preference for foreign cheap labor over local talent.

Proven or promising external resources or approaches

There is literally no reason other than MONEY why postdocs do not want to join academia. Increase the stipends and the students will flock to academic postdocs over industries. Academia is a lot more chill and satisfying over industry postdoc. Students will want to be in academia and nurture basic science ideas over purely translational ones.

Response 952

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are important aspects of my laboratory research. The experience that they enter with provides a great foundation for me to help them learn how to think about science broadly and for their future careers.

Fundamental issues and challenges

Limits on funding due to R01 funding limits and low paylines

Lack of structured training experiences in academic settings

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Structured training experiences in academic settings similar to those that exist for graduate education

Response 953

Perspectives on the postdoc roles and responsibilities

An academic postdoctoral position is a professional research science position and should be treated as such. The current postdoctoral situation allows mentors to treat postdoctoral researchers as essentially glorified graduate students, and that should not be the case. Academic postdocs are highly educated researchers who should be conducting research aimed towards developing scientific skills to transition to industry or conducting research to lay the foundation for their own lab. These are highly skilled individuals trained to a high level conducting research projects that have the potential to change human health, and they should be treated and compensated as such.

Fundamental issues and challenges

This is largely a financial issue. Starting salaries in industry can be more than 2x a postdoc salary, and with excellent retirement packages. The overall pay for postdocs is horrendously low for the amount of training PhD's receive, and by the time people finish their post-graduate education they should not be expected to wait another 3-5 years to start receiving retirement benefits. Furthermore, the postdoc system is largely abusive, and unless you get a lucky with a good mentor, you run the risk of being subjected to unrealistic expectations and required to work an excessive number of hours, with the mentors virtually held to no standards for work-hours.

Existing NIH policies, programs, or resources

Increase starting salaries to align with industry standards (95k starting salary). Consider postdoctoral associates full-time faculty at institutions, eligible for all institutional benefits, particularly retirement benefits. There should be strict regulations regarding work hours so that way trainees are not required to work an unreasonable number of hours for little pay.

Proven or promising external resources or approaches

More money. More benefits. More oversight to prevent mentors from abusing postdocs time. Quite literally pay people what they are worth and have a system with clear rules to prevent abuse, and more people will be interested in taking a postdoctoral position. These are highly educated people who want jobs that are commiserate with their training and experience, and the current postdoc positions are woefully behind the curve on this.

Response 954

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a period that allows for additional training and development as an independent scientist. More responsibilities are given as well as some potential additional research freedom depending on the funding source and PI. Additional responsibilities include increased supervision and mentorship, increased role in the development and execution of the project, and may include additional administrative tasks.

Fundamental issues and challenges

Funding is a major challenge. Although postdocs are payed more than grad students, they no longer fit the role of student and the additional protections and benefits that those entail. Despite this, it is still considered a training position and therefore temporary and often not provided the support structure that a student or faculty role may offer within an institution. This includes lack of support or direction regarding benefits, training on proper mentorship (which is a major role of the position), and support in obtaining funding and how the different funding mechanisms may impact their pay, benefits, employment status, and more. Unless the trainee is in a large lab group or department with interaction between groups, there may not be much peer support if there is no institutional support mechanism in place. Furthermore, the dearth of academic positions means that most postdocs will remain a postdoc for many years unless they are extremely lucky or consider roles outside of academia. Training and information about non-academic roles is growing, but many of these positions also may not require a postdoc experience to be hired. This leaves the postdoctoral research position superfluous unless the individual is strictly focussed on a future in academia or some other similar research role.

Existing NIH policies, programs, or resources

NIH webinars are helpful in providing insight into available opportunities and support. IDPs, when implemented correctly can be helpful to ensure both the trainee and supervisor are aware of developmental and career goals as well as how they might be accomplished. However, this is not universally adopted, especially if there is no NIH funding involved to require these plans.

Most corrections I can think of are more at the institutional level having come from a university with more developed graduate student and postdoc support and tranistioning into a postdoctoral position which is only beginning to try to develop these support structures.

There is a large gap between the academic postdoctoral pay and salary that might be earned in industry or even state or federal government. This makes it unfeasible for many especially if they have already delayed their income earning potential during the time in grad school.

Proven or promising external resources or approaches

I have found some training and developmental opportunities to be effective, such as "What can you be with a PhD" in NYC or other similar seminars or workshops on career related training and support.

Response 955

Perspectives on the postdoc roles and responsibilities

The postdoc is not well defined which can lead to mismanagement. My postdoc position currently resembles what my PhD looked like and therefore makes me feel like I'm just doing a second PhD. Even though the positions I am training for include managerial roles which I get no formal training on. Because we are over skilled and underpaid that means we are easily taken advantage of. Often it feels like we are just here to work and the "training" for our career development is secondary.

Fundamental issues and challenges

1. We are underpaid.
2. Our position is not clearly defined
3. Vacation policies at Universities for postdoctoral trainees are not generous.
4. Healthcare is costly and adding a spouse or children is inhibitory.

Existing NIH policies, programs, or resources

F32 postdocs should be employees. There are many financial consequences of us not being employees.

Proven or promising external resources or approaches

No response

Response 956

Perspectives on the postdoc roles and responsibilities

As a Postdoc I want to shape my skills as a future PI and learn to develop projects and ensure money and support for me and my colleagues ideas. I do believe that my responsibilities as PostDoc to supervise Master and PhD students as well as spearheading my own project while representing my lab to outside funding agencies and potential collaborators, give me the possibility to do that. I strongly believe that people look to me as a more experienced scientist for guidance and advise not only on a scientific, but also on a personal basis, as the academic curriculum can be challenging and sometimes overwhelming. I strive to be helpful in the lab and improve protocols and schedules in the lab in order to prevent misunderstandings and ease everyones work. In general I think a huge part of my work is to keep an eye on the bigger picture and try to broaden our view on how our work fits into the recent advances of the field. This is directly tied to making sure we can win over funding agencies to finance my colleagues and my work.

Fundamental issues and challenges

As a Postdoc in the Boston area I am mostly struggling to make ends meet because life expanses and especially the rent for a one-room apartment is simply ridiculously high. More than half of my salary goes into paying rent and this simply does not relate to the amount of work I am doing in the lab (including weekends, holidays e.g.). It feels like I am continuously being confronted with the fact that friends my age that decided to pursue a career in industry are earning more, working less hours and receive more appreciation for what they do. Me not being able to save up money makes me rather worried about pension and keeps me from being able to pay even for a small vacation, which I could really need. If it wouldn't be for my inredibly amazing PI, I would feel rather left alone on how to found your own group and how to take first steps into becoming a PI myself. On that note I am continuously confronted with other PIs that don't seem to respect the work of PostDocs in general, which adds on the feeling that the exhausting work we love is neither taken seriously nor is it appreciated.

Existing NIH policies, programs, or resources

Increase salary

Extend pension programs

Introduce a system of mentoring that is not solely dependent on the own PI but rather a network of people that ensures different perspectives

Increase seminar series or workshops that prepare Postdocs for PI positions

Encourage and support presence at international conferences, since collaboration and science communication is essential for new groundbreaking developments

Encourage and support cooperations with the industry further to ensure projects find their way into the clinic faster and in closer cooperation with the people that developed and are passionate about them

Proven or promising external resources or approaches

Increasing the salary!!!!!!!!

Response 957

Perspectives on the postdoc roles and responsibilities

In my opinion, postdoctoral positions are designed to overwork the postdoctoral scientists (PDs) with very little pay. There are not enough teaching position available for the amount of post docs in the market which ultimately leads to the PDs being a work force that is abused in the academic setting since not very low percentage of PDs end up getting a faculty position.

Fundamental issues and challenges

There are always been a PD retention issue but it was more evident after the pandemic since the amount PDs are paid to do their work is minimal. With the on going inflation and barely any change in PD salary, no one should really be surprised that recent graduates are not going into a post doc position. Additionally, PDs are not applying for a faculty position and not wanting to stay in academia. Money is not the end all be all issue. Even if there was a raise in PD position, there may not be an increase in retention rate because of what comes after post doc. PDs have to fight tooth and nail to secure a faculty position and even if they do end up securing a faculty position, it is not secure. They have to constantly apply for grants. The percentile threshold for grant funding is getting lower and lower. Due to all these issues PD positions are not very enticing.

Existing NIH policies, programs, or resources

More funding opportunities for international post docs, not just the K grant. Since non-citizen PDs cannot apply for F grants, their likelihood of getting a K grant decreases. MORE FUNDING!! Can't stress that enough. More funding at all levels. R grants so that faculty members don't have to struggle to get a grant. More funding to institutions so they can retain more faculty members and post docs. Higher salary for post docs! There are a lot of international post docs, please make it easier for them to get to the next phase of their career. Solicit suggestions from them. Hold a virtual town meeting. Ask them what they need from the NIH

Proven or promising external resources or approaches

See the prompt above

Response 958

Perspectives on the postdoc roles and responsibilities

The purpose of the academic postdoc is to develop the skills to transition from bench scientist with technical capabilities to PI that can initiate research and run an academic lab.

Fundamental issues and challenges

One of the largest issues pressing recruitment of postdocs is the indefinite length of the position. Postdocs are becoming longer and typically now go 4+ years. It is difficult to take a job that pays way less than industry and has no true end in sight on when the next promotion/pay bump will occur.

Existing NIH policies, programs, or resources

The NIH and academic postdocs already have standard raises. Make the raises significantly higher after the 3rd year but lock in their positions and guaranteed funding for 5 years. This will make 4th and 5th year postdocs significantly more costly and will encourage academic institutions to recruit candidates after the 3rd year.

Proven or promising external resources or approaches

No response

Response 959

Perspectives on the postdoc roles and responsibilities

I started the academic postdoc as a "natural" route to advancing my research career, but soon find that there is no prospect at all. I do not see myself becoming an assistant professor and fretting over someone borrowing 1 mg of ampicillin, or a well-established professor chasing after their postdocs and students to generate data everyday. The research scientist position in the academic environment is simply a "stable" version of postdoc, swearing loyalty to their masters for the rest of their lives. The academic postdoc is like a research nomad, wandering everywhere to find a greener pasture.

Fundamental issues and challenges

1. Low pay—spend half of your wages to rent an apartment in the city (close to work), a quarter for a shared room, or commute 2.5-3 h every day to work. Talk about reducing carbon emissions?
2. Fringe benefits—no 401k, minimum healthcare benefits, ineligible for all regular staff benefits.
3. Temporary staff contract—forget about getting a loan because there is no payroll.
4. Unreasonable expectation—why do bosses like to give postdocs the guilt of not working till late at night AND on weekends while they take 3 weeks' vacation after an "exhaustive" school year?

Existing NIH policies, programs, or resources

A postdoc with grey hair and wrinkles is worrying about his future after his mentor's lab shuts down. He told me that his skills are outdated for academia and the industry does not like long-time academic postdocs. I feel sorry for him and worry about my future too. Time to consider career transition.

Proven or promising external resources or approaches

1. If postbacs are not trainees, but have a "title" of research assistant; why are postdocs "trainees" and not get any staff benefits?
2. Even though not everyone might be good at running labs, we are trained to do research independently. Why can't we take advantage of shared facilities and get small grants to have that little financial freedom to conduct research of our own interest?
3. Public school teachers get professional training on teaching. Professors should get professional training on mentoring too!

Response 960

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a training position that people use after the PhD, MD or similar to consolidate research skills, acquire maturity, acquire new or diversify expertise, and prepare to transition to an independent job, which could be an academic position, and industry position, government, education, etc.

Postdocs are responsible for planning and conducting research with minimal supervision from mentors, writing grants and fellowships pertaining to their research topic, train younger members of the lab, and preparing for their own professional career.

Fundamental issues and challenges

Fundamental issues associated with the postdoctoral training that affect recruitment, retention and quality of life of postdoctoral trainees are: low wages, lack of stability, salary insecurity, salary inequity, lack of mentoring, absence of career development programs, and migratory uncertainty.

Most postdocs enter the system after PhD without a realistic plan of where they are headed professionally. The few faculty positions available for postdocs are taken by a slim fraction of trainees, leaving the system overpopulated by highly trained professionals without a clear perspective. Because of the low wages that postdocs are paid, they become a valuable asset for the labs, that don't see a real reason to push them to move on. Consequently, an aged postdoc population starts to have additional needs such as familiar commitments and a grim retirement perspective.

Individual labs or even institutions have very little power to correct this situation on its own. The NIH recommended pay scale for postdocs under the NRSA -which are followed by many research institutions does not contemplate adjustments depending on the state or city of residence. Individual attempts to correct that situation creates inequities, and hence institutions resist them.

In addition, a vast majority of postdocs who are foreign and depend on visas that tied them to institutions do not have the same capacity to negotiate salaries with the PIs. Data is missing with regards of wages in comparable positions of J1 visa holders vs US persons (citizen and/or green card holders) but it is reasonable to suspect that US persons make more money on the same position than a J1 visa holder.

Existing NIH policies, programs, or resources

Several changes can be implemented to improve the status of postdocs. Without trying to make a comprehensive list, I consider that huge improvement can be achieved by pointing to two key aspects: salary and migratory situation.

NIH R01 and similar federal grants should allow budgeting more money for postdoc salaries, by increasing the direct cost of the grant. Additional measures should include extending fellowship programs such as T32 or T31 to non citizen scholars. Extending access to mentoring and career development programs can be helpful to help postdocs identify career opportunities earlier and help them come closer to their professional aims.

Migratory situation can be improved by simplifying the visa system. While some of this may be outside the competence of the NIH, if institutions can issue visas for longer times that can help bring some stability to visa holders. Specially in the case of J2 dependent visas, which depend on the J1, this is very helpful in maintaining jobs, avoiding unnecessary paperwork, etc.

Proven or promising external resources or approaches

Getting in touch with postdoctoral associations from institutions or professional organizations, and using scholarly published data.

Response 961

Perspectives on the postdoc roles and responsibilities

I think post-doc can be an important continuation of the extensive training we have already received. It's an opportunity to build collaboraitons and begin an independent program of research.

Fundamental issues and challenges

To put it simply, and bluntly, after years of sacrificing time, money, relationships, it feels exploitative to continue making very little money. There are also institutional barriers that increase the costs that fall on our shoulders. For instance, my institution does not withhold taxes from my stipend and offered no tax support or counseling, so I incurred a fee from the IRS because I did not know I needed to pay taxes quarterly. My health insurance supplement comes from my research fees, which means I have less money for research in order to have health care. We are exceptionally well qualified scientists and we are still not receiving the financial support we need to thrive after years of training. We have loans, and not everyone has the distinct honor of receiving an LRP award. The field is pushing to increase representation of historically underrepresented people, and yet the only way to move for internship or post-doc is to come from a wealthy family or incur more loans. It all starts earlier down the pipeline. The graduate and internship stipends are too low. The post-doc stipends and benefits are too low. I'm not even considered an employee of my university (a prestigious and research heavy institution, mind you). The VA has at least acknowledged this in recent weeks and it's still not enough.

Existing NIH policies, programs, or resources

We need to be treated like scholars and staff of our universities. We need benefits and privileges that are commensurate with our training. My peers and colleagues are leaving the field to pursue careers in industry, where they are valued and paid more. My peers and colleagues are applying for faculty positions right after internship because they are that strong and competitive, why would they stay back and earn less and be undervalued as a post-doc? I understand that given the different fields represented at NIH, the definition of a post-doc is wide ranging. However, it is almost insulting that NIH provides a salary for post-docs that are 7 plus years post graduation. And the salary is still so low even for them.

Proven or promising external resources or approaches

I think this RFI is a late, but good first step.

Response 962

Perspectives on the postdoc roles and responsibilities

Post-doctoral fellows are the most important workforce in the biomedical research community. All hospital and medical school based research institutions rely completely on post-doctoral fellows to move the research forward in new and exciting directions. Without them, biomedical research will fall apart leaving research only to teaching universities, which do not have the clinical exposure/expertise that is needed to solve "real world" problems.

Fundamental issues and challenges

In the field of computational and quantitative sciences (including engineering), there are several challenges which I list below:

1. Phd graduates from these disciplines are increasingly attracted to the industry (which is a good thing as well). This is because, academic environments are not as attractive anymore. The starting pay for these post-docs or newly minted Phds is close to the NIH max for an established PI (about $210K/year). Thus, there is little incentive for them to join as post-docs where the salaries are around 50-70K/year.
2. The lure of academic freedom to pursue the dream drowns in-front of these fat salaries.
3. With less access to top class PhD graduates, the workforce is increasingly becoming less innovative as people who are not really interested in research are joining the workforce and thus are not so motivated to generate new ideas. This trend will have a long lasting effect on the quality of research and the leadership of USA in biomedical research.
4. Since the modular NIH budget is $250K/year and max is $500K/year —which has been fixed since 1999, yet the purchasing power by 2023 has gone down by 78% ! Unless we are able to increase the NIH grant budget (beyond $500K/year), we will not be able to increase the post-doc salaries to make it attractive for them to join the academia.

Some potential solutions:

1. Increase upper limit on NIH grants with commensurate increase in post-doc salaries.
2. Provide long-term K grant mechanisms for post-docs as well as senior faculty with 10 year grant cycles, which will provide a much better stability than current 5 year cycles. Such long-term grants will also fuel new risks and innovations that are not possible with the current grant system.

Existing NIH policies, programs, or resources

Some potential solutions:

1. Increase upper limit on NIH grants with commensurate increase in post-doc salaries.
2. Provide long-term K grant mechanisms for post-docs as well as senior faculty with 10 year grant cycles, which will provide a much better stability than current 5 year cycles. Such long-term grants will also fuel new risks and innovations that are not possible with the current grant system.

Proven or promising external resources or approaches

No response

Response 963

Perspectives on the postdoc roles and responsibilities

I view an academic postdoctoral position as a stepping stone towards a faculty position or an opportunity to gain further skills and expertise before transitioning outside of academia. The specific responsibilities should align with the fellow’s career goals and IDP.

Fundamental issues and challenges

The pay is not proportional to the skills or level of training; the position is short-term and therefore unstable with no guaranteed job afterwards; a postdoctoral position is often unnecessary for a position outside of academia, which means that it is more time where we are earning less money despite being highly skilled and educated; not always guaranteed to have more freedom in area of research/field of study.

Existing NIH policies, programs, or resources

It would be great to have more resources for positions outside of academia and how to attain those positions.

Proven or promising external resources or approaches

At present, it seems that most postdoctoral fellows are still expected to apply to faculty positions. Potentially reframing this expectation and providing more career resources to postdoctoral trainees could be helpful, or partnerships with non-academic agencies and companies.

Response 964

Perspectives on the postdoc roles and responsibilities

Academic postdoc is a role which specializes in research, being responsible by advancing in a certain field and/or topic.

Fundamental issues and challenges

The main challenge is compensation for work, which is low when accounting for inflation and recent increases in prices of overall life.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 965

Perspectives on the postdoc roles and responsibilities

The postdoc position is a time for me to gain some training in specialized technical and career skills. It is a time to develop my hypothesis and projects to be able to take them to the next stage as an independent research faculty.

Fundamental issues and challenges

Things that make me want to get out of academia are: Lack of support in covering benefits, Feeling devalued or degraded when the institution retains rude and inappropriate faculty, and knowing I may have to move far from my family and support system in order to get the career that I want.

Existing NIH policies, programs, or resources

NIH should include additional financial support to cover our health insurance, retirement payments and other required institutional payments they take from our paycheck. This will allow us to keep the intended salary equal to our foreign colleagues and maximize research funds.

Proven or promising external resources or approaches

The MOSAIC/K99 model. NIH provides annual grades to institutions and departments to give postdocs an idea of how supported they will be. Requiring institutions to fire faculty who degrade and harass students and postdocs. Require institution to pay 30% salary for insurance & benefits for fellows.

Response 966

Perspectives on the postdoc roles and responsibilities

I'm doing my second postdoc in the US and for me it means getting more and more independence and shaping my path for an assistant professor position. It means intellectual freedom and excitation about science

Fundamental issues and challenges

- Job insecurity since there is no fix scientist positions in US universities, that impacts on retention (and quality of work)
- We could be paid 2-3x more in the private and let's face it, if we have a family, the salary is not enough for people with the highest university degree
- The fact that we are considered as trainees is offensive, we are scientists, not trainees! What are we training for?
- One thing the NIH can not do anything about but the politics and social and societal issues in the US are discouraging international scientists to come especially women

Existing NIH policies, programs, or resources

I am personally not aware of any programs

Maybe a grant exclusively for postdoctoral scientists to acquire some preliminary data on their own to go into an R21 and get more independent

Proven or promising external resources or approaches

No response

Response 967

Perspectives on the postdoc roles and responsibilities

A postdoctoral position while touted as a training position is rarely one. I expected it to be one where I further honed my research skills, learned grant writing, lab management skills, skills to mentor and guide a students project, and setup collaborations that will help me setup my own lab.

Fundamental issues and challenges

I (and a majority of postdocs in my institution) are treated like high skilled technicians who are in the lab to finish projects and can be financially exploited under the guise of being called a trainee.

1. Exploitation of immigrant status
2. Low pay, no defined hours
3. No institutional or NIH oversight to prevent PI abusive behavior and harassment
4. No institutional or NIH support for parents
5. No PI repercussions for not providing mentoring

Existing NIH policies, programs, or resources

1. Ask for letters from previous postdocs of PIs when they submit grants. Ask the trainees to comment on if and how they received mentoring and support. Create another metric for scoring R01s or other grants : mentoring! Rate them on a scale of 1-10. Make mentoring the first priority when scoring investigators on R01s or other grants. A history of where postdocs from a lab end up is NOT a sign of mentoring. Many postdocs find other mentors in their careers who help them more than the PIs themselves. So just looking at history ends up giving false credit to PIs that transition a lot of postdocs to successful careers but dont do any of the mentoring themselves. Ask the previous postdocs for letters. We will be honest! This is also a method to equalize the skewed power structure in academia that leads to a lot of abuse. For new PIs without previous postdocs to offer letters, institute the requirement of a postdoc mentoring statement like facilities and resources statement when submitting grants.
2. Provide small grants for postdocs who are expectant parents: A lot of PI abuse occurs around the time of child birth when projects are suddenly reallocated or the annual contract extension for postdocs suddenly is in peril. Institute NIH policies of family leave for anyone supported by an NIH grant irrespective of institutional policies.
3. NIH providing institutions with overhead costs for 5 years should ask that institutional postdoc contract policies are for 3 or more years to prevent abuse and immigration status exploitation.
4. Improve the pay scale. A postdoc making $40,000 in NYC or SF is living well below the poverty line. With a Ph.D.

Proven or promising external resources or approaches

No response

Response 968

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions, in my view, are intended as a middle step where they focus is growing in the areas that a faculty member requires (learning additional technical skills, learn/practice grant writing, and potentially mentoring) while also completing research projects semi-independently. This position is meant to be mentored not just casting postdocs free into a lab with no support as though they were just staff scientists. If institutions still insist on referring to postdoctoral scholars as ‘trainees’ then they are beholden to provide and make time for training. Postdoctoral positions are meant to be a time to learn and do research; not a time to spend excessively long hours working on other people’s projects with no recognition for their efforts.

Fundamental issues and challenges

There are many fundamental issues with the postdoctoral experience in academic research. Postdoctoral positions are extremely underpaid given the actual number of hours worked (much greater than 50). This leads to financial stress as well as quality of life deterioration as postdocs have very little time for non-lab related things (family, friends, hobbies). As postdoctoral associations have become more vocal about the low pay, long hours, high stress, low quality of life, transient nature of the post, lack of academic positions open, and little recognition, graduate students are becoming deterred. The compensation simply is not there the way that it is with industry jobs that are less stressful, pay more, have fewer hours, and actually treat PhDs as humans.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

I think the NIH should survey all of the postdocs it supports and ask about actual working conditions. Recruitment is unlikely to go up if actual conditions remain as they are.

Response 969

Perspectives on the postdoc roles and responsibilities

This is a training opportunity for postdocs, so it should be guided by what training they want to get. It often involves writing lots of papers and early career grants.

Fundamental issues and challenges

Graduate students don't make a lot of money. Committing to another time chunk of time with a low salary when they could be making a lot of money in industry is a hard sell.

Having postdoc positions that transition into faculty would possibly help.

Many graduate students see the culture of academics as unappealing. There's an individualistic cut-throat culture in many departments with a lack of work-life balance and mediocre pay. They get the impression that they could work less in industry (often not true) and get to do similar work with more pay. They worry about their mental health in academics.

Existing NIH policies, programs, or resources

More pay

More programs & grants that facilitate transitioning at the institution where they are doing a postdoc to tenure-track faculty

Acknowledgment in the K/early career awards that many faculty positions are dependent on the person getting that award. It's silly that everyone knows it's how it works, yet they have to write the letter that the position is in no way dependent on that award. Rarely true.

Fund programs that facilitate recruitment of postdocs—maybe fund regional events where one large institution hosts graduate students and faculty who are interested in getting a postdoc and both sets of people can give lightning talks about their work

Proven or promising external resources or approaches

No response

Response 970

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are well trained scientists who can conduct independent research, and the impact and scope of their work is strengthened by working in the lab of a senior scientist with greater funding, resources, and experience than the postdoc themself. The postdoc is a senior trainee, whose training is more targeted towards mentorship, professional development, and highly specialized technical training, but not in the foundations of good science.

Fundamental issues and challenges

Funding/fair compensation. Postdocs hold doctorate degrees and are experts in their field. They also are typically in their late 20s to 30s, a period of life where securing financial and familial stability is important to most. NIH fellowship rates and most institutional payscales do not fairly compensate postdocs for their experience or expertise, and the gap between these rates and those offered in the private sector is now so large as to make choosing a postdoc over an industry position nearly indefensible. Meanwhile, the return on investment for this underpaid position is commonly the hope of a tenure track faculty position. These are too competitive and the funding rates and personnel needed to sustain them are also very difficult to

achieve or maintain. This creates a cost benefit equation in which both the financial and personal costs to the postdoc commonly exceed the potential benefits of seeking or even securing an academic position.

The increasing demand for more and more figures and data per publication also means these unfavorable positions take a longer and longer time to complete, which doesn't work for fellowships with their current limited eligibility timelines.

Finally, academia is perceived as only accessible to specific demographics. Limited diversity justifies this perception, and also limits the range of viewpoints of those trying to make it better.

Existing NIH policies, programs, or resources

Higher pay scales for F32 and K99 fellows, bringing them to greater or equal to the 80th percentile of first year compensation rates for PhDs entering biotech industry positions.

Longer periods of eligibility, such that postdocs can apply for the F32 until their 4th or ideally 5th year of postdoc (not after graduation), and can apply to the K99 until their 6th or ideally 7th year. Senior postdocs in the current scientific climate should not be penalized/excluded from these mechanisms.

Extending and increasing slots for postdocs on training grants.

Extending and increasing slots on fellowship programs to increase diversity.

Structured mentorship and training support for fellows, including a once-annual conversation with the PO or other institute representative to discuss the fellows career goals, and a once-annual networking session with other fellows.

Proven or promising external resources or approaches

I'm not sure what is meant by external resources in this context. Assuming it's money: not to be glib, but perhaps we should all be seeking private philanthropic sponsors for our postdocs and research programs. It's clear there's an unsustainable mismatch between the large increase in resources required to adequately recruit, support, and retain postdocs and what can be eked out from existing budgets.

Response 971

Perspectives on the postdoc roles and responsibilities

To me, the postdoctoral position meant an opportunity to receive additional training while having the opportunity to manage multiple simultaneous projects. Unfortunately, this was not the experience I have received and hence feel like the postdoc only held me back rather than helped to push me forward in my career.

Fundamental issues and challenges

The amount of money that postdocs make is laughable, how are we expected to pay off student loans, raise a family, pay bills, buy food when we are making wages that quite frankly feel like we are low income individuals. You cannot expect to retain and maintain scientists who have been training for 5-6 years getting paid minimum wage to then go into a position that does not respect them as research scientists, the pay speaks volumes to how we are not respected as scientists.

Existing NIH policies, programs, or resources

Pay postdoctoral research scientists wages that will allow them to pursue research and not be stressed out about whether they will have enough money to cover the growing costs of life in the USA. Provide scientists with support throughout the application process for TT positions. And for those who are not interested in academia, provide avenues for them to receive support in their application process as well.

Proven or promising external resources or approaches

Improve postdoctoral pay and you will be able to recruit and retain more diverse scientists. Those of us who do not have family who can pay our rent will be the first to go when there is an opportunity where we feel valued and respected as scientists.

Response 972

Perspectives on the postdoc roles and responsibilities

It is position that should prepare you to become a PI or an independent researcher. This should include developing your research field and the research you want to pursue. But also it should include training on writing grants, writing papers, type of grants you should apply, people management. None of this areas are currently cover in a postdoctoral training except for the research part.

Fundamental issues and challenges

LOW SALARY (borderline with disrespectful). Long hours you have to put for work. The insane amount of competition for the grant. The ridiculous amount of work you have to do beside research, such as teaching, serving administrative positions in academia, thesis committee, study section. We are doing more and more work for the same pay.

This left you with almost no time if you want to start a family, and rise your kids properly and not as an absentee parent.

Existing NIH policies, programs, or resources

Fix the amount of money in a grant that should be pay to the postdoc, that way is not just whatever the PI wants to pay.

Increase writing training (grants, papers, books)

Increase the number of positions available for continuing in academia. Why would I spend 5 years in a postdoc if I know there is no room in the next step of the scientific carree

Proven or promising external resources or approaches

No response

Response 973

Perspectives on the postdoc roles and responsibilities

This is typically a first 'job' after graduate school. As such, I believe that postdocs should be fairly paid and be classed as 'employees'. This means that they are eligible for benefits (health care, paternity, retirement, vacation, etc), which many Institutions still do not provide. Some PIs expect postdocs to be the ones training grad students in the lab, which is great experience, but postdocs should be paid for this work (which the faculty member should in theory be doing since they are paid for it).

Fundamental issues and challenges

Current NIH stipends cannot compete with starting salaries in biotech. I was recruiting a postdoc at entry level (~$53k) and she ended up with a biotech position that started at $85k. My Institution abides by the NIH stipend levels and would not let me offer more $ to try and get her recruited.

Our Institution treats postdocs paid by stipends (those on training grants, NRSA, etc) differently than those paid by wages (typically off a R01). Differences include vacation and sick time (determined by funding source, not the Institution), not eligible for Health Savings Accounts, they are eligible to contribute to retirement accounts, but on post-tax base only—there are no pre-tax benefits allowed. ALL of these add up to less $ in the bank accounts of postdocs who are on a stipend. These postdocs are meant to be elite having successfully competed for their own funding/T32, yet they are treated as 2nd-class due to these rules/regulations.

Existing NIH policies, programs, or resources

Changing policy to make postdocs 'employees' (not trainees) would allow them to be paid competitive salaries with benefits. This is important since many postdocs are child-bearing age and would then be eligible for many more benefits to care for their newborn.

Proven or promising external resources or approaches

Simply changing their title from 'trainee' to 'employee' would make postdocs immediately feel more valued.

For all postdocs on NRSAs/T32, provide an annual retreat from NIH with workshops to cover fundamentals such as how to write grants, RCR, setting up your first lab, managing people, etc. It would be very attractive for postdocs to learn concrete skills, while networking with other postdocs and meeting folks at NIH.

Response 974

Perspectives on the postdoc roles and responsibilities

Postdoc position is an wonderful opputunity for research motivated individuals and also allows us to work more closely with our PIs. The close association with PI provide a better insight to present yourself for next stage of career (academia or industry). Postdoc can run their lab, project and ideas, which is unique and fascinating in any job.

Fundamental issues and challenges

Challenges:

1. Low salaries and benefits as compare to cost of living
2. Strict visa conditions for International postdocs
3. Unequal finding opputinities to all postdocs, irrespective of citizen status
4. Low resources for faculty/industry transition
5. Travel grant/skill development programs are scarce.

Existing NIH policies, programs, or resources

1. As an international postdoc, we have very limiting options for grants and other competitions compared to US citizens. This imbalance hinders postdoc from staying as postoc in academia as it might not be fruitful in terms of faculty transition.
2. Visa conditions for postdoc is very strict. Most of the universities offer one year visa (each year), which limits scholars to meet and see their family in case of emergency (as renewing a visa is challenging in most of the countries)
3. Salaries and benefits are comparable to employees having much lower qualifications/skill sets, which makes it less apt career option.

Proven or promising external resources or approaches

Suggestions:

1. Increased salaries and benefits
2. Relaxed visa conditions for International postdocs
3. Equal finding opputinities to all postdocs irrespective of citizen status
4. Better resources for faculty/industry transition
5. Travel grant/skill development programs.

Response 975

Perspectives on the postdoc roles and responsibilities

It is what I expected it to be. I mentor student/technicians, plan experiments, teach, and start my own projects.

Fundamental issues and challenges

The only issues is not having enough time to do everything but that’s an issue with myself and not academia in general.

Existing NIH policies, programs, or resources

Honestly i know few other postdocs and I would like to know more of them. Again more of my own problem and not the NIH's.

Proven or promising external resources or approaches

I've really enjoyed being encouraged to start my own side projects. I wasn't as free to do this in graduate school so now that I have the opportunity I'm flooded with my own projects. Also why I don't have enough time.

Response 976

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

LOW SALARY.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 977

Perspectives on the postdoc roles and responsibilities

The postdoc position is a scam. It is a dead-end path that will only benefit a small percentage of trainees. The vast majority will find themselves with no faculty positions after their apointments and trying to find alternative careers in industry or in another career with no skills. It only benefits the PI and organization by obtaining cheap labor to further their goals. There is very little training during this period and the postdoc is most often seen as an object that has to give everything to the career aspirations of the PI and goals of the organization. It makes sense people are not joining postdocs.

Fundamental issues and challenges

As stated above, most postdocs won't gain anything from this period. They are underpaid and under-appreciated. In addition, they know that most likely they won't find a job after doing a postdoc and will have lost precious time needed to move up the ranks in an alternative career. Most postdocs are under a lot of stress because the uncertainty of their own and their family's future. It doesn't help that the environment in academic institutions is incredibly toxic and negative.

Existing NIH policies, programs, or resources

Terminate the postdoctoral contract. Instead of postdocs, there should be permanent positions still working under supervision. If people want to move up the ladder, they can do it, but if they are not successful at least they have a permanent job. I think it is a good thing that phD students are finding careers outside academia sooner than before. Isn't this a success story? or do we want them to be unemployed after we have used them for 5-7 years?

Proven or promising external resources or approaches

If postdocs cannot be made permanent with better salaries, at least, make the experience better by not making all of their career depend on one supervisor and one path. Also provide mentoring training for supervisors so they learn that motivation and encouragement are key for sucess. Provide easy access to industry or other paths. The postdoc cannot be about getting a job in academia because over 90% will fail on this endeavor.

Response 978

Perspectives on the postdoc roles and responsibilities

Postdocs are the workhorses of most research labs and the ones pushing forward research and results in the most substantive ways. Postdocs are the ones to carry out experiments, analyses, and writing that PIs do not have time to do, and mentor more junior lab members on a smaller scale that PIs do not have time for. Of course, all lab members are vital, but among trainees, postdocs provide the greatest impact for money—this has been observed and written about since the 1960s (by NIH no less).

Fundamental issues and challenges

The salary and pay. This is being said repeatedly by trainees, and NIH is refusing to listen and just issue more surveys on the topic. Postdocs are self-selecting to take postdoc roles, because they want to be in academia and continue this line of work despite that alternatives are more lucrative. However, the mis-match in academic and baseline industry salary is almost 1:2 ($54,000 vs. $110,000), making is extremely unattractive to be a postdoc. NIH should follow NSF and the minimum cost of living and inflation and raise their postdoc salaries extensively—to at least $75000. The vast majority of postdocs receiving NIH funding are located in major metropolitan areas, with high costs of living. The NIH postdoc salary for F32s, etc. sets the standard for the market. Indeed, many universities have clauses prohibiting the pay of postdocs above this level. By setting the industry standard, the extremely low NIH postdoc salary is the reason that postdoc positions are so unattractive and many post-grads and postdocs are leaving academia.

Existing NIH policies, programs, or resources

Again—salary and benefits. Taking an NIH fellowship is to take a financial cut, it's deeply disincentivized because of the loss of university benefits. I lost 5% of my annual salary as a grad student when I took the F31 fellowship because of the increase in student fees and healthcare cost that I had to then pay for. Now, as a postdoc, I would lose thousands of dollars in benefits, as well as my vision and dental insurance if I were to take a NIH fellowship. The NIH does not provide parental leave or a large number of other common (and necessary) benefits. This survey may be well-intentioned, but NIH's policies and pay are completely at fault for the current postdoc exodus, as NIH's fellowship stipend sets the industry standard for postdoc pay. Also, the nearly year-long process of grant review to NOA is problematic in an inherently short-term position as a postdoc.

Proven or promising external resources or approaches

I guarantee that the number one item people will advocate for improving is postdoc salary and pay—JUST LISTEN. The minimum salary should be $75000, which keeps on par with NSFs postdoc award, is the minimum livable wage in many US cities (where the majority of postdocs live), and cuts the gap between the average industry salary and NIH postdoc fellowship salary in half, which will substantially reduce the current bleed of talent from academia to industry.

Response 979

Perspectives on the postdoc roles and responsibilities

From 2000-2021, I directed a large Physiology of Aging T32, which had multiple PM and PhD post-doctoral trainees.

Fundamental issues and challenges

1. The additional funds required to support a post-doctoral trainee, beyond what is supplied by the training grant position
2. Funding for training program directors and faculty
3. Overall academic burnout
4. More time spent on career counseling and leadership training

Existing NIH policies, programs, or resources

See above

Proven or promising external resources or approaches

No response

Response 980

Perspectives on the postdoc roles and responsibilities

I view it as a bridge from a Ph.D student to become an experienced PI.

Fundamental issues and challenges

Working long hours without competitive salary and good benefits.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase pay

Response 981

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are meant to provide a space to help doctoral students transition to independent scientists.

Fundamental issues and challenges

Low salaries, costs associated with moving, uprooting my life (again)

Existing NIH policies, programs, or resources

Minimum postdoc salary should be increased. Healthcare coverage should be expanded. All postdoctoral fellows should receive a sizeable moving stipend.

Proven or promising external resources or approaches

No response

Response 982

Perspectives on the postdoc roles and responsibilities

Postdocs are supposed to work on building their research portfolios to be qualified to enter an academic faculty position

Fundamental issues and challenges

Postdoctoral trainees are not fairly compensated for the amount of work they produce. Industry pays much better. Additionally, the length of time many postdoctoral trainees must stay in their position before getting an academic faculty position is very long.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 983

Perspectives on the postdoc roles and responsibilities

Postdocs are hit or miss.

Lot’s of room for abuse and treating like an employee vs trainee (I.e. little emphasis on career mentoring).

Lack of term limits (as in graduate school) delay careers and life

Fundamental issues and challenges

Postdoctoral experience lack structure; depend on institution to provide structure.

Usually, no oversight of postodoctoral development and experience as with graduate students. They should have advisory committees

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 984

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is varied, depending on the end-goal, and should be tailored to the roles and responsibilities of potential future positions. The training for an academic scientist who wants to run their own lab and train undergrads and graduate students is different than someone who wants to enter industry as a bench scientist and is different still from someone who wants to enter the administrative side of science. In my case, I would like to continue in acadmic science and mentor students, and have been trying to gain experience in grant writing, administrative duties required of faculty (animal protocols, safety, etc). Ideally, I would also like to be teaching classes and mentoring rotation or other students. However, contrary to what was discussed in my interviews with my current PI (and what transpired while everything was very limited during the height of the pandemic), I will not have that opportunity because I am at the mercy of my PI.

Fundamental issues and challenges

Postdoctoral trainees are largely aware of the toxic nature of many academic labs and are actively trying to avoid these situations at all cost. We understand the lackluster pay and long work hours associated with academia, however on top of that, postdocs do not also want to join a lab where the PI or manager has a reputation for ignoring the well-being of their lab members and focusing solely on the science being produced. At this point in our lives, postdocs are trying to also move forward with things outside of lab—growing families, spending time with loved ones after sacrificing a lot during their PhD, and trying to adjust to a post-pandemic world. Long work hours and low pay are acceptable for some, as long as they can also enjoy the work and environment and see an end, however the temptation for more moderate work hours and better pay are too great when the work environment is awful. The prospect of trying to find an academic job in this job market is also daunting—the requirements are much steeper than they were even 20 years ago. Unless a postdoc is required, it is abslutely not worth the time and financial burden of a $50,000/year position after struggling at $30,000/year as a PhD student when your undergraduate friends either started at $70,000+ or at least enjoy their jobs and are able to go home and enjoy time with family and friends in the evenings and weekends. One of the biggest hurdles is the fact that graduate students and current postdocs are asking "Is this worth it?" and coming back with "No, it is not." as the answer.

Existing NIH policies, programs, or resources

There are a lot of potential funding sources for postdocs, they are very competitive, and are required to land a job in academic research after a postdoc. I have to establish my own source of funding to have the potential to secure an assistant/associate professorship, however the grants and fellowships depend on your ability to read through a hundred different pages and sources for each opportunity (no resources should link to other resources, which also link to other resources, in order for you to grasp what is required of you). The disjointed application instructions need to be streamlined, and are entirely out-of-reach for any postdoc that does not have a strong grasp of English, anyone with a learning challenge, or anyone that does not have strong institutional support from both their PhD institution AND their postdoctoral institution. The resources from the NIH are not well advertised, and need to be available at all times, because as mentioned in other comments—postdocs are often at the mercy of their PIs and cannot sit for hours at a computer or take a trip to take a class. Perhaps if more support for the PIs was

given, they would allow postdocs the freedom to extend their own training—this can also happen at the institutional level and does not necessarily need to rely on the NIH completely.

Response 985

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Increasing the salary of postdoc would help.

In addition, when a PhD student does not want to become their PI one day after seeing the PI's struggle with funding, the PI's life quality (relatively low salary), and oftentimes experiencing bullying or micromanagement from the lab, they would not want to pursue this route by continuing the postdoc training.

So improving the PI's situation is also important.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 986

Perspectives on the postdoc roles and responsibilities

I am a PI of a T32 postdoctoral fellowship program. Postdoctoral fellowships are a wonderful opportunity to transition fellows to faculty jobs

Fundamental issues and challenges

The fundamental challenge we have every year is the low PGY pay scale. I urge NIH to consider increasing this!

Existing NIH policies, programs, or resources

Pay scale!

Proven or promising external resources or approaches

No response

Response 987

Perspectives on the postdoc roles and responsibilities

Pros

1. Opportunity to have protected time to develop grants and a pilot program of research.
2. Continued mentoring.
3. Higher starting salary after postdoc

Cons

1. Pandemic delays in finishing doctoral work makes it less attractive.
2. Wages are low.
3. Few opportunities to obtain postdoc.
4. Likely requires relocating possibly to a more expensive housing market.

Fundamental issues and challenges

I feel the entire postdoc system is unsustainable if academic research is committed to DEI. Many BIPOC people entering academia can't afford the reduced wage of a postdoc. They have financial or other obligations beyond their own household that makes a postdoc an unaffordable luxury. Further, lower wages for academic researchers without postdocs is a barrier (especially considering the heavy student loan burden). The entire postdoc system feels like a relic of an era where only the (overwhelmingly white) wealthy and connected could afford to be academics. It is a system that reinforces the existing social hierarchy.

Existing NIH policies, programs, or resources

Either radically expand postdoc opportunites so people with research degrees can stay in their community and earn a living wage or support all new tenure-track faculty with protected time and mentoring and eliminate the postdoc system all together.

Proven or promising external resources or approaches

No response

Response 988

Perspectives on the postdoc roles and responsibilities

A postdoc is an academic scientist is training. They are both proving themselves and aiding in a lab's research effort.

Fundamental issues and challenges

Pay is insultingly low.

Job prospects appear poor.

They aren't idiots and they can tell that the life of an academic scientist is challenging.

Our postdocs are way too old and the work-life balance issue it tipping towards life for them. They need to be mid-late 20's, not mid-late 30's.

In most communities, they are the "lost generation".

Existing NIH policies, programs, or resources

Much shorter training path —postdocs should end 10-11 years after college graduation.

The narrative about what it takes to "succeed" in academic science needs an overhaul.

For-profit glossy journals need to go away so they can stop allowing failed scientists to determine who succeeds in science and who doesn't.

In short, we need to blow the system up and start over.

Proven or promising external resources or approaches

No response

Response 989

Perspectives on the postdoc roles and responsibilities

In an ideal world there would be no postdocs. Postdocs are not trainee and it is a huge disservice to these underpaid professional scientists to call them so.

Fundamental issues and challenges

PhD scientists are not only making more salary in the industry than they would as a postdoc, they are making more salary right after graduation than most junior faculty. Increasing postdoc salary won't change that.

Existing NIH policies, programs, or resources

Expand early independence awards and make it standard for PhDs to start faculty position or move to the industry right after graduation. Postdoc "training" is unnecessary, pointless, abusive, and extortive.

Proven or promising external resources or approaches

No response

Response 990

Perspectives on the postdoc roles and responsibilities

- Generating research data
- Communicating findings (research talks, posters, peer-reviewed papers, etc.)
- Training students

Fundamental issues and challenges

Postdocs need more money and PIs need more money and flexibility to pay postdocs enough to live. NIH R01 budgets are prohibitive and postdocs suffer. There should also be greater accountability for minimum standards of postdoctoral training and how PIs function as mentors and managers.

Existing NIH policies, programs, or resources

Larger R01 budgets can help PIs pay postdocs more. NIH can provide support or incentives for a postdoc-focused career development office at NIH-funded instituitions.

Proven or promising external resources or approaches

IRACDA at Emory has a published study showing that creating cohorts and community among postdocs improves attrition of postdocs from URGs.

Response 991

Perspectives on the postdoc roles and responsibilities

It is very hard to identify and attract high quality postdoctoral trainee candidates. Many candidates are not very driven, not well trained and not very knowledgable. This is especially true for candidates who are U.S. citizens.

Fundamental issues and challenges

Academic science is not an easy or highly financially rewarding career choice. Therefore, the best students are choosing careers that are more flexible and lucrative than science. If they go into science, a position at a start-up company or big pharma, with no need for a PhD, much less postdoctoral training, is the way to go—there is no ceiling on advancement and much greater potential for financial rewards than in academia. Plus, the world has changed and Chinese postdoctoral trainees are staying home. Because of this brain-drain, it seems easier to find an experienced professional technician than it is to find a well-trained and highly-driven postdoctoral candidate. (Of course many of these professional technicians aspired be a PI and failed.) In addition, R01 grant budgets have not increased for decades, and there are few positions on training grants to support postdoctoral trainee salaries. It seems that R01 trainee supplements are only

available if the candidate in a minority. An outstanding postdoctoral candidate is worth their weight in gold, but given that postdoctoral salaries are relatively high and that excellent postdoctoral trainees are hard to find, a professional technician can be a more efficient choice.

Existing NIH policies, programs, or resources

The NIH obviously made the decision to support more big science, such as huge program projects and multi-million dollar internal projects, and to let education and training wither. I remember a similar RFI regarding how to reduce the number of students and trainees, for the reason that there just are not that many PI positions to fill. It seems it was successful. Perhaps it is for the best; the US no longer is the leader in biomedical science, China is. I am and Editor-in-Chief, serve on several editorial boards and review for many journals. I can attest that the number of papers being submitted from China is increasing at an alarming rate, such that it will soon dwarf the number from the U.S. The NIH should be sounding the alarm to Congress and the country at large regarding this relinquishment of our biomedical research leadership position! The NIH does not need to increase training if it cannot provide additional support for research that will increase the number of external academic research labs and increase the prospects for successful and rewarding careers in academic biomedical research. This would require an increase in training grants (of course), but also, an increase in FIRST grants, an increase in support for equipment cost so that labs can be outfitted, an expansion of R01 funding so that grant success rates can double and careers can be sustained, and more funding for P30 core grants (P30 budgets have been stagnant for years). I would also recommend that you relax your strong bias towards physician-scientist trainees, which is demoralizing for non-clinician scientists.

Proven or promising external resources or approaches

If there is no increase in overall funding for extramural NIH programs, then any effort to improve the postdoctoral training ecosystem will simply be for show. What will the improved postdoctoral training ecosystem produce—postdoctoral trainees with very little chance of obtaining and sustaining an academic research career in the U.S.? Perhaps the NIH should instead fund Chinese language programs for U.S. biomedical students; for then, U.S. trainees might find a promising career in the fast-expanding Chinese biomedical research academy.

Response 992

Perspectives on the postdoc roles and responsibilities

My perspective is that a post-doc is generally applying training from PhD to >doing< research. It is no longer officially a training position and I am now employed by the university where I am based. My own post-doctoral position includes continued training from my PI, but I know others post-doc does not have any continued training or supervision. The ‘continued training’ aspect of being a post-doc is variable and is often used as an excuse for reduced salary.

Fundamental issues and challenges

Of course, the fundamental challenge for post docs is being a highly skilled worker surviving on a low salary. If it were not for flexibility of academia that I am provided personally, I would not accept the NIH post-doc salary. In fact I actively work >less< than full time to make my reduced salary feels like I am being paid >more

Existing NIH policies, programs, or resources

1. NIH needs to overall increase post-doc salary in line with inflation or universities will continue to bleed postdocs to tech and industry, where jobs are well-paid and are becoming increasingly flexible. At the moment, the NIH seems detached from the issues post-docs face.
2. NIH needs to scale post-doc salary (and PhD funding) in line with cost-of-living for location. I know people in Wisconsin who bought a house on a PhD salary. I know PhD students in NYC have $400/month left over to survive. It doesn’t make sense.

Proven or promising external resources or approaches

You can pay us better so that you don’t have highly skilled employees struggling to pay for basics such as housing and groceries. I suspect this would lead to better post doc retention and job satisfaction.

Response 993

Perspectives on the postdoc roles and responsibilities

In my view, the postdoctoral position is very important not only on a personal level but also from a continuity perspective in the research community. The primary aim and objective of this training position are to train and enable the postdoctoral trainee to become an independent researcher so that she/he can contribute to scientific growth.

I am from a clinical background when I finished my MD degree and when I joined residency, the aim was to enable me to give myself enough experience and expertise to practice individually once the residency period is over.

Similarly, I believe that this long postdoctoral training (5 years vs, 3 years) aims to train and enable the fellow to contribute individually. I am very sorry that that's not the case, especially since I have been through it.

Fundamental issues and challenges

I am just a data production factory to my PI, with no scope for growth, after these 5 years, I am sure he will have another one to do the same as this is the most efficient way (low-cost, well-educated/doctoral labor).

The situation becomes worse when you are on an alien VISA status, your PI is a non-clinician, and your PI is from Asian country.

On an alien VISA status first of all your status you are not allowed to contribute outside your authorized institution, even if you try to ask for help outside or look at other avenues for career growth you get very hard repercussions (yes there are processes in place, but PLEASE think are they really practical? Yes, you can complain against your boss and do you believe he/she will still keep you? There are thousands of legal as well as ethical ways to teach you how to behave the way they want you to.

Existing NIH policies, programs, or resources

How many of the postdocs have a realistic individual development plan (IDP), and how often it is reviewed by the external agency in a similar way they scrutinize the budget and other key data before renewing the grant? Are the parameters mentioned on IDP ever met? Did these agencies ever ensure the growth and well-being of postdocs before renewing grants to the PI?

Proven or promising external resources or approaches

Like there are compulsory procedures and mandates to review data, budget, and publication by external agencies, before grant renewal, there must also be processes in place to make sure PIs allow the postdocs to grow in their career.

The authorities may impose severe penalties on PIs if their postdocs are not progressing as per the given guidelines (which may include such as participation in the seminar, and conferences, publishing papers, submitting a grant, participating actively in developing grant writing, IRB correspondence, etc.

Several mandates and guidelines have already been developed to ensure subject well-being why not some strict and mandatory guidelines for PIs on postdocs with severe penalties if not followed?

Response 994

Perspectives on the postdoc roles and responsibilities

A post-doc in my lab is someone who is being trained to function as an independent researcher as faculty in an academic setting. The responsibility of the post-doc is carry out (semi-) independent research related to the mission of the lab. The post-doc will contribute to and perhaps initiate high-impact work that will further their own career.

Fundamental issues and challenges

The supply of US (citizen/permanent resident) post-docs is highly restricted in my field because the number of US faculty positions available in the field are limited and the prospects for sustained NIH funding are further limited. The lack of highly motivated senior personnel has a negative impact on the

productivity of my lab. My solution has been to cast a world-wide net so that I am attracting skilled post-docs from other countries who will return to those countries and obtain faculty positions. I have also recently trained a US citizen who obtained a position in a prestigious foreign lab. The best thing that NIH can do to improve the number of post-docs available to domestic labs is to enable funding of non-citizen, non-permanent resident positions that could be time limited (eg, 2-3 years). Currently, a modular R01 in my lab can only provide support for 1 not TGE post-doc at the 50% level as I aim to provide an above average salary to help with retention and quality of life. The most-skilled and successful foreign postdocs will obtain faculty positions and NIH funding in the US, so this approach is win-win.

Existing NIH policies, programs, or resources

See above

Proven or promising external resources or approaches

Response 995

Perspectives on the postdoc roles and responsibilities

I received the NIH Diversity Supplement in 2019 to fund my postdoc at [redacted for anonymity]. I was excited for the opportunity and to pursue research aligned with my interests in gender development. I initially had the goal of applying to tenure track faculty positions. I felt that I had a good chance—I have degrees from [redacted for anonymity] and [redacted for anonymity]; I also had 25 peer-reviewed publications at the time as well as over $650k won in funding, scholarships, and fellowships. However, I had to leave my postdoc and return funding in winter 2019 because I could not afford childcare and rent with the NIH postdoc salary.

Fundamental issues and challenges

I started graduate school at 27, and I had my daughter at 33 during the last year of graduate school. In Seattle, childcare is on average 25k a year. Rent is even more expensive. There is absolutely no way that I could afford to support my family with the low NIH postdoc salary. The salary assumes that the recipient has a partner who earns significantly more than them. It is impossible to have a family and live on this salary in an expensive metro city like Seattle. I left my postdoc and landed my first industry job making 100k a year with full benefits. It was life changing—we were able to afford childcare and eventually buy a house. I now make over double that starting salary. Women and POC like myself are pushed out of the academy because we

1. often don’t have family wealth to support the low pay and
2. offers almost no support for those with families.

Existing NIH policies, programs, or resources

Pay postdocs more. Give postdocs more money if they live in expensive metro areas b/c that is where the university is located. Have a childcare credit.

Proven or promising external resources or approaches

No response

Response 996

Perspectives on the postdoc roles and responsibilities

I believe a postdoctoral position is training to become an independent researcher and learning in detail the grant mechanism. However, most academic institutions do not have clear postdoctoral training guidelines, and hence fail to provide the intended training toward independence.

Fundamental issues and challenges

Postdocs are extremely underpaid, and the salary difference is significant compared to any entry-level post Ph.D. jobs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Postdoctoral mentoring varies based on the mentor. However, there should be some sort of performance measuring metrics for the postdocs, as well as for the mentor. At minimum, an yearly evaluation both from the postdoc and mentor should be on record.

Response 997

Perspectives on the postdoc roles and responsibilities

I serve to complete research objectives set by funding awards.

Fundamental issues and challenges

Greater emphasis on skill and career development of trainees would be promote recruitment, retention and overall quality of life. Major awards depend on postdocs for completion of research aims and this could be considered in grant applications.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

The IRACDA training grant has provided me with significant structure in achieving career development goals.

Response 998

Perspectives on the postdoc roles and responsibilities

Engage in rigorous research, increase ability to mentor and write grants and communicate science.

Fundamental issues and challenges

The NIH standard for salary is too low. I am at a UC institution and as the postdoc salary just increased we can not afford to have postdocs. Many labs are now having to not include postdocs bc the NIH salary is too low. If we do find one we often loose them to industry bc postdocs start out at a much higher rate in industry. The budget for grants in entirety needs to increase as it has been flat for a long time. With this increase should also come an increase in graduate and postdoc rates.

Existing NIH policies, programs, or resources

Increase salary

Proven or promising external resources or approaches

Increase salary

Response 999

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is designated as a “trainee” position. I expected this to be a stage in my career where I can explore my abilities as a scientist without the interruptions and formalities associated with being a graduate student (which is also a trainee position). I expected that I will be able to have at least a small amount of say in the direction my research takes and define my own contributions to science. At the end of my “training” I expected that I will have adequate preliminary data to “take with me” to start my own academic career. I expected institutions that try to attract postdoctoral fellows will be more invested in their future and devote resources to ensure that future and not just trust their faculty to “do the right thing”. I expected I will attend conferences (annually) and interact with other scientists as a postdoctoral fellow. In return, my role is to work hard in ensuring my work is performed with a high level of

professional integrity, dealing with the day to day training of students in the lab and being as productive as I can be.

Fundamental issues and challenges

Poor pay

1. A postdoctoral position is a "no man's land" in most institutions, where we don't qualify either as a student or staff/faculty. There are no committees or mentorship teams (at least in my institution) to check on my progress, find out what my goals are and help me achieve them. IDPs are voluntary in my institution and are rarely ever done.
2. Lack of avenues for funding: The K award time limits are a joke. Postdocs like me, who spent almost their entire tenure in the pandemic dealing with supply shortages, work shutdowns etc were given a one or two cycle extension. This amounted to ~8 months or so, given the 2-3 years the pandemic has set everyone back.
3. I was an immigrant scientist before I became a permanent resident and eventually a US Citizen. There are NO avenues available for immigrant scientists and this sets us back several years as we frequently find ourselves trapped in positions with very little leverage. Immigrants who have formed a bulk of the US postdoc population, are realizing this and simply not coming anymore.
4. It is increasingly unclear what advantage a postdoctoral training is actually providing. What used to be a 2 year stint has now extended into an average of 5-6 years, with no clear outcome in terms of improved job prospects both in academia and industry.
5. The needs of postdocs have always been treated as the lowest of priorities for everyone that benefits from our work. The younger generation of students are simply paying attention and choosing other careers.

Existing NIH policies, programs, or resources

1. All NIH institutes need to extend or preferably eliminate their K-award submission limits. The K99 submission limit of 4 years and some K22 limits of 5 years is completely unrealistic. While I support term limits for postdoctoral fellowships to disincentivize institutions from exploiting trainees, these terms limits are truly just hurting postdocs trying to find funding for themselves. Scientific progress does not happen on a strict schedule.
2. Increase the documentation required from PIs applying for NIH funding to show that they are committed to improving the lives of their postdocs. If a postdoc is funded by an NIH grant, ask the PI to budget specific events in their postdoc's training, such as attending conferences, workshops etc. Ask them to submit a clear plan for their postdoc's career under their care, during the term of the grant and evaluate that as part of their progress reports. Ask for reference/support letters from the postdoc as part of the grant submission process.
3. In my personal experience, I found very little support from my current institution towards my K award submissions. These awards provide no indirect support and I think institutions are not economically incentivized to support these grants. These are highly competitive grants with unreasonable time limits, which are additionally difficult to get without adequate institutional support.

Proven or promising external resources or approaches

Any educational institution that receives NIH funding, needs to get evaluated for their educational efforts. If the institution accepts trainees, there needs to be documentation that the institution needs to produce to show that their trainees are actually receiving training. Without that, score grants being submitted from these institutions lower than ones that prioritize training.

The fundamental problem is that postdocs do not participate in the economics of science in a visible way. Faculty are the ones that support institutions by bringing in money through grants. The money is awarded to them, they control how it is spent and so they get the final say on all decisions. In times of a funding crisis, the training priorities of the postdocs are the first on the cutting block. The reality is that even though the postdocs are the ones actually making sacrifices and doing the work described in the grant proposals, as long as they have no leverage over the money, there is going to be no incentive for institutions to do anything to improve their lives. The decline in the numbers of incoming postdocs is just a simple reflection of this reality.

Response 1000

Perspectives on the postdoc roles and responsibilities

Academic postdocs are at the core of scientific research. They are the only lab members with the time and the knowledge necessary to carry the research activity of a laboratory. PI do not have the time, and graduate students are rarely independent at this stage. In my department, all the successful research projects are carried or supervised by postdocs.

The view of a postdoctoral internship as as a period of additional training after the PhD should be dramatically revised. This could have been true when postdocs lasted one or two years. Nowadays, most postdocs do their full 5 years then change status (Research Associate). Our postdoc stay way to long in this limbo position. It does not take more than two years for a PI to identify postdocs unfit for research.

It is true that not all postdoc are independents, and some will never be able to fulfill the position of a PI. There should be the possibility for those postdocs to access positions where they will not be able to access to the PI status but will be able to carry out research project under the responsibility of a PI.

Fundamental issues and challenges

Academic salary are abysmally low. In particular in the university located in the main urban centers of the US, NIH is not adapting the salaries to the lab location. In [redacted for anonymity], postdoc who are single are making 50% of the median income of the city. They struggle to find decent accommodation and are living on a budget. The industry in the area is providing very attractive salary for people with their education and talent. We should not bet they will all want to live like monks to fulfill their love of science very long.

For American citizen, the burden of student debt is a major issue. In my university (state university), graduate students that are born and raised in the US are rare, postdocs that are born and raised in the US are not to be found. Removing the burden of student debts could be attractive to retain US talents in academic research.

The difficulty in hiring postdocs is worsened by the fact that most PhD recipient are not doing a postdoc or not postdoc material. It is becoming increasingly difficult to recruit talented graduate students. In my graduate program, the amount of applicant was divided by 3 in 10 years. Low salaries and the absence of benefits in having a PhD on the job markets are main factors of the lack of activity of PhD programs, at least for US applicants who usually have student debts. We are now recruiting mainly foreign graduate students. The graduate students we have are often staying in academia for lack of better prospect, most of them don’t want to stay in academia.

Existing NIH policies, programs, or resources

To me, the problem is extremely simple: You cannot not attract the extremely talented working 60 hours/week with $56,000 a year in NYC area. NIH must increase their graduate student and postdoc salaries. Their salary should be modulated by the lab location. The fact that NYC postdocs receive the same salary than postdoc working in rural US does not make sense. R01 modular should be moved to at least $350,000 so we can correctly pay our postdocs. My R01 can barely afford two postdocs as my F&A are through the roof (above 50%!!) and my research barely ask for consumable.

Also, we should be able to provide a future to our postdoc. Most of them see the task of staying in academia as impossible, even the most talented. The early investigator status should be provided so Research associate can develop an independent research program in the lab of their PI. This will facilitate the transition postdoc to PI and reduce the time between starting a lab and first R01.

Proven or promising external resources or approaches

No response

Response 1001

Perspectives on the postdoc roles and responsibilities

In addition to performing their own research, a postdoc plays an important role in helping to teach and mentor the more junior members of the lab. They bring with them the expertise and perspective obtained from their graduate school training, which can dramatically influence and breathe new life into the lab they

join as postdoc. Postdocs represent a major avenue for a lab to gain new techniques or avenues of research as they share their knowledge with the lab as a whole. Likewise, since they have had a training independent of their current mentor, a postdoc is more likely to question or correct their mentor in a way that improves the science being done in the lab.

Fundamental issues and challenges

Funding and the nature of grants (both postdoc-targeted and wider lab-wide funding of grants) is not keeping pace with inflation and the cost of living, especially in major cities. Even in institutions that have recently increased postdoc salaries, postdocs are accepting a substantial salary cut when they choose to stay in academia as opposed to going into industry, consulting, etc. Given the numerous/meaningful research opportunities in industry and the fact that there is no longer a stigma around going into industry, the "prestige" of staying in academia is no longer sufficient to justify the growing salary gap between academia and industry.

In addition, I think there is a concern of what is the step after a postdoc. Until maybe recently there were far more postdocs than there were PI positions, so the stage after a postdoc is uncertain. If a PI position isn't a sure thing, a postdoc may find themselves doing another postdoc (not tenable for many) or they may go into a non-academia career. If they go to the non-academia career they may as well do that straight out of graduate school. They will end up at the same non-academia position eventually in theory and will make more money along the way. The current postdoc shortage may be a response to this supply/demand issue at the PI level and while it did feel like there were too many postdocs previously, the current shortage may have been an overshot and there needs to be some added incentives for individuals to do a postdoc even if they don't need/want to be a PI afterwards.

A lot of other things feed into postdoc recruitment, such as graduate school experience and how that impacts their perspective on science, but those are too personal/varied. Paying graduate students better would probably help there.

Existing NIH policies, programs, or resources

Grants need to be increased to reflect the increasing cost of living for postdocs (as well as graduate students and technicians). This may lead to fewer grants, but that may simply be necessary if the grants are to be sufficient to encourage and allow for people to be academic scientists. It doesn't seem to be appropriate to return to old PI:postdoc ratios, but there should be a middle ground between that and the current shortage.

I think it would also be good to have more funding options for postdocs to transition to non-PI academic research scientist positions. I would be perfectly happy to work as a research scientist in my current mentor's lab, but there are few grants to support such positions, their salary caps cannot compare to a similar position in industry, and only the most successful of labs can afford to maintain such a person. If postdocs knew PI wasn't the only possible academia career after their postdoc, it would reduce the risk of doing the postdoc itself.

Any training or workshops are going to effect such a small percent of graduate students and postdocs so as to have no influence on the problem. Every graduate student has already been to plenty of panels on career trajectories and they have seen how postdocs live in their lab. A sense of inspiration and interest are the only things that can counter the difference in salary between academia and industry. There isn't going to be a simple set of resources that address this as inspiration/interest are impacted so much by the day to day of someone's life/career, and rarely does a panel/handout have any effect. For better or worse, more money to directly support postdoc salary is likely the best solution for reducing stress and increasing inspiration/interest in postdocs.

Proven or promising external resources or approaches

Response 1002

Perspectives on the postdoc roles and responsibilities

The roles and responsibilities of academic postdocs can vary depending on their field, discipline, and the specific research project they are working on. Here are some common Perspectives on the postdoc roles and responsibilities of academic postdocs:

Research: One of the primary responsibilities of academic postdocs is to conduct research. They are expected to work on research projects independently or in collaboration with their supervisors, contribute to the design of experiments, analyze data, and interpret results. Academic postdocs are also expected to stay up to date with the latest research in their field and develop new research ideas.

Publication: Another key responsibility of academic postdocs is to publish their research findings in peer-reviewed academic journals. This requires them to write research articles and present their findings at academic conferences.

Teaching: While academic postdocs are primarily focused on research, some are also involved in teaching activities, such as supervising undergraduate or graduate students, giving lectures, and leading lab sessions.

Professional development: Academic postdocs are expected to continuously develop their skills and knowledge, both in their specific research area and in broader academic fields. This can include attending workshops, conferences, and training courses.

Collaborations: In addition to working independently, academic postdocs are often expected to collaborate with other researchers within their institution and outside. This collaboration helps to expand their network, exchange ideas, and gain different perspectives.

Career preparation: Academic postdocs are typically in a transitional phase between completing their doctoral studies and securing a permanent academic position or pursuing a non-academic career. As such, they are expected to prepare themselves for their future career by seeking mentorship, networking, and developing a professional portfolio of research accomplishments and publications.

In summary, academic postdocs play a critical role in advancing research, contributing to the academic community, and preparing for their future career.

Fundamental issues and challenges

I want to emphasize International postdocs in academic research and the Fundamental issues and challenges that can inhibit their recruitment, retention, and overall quality of life. These issues can include:

Visa and immigration restrictions: International postdocs often face complex and restrictive visa and immigration policies, which can impact their ability to secure funding, travel, and participate in research activities. These restrictions can also impact their ability to bring family members with them, which can contribute to a sense of isolation and loneliness.

Language and cultural barriers: International postdocs may face language and cultural barriers when they arrive in a new country. This can impact their ability to communicate with colleagues, build relationships, and navigate unfamiliar cultural norms.

Discrimination and prejudice: International postdocs may also face discrimination and bias based on their race, nationality, or religion. This can lead to a sense of alienation and may negatively impact their mental health and well-being.

Limited access to resources: International postdocs may have limited access to resources, such as health care, housing, and financial support. This can contribute to insecurity and uncertainty, which can negatively impact their overall quality of life.

career mobility: International postdocs may also face additional challenges in terms of career mobility. They may face limited opportunities to advance their careers in a new country or may be expected to return to their home country after their training, limiting their career opportunities.

To address these issues, academic institutions and funding agencies can take steps to provide more support and resources for international postdocs. This could include providing language and cultural training, creating mentorship and support networks, and advocating for more inclusive visa and immigration policies. Additionally, creating a welcoming and inclusive environment can help to reduce discrimination and prejudice, and promote a sense of community and belonging.

Existing NIH policies, programs, or resources

Response 1003

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

One of the most fundamental issues inhibiting academic postdoc recruitment would be funding. Many graduate students leave PhD programs in debt or without many savings which makes deciding to do an academic postdoc challenging when they could be earning much more in industry. Another issue along these lines is relocation as that can be an expensive gamble when costs are not covered.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Response 1004

Perspectives on the postdoc roles and responsibilities

A postdoc is an opportunity to acquire new skills, develop an independent project within the purview of a mentor's lab's goals, and develop necessary professional skills. A postdoc should not be a Scientist or technician position without intellectual freedom and at least some level of research independence.

Fundamental issues and challenges

Lack of training opportunities at institutions (i.e. career services), a typical lack of trainee advising (i.e. a lack of postdoctoral affairs offices), poor pay relative to other competitive research areas, poor career prospects (i.e. a lack of academic positions), poor funding opportunities and lack of career security for non-US citizen scientists, lack of child care.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Career transition programs at some institutions have been extremely successful for attracting and retaining talent, especially minority researchers. Uniform postdoctoral affairs offices or organizations that could be NIH funded or somehow influenced by the NIH may be useful. More grant opportunities for international scientists could help to retain new PhDs in the US and encourage existing postdocs to stay in their positions. Greater flexibility to carry grants with you, to escape hostile workplaces. Fellows programs that encourage camaraderie and inter and intra-institution training to provide a greater sense of community, better training, and enhanced networking opportunities for postdocs across fields and locations.

Many of these hanges would need to be implemented at home institutions, but NIH guidance, mandates in fellowships, or NIH awards to support greater access to such programs could be options.

Response 1005

Perspectives on the postdoc roles and responsibilities

In my words, postdoc is an employment opportunity and skill development program for Early career researchers like me from developing countries like India

It suppose to train future scientists.

Fundamental issues and challenges

Major issue is Salary. The Salary we get is does not support the small family and their dependents.

Salary is not attracting many researches

Existing NIH policies, programs, or resources

Annual increment should be changed according to inflation rate.

Or provide rental allowances like Indian funding agencies do.

Proven or promising external resources or approaches

If you provide the mentoring sessions for new faculties it would be good. Many of the new faculties doesn't have any clue on how to manage human resources in their lab. They waste money and pressurize postdocs (from my personal observation). Institute should evaluate faculties postdoc mentoring performance by taking inputs from the postdocs.

Response 1006

Perspectives on the postdoc roles and responsibilities

I view it as a transition period where my job is to figure out what is the next step (academic path, industry path, etc.). I am trying to gain expertise in new methods/areas of research.

Fundamental issues and challenges

Pay is my main concern. I am taking interviews elsewhere and considering leaving my current post-doc. l enjoy it but for this stage in my career the pay is not meeting mty financial goals. I cannot contribute to typical 401k employee retirements, when I am already significantly behind on savings because of graduate school. It is hard to feel especially like a post-doc is worth it when I could have gotten a job ~55k BEFORE going to graduate school. I do enjoy the freedom of the job, but it is not the best training if I don't go towards academia. The places I am interviewing at are offering between $80-140,000 for industry research roles with better benefits. It is hard to feel like a post-doc is worth sacrificing those things for the CHANCE at the lottery of an academic job.

Existing NIH policies, programs, or resources

Better pay, better training for paths outside of academia, more benefits like retirement, ACTUAL training (not just time to train myself/apply to trainings, but structured training experiences built within T32s), more leeway on clinician-scientist careers.

Proven or promising external resources or approaches

Better pay, mentors should receive training on HOW to mentor effectively, more discussion for roles in industry, non-profit world, etc. More intentional post-doc groups/connections. Too much of post-doc is navigating all this on my own—I have a mentor but I almost feel like sometimes a body to produce more research to meet the goals of the institution/training grant, not so much pure investment in my career.

Response 1007

Perspectives on the postdoc roles and responsibilities

Academia uses postdocs as migrant laborers, to execute their research plans and conducted their analyses, while paying them a low wage given the exorbitant costs of living remotely near their physical locations. The role of a postdoc should be to learn the skills necessary to run their our research program, not take the place of research staff that the PI doesn't want to hire to run the programs of PI because are too "busy" to execute their own R01s or other large grants themselves. Postdocs are responsible for their own research, not the research of exploitative PIs.

Fundamental issues and challenges

NIH has allowed academia to hire postdocs like migrant workers to labor in their labs with insufficient support, lack of commitment, and/or no promise of a future. Because of this, academia has no reason to change because the only people valuable to academia are senior and mostly White investigators that consistently score well in grant review and bring funding for indirect costs to the institution. Why would an

institution change their ways if NIH doesn't prioritize funding good behavior, treatment, and support of postdocs and other trainees and deprioritize funding senior researchers.

Existing NIH policies, programs, or resources

Quit pouring money into the research of PIs who's postdocs aren't given tenure-track positions, or other jobs, at the end of their postdoc. They have NO reason to change their habits if NIH keeps blindly funding them. The top NIH-funded institutions game the NIH system to increase their wealth, keep wages for those who aren't senior as low as possible, and maintain White supremacy/control at the highest levels of research. It is no coincidence that as the scientific student pipeline racially and ethnically diversifies, the conditions for postdocs are getting worse. There is a long track of such behavior in U.S. history. NIH is actively funding and maintaining White supremacy in research and it needs to stop.

Proven or promising external resources or approaches

Quit making the argument that this is an issue with the postdocs. This is a NIH-funded academia issue rooted in the exploitation of cheap highly-skilled labor, the lack of desire of creating tenure-track positions and other jobs after being a postdoc, and the maintenance of White supremacy/control at the top NIH-funded institutions.

Response 1008

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary is too low.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase salary.

Response 1009

Perspectives on the postdoc roles and responsibilities

An academic postdoc is an advanced research training for scientists interested in careers in research, particularly, though not exclusively in academia. As a more advanced trainee, a postdoc is expected to contribute to the execution of the research, but also contribute more significantly to the intellectual development of the research questions and methodologies.

Fundamental issues and challenges

The apprenticeship model of training in biomedical science falls short. PIs expect postdocs to be productive in accomplishing the aims of their research grants that pay the postdoc's salary. It has long been assumed that if a postdoc is successful at this, their future career advancement will fall into place. With the dearth of tenure track faculty positions available, this is not the case. Graduate students recognize this and, thus, are eschewing careers in academic research and are less likely to perform postdocs.

Existing NIH policies, programs, or resources

The fundamental problem is that postdocs are primarily paid by research grants awarded to the lab PI and these grants are based solely on the potential impact of the research objectives. American universities and research institutions have become completely dependent on federal grants to fund their research operations and so there is very little support available to build a different kind of training and development model. Separating funding for training from funding for the direct research may provide opportunities for institutions to provide a more well-rounded training experience that better prepares students and postdocs for the variety of careers now available to them, including academia. In addition, the NIH should expand

their institutional career development training programs and develop a format so that those institutions who receive these awards can (and must) share their findings and best practices with other institutions.

Proven or promising external resources or approaches

No response

Response 1010

Perspectives on the postdoc roles and responsibilities

I think the postdoctoral experience is crucial for trainees interested in traditional academic research careers. It allows the postdoc to learn and solidify new techniques and gives them an opportunity to grow their 'hard' science skills and their development and management skills.

Fundamental issues and challenges

Frankly, postdocs are underpaid compared to entry-level industry careers. Funding is difficult to obtain even for established investigators and postdocs are no different. If PIs cannot obtain funding, they cannot fund postdoctoral research/salaries. When those two things are coupled together, it does not make an enticing career option and most PhD graduates are opting out. Postdocs are not given any of the 'quality of life' benefits that peers at entry level careers are are allowed—we often have no choices for health insurance, retirement benefits, child care options, paternity leaves, etc. Postdocs are 'students' when it is helpful for universities and 'employees' when it is helpful for universities, regardless of what is best for trainees.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1011

Perspectives on the postdoc roles and responsibilities

I view the postdoc position as a chance to be an independent scientist in a mentored position.

Fundamental issues and challenges

Personally, my career has been untraditional and I have found funding sources available to postdocs to be incredibly inflexible for anything but a traditional career path. In my opinion, this leads to the lack of diversity at higher levels of science that organizations are continually trying to fight against while still maintaining strict boundaries around postdoc funding. I did my PhD and first postdoc in quick succession and by the end of my first postdoc position had had two children. I decided to take some time off from research when my kids were young. This did not decrease my ability to do science, but most funding sources give flexibility of 1 year per child and no more. I taught when they were young to have more time at home and more flexibility with their care, as I could do much of my work in the evening after they went to bed. During this time I held a tenure-track position at a primarily undergraduate teaching university. Because I have more than 4 years of postdoc experience and have previously held a tenure-track position, I am ineligible for most postdoctoral funding sources. However, I need to do another postdoc position to get back into research (which was always my intention), as I have found that I am not competitive for faculty positions without recent publications. I am tenacious, but the roadblocks put up are pretty intense, and on many days lead me to believe that it is not going to be possible for me to succeed in an academic research career. If you want to have people, and particularly women with children and other people coming from less traditional backgrounds, interested in postdoctoral and academic faculty positions, you must create funding mechanisms that recognize and accept diverse career paths.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1012

Perspectives on the postdoc roles and responsibilities

It's a buffer position so academia can exploit (underpay) the labor of PhD-level workers and filter out most of them (there more post-docs than professor positions). I do believe that a young PhD is not fit yet for a PI position, but postdoc "training" implies kind of a student status that justifies the salary.

Fundamental issues and challenges

It's simple. As a postdoc, I have a skill set (problem solving, adaptability, learning skills, engineering, programming, surgeries, data analysis, writing, publication) that is worth at least 3 times more than a postdoc salary in the industry job market. Research is an intense job that requires personal sacrifices, and there's no certainty of getting a satisfying, well paid job in the near future. Along with these sacrifices, I barely make enough to pay a rent, my bills, and food in the [redacted for anonymity] area. This situation is not enviable and only a few very passionate people can reasonably make that career choice.

Existing NIH policies, programs, or resources

Give postdocs a decent salary, especially in the areas where the cost of life is heightened.

Proven or promising external resources or approaches

No response

Response 1013

Perspectives on the postdoc roles and responsibilities

I think a postdoctoral position is a valuable training step on the path to becoming faculty. Ideally, this should be a period of time where you are working almost totally independently on a question that you posed. However, its important to note that many postdoctoral fellows *are* prepared to run a lab themselves, but are staying in a postdoc as simply a job until they find a faculty position.

Fundamental issues and challenges

The primary challenge is that the postdoc salary is too low considering their qualifications. Postdocs are mostly at an age where they are starting families and wanting to settle down, but the NIH regulated postdoc salary is not sufficient to support a family.

Ideally, a postdoctoral position could be a full-time permanent job. It should not be necessary for every scientist for fight for a small number of faculty positions in order to make a living wage. If we had a class of full-time research scientists, the amount of institutional knowledge rate of scientific progress would increase substantially

Existing NIH policies, programs, or resources

The NIH standards for postdoc salaries need to increase substantially and should regularly increase with inflation. It's hypocritical that the internal salaries for NIH postdocs are 10K more than the standards for everyone else.

Proven or promising external resources or approaches

Postdocs need a salary and benefits that's most consistent with other fields.

Response 1014

Perspectives on the postdoc roles and responsibilities

I view the Postdoctoral position as a transition that allows PhDs to improve their knowledge and skillset on their field and that would prepare them for the future steps of their career.

Fundamental issues and challenges

As Postdocs, we have all the responsibilities of an "actual" job without having the "actual" job. Salaries are ridiculously low for a PhD, and benefits are basically not existent. The "training" aspect of the position is also mainly an utopia, with PIs prioritizing the productivity of their trainees over their professional development and not providing the required mentorship—not only a scientific one, but also from the point of view of discussing future career steps. Postdocs are normally left on their own at the moment of moving forward with their careers—reason why many of us end up staying postdocs for way too long.

Existing NIH policies, programs, or resources

Improve salary and benefits conditions—despite the transitional nature of the position, we are PhDs with years of experience, not students-, as well as the training aspect of the postdoctoral programs.

Proven or promising external resources or approaches

Improve salary and benefits conditions—despite the transitional nature of the position, we are PhDs with years of experience, not students-, as well as the training aspect of the postdoctoral programs.

Response 1015

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as a sort of limbo. Options can be either moving to industry or moving forward in an academic environment, but the lack of professorships available is definitely worrying. Watching faculty at my institution scramble because not enough new postdocs are coming in is interesting; we're often paid as little as possible and even if we are valued in our lab, it seems we are not valued by institutions. It is not a sustainable or desirable system and leaves me worried about what will happen as my postdoc draws to a close.

Fundamental issues and challenges

The biggest fundamental issue is pay. After spending the time and effort to achieve a PhD, it does feel a bit of a waste kept very low in pay but with many added responsibilities. On top of often being the scientific backbone of many labs, mentoring and training graduate and undergraduate students and building management skills, having to spend so much additional energy on trying to build funding and support to take control of your own lab—even before you can think about applying for limited faculty positions—sometimes seems like an impossible task. Overall quality of life can be decent though, as long as you are in a lower cost of living area.

Existing NIH policies, programs, or resources

The expansion of possible academic research career pathways seems like the most sustainable answer. I love my research, and I love my lab and the institutional projects we work on, but I don't necessarily want to become a tenured faculty member. That means less time at the bench, more time writing grants and managing students and staff, and a different kind of stress. But staying as a research faculty offers marginal pay and basically zero recognition or chance for advancement despite having a high level of expertise. It puts people in a tough position, which is why the vast majority of my colleagues cut out academics altogether and went straight for industry jobs.

Proven or promising external resources or approaches

Postdoctoral recruitment and job satisfaction would be vastly improved if we were simply paid better. Training is highly individual but many institutions do a fine job of offering training in grant writing and lab management.

Response 1016

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The number one issue I see with current postdoc retention and recruitment is a complete failure of the NIH to address cost of living and salary concerns. The NIH continues to turn a blind eye to an obvious

problem that everyone in the academic environment knows is an issue. Postdoc pay must increase drastically and a framework has to be put in place that allows for postdoc pay to keep up with inflation and adjusts to cost of living within the city where the postdoctoral tenure will be carried out. If the NIH is serious about the future of science in this country, it must make this its #1 priority.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1017

Perspectives on the postdoc roles and responsibilities

Postdocs are basically the day-to-day managers of the lab for PIs who have too much else going on to provide direct mentorship to their labs. Sure, there is probably some training required in new techniques or protocols, but that is the same for any job. There isn't enough professional training for it to be viewed as a training position, which is the justification for the abysmally low salaries of postdocs. Basically, the postdoctoral position is a research scientist position and shouldn't be broadly viewed as a fellowship/training position.

Fundamental issues and challenges

Faculty jobs—why suffer through 5-10 years of being underpaid and overworked to not even get a faculty job at the end?

Respect—postdocs are just treated like senior graduate students; give people respect for their work and expertise! Give people credit for their own unique research ideas!

Pay scale—we already have to live at the poverty line for 5-7 years of grad school. To do that and then barely get a pay raise after getting the degree is an unimaginable financial load, making so that the only people who can afford to do gradschool + postdoc financially are people with either family money or a spouse who makes enough on their own to cover almost all of the rent/bills/expenses. Pay scales need to account for inflation and I feel like I shouldn't have to say this but postdocs should be able to live comfortably with a reasonable commute above the poverty line with their own apartments (i.e. not have to have a roommate).

Control over one's own destiny—the current system necessitates ingratiating yourself to your PIs so that they write you letters of recommendation for the rest of your career. This means that everything is dependent on getting everything done that your PI wants, even if it isn't best for you and they are holding you/your paper/your recommendation hostage.

Management—no incentive for PIs to be good mentors, no mechanism to provide feedback to bad mentors, no punishment for being a bad mentor

Existing NIH policies, programs, or resources

Payscale payscale payscale

Make trainee feedback a component of awards, especially R01s

Proven or promising external resources or approaches

Look at industry work culture. People are happy, feel valued and respected. Sure, there is more pay and more pay would help postdocs too. But there is also a realization that people have entire lives that aren't defined by their research, which isn't the standard in academia. People expect and praise overwork culture, and it shouldn't be this way.

Response 1018

Perspectives on the postdoc roles and responsibilities

Cheap labor that is part of the system to climb a ladder with no guarantee of progress.

Fundamental issues and challenges

I believe that the expectations are too much with no guidance. So individuals that have the experience to succeed in the expectations will be successful, but individuals that were not trained and guided in grad school pr previous post-doc, that will not be successful. This turns away many post-docs from the academic lab. The time and effort becomes not worth it, and people steer away easily.

Existing NIH policies, programs, or resources

Unfortunately, I think there has to be a root change in the idea of training a post-doc. This types of training is not sustainable and therefore not worth remolding. It should not exist. A program-based program where certification in a field maybe more appropriate. (similar to a residency program in medicine)

Proven or promising external resources or approaches

No response

Response 1019

Perspectives on the postdoc roles and responsibilities

I plan to pursue a post-doc, likely in the academic sector. A post-doc has more responsibility and independence in the lab than a graduate student. They are also expected to come in with greater experience and be able to produce results faster than a graduate student. A post-doc is simply another stepping stone that acts as a time for you to secure additional funding prior to entering the job search. Many post-docs are spending 4 years in their position. Ideally I would like to be on the shorter side of this length because I don’t want to feel stagnant in my career trajectory.

Fundamental issues and challenges

Length of time for average post-doc. Expectations as far as work/life balance--I’ve been told that as a post-doc you have less work/life balance than when you did as a graduate student. Paygrade for amount of work hours expected of a post-doc may be an issue.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1020

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is supposed to be a ‘training’ position, required to transition to an independent academic career or to leverage better industry position and salaries. It’s essentially another PhD on top of your PhD. The main difference is that because you are not working towards a terminal degree, you can in theory walk away any time and only sacrifice an academic career path. On the plus side: I am more experienced and have more freedom, so its more fun and I can approach science at a higher level. But there are significant caveats in being a postdoc, which have driven so many people away (and I am struggling with leaving on the daily as well).

Fundamental issues and challenges

4. The salary is pitiful. Most postdocs are in their thirties, highly educated and making little money. As a lot of universities are located in expensive cities, in some cases >50% of our salaries goes to rent.
5. You are not a bona fide employee. Whenever the university wants, you are 'Staff' but when it comes to benefits, you are a 'trainee'. These years do not count for retirement.
6. Creating a family in parallel has been extremely challenging financially.
7. Securing a fellowship (which is viewed favorably when you transition to an independent position) is financially penalized. You are left to fend for yourself for taxes. In some cases health insurance is not covered because you are not 'an employee of the University'.
8. You are still at the mercy of the PI. If they are abusive, your work life balance can be abysmal, your mental health severely damaged and your career prospects can hang from this one person's whim.
9. You are still doing science alone for the most part. Academic science is mostly collaborative on paper only. Team work is always contentious and strained due to 'who's name will get to be first/last on the paper'. In short, doing a postdoc is unsustainable unless you have a supportive partner. and even then its highly masochistic.

Existing NIH policies, programs, or resources

- Expand Childcare support.
- Facilitate Access to training grants and Career development grants (F, K's). The mechanism as it stands is super intimidating, very bureaucratic and favors people from established labs, where grants are there to boost prestige and not really required to help with training.
- Make OVERHEAD conditional. The NIH gives 50-90% of the sum of an awarded grant to the university. Withhold funds from institutions until they provide proof that they are providing fundamental services to their postdocs (e.g. healthcare, a W2 form, employee benefits, child support etc)
- Accountability: Make mentoring a component of evaluation. Stop funding and supporting abusive PIs that get free rein and control over postdoc's careers.

Proven or promising external resources or approaches

I do not know of implemented, proven approaches because everyone loves convenience and inertia. Why change without pressure? And its exhausting and so unfair to constantly expect pressure to come from the bottom and least powerful entities (in this case, the postdocs). Systemic change is most effective when it starts from the top and because in the US, the NIH holds the lions share of the money, the NIH has the biggest sway to impart change.

Here are some suggestions:

- Childcare support.
- Subsidized housing.
- Facilitate Access to training grants and Career development grants (F, K's). The mechanism as it stands is super intimidating, very bureaucratic and favors people from established labs, where grants are there to boost prestige and not really required to help with training.
- Make OVERHEAD conditional. The NIH gives 50-90% of the sum of an awarded grant to the university. Withhold funds from institutions until they provide proof that they are providing fundamental services to their postdocs (e.g. healthcare, a W2 form, employee benefits, child support etc).
- Accountability: Make mentoring a component of evaluation. Stop funding and supporting abusive PIs that get free rein and control over postdoc's careers. Healthy mentorship is critical. Universities can't be supportive of title IX and anti abuse in theory only. There are no universal policies or follow through. So abusive PIs with lots of power over 'trainees' (that are grown adults), can reck careers.

Response 1021

Perspectives on the postdoc roles and responsibilities

I view a post doc as an independent scientist who is developing their skills and expertise under a more senior scientist. I think post docs are largely independent who may occasionally need guidance by their mentor. I think the most important resource that is provided to a post doc by their mentor is lab space and resources such as instruments to perform their experiments. Most importantly post docs, like graduate students, are underpaid for the amount of work they produce. Post docs often work longer hours and more days than staff scientists or even their mentor and are not compensated adequately for this effort.

Fundamental issues and challenges

The post doc salary is the largest challenge in recruiting, retaining, and overall quality of life for a post doc. As a graduate student nearing graduation I am not considering post doc positions because they are poorly compensated and have a poor work-life balance.

Existing NIH policies, programs, or resources

A new post doc minimum salary needs to be implemented.

Proven or promising external resources or approaches

Increase post doc compensation.

Response 1022

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

I believe the NIH grants and positions should not be limited to individuals that are only U.S. Citizen or permanent residents. This limits the diverse graduate and postdoc individuals with extraordinary ability from pursuing NIH-affiliated positions. I would advice you to try expanding the horizon to include non-U.S. citizens/permanent residents. Thanks.

Proven or promising external resources or approaches

No response

Response 1023

Perspectives on the postdoc roles and responsibilities

Postdoc is a second training period and opportunity to carve out my own niche in science that I can pursue going forward as a PI. i.e. it’s a transition to independence.

Fundamental issues and challenges

Cost of living, especially for positions in cities with high cost of living. I know many scientists from my PhD training who chose to go into industry rather than continuing in academia for this reason, even despite their joy for scientific discovery and curiosity. Additionally, despite a seeming lack of postdocs across academia (every PI is always looking to hire a postdoc), some PI’s still have unrealistic expectation for work and drive postdocs away from academia. For example, constantly telling postdocs that they don’t work enough despite working 60-70 hours per week. Essentially, you can make twice as much money, better benefits, and work 70% as much in industry. We could improve those things for postdocs.

Existing NIH policies, programs, or resources

Grants should be expanded for additional salary and funding for benefits for postdocs (and Ph.D. students, who will be postdocs soon). Maybe this could be tied to inflation. PI's should be encouraged by the NIH to allow vacation time for employees. The NIH should only fund PI's who show that they pay at least the NIH recommended salary for postdocs. This was an issue in my lab, which is very well funded, where one postdoc was paid more than the recommended salary while another was paid less than the recommended salary for the same work. The NIH should not fund PI's who do that, and it should be communicated to PI's that funding will not be given if they do so.

Proven or promising external resources or approaches

Higher salary and better benefits improve recruitment, training, working environment, mentoring, and job satisfaction. Especially in a field where positions are paid by salary rather than hourly, so working more than full-time is expected.

Response 1024

Perspectives on the postdoc roles and responsibilities

An academic postdoc seems to me like an obligatory step in an academic career, one that you have to do in order to stay in academia. Ideally a post doc should help you develop a new skill or establish yourself in a field of research, but my current impression is that you just have to do a post doc in a famous scientists lab to get a good academic job. I have thus far been mentored primarily by postdocs, they have taught me all the basic lab/bench skills that help me every day in lab, so my current standing as a scientist is indebted to post docs, however I am not envious of their position or excited to continue with a post doc after graduating.

Fundamental issues and challenges

The primary issue is money. I consistently see job opportunities outside of academia offering double the normal post doc salary for the same amount of experience. If an academic post doc position paid appropriately for the level of experience and training I would more than likely continue in academia with a post doc. Post docs often have to relocate/move from their graduate school which is another barrier to entry. Better post doc positions are primarily in more expensive cities (San Francisco, Boston, D.C. etc) so the cost of living is made more difficult by the stringent current salary.

Existing NIH policies, programs, or resources

Higher pay and standard benefits as with any other career track job in the United States. NIH policies set the standard for post doc pay and benefits across the country. The unionizing and striking done by the UC schools will inevitably spread if current policies are not altered.

Proven or promising external resources or approaches

Feeling valued rather than exploited by one's institution. Higher pay and benefits are the bare minimum for improving the postdoctoral training ecosystem.

Response 1025

Perspectives on the postdoc roles and responsibilities

Being a postdoctoral researcher means that soon after the completion of your Ph.D., you are expected to transition to a new lab to begin your development as an independent scientist under the direction of a more established researcher. This professional, academic, and personal development includes training in grant-writing, mentoring of junior research staff/students, leading projects and collaborations, attending conferences, and writing/publishing manuscripts. Once again, while this is happening, there is a well-established mentorship team that is guiding the postdoc by helping them get trained, guide them in the work they want to do, ensuring that the postdoc has what they need.

Fundamental issues and challenges

The mentorship within a postdoctoral position can be hit-or-miss and their is little consequence for bad/nonexistent mentorship for PIs. PIs need to be trained in lab management and understand that

different positions/levels have different needs (i.e. undergraduate vs. research tech vs. grad student vs. postdoc vs. senior associates).

The other aspect is that the pay for postdoctoral positions is far too low for the increasingly complex level of technical level of expertise that post-docs are expected to have even just starting out. Also, all PIs are not even paying the base-level salary so there is a lack of transparency on this. This lack of transparency can disproportionately impact systematically marginalized identities within STEM research and can perpetuate inequity.

Existing NIH policies, programs, or resources

Raise the salary for postdocs at all levels. Also, providing relocation funds to postdocs (as-needed) who may be moving from their home institution as moving is often a financially-draining process. This also provides postdocs time to ease into their new position.

Proven or promising external resources or approaches

No response

Response 1026

Perspectives on the postdoc roles and responsibilities

Training position to establish independence.

Should be a period in the career to scale up our knowledge to create a niche.

Fundamental issues and challenges

No need for 300 words: SALARY!

Competitive salary relative to industry folks AND cost of living!

Existing NIH policies, programs, or resources

It drives me crazy to see so many PD getting NIH fellowships and leave for industry with *no* papers. It is basically free money without any thing in return for the taxpayer. Higher salary for high productivity.

Also, K99/R00 transition award should be extended to 5years. It is nearly impossible to produce high quality and high impact paper within 4 years, especially if starting an independent project or working with rodents.

Proven or promising external resources or approaches

Response 1027

Perspectives on the postdoc roles and responsibilities

It’s a great way to be stable after grad school and develop skills in existing deficiencies. It may come with teaching or training roles and often has a higher expectation than PhD roles. Generally it’s a respected role, but not a prestigious one. The academic postdoc does little influence for industry jobs and only bolsters professorship applications. Too much time in a postdoc is now necessary in academia. Generally the brightest and most dissatisfied PhD holders go for postdocs. The middle ground tends to go to industry.

Fundamental issues and challenges

Pay is abysmal. No guarantee or high chance of professorship. High requirements. Poor benefits. Poor institutional support. Lots of postdoc exploitation occurs with no potential relief.

Existing NIH policies, programs, or resources

Enhance pay, require benefits to be of reasonable quality, standardize work hours, standardize tasks and reasonable outcomes, limit term in postdoc. Limit postdocs seeking academic roles.

Proven or promising external resources or approaches

Look at industry pay and hours.

Response 1028

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a fellowship-based position one embarks on following the completion of their PhD work if they are planning on continuing a role in academia. It is a position in which the postdoctoral researcher gains more independence in planning experiments, learning new skills and techniques, and other necessary experience (ie teaching) in order to successfully transition into an assistant professor or other teaching role following their fellowship.

Fundamental issues and challenges

I think there are many challenges. The pay scale and job opportunities are the biggest hurdles. Postdocs are some of the most highly trained and educated individuals and paying them $56,000 which is well below the majority of college graduates who just have a bachelors degree in their first entry level job is too low, especially when many of these highly desirable positions are at universities located in major cities or university towns where the cost of living is very high. The starting salary for a fresh PhD is over 2X that in industry where they are actually paid for their skills and expertise

Also, usually postdocs are around their late 20s to early 30s where they want to be able to start a family, this low pay makes it particularly difficult for women and having to move around to different places to get additional postdocs prior to academic positions is not feasible.

Additionally, there are not great job prospects. Professors do not retire at the rate universities are churning out PhD students, and are only training them for academic positions and for most students, they will have to take more non-traditional careers due to the lack of jobs, many of which a post-doc is not necessary for.

Existing NIH policies, programs, or resources

Increase the payscale is the best way. If you want to compete with industry jobs, the pay and benefits need to improve. As for the lack of academic jobs, I am not sure how you fix that. The majority of students doing a postdoc want a tenure track assistant professor position at an R1 or teaching university and there just are not enough jobs for all of the students who want them. Most of them are being forced into adjunct or associate positions, with no job security, no benefits and short contracts.

Proven or promising external resources or approaches

Better pay

Better benefits

Better mentors

Better career outlook

Response 1029

Perspectives on the postdoc roles and responsibilities

I think in many/most labs postdocs are in exploitative situations. The role of a postdoc in my ideal view would be a mostly independent researcher who is supported by their PI and the lab but otherwise has a clear goal in mind before starting and a set time-frame they should be able to achieve the goal. It seems many PIs see postdocs instead as highly qualified and trained versions of graduate students who are under paid and kept in their position for far too long on exploratory projects.

Fundamental issues and challenges

As it stands for most postdocs the position is too demanding and long-term/undefined for many to agree to the lack of financial security while completing a postdoc gives no guarantee that the postdoc will secure their ideal job as a PI since that field is so competitive. For most jobs outside of the PI role the postdoc is dispensable so there is little reward to agreeing to such an undefined and underpaying job for many.

Existing NIH policies, programs, or resources

I think a closer definition of what a postdoc is in terms of time and project scope would be useful. Perhaps there could be some body that exists to provide framework and job definition so that in cases where PIs are abusing the role there is an HR like way to get help knowing rights ect. I also think the dogma should be dramatically changed, most PIs want as many postdocs as possible because they are highly effective, however it feels like a selfish use of labor. Perhaps each lab should have less postdocs but the postdocs should be compensated better.

Proven or promising external resources or approaches

I do not think recruitment is the problem, I think the nature of the postdoc appointment has shifted and been misused in the last few years and people are realizing how silly it is to take a postdoc position if they are not going to be competitive for the job market based on the status of their graduate school papers, if they do not have strong financial security from other means, and if they are unsure if they truly want to push for a PI job.

Response 1030

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as a job for a fully-trained PhD holder to contribute to the scientific field. As with any job, there is some on-the-job training/learning, but I want to emphasize that in looking for a postdoctoral position I expect to be treated and compensated as the highly trained professional scientist that my graduate training has produced. I view the postdoc as an intermediate stage mainly for who are interested in an academic career path. The postdoc is an opportunity to establish a line of research that may directly translate into a PI's lab focus.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

The reason many PhD holders go to non-postdoc roles is the improved compensation and respect/autonomy that is granted in the industry setting. Postdocs in academic settings are poorly compensated and treated like transient employees/trainees, resulting in a lack of work and life satisfaction.

Response 1031

Perspectives on the postdoc roles and responsibilities

A postdoc should be an opportunity to further ones career by pursuing original research and (if desired) submit grants that list that postdoctoral fellow and thus continue to advance their career.

Fundamental issues and challenges

1) PAY. the fact that i could make literally twice as much money outside of academia is a major reason why I'm leaving. I'm in my 30s and tired of living like i'm still in college in a group home or other cheap accommodations.
2) We are often stuck doing admin work for the lab that we should not be doing and it takes time away from us doing science and other things that would actually advance our careers.
3) Stuck writing grants for the lab or PI where if these grants are accepted, our names our not on them and thus we receive no credit.
4) Stability. I'm in my 30s and I'm tired of moving around. I'm ready to find a stable job and settle down.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Pay should be linked with cost of living around the country, not a blanket postdoc salary. More opportunities that allow a postdoc to continue on in a permanent position. Better protections from PIs dumping their admin work/lab grants onto postdocs without a way for the postdoc to get reasonable credit for that work.

Response 1032

Perspectives on the postdoc roles and responsibilities

Postdocs are the main workforce performing scientific studies, alongside graduate students. They are highly skilled in their field and produce high quality work.

Fundamental issues and challenges

In general this position is precarious (especially international postdocs who must maintain their immigration status through work), and immensely underpaid. Quality of life is significantly lower than their peers due to low salary.

Existing NIH policies, programs, or resources

Minimum pay for postdocs should be increased to at least 75000 per year, and be adjusted for region rather than the same over the country. Some areas such as Boston/NYC are too expensive for the current standard pay.

Increased funding for labs by an increase in the modular R01 grant would help this.

Proven or promising external resources or approaches

No response

Response 1034

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1) It's very clear to me that it is difficult for both clinical and research focused postdocs to compete with industry focused roles for new PhDs. My institutions (a highly prestigious VA and academic medical center) struggle to recruit for postdoc roles that offer significant support—eg for licensure, for K award development, etc. The reasons I understand are:
2) We can't pay enough money to compete;
3) Postdocs don't receive all benefits permanent staff do;
4) Student loan repayment looms, and postdocs don't receive repayment through VA programs (I remain ineligible for all federal programs as a VA-funded researcher—I cannot receive LRP or VA loan repayment);
5) New PhDs are looking for something that adequately recognizes their expertise while supporting their individual goals—and feel that postdocs don't receive that recognition, and perhaps not enough tailoring or support either. Many postdocs also require moving, and particularly in my field—clinical psychology—many PhDs have already moved twice for their doctoral program and internship. Finally, I think there are fundamental issues in terms of equity and inclusion that mean that some early career folks—postdocs and otherwise -receive more support and facilitation towards their career goals than others. New PhDs from underrepresented groups who know they are less likely to receive that needed support may opt-out rather than putting themselves through an already overly precarious process.

Existing NIH policies, programs, or resources

1) Change payment policies to increase salary and require full benefits
2) Advocate for loan forgiveness policies and fundamental changes to educational policies to reduce undergraduate, graduate, and professional training debt
3) Advance policies and programs that protect postdocs from abuse and exploitation
4) Advance equity in postdocs including related to retention and advancement
5) Protected paid leave for parents, caregivers, people with disabilities, etc. including extensions on grant funded postdocs—much longer time lines than current
6) Remote options and pay for moving expenses
7) Pay for licensure expenses

Proven or promising external resources or approaches

No response

Response 1035

Perspectives on the postdoc roles and responsibilities

In my view, the purpose of the academic postdoc is to either

1. prepare to be a principal investigator and/or, in more rare cases,
2. to gain additional training or skills for another career. Increasingly, it is the first case, because many other careers rightly consider a PhD sufficient training to perform well in a job environment.

Therefore, I think the roles **and responsibilities** of a postdoc include practicing the skills that will be employed as a PI in a mentored environment. This includes things like applying for grant funding, developing projects independently, teaching courses, mentoring students, presenting at conferences/seminars. I do not think the position should be viewed as just 'working for a PI', but really should be focused on facilitating the next career step and making scientific discoveries from one's own ideas.

Fundamental issues and challenges

To me, the core issues are that postdoctoral researchers are financially under compensated for the value that they provide, and the postdoctoral phase is too prolonged and restrictive. Relatively low compensation as a PhD student makes some sense (as long as the stipend is livable), because during the

PhD you are working toward a tangible credential and receiving substantial training. During the postdoc, however, every additional year is a massive opportunity cost for a gamble at a faculty position. The NIH F32 is an absolute disaster of a financial decision, despite the prestige, because in addition to the low salary, postdocs cannot contribute to a 403b (like other university employees), do not get credit as a 'worker' for social security purposes, and are (alarmingly) on the hook to pay back the money. The idea that postdocs continue to be 'trainees' in any real sense for a half decade post-PhD strikes me as ludicrous. I am certainly expanding my skill sets, but much of this is self taught and unregulated. I question whether we are trainees any more than anyone starting a new job. I think this bad financial decision could be tolerated if the typical length of a postdoc were a year or two. But it increasingly requires 4-5 years, with no guarantee of an academic job. This undervalued postdoctoral phase also corresponds with the time of life when many people want to move forward in their relationships, put down roots in a geographic location, and women in particular may have to contend with family planning. The prolonged uncertainty of the postdoc makes all of these factors difficult. One must be absolutely sold out on a faculty position to continue through the conditions of a postdoc, and I don't think that is the optimal way to advance the scientific enterprise.

Existing NIH policies, programs, or resources

- I suggest dropping the F32 and expanding the number of K99/R00s. I suggest expanding the 'Early K99' to more NIH divisions, so that postdocs can receive an award with adequate salary early in the postdoc based on their PhD work. I also suggest that the K99/R00 be more flexible in terms of the duration of K99 support, such that postdocs who get a faculty job are not penalized if it is awarded after their job offer. Imagine if the K99 were from 0-4 years, with renewals each year, for maximum flexibility.
- Adjust T32 awards to facilitate postdoc-to-faculty transition at the same institution. An increasing number of institutions are offering such a program and explicit support from the NIH would be ideal.
- Drop the penalties in fellowship proposals for working on the same model organism or at the same institution as the PhD. First, the focus should be differentiation from the postdoc and PhD advisors, rather than litmus tests such as model system. Second, the idea that people need to switch institutes at every phase of the career is difficult for people with families or other ties to an area. In an uncertain postdoctoral phase, at least let people live somewhere they are familiar with.
- Postdocs should be able to apply for some 'regular' grants (e.g. the R21) and transfer them to a new institution if they get another job. Frankly, I am not sure if this is possible now, but if it is, it should be more publicized. In general, barriers to switching institutions with grants should be lowered.
- Drop the payback agreement for F32/T32. Postdocs should be compensated like any real job without the threat of having to pay the money back, no matter how unlikely that possibility may be.

Proven or promising external resources or approaches

- Virtually ever other postdoctoral fellowship pays more and offers more benefits than the NIH F32/T32. Hanna Gray Fellows receive 70k salary, Jane Coffin Childs fellows receive 70-74k, Damon Runyon fellows receive 60-66k, Helen Hay Whitney fellows receive 61-65k, NSF Fellows receive 60k. I think 70-75k is much more reasonable, but the starting NIH salary of 56k with a payback agreement for a 'prestigious' PhD fellowship is almost an insult.
- Fostering community among people with fellowships would be nice. Many others have networking opportunities such as an annual conference, but even something like a Slack community would be helpful.
- An easy way to get funding for conferences would be ideal. By the time NIH fellows pay for their own health insurance, there is not institutional allowance left for experiments or conferences. Many grad students have easy ways to get $1000/year to go to conferences, but lack this support for postdocs. I think it would be nice to have such support that is easy to apply for and virtually guaranteed.
- Given that moving around is currently such a big part of academic life, a straightforward way to get moving expenses covered like any other job would be nice.
- Many of the approaches I am proposing are to treat postdocs like any other person with a job requiring a PhD. Scientific discoveries depend on postdoc labor, but this is not consistent with how postdocs are treated. I enjoy my lab and research but the institutional barriers largely in place due to the NIH make me uncertain whether this is a tenable path. Although we have collectively reached a crisis point, these issues are perennia–see the article "NIH Pledges Big Hike in Postdoc Stipends", published in Science in March 2001 (yes, 22 years ago). I sincerely hope that this feedback is considered.

Response 1036

Perspectives on the postdoc roles and responsibilities

The postdoc should be a temporary mentored position where they are meant to gain critical skills prior to entering industry, academia, or another field. Yes, it is meant to identify skills gaps in the lab, but the sole purpose of a postdoc (as a person) shouldn't be an extra set of hands to do the PIs work. This is a time to explore various paths, professional experiences, social settings, etc to see what they do and don't like, which will ultimately help them determine their values and strengths and help them better choose a career. The postdoc should be a time for constantly new and challenging (and fun) experiences to engage and inspire the postdoc.

Fundamental issues and challenges

Postdocs are overworked and underpaid. As mentioned below, they are expected to just stay in the lab and do work for the PIs without the PIs putting effort into making them well-rounded (professional development, public speaking, networking, grant writing, management skills, leadership skills, etc). There needs to be more of a postdoc curriculum that sets specific milestones or actively encourages sending them to conferences. Having a curriculum and guaranteed "you're expected to present at conferences, network, manage, lead, write proposals, and have a mentoring committee" would help with recruitment because they would know after coming out of their postdoc that they would have gained some of these skills. Having a mentoring committee in addition to their PI would also ensure they have someone else looking out for them and offering resources and guidance (not to mention networking outside of only their PIs circle).

They also need more resources on writing grants, the different kinds, and how to find them. They should be encouraged by their PIs to go out and find their own funding, but there is little guidance on how to start that process.

Existing NIH policies, programs, or resources

I think the NIH could require paying for whatever level of postdoc health insurance is required (be that single, dependent, or family level). Postdocs don't get paid a lot and insurance is high. Many postdocs are international and do not fully comprehend the high monthly out-of-pocket cost to cover their family. This leaves them

1. paying a high cost,
2. enrolling their family in inadequate insurance, or
3. having their family go uninsured.

This leaves them open to getting hit with huge bills should something happen and leaves the university liable if they go uninsured and are on a visa like a J2. Requiring that the PI pay for their necessary level of coverage would be an added benefit and would give the postdoc peace of mind.

Additionally, PIs should be encouraged more to send postdocs to conferences or participate in professional development programming. I would love to see this made a requirement for their funding. Too many times as the Director of Postdoc Affairs do I have postdocs come to me asking for conference/travel funding because their PI hasn't allotted them funds, or actively discourages it.

Proven or promising external resources or approaches

No response

Response 1037

Perspectives on the postdoc roles and responsibilities

I originally approached my post doc position as a way to broaden my skillset beyond what I had learned in my PhD program. While this was initially true, the longer I was there the more I encountered people who were in post doc positions because they didn't have the opportunity to start faculty position or similar jobs and so I quickly realized that I didn't want to remain in academia and instead pursued an industry career.

Fundamental issues and challenges

In many institutions, post docs get stuck in positions with no advancement. There is a real risk of people spending many years in the role with nothing to show for it before they find alternative career paths. PhD-educated students need to be made aware of the career options that are available to them so that they don't feel like post doc-ing is the only choice.

Existing NIH policies, programs, or resources

Overall, greater awareness of the many career paths available is needed.

Proven or promising external resources or approaches

Mentorship programs, industry rotations,

Response 1038

Perspectives on the postdoc roles and responsibilities

Postdoc position is obviously challenging. I love being a post doctoral fellow. But heard from many friends that , higher officials just consider postdocs as a machine that works. It's obviously energy consuming and draining and we are not properly rewarded.

Fundamental issues and challenges

We are not paid properly. Considering the fact that we have the most highest degree and not much paid. Also, we work more than 40 hours per week for sure. Because experiments need not to be finished in 8hrs of time. I have personal experience of being in lab for almost 16 hours continuous. Either we should be rewarded for hourly basis or pay should be increased. Many people go to industry because of this reason because I know many people who just have masters are earning more than we do. Quality of life is too bad in postdocs. We are working even in weekends.

Existing NIH policies, programs, or resources

More trainings should be done.
Also increase the wages.

Proven or promising external resources or approaches

Also, teaching opportunities should be mandatorily included for postdocs. At least they can show in their cv , that we have teaching experience.

Response 1039

Perspectives on the postdoc roles and responsibilities

Academic postdocs are important in the American system where few scientists exist to help train more junior trainees (e.g., PhD students). Academic postdocs develop their own independent projects under the umbrella of their faculty mentor and advisor to prepare the launch of their own laboratory. They also continue to develop new skills preparing for a career in biosciences (whether they pursue an academic career or they don't).

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Response 1040

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary, salary, salary. Ultimately, nothing else matters if the postdoctoral salary is not commensurate with the degree of skills and experience of the employee. It is unsustainable to expect the academic enterprise to thrive on the backs of employees making $54,000 a year.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1041

Perspectives on the postdoc roles and responsibilities

A postdoc position within an academic laboratory should remain the least of all committed positions that a graduate student could have taken upon graduating. That is, the expectation should be that it neither positions them closer to an academic faculty position or employment elsewhere. That said, it remains the most typical path for a trainee aspiring to secure a faculty position. But over the years, the perception and reality of one's chances in landing an academic appointment, particularly in light of industry positions offering significantly higher salaries, makes the academic postdoc an unappealing choice for many.

Fundamental issues and challenges

The fundamental issue remains a lack of financial resources necessary to compete against many lucrative industry, biotech, startup companies (or similar). R level grants have remained largely static, and PIs are being asked to do more with less. At the current rate of each typical R level grant, there is not sufficient funding to support or compete for talented postdocs—who inevitably seek industries that compensate them more handsomely.

Existing NIH policies, programs, or resources

I think that two approaches to consider are to

1. Increase the baseline for modular and non-modular grants to a level that clearly reflects the financial reality that most federally funded PIs are having to deal with. And
2. Work with institutions to make the research track (non-tenure) faculty position a more viable endpoint for scientists who wish to remain in academic position. This should be done in a manner where postdoctoral associates transitioning into a research track position are able to apply for their own funding that is wholly separate from mechanisms that tenure-track investigators can draw upon—so as to mitigate conflicts of interest and perceptions of yet another cohort of competition. An extended consideration would also be for international postdocs to have their own funding mechanisms—since at this point the difficulty of recruiting postdocs is more concentrated with domestic scientists.

Proven or promising external resources or approaches

No response

Response 1042

Perspectives on the postdoc roles and responsibilities

The postdoc position is a transitionary time for an early career researcher to establish independence, while also having the opportunity to plan and carry out a research project that will promote their future career and directions.

Fundamental issues and challenges

The biggest issue for postdocs, by far, is the lack of competitive pay relative to fields outside academia. Without proper compensation, it becomes burdensome for researchers with PhDs to stay within academia performing research. In addition, graduate students and other trainees from underrepresented backgrounds have an even larger financial burden to overcome.

Existing NIH policies, programs, or resources

Significant pay increase (pay beyond that of year-to-year inflation) is a good start for alleviating the financial pressure and making it possible for scientists from all walks of life have a fair opportunity to succeed in academia.

Proven or promising external resources or approaches

Providing more financial resources as part of large research grants, as well as for training grants, will enable improved recruitment and provide for better job satisfaction, and working environments.

Response 1043

Perspectives on the postdoc roles and responsibilities

I really enjoyed being a T32 fellow but I am also very blessed because I won a coveted NIH LRP award.

For a physician this helps offset the trade off cost of going in to traditional clinical practice and balancing the loss in financing from doing a T32.

The T32 provides about 60 ish K, but with the LRP that help off set upwards of 100K and sometimes plus in student loans.

So I think that the T32 should also come with an LRP.

Fundamental issues and challenges

I am a MD. It comes down to finances. Typically for these people they are in the mid 30s. Some have young children and are starting a family. The exact time that its a big financial opportunity cost for these individuals.

Existing NIH policies, programs, or resources

NIH T32 + LRP combined program.

Proven or promising external resources or approaches

I would allow the post docs to have group national course. Maybe a consortia of universities, Harvard, Michigan, Penn, Stanford etc faculty can put on a year long course. 1 hour every 4 weeks.

Response 1044

Perspectives on the postdoc roles and responsibilities

A significant step in increasing your training and a necessary step for getting an academic position.

Fundamental issues and challenges

Science stress—poor work/life balance; unwielding goals; the push to always publish or perish culture; poor pay that is not commensurate with living standards; poor negotiating ability for contracts; poor access to resources (once you are a grad student you are entitled to a lot of school resources, but not when you are a postdoc); no paternity or maternity support for postdocs with newborns.

Existing NIH policies, programs, or resources

Increased stipends; increased training for PIs for hollistic post-doc training

Proven or promising external resources or approaches

Well first and foremost stipends commensurate with the private sectors.

Response 1045

Perspectives on the postdoc roles and responsibilities

I did an academic postdoc because I wanted to keep my options open and was still deciding what I wanted to pursue for my career. It was mainly between an academic faculty position, teaching and industry but I was also open to any career path. I see postdoc responsibilities as leading research projects more

independently than graduates students. I also believe that postdocs should be involved in training either undergrad or graduate students in the lab.

Fundamental issues and challenges

My experience with issues inhibiting retention is that PIs just don't know how to manage or train people, or the experiences with training vary widely from lab to lab. I've seen PIs that just expect them to function completely independently. Examples include not even editing or contributing scientific insight to grants and papers written by the postdoc. The other end of the spectrum are PIs that are completely controlling and don't allow the postdoc to make decisions about the scientific direction. Of course the low pay is also a big factor, but this is compounded by no useful training and so the postdoc experience loses its "training" value. In general, right now the postdoc position has no real training value outside of pursuing an academic position, and even that varies depending on the lab.

Existing NIH policies, programs, or resources

Having more institutions with established NIH BEST programs.

Proven or promising external resources or approaches

No response

Response 1046

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The most important issue is how little I am paid as a postdoc. As described in Yalcin et al., Nature Biotech, 2023, postdoc salaries are below the living wage in Boston. Because I am poor, I have intense stress and other mental health issues associated with constantly worrying about my financial situation. Because I am poor, I am unable to consider starting a family. Because I am poor, my quality of life is generally lower than I'd like it to be. Because I am poor, I waste a lot of time each year organizing temporary housing situations with strangers, as I cannot afford to live alone. Because of all these reasons, I am strongly considering leaving my postdoc for a position in industry where I am paid enough.

Existing NIH policies, programs, or resources

The single most important change that could be made would be to pay postdocs a living wage.

Proven or promising external resources or approaches

No response

Response 1047

Perspectives on the postdoc roles and responsibilities

The postdoc has become a necessary career stage to transition into being a scientist—usually as a faculty member at a university with research programs. Postdocs are mostly employed to conduct studies under existing research programs and further their mentor's and department's research successes, rather than given funds or opportunities to develop skills or their career. Postdocs often provide mentorship and teaching to students or other lab members, as well as within the department but are not often recognized for their efforts or compensated for their labor. Postdocs are expected to keep up with current research trends, and often provide resources or time to helping supervisors (principal investigators) maintain the modernity of their research programs, and update their lab resources to conduct cutting edge research. In the meantime, postdocs are not invested in by their supervisors or the department due to the temporary nature of the job, sometimes even on a rolling year-to-year contract basis, meaning no stability of livelihood and constant future planning and anxieties during the course of the postdoc. Further there is no help afforded to improve the postdocs' upward mobility in career. In addition, as an international postdoc, there are consistent struggles with the VISA and knowing that without the postdoc, I would have to uproot and return back to my home country and abruptly leaving all livelihood here behind.

Fundamental issues and challenges

The NIH pay scale is absurdly low for postdoctoral scientists, especially in consideration of their amount of labor and contribution to furthering science and in comparison to equivalent industry positions with the same qualifications. The NIH scale is not adjusted for cost of living in various states, and denies additional sources of income or top-up payments from the institution. It has not been increased beyond the rate of inflation and increases to cost of living.

Postdocs need to be given more recognition and credit for their work—especially in initiatives beyond producing publications such as initiatives to improve and reform science. Further, for their expertise, postdocs should be treated as specialists rather than trainees, or if they are considered trainees, given significant more funding and resources to develop skills. In fact, postdocs could be reformed to be continuing employment as research scientists.

Postdocs need to be provided more capability of getting faculty positions, especially tenure-track. The K99 awards that propose a pathway to independence are no longer getting candidates into faculty positions, because there are not enough positions and standards have risen to ridiculous heights as a result. There should be more awards and development to give postdocs the means to continue their research programs and establish a career path.

Existing NIH policies, programs, or resources

The NIH pay scale for postdocs need to be vastly reformed—including increasing the salary, establishing benefits that need to be provided by the institution for fair work conditions, transparency in payments beyond the pay scale such as topping up by institutions, transparency in how changes in the scale are determined each year and ensuring those considerations are relative to inflation and increases in cost of living.

The NIH grant funding to improving research rigor, such as by creating resources and training modules, in all of science needs to be expanded and perhaps marketed as potential employment opportunities and careers: https://grants.nih.gov/grants/guide/rfa-files/rfa-gm-18-002.html. Establishing careers and permanent science positions conducting review, quality control, teaching reproducible research, establishing Open Access and Open Science infrastructure is needed.

Proven or promising external resources or approaches

ReproducibiliTea is a grassroots community-based approach that establishes training in reproducible and Open Science and may provide a model in which postdoctoral training could be established (also applicable at the graduate student level).

Response 1048

Perspectives on the postdoc roles and responsibilities

Postdocs are highly trained scientists fully capable pf taking ownership for their projects—they should be able to submit RO1s—they are junior PIs learning to develop programs instead of projects—there is no justification to pay them poorly—it is exploitation

Fundamental issues and challenges

Most are non resident aliens—not only they do not have financial stability but they also live constantly threatened by their residency status—postdocs foreign or American should be eligible for support from T32

Existing NIH policies, programs, or resources

Better pay—ability to submit R grants and a path for residency—also eligibility to be supported by T32

Proven or promising external resources or approaches

No response

Response 1049

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as a temporary position that provides opportunities for additional training that will prepare the trainee to enter the workforce in a related career of their choosing. I believe that the roles **and responsibilities** of the postdoc should vary depending on their career goals and trajectory which should be discussed with the PI to ensure that there is support prior to accepting the position. Postdocs wanting to be on faculty at major research institutions will need to focus on publishing in high-impact journals, securing independent funding such as career development awards, and building name recognition through conference presentations and networking. They will also need experience mentoring and with administrative responsibilities that come with running a lab. I think it's especially important to set realistic goals/benchmarks for those wanting academic positions, and to have a backup plan if those benchmarks aren't met. It is up to the postdoc to take initiative, be proactive, a self-starter, and to ask for help right away if it is needed. It is their mentor's responsibility to provide scientific and career advice, an environment that allows the postdoc to explore independent ideas successfully, and networking/sponsorship. It is the postdoc's responsibility to take initiative, communicate effectively, and to figure out the best ways to carry out the work.

Fundamental issues and challenges

Low salary and long hours are probably the most notable deterrents. It is also especially difficult for postdocs of child-bearing age, as many feel they have to choose between having a family and a career—some think they can have both and then turn 40 with neither. Child care benefits don't even come close to support that is needed.

Universities are now increasing postdoctoral minimum salaries above the NIH standard (esp. in cities where cost of living is very high), but are abruptly asking PIs to pay the difference which isn't always an option due to budget constraints. Such abrupt changes rather than grandfathering in can result in postdocs losing their positions.

But ultimately, I think it might be better to increase postdoctoral salaries and to have fewer postdocs. I think many people who pursue postdoctoral positions ultimately take jobs that didn't require postdoctoral training. It is also more equitable, because some don't have the luxury of taking a lower income to do what they love, and I think those who can tend to be from more privileged backgrounds.

Existing NIH policies, programs, or resources

T32s and F32s should have a locality adjustment, similar to GS scale. It would also be cool if those who were serious about a postdoc had the opportunity to secure funding for their salary/benefits and some small budget prior to beginning their postdoc, as this would give them a bit more clout to shop around and make it easier to match with a PI.

Proven or promising external resources or approaches

I wish there was some sort of database where interested postdocs on the market could match with PIs searching for a postdoc. I feel like it would make the postdoctoral search more efficient and less stressful. And also more equitable, because often people meet each other at conferences and not all grad students have labs that can support their attendance at conferences or can afford to pay out of pocket to attend.

Response 1050

Perspectives on the postdoc roles and responsibilities

When I was a postdoc, my roles and responsibilities are to do well in research and hope that it can help me to transition into academia or industry. I view it as a transitioning period and if I do well in postdoc, I could either stay in academia, industry or somewhere.

Fundamental issues and challenges

I am currently a staff research. After my maximum postdoc training, I transition into staff research in the same institution and lab and continue my research and at the same time train members in the lab. I am here for 15 years and for the last 5 years, I am getting very frustrated with the productivity of postdoc trainees. They are very different from postdocs whom I know and they are demanding, not demonstrating

interest, motivation, and not initiative. But there are a few postdocs who are in the top tier and those are being retained by top professors thus researcher like me or my PI, hard to get top tier postdocs. So the Fundamental issues and challenges are two ways: lack of great quality postdocs and great postdocs will join big labs. Those average postdoc will not stay long and will for certainly join industry or other sectors with higher paid. In the end, researcher like myself is frustrated.

Existing NIH policies, programs, or resources

Make promotion an easy step from postdoc to academic research track. Promote researcher that works hard, and demonstrate that, do not block their promotion. Make promotion for research career pathway, simple and easy. I have seen at my institution that postdoc/graduate student transition to administrative track much easier, without assessment and get promotion and higher paid than postdoc who want to transition into research career track (even for non-tenure track).

Proven or promising external resources or approaches

Personally, I have stayed on after postdoc, and my incentive and promotion to stay are very limited and frustrating. I worked hard for >15 years, and promotion is limited in academia and non rewarding. I stay because I love my research and many times I asked myself why I stay when after 15 years, I am only a staff researcher who work >70 hours per week, contribute the lab member training, contribute to grant writing, contribute to teaching. Honestly, I am determined to leave academia and in fact my New Year's Resolution. Bottom line is that even after my postdoc training and stay on as researcher do not get any better salary and promotion, so why should I stay even if I love doing my research? I feel that the institution need to revisit and should not make promotion so hard for staff researcher who stay on after postdoc and should give them easy path to transition to adjunct position without blocking them to get promotion.

Response 1051

Perspectives on the postdoc roles and responsibilities

I think academic postdoc in USA is big trap and it makes people hopeless, clueless and useless. There is no salary guidelines if you want to start family or having kids, postdoc cann't survive on this salary. More importantly, for international candidates, lack of funding opportunities of NIH to start independent carrier.

However, I am experienced (post PhD >5 years) in design, synthesis, and development of drug-like small molecules as new therapeutic agents. As I am international candidate on H1-B visa so I can't apply for most of the funding opportunities of NIH, therefore there is very less hope for academic carrier as I am also losing age and enthusiasm for research.

It is a big trap.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1052

Perspectives on the postdoc roles and responsibilities

Very critical period as it should provide opportunity to establish the framework for his/her entire ensuing career through discoveries.

Fundamental issues and challenges

Lack of guarantee for research career as university position is unstable, i.e. must leave and find another job if cannot get grant, even if he/she becomes a professor.

Existing NIH policies, programs, or resources

Another discouraging factors is that the process of applying for postdoctoral grant requires submitting ideas for research, which become distributed to so many other people in the process (as many as 35 individuals) so there is no confidentiality.

Further, if he/she cannot gain grant, the research idea is now given to other people who reviewed it–who will then have opportunity to pursue the idea although the idea came from the applicant.

If the grant was not funded, then the applicant will have gained nothing in the process and probably must leave the university.

Proven or promising external resources or approaches

Although the practice of providing a block funding to those who are considered pioneers are ongoing, the selection of individuals as pioneers are highly biased. It generally selects individuals who have faithfully followed the mentor's ideas .

Problem is that most researches did not lead to "cure" for cancer in the past as ~600,000 are expected to die from cancer this year.

So a drastic change in current practice may be necc—which is more based on one's achievement in curative medicine–though under this criteria, most of those working in the field may not qualify.

Also a more NASA like institution with a definite goal may need to be established (where job is not unstable) as it is quite clear whether you can go to the moon or not .

Also with strong training in fundamental of biology—very few postodoc with today's training have sufficient experience in DNA replication, transcription, recombination, structure, metabolism, repair.

Response 1053

Perspectives on the postdoc roles and responsibilities

Postdoc is an important bridge to academic career but these days I would consider it working for nothing from a financial perspective.

Fundamental issues and challenges

1. Lower pay, especially in cities with higher cost of living
2. Using postdocs to complete remaining works from existing grants without considering Postdoc's own research plan/getting ready to apply for small and early career grants funding.
3. Assigning meaningless Green Card requirements for some findings for postdocs like T32.
4. Opening the gate for more postdocs from other countries with established research background.
5. Considering full insurance coverage for postdoc s (not like a graduate research assistants).
6. Applying retirement plans during postdoc (maybe some Institutions do this already)

Existing NIH policies, programs, or resources

Removing Green Card requirements for grants that can potentially higher those without Green card but with work authorization, such as T32.

Proven or promising external resources or approaches

Requiring grants PIs for providing a personal and confidential reports from postdocs (written by postdocs) during their works at that institution/lab/university.

Response 1054

Perspectives on the postdoc roles and responsibilities

Ideally mentored training with considerable more independence than a PhD student. It should ideally also be a position where one gets to learn about a new system of a technique etc.

Fundamental issues and challenges

a) Extremely low pay.

b) Lack of investment from mentors in training, most PIs want trainees' who are already trained and do not invest efforts to mentor postdocs.

c) Lack of protections as regards mistreatment by PIs. PIs have way too much power over the career prospects of postdocs, and it's a complete hit or miss. Too risky.

d) There is no need for postdoc training unless one is determined to go into academia, and as things stand, there is little to justify going into biomedical academic research. Funding rates are abysmal, PI salaries are low, and the amount of free work expected of PIs (grant review, manuscript review, DEI work, outreach work, student recruitment, science communication etc) is absurd. The notion of 'Academic research is a calling, not a job.' is a privileged notion only applicable for people who have not had to or do not have to think about money.

e) Poor work and life balance. There is little opportunity for work/life balance as a postdoc if one wants to get an academic research PI position. Also, postdoc length is progressively increasing.

f) There already are far too many postdocs compared to the number of academic positions generally available. Why is there even a specific need for 'postdoctoral training' aside from cheap skilled labour (which is exactly how postdocs are treated)?

Existing NIH policies, programs, or resources

Increase postdoc pay. Provide paid leave. Require a postdoc to have a committee so one bad mentor cannot ruin a postdocs career prospects. Provide a term limit on someone being a postdoc.

Proven or promising external resources or approaches

NIH should not only promote academic research track or independent PI tracks for postdoc funding. Every trainee fellowships require postdocs to aim for independent PI positions, which is absurd given the lack of job opportunities. Also, provide more research support for postdocs in terms of fellowships available.

Response 1055

Perspectives on the postdoc roles and responsibilities

An academic postdoc gives an opportunity to further hone research skills, mentor students, apply for grants, and work to establish independence. It also provides opportunity to develop scientific maturity. Not all postdocs are created equal and not all institutions and PIs necessarily see the postdoc in this way. The creative energy used in designing experiments, reviewing papers, and writing manuscripts is the key to independence. Postdocs need to harness the skills that they have scientifically and prepare themselves professionally for different careers, as there are no guarantees.

Fundamental issues and challenges

Postdocs write papers to support their next steps and the lab of their PIs. PIs may be stressed with trying to maintain funding, which puts stress on the laboratory staff. PIs may move to different institutions, further adding instability to life. If postdocs choose to start families, opportunities for obtaining adequate support, especially childcare in already expensive cities are difficult. (There is no good time to start a family, but the biological clocks of scientists are ticking.) As industry has evolved, new opportunities for scientists have arisen and the concept of a postdoc has been challenged. People going into industry may not see a postdoc as being necessary or valuable. Some scientists who may have wished for academic appointments also realize that their lives may be put on hold and may also go into industry, which is also volatile.

Existing NIH policies, programs, or resources

The K awards seem to provide a number of opportunities. (However, many of these are geared toward clinicians.) Infographics are OK, but one could add more for the research scientist track. There seems to be more information for the veterinary or clinician pathways. How do we value the PhD vs. the DVM vs. the MD? Should a certain number of slots be offered for postdocs such that the potential for exploitation decreases? Can there be a check and balance system for evaluating a postdoc's progress after each year? Can institutions harmonize their postdoc offices to ensure all are aware of the benefits offered?

Proven or promising external resources or approaches

Consider providing dedicated time and space for those who explore: teaching at primarily undergraduate colleges, going into industry/partnering with industry partners, applying for science policy roles, etc. Integrate and align with the National Postdoc Association for feedback. Ensure that healthcare for postdocs is equitable, as are policies for parental leave. Consider the benefits of someone going into industry after the PhD and how this may be seen as a better choice from a psychological, financial, and practical standpoint. Consider the opportunities of having PhDs enter into physician-scientist roles. accelerated programs PhD --> MD = MD/PhD? Some people in the biomedical sciences may have not known about this sort of program and/or developed interest late. It seems that MD/PhDs in research get more opportunities for applying for and obtaining grants (and they can also still function as care providers).

Response 1056

Perspectives on the postdoc roles and responsibilities

To me, a postdoc should be an opportunity to design a novel research project in a supportive environment, which will allow you to generate publications for landing a faculty position and establishing grant funding. I would like a postdoc entering my lab to propose a research project that could be their own to take with them, in addition to working on a project in my own group that needs to be pushed forward. This requires a postdoc to have a decent skill set already for the work that my group does, some training is of course expected but they need to come in with 30-50% of the knowledge base or else it's essentially another PhD project.

Fundamental issues and challenges

Recruitment is a severe problem for me, I've yet to get any strong candidates. I am instead awash in weak candidates, who seem to be looking simply for a job, have no skills related to my research, and don't have any vision for a potential project. Some of these are just poorly trained, but some I think simply want a staff position. Having recently been a postdoc, I've been on the other side of this as well: I received almost no specific training in how to be a faculty member, and my last mentor was upset that I was spending time writing grant proposals and picking out equipment for a new group in the last months of my employment. The current postdoc is essentially a staff scientist, which is a waste of our youth and energy. The problem is that PIs are dependent on their cheap and experienced labor. I could lose my tenure because I can't find a postdoc to push projects through in these early years—graduate students take too long to train and I need papers now.

Existing NIH policies, programs, or resources

I have had NIH funding at every stage of my career: PhD, postdoc and ESI. Only in my PhD training grant (run through my university) did it ever feel like more than a paycheck and CV tick. It would have been very helpful to have some sort of organized meetings to talk about career development etc. as a postdoc, serve as an ad hoc ESI member of a study section to learn more about the inner workings of the NIH, have opportunities to travel to the NIH and meet with scientists in my funding institute. Essentially keep the programs as they are, but just provide a little more humanity so that in addition to the money (which is great!) we can also feel like we are participating in something larger. I think we also need more "real" staff scientist positions, for the people who want to stay in academia but won't become PIs.

Proven or promising external resources or approaches

A strong jobs board, free, would be a great help for recruitment. Perhaps people with NIH-funded postdoc positions available could post them? And better built-in ways to interact with PIs in the field who will eventually be the connections they need for jobs, which some of the foundations do for their fellows through yearly retreats. Many postdocs, myself included, don't get a lot of contacts outside their lab until they go on the job market. My experience may have been worse due to the pandemic, but I don't think it was atypical.

Response 1057

Perspectives on the postdoc roles and responsibilities

It is a transition time which provide an opportunity to switch to independent career. It also provide a platform to develop own parallel line of research.

Fundamental issues and challenges

Many PI do not consider them as trainee as they want someone to lead the project from day one and put lot of pressure. Many lab also do not prefer to hire senior postdoc so there must be some job hierarchy so that postdoc should not feel insecure and focus on research. PI or University must have plan to place trained postdoc. As postdoc is transition at both level personal and professional authority must provide support them to grow.

Existing NIH policies, programs, or resources

Some policy to retain and give job security.

Proven or promising external resources or approaches

While awarding grants to PIs, NIH should ask them to follow good mentoring practices and some weightage can be given for mentoring.

Response 1058

Perspectives on the postdoc roles and responsibilities

The academic postdoctoral training serves to develop leadership and individuality in scientific pursuits. It is should allow for academic freedom to explore fundamental scientific questions that would not be of financial interest to industry. This type of training creates new ideas and brand new fields of research. It is a critical sector of the scientific and translational process. Without these positions, there stops a flow of early stage investigators and chokes scientific discovery overall.

Postdoc training could also provide opportunities and a proving ground for under represented populations and under served graduate students to receive further training and develop leadership roles. These opportunities are invaluable to students that would otherwise be restricted to their social economic circumstances.

The academic postdoc should build on the creativity of motivated students and an exchange of new ideas. It allows for the exchange of ideas from across disciplines and global technological advancements. The critical mass of postdocs in the US and in the academic environment is unparalleled in generating and advancing knowledge.

Fundamental issues and challenges

Issues stem from multiple levels.

- Stagnation of graduate student and postdoctoral salary in the face of rising cost of living.
- Underfunding of lab operating budgets that do not match the reality of scientific research costs
- Poor graduate school training that lack leadership development and understanding of the scientific process
- The perspective that academic postdoc is a sacrifice in personal life (work life balance, family life, personal development) driven by unrealistic timelines and the publish or perish model
- Top down stress system of austere grant funding model for most labs and funneling of money into small subset of “star” labs
- Poor accountability of PIs in repeatedly abusive practices and a fear-retaliation system where a fear of a bad recommendation primes a negative work environment
- A lack of PI training for people management promotes and propagates historical malpractices

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1059

Perspectives on the postdoc roles and responsibilities

I consider the postdoc as a preparatory mentored phase before a potential academic career, as well as a chance to consider how to refine and further my own research agenda as I prepare for research independence.

Fundamental issues and challenges

Off the bat, the pay discourages one from seriously considering continuing in an academic career. The years of training to get through the PhD is met with an almost insultingly low pay, one that many undergrads will likely surpass in their first year of working full-time. As much as I desire to do research and teaching in an academic setting, the low wage and lack of childcare related benefits stings. I pay my childcare provider nearly as much as I earn myself per hour.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1060

Perspectives on the postdoc roles and responsibilities

I don't think there were clearly delineated roles **and responsibilities**, or if there are they get ignored. Ideally the job provides training for people so they can become better PIs, but given how many obvious differences there are between these two types of roles and what they do, that is plainly not true. In real life my experience suggests that most scientists including postdocs view them as slightly better-paid senior grad students.

When I joined my lab as a postdoc, my role was to learn the techniques and produce research product. That happened and projects have evolved (and I am still doing them), but now as our lab manager has left, my role also envelops what they have done, so it increasingly involves lab management (IACUC, mouse colony maintenance, management of junior lab members, etc.). In that sense I do think I am getting some "PI training". But what a postdoc means will easily vary from lab to lab, or situation to situation within the same lab.

Fundamental issues and challenges

Recruitment of postdocs—The challenge that made me question whether I should be a postdoc is the generally negative view of job prospects after the postdoc. If this job is to prepare me for an academic faculty position, yet there are so few academic faculty positions available, why should I even try?

Retention of postdocs—Poor retention is usually due either to a poor PI-postdoc relationship, the fact that postdocs can't afford to be postdocs (especially those living in expensive cities), or the PI runs out of funding to support the postdoc. Postdocs can get their own funding, but while there are several mechanisms for this, the overall proportion of fellowship-supported postdocs is still pretty low.

Quality of life—this depends on institution, department, and lab culture. The things that impede good quality of life include a PI that is not supportive or encouraging, a department that does not recognize the existence of it's postdocs, or an institution that does not support postdoc development or organizations.

Existing NIH policies, programs, or resources

I think there will always be an argument for giving more money to postdocs (fellowship awards or career development awards), as well as increasing the R01 budget so labs can better accommodate increasing postdoc salaries and other costs.

The NIH also publishes a payscale they recommend for postdocs, and this payscale is used by departments to determine how they will pay theirs. This payscale is not adjusted for regional differences in living expenses, and for postdocs who need to live in cities this high cost of living combined with low pay could result in poor retention.

Proven or promising external resources or approaches

There are a lot of possibilities here, but it's not clear to me what the best would be. The postdoc is supposed to be a training position for one to become a faculty member. But since there are not many faculty positions available, it's not clear to me that we should be trying to increase the raw number of postdocs. If you do, you're really just setting more people up for failure as they try to move on to their next steps. Rather than increasing the number of postdoc positions, I think It'd be better to focus on increasing quality of life for existing and future postdocs. This could be done by increasing salaries, or at a minimum ensuring that recommended salaries are accompanied by cost of living adjustments. Also, a very notable NIH fellowship disincentive is that fellowships prevent postdocs from receiving institutional benefits, such as matching for retirement savings plans. That should be solvable.

Response 1061

Perspectives on the postdoc roles and responsibilities

A Postdoc is a temporary research position that is typically taken on by someone who has recently completed a PhD or other doctoral degree. Postdocs work under the supervision of a principal investigator or senior researcher, and their primary goal is to conduct research that advances their field of study and contributes to ongoing projects.

Fundamental issues and challenges

The industry was booming and postdoc positions are exploitative. No one wants to be stuck in a low pay position when you can get better pay in the Industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Improve job satisfaction and opportunities after you complete the postdoc.

Response 1062

Perspectives on the postdoc roles and responsibilities

A postdoc is a PhD graduate who fails to launch. It is any necessary position that only exists to secure cheap labor at the expense of the individual.

Fundamental issues and challenges

No career advancement. No training. Under paid. Academia is dying.

I am now 5 years post PhD, working in industry. Current salary is ~600k (tech). In those 5 years I have earned a bit over $2M, been promoted 5 times and have held 3 roles at 2 different companies. I have started a family, purchased a home and have raised 3 children. The amount of experience I have gained is significant.

Had I stayed in academia. I would be just now finishing up my first post doc. I would have earned 50k/yr for a total of $250k. My experience would be far more focused and narrow. My home life would be on hold until I had secured a "permanent" position. I'd be facing a choice of either finding a PI position (rare/difficult, not desirable) or moving to industry where my 5 years of post doc industry "experience" would be rightly discredited and downplayed.

This did not happen overnight. This is years of failed leadership and policies in the making.

Existing NIH policies, programs, or resources

Why only existing and not new policies ?

Proven or promising external resources or approaches

Compete with industry on pay, benefits, career advancement and training.

Response 1063

Perspectives on the postdoc roles and responsibilities

I think the postdoc role is an opportunity. At it's best, it's an opportunity for someone to transition from the pace and narrow focus of research in a PhD to a higher level of research productivity, collaboration, and capability. A great postdoc should take someone who is already a capable scientist and help propel them forward by mentoring them through gaining complementary new skills (often including things like grantwriting), providing opportunities for productive writing through leading publications, and ultimately help them get their next job. I don't think this is true for many postdocs (will write more below)

Fundamental issues and challenges

Often I think PIs on grants (and I can't speak to training grants) often see a written in postdoc as a staff scientist position rather than a trainee, with a steep discount in cost. This is fundamentally unfair to the postdoc as they end up having a lot of responsibility (things like data management, data cleaning) for a project that is not theirs and will not result in publications or any thing that will stay with them when they leave. Wisely, many PhD grads are unwilling to take a position at a very low salary to do this sort of position.

Existing NIH policies, programs, or resources

I think if a PI writes a postdoc position on an R01, they should have to describe the amount of time that will be training and professional development for the postdoc and how the grant will allow for that. Grants that write postdocs in to do the job of staff scientist should be flagged and scored lower accordingly.

Salary increases and moving costs would be nice. Ensuring postdocs have access to funding for conferences and professional development is important. Training for PIs before they start postdocs (in mentoring, mentorship contracts, etc.) would be lovely.

Proven or promising external resources or approaches

Mentorship contracts can really help. For many, writing and grant writing classes are really important. I loved the OpEd Project "Write to Change the World" Workshop—not specific to grant writing but relevant.

Response 1064

Perspectives on the postdoc roles and responsibilities

It seems like postdoctoral positions are just another step in the inflation of training that is required for entry level positions. After I get a PhD, I should be done. But now we have to get a PhD and then essentially continue to go to school even more just to be competitive for many entry level jobs that should only require a PhD. It feels like a ridiculous scam.

Fundamental issues and challenges

At my institution, nothing is designed with postdocs in mind. They have no formal events or communities, they hardly know each other, and they struggle with basic admin issues because they're not students and not faculty/staff, so they are always wondering which rules apply to them and which do not.

Existing NIH policies, programs, or resources

I do not think the postdoctoral training system should be enhanced. I think it should be entirely reimagined (i.e. only for people in very specific circumstances who truly need that training) and reduced.

Proven or promising external resources or approaches

No response

Response 1065

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Subpar salary and benefits. Lack of childcare and moving expenses. Obtuse expectations and future career prospects.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Pay them a fair wage.

Response 1066

Perspectives on the postdoc roles and responsibilities

Narrow training geared toward academic professorship and grant writing. Very few ex-Gov and ex-industry persons in academia creates a bubble of experiences.

Fundamental issues and challenges

Pay. Pay. Pay. Training is almost exclusively geared toward a career of never leaving academia, so years spent in a postdoc are not applicable to industry seniority. Childcare support (pay). Housing (pay). Retirement (pay). Financial stability (pay).

Existing NIH policies, programs, or resources

Improve pay to be competitive. Pay rates for post-doc are approaching poverty lines for a family, which self-selects for people who don't/can't start a family. Work hours are typically incompatible with family obligations (80+ hours/week is typical across academia). Enforce or encourage work/life balance beyond self-reporting

Proven or promising external resources or approaches

Pay and increased success rates for grants (eg academia prospects) is proven to improve recruitment. Everything else is hand waving.

Response 1067

Perspectives on the postdoc roles and responsibilities

During a PhD one learns to perform ethically appropriate science, to formulate hypothesis and to critically test these. After the PhD follows the postdoctoral position, which is a time one can develop the skills needed to evolve into an independent scientist. Skills that are required for independence include having leadership roles, writing papers and writing grants. It can also be a time during which one learns new techniques, to enrich the researcher's toolbox to answer those critically formulated research question.

Fundamental issues and challenges

Currently many postdocs are more used as people performing the technical work and mentorship for career development often lacks. Professors don't have time for postdocs to sit down and go over their papers or grants in detail, whereas PhDs get actual training in the form of classes. In addition, postdocs are not socially taken care of as benefits are lacking and salaries are below standard. Job security has always been difficult in academia, but the combination of little job security and too little money to afford proper childcare and benefits make a postdoc position in academia very unenticing.

Existing NIH policies, programs, or resources

Improve the social regulations for the postdocs: increase pay, ensure proper healthcare, benefits, and maternity leave regulations. So that postdocs can focus on the science instead of making sure their families are able to eat. Offer NIH courses on grant writing for free!

Proven or promising external resources or approaches

No response

Response 1068

Perspectives on the postdoc roles and responsibilities

I think a postdoc is similar to any entry-level position where you acquire new skills building on previously guided skills. I think it is often generally viewed as a stepping stone to becoming a faculty member but it doesn't have to be.

Fundamental issues and challenges

I think that for the most part, funding agencies and PIs fail to see postdocs as an entry-level position. In any non-academic sector, an individual with the amount of training a postdoc has would be paid a highly competitive salary. However, in academia and at the NIH, postdocs are paid wages barely above those of a graduate student and the salaries are not even close to competitive with industry. A postdoc is a training experience but so is any entry-level position in industry.

Existing NIH policies, programs, or resources

Salaries should take into account the cost-of-living for the location of the postdoc.

individuals that come from families with wealth versus individuals with very little to no family support have very different experiences trying to navigate the finances of postdoctoral life and procuring housing, food, child care, etc can be much more difficult for individuals without family/financial support that does not come from the postdoctoral institute and/or funding. Mechanisms that enable postdocs to have easier access to childcare, summer programs for school-aged children, and housing (including the cost of moving and the expense of rent without assuming that every postdoc is in the position to split the cost of rent with another income-earning adult) would be hugely beneficial.

It could also be helpful to increase communication across disciplines for postdocs to learn about different funding mechanisms and to navigate federal funding mechanisms and the challenges that arise while navigating their use.

There should be more open communication about postdoc salaries and the process for negotiating salaries.

The NIH should have a postdoc salary range for each year of experience, not a single number.

Maybe the NIH, rather than changing the postdoc salary according to zip code, could have a standard set salary range but would also provide a cost of living allowance (COLA) similar to what the military does.

Proven or promising external resources or approaches

The D-SPAN F99/K00 works hard to provide platforms for fellows to communicate with each other for the duration of the funding. But, postdocs that are funded through other mechanisms don't have access to this same community. Maybe there could be something similar for all funding mechanisms.

The military provides employees with a cost of living allowance based on zip code to help defray differences in cost of living according to zip code. Perhaps the NIH could consider doing something similar given there is huge variation in postdoc living expenses depending on the location of the institution where the postdoc is employed.

Response 1069

Perspectives on the postdoc roles and responsibilities

The academic postdoc training experience is a personalized training time of growth that depends on the ultimate career goal. If a postdoc is interested in being a research-heavy investigator in academia, the

training should be tailored into how to be an investigator (e.g. how to write grants, how to increase publication output, acquiring new skills and theories relating to the field, networking with experts in the field, navigating the academic job market, managing a team, etc.). If a postdoc is interested in a career in the industry, the training should be tailored into how to be an industry-focused scientist (e.g. the business aspect of industry, entrepreneurship, acquiring new skills and techniques as to be a competitive candidate in the job market, how to be a project leader, writing industry grants, etc.).

Fundamental issues and challenges

1. The definition of a postdoc is not universal across institution (e.g. are they trainees or staff). As such, there is great disparity in postdoc benefits and salaries. In regards to the latter, although NIH sets specific guidelines for postdoctoral research pay scale, not all institutions (or principle investigators) are following it. The low postdoc pay relative to an industry position is what turns off many PhD students from entering the academic research after acquiring their PhD.
2. The time scale for eligibility of prestigious postdoctoral grants put a ton of pressure on the postdoc training experience. E.g. K99 4-year eligibility limit. What this means is that as soon as the postdoc joins a lab, they need to build their profile and publish enough to be competitive for funding. This means it doesn't even make sense to aim for an F32 fellowship because by the time the F32 starts the postdoc should already be applying for the K99.

Existing NIH policies, programs, or resources

NIH needs to implement and regulate the guidelines for postdoctoral pay in addition to ***how it relates to the location of training*** (e.g. more expensive to live in San Fran, Boston, New York).

The eligibility limit for NIH postdoc grants need to be revisited to lower the publication pressure of postdocs so that they could acquire a well-rounded training. This could be mitigated by

a) shifting the K99 eligibility limit from 4-year to 5-year or

b) make the K99 the 2-year funding of the F32.

Proven or promising external resources or approaches

I don't have any recommendations as I have not seen any that are effective. Many of the postdoctoral training ecosystem resources have been tailored over to acquiring a career in non-academia.

Response 1070

Perspectives on the postdoc roles and responsibilities

A postdoc is establishing independence and honing specialized skills for a faculty or industry position. They are usually also expected to support an existing lab culture by managing and training students, maintaining lab infrastructure, and obtaining their own funding.

Fundamental issues and challenges

Low salary, unrealistic expectations from supervisors, and extremely limited academic job prospects are discouraging to say the least. From what I've seen at several R1 institutions, postdocs are essentially persona non grata especially to administration.

Existing NIH policies, programs, or resources

IOM and NIH have talked for years about bolstering soft-money faculty positions, but nothing has come of it. I know many people who would be willing to go this route, but it seems inordinately risky.

Proven or promising external resources or approaches

No response

Response 1071

Perspectives on the postdoc roles and responsibilities

The current responsibilities of a postdoc are to produce high quality research in a high pressure atmosphere with little support and compensation. A postdoc position used to be a training role for

individuals who would transition to a professorship within a couple years. The goal was to learn how to mentor under the guidance of an already-successful mentor.

Fundamental issues and challenges

1. Professorships can be attractive positions for which the postdoc is seen as a necessary intermediate. More and more, individuals become trapped in one or more 5+ year postdocs without a clear path to obtaining a tenure-track professorship. This issue has become worse recently and is viewed as too large of a sacrifice to trade for a desirable professorship position. Senior profs have told me that they did a 2 year postdoc and then got a call from a friend at a top-tier research university asking if they would like the open professorship position. That would never happen now.
2. The low postdoc compensation has made the position a source of cheap but skilled labor for professors. Many professors no longer have the personal resources or motivation to act as the mentor they are supposed to be for postdocs. There is little interest among current PhD candidates to fill this role.
3. There is a problem with how professors and senior academics view postdocs and the academic track. The academia path is preached as a "passion" and if you have that passion you accept that you will do whatever it takes to fulfill it. This is a lie that the young generation of PhDs have realized. You shouldn't have to sacrifice your quality of life to pursue a high stress professorship to be able to tell yourself that you're happy.

Existing NIH policies, programs, or resources

1. Substantial increase to postdoc compensation. Would probably have to go hand-in-hand with an increase in grant size. The R01 grant has not gone up in ~25 years which means its purchasing power has been cut in half over the same time.
2. Hold professors accountable as mentors. I think restrictions to lab size could address this partially.

Proven or promising external resources or approaches

No response

Response 1072

Perspectives on the postdoc roles and responsibilities

Postdoctoral position sets one up for trainings that are important for becoming an independent investigator.

Fundamental issues and challenges

Low salary and uncertainty with career transitions

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1073

Perspectives on the postdoc roles and responsibilities

An opportunity to gain distinct, complementary skills to PhD work with expanded independence in mentorship, writing, and scientific direction

Fundamental issues and challenges

For a highly educated institution like the NIH this should be obvious. The pay. The NIH base postdoc salary is pitiful, and given current trends in cost of living unsustainable. Especially when considering the cost of living in many major academic hubs (e.g. Boston, Bay Area, DC metro), it is not sustainable to live off of the paltry NIH postdoc salary.

Second to this is the exploitive nature of the role, and the general toxicity and abuse of academic environments. It doesn't make sense to subject ones self to this environment especially given my first point.

Existing NIH policies, programs, or resources

The salary!!!! Literally, this should be so obvious. It's time that academics recognize that a postdoc position is more of a parasitic relationship than a symbiotic one. A relationship where PhD trained scientists work very hard for very little pay to perform mostly independent research. Any 'training' that happens at this stage does not justify the extremely low wage deemed sufficient by the NIH. There is no other policy, program, or resource that would have as significant of an impact on postdoc recruitment as salary. Until the NIH grasps this fundamental concept and recognized the basic right to fair compensation , I don't expect the trend in postdoc numbers to change.

Proven or promising external resources or approaches

Literally the money. Just pay people livable wages. That's it. This isn't hard. It's literally what everyone is talking about. Did you even consult the literature before designing this survey? I'll say it again, it's the money. People want to be able to live while they do their work.

Response 1074

Perspectives on the postdoc roles and responsibilities

A post-doc is a fully trained, PhD level scientist whos job is to fully devote their time, energy, and passion to answering a question. These individuals are preparing themselves to train future scientists as well as developing their skills further in order to drive research in their field in their own labs.

Fundamental issues and challenges

Post-docs are generally paid starvation wages with little to no benefits. They are expected to work long hours, with little breaks to push projects forward and publish at high level in a very short amount of time, in order to be competitive in the academic job market. These individuals are generally in their late 20s and early 30s and are often times in a period in their lives in which they are settling down and trying to start families of their own, but are expected to be able to do this with no money. Post-doc salaries are a joke compared to what individuals with the same qualifications are making in the private sector. Why should we expect highly trained individuals who are trying to build lives to want to do this work for almost no compensation and no guarantee of a tenure-track position at the end of it? Love of science can only carry you so far when you are struggling to take care of yourself and your family.

Existing NIH policies, programs, or resources

Pay post-docs more! Increase health and other benefits so post-docs can take care of their families as well as prepare for their futures. The cost of living of individual cities should also be considered and perhaps implemented in a post-doc pay scale. A 54,000 salary may be enough in places like Buffalo NY, but for post-docs in programs in Boston or San Francisco this salary is poverty wages. Also set a minimum post-doc salary, the amount of foreign post-docs who are being underpaid is egregious and should be illegal.

Proven or promising external resources or approaches

Look to the private sector. What are they offering potential workers that academia is not? If you want to be competitive with the private sector and continue to supply academia with high level scientists who will continue to innovate and produce cutting edge science, the future of academia (post-docs and PhD trainees) need to be given more support, and I mean monetary support as well as in other areas.

Response 1075

Perspectives on the postdoc roles and responsibilities

As an independent researcher, the Postdoctoral Researcher will be responsible for devising and implementing intricate and experimental procedures that are grounded in established scientific protocols. They will also have the flexibility to design novel protocols when necessary. The Postdoctoral Researcher will be expected to meticulously summarize and analyze the findings from these experiments and then prepare and publish their results in research journals.

Fundamental issues and challenges

I spent a considerable amount of time weighing my options between pursuing a career in the pharmaceutical or biotech industry versus a postdoctoral position and academia. My mentor has always wanted to work on similar projects being conducted in industry for years, but the funding was never there, and many of his ideas were not viable for grants for reasons like being too out there or too difficult. It is incredibly frustrating for him to see concepts and strategies he's thought of half a decade in advance being explored by companies now. The biggest draw of academia was the ability to peruse your own research interests but that is only true if it's fundable and if said funding is available. Chasing grants honestly seems demoralizing and Bruce is really good at it. Moreover, there is the financial aspect to consider. Pursuing a PhD is an expensive endeavor. It is a financial cost to my future and the costs continue during the postdoc phase. I don't rely on my parents for financial support at this age and wouldn't even if I could. It seems irresponsible to live in Boston on a postdoc's salary of 55k-62K before taxes (average rent is 31K a year) when I could do the same work at a company for more than double the pay without considering additional compensation. The post doc salary in SF is slightly higher with a far higher overall cost of living. I would have been interested in pursuing a postdoctoral position but the current climate surrounding this career path makes it an irresponsible pursuit. It's likely that the individuals asking for this information come from a different and older generation than current postdocs, as this this is widely recognized as notorious barrier among my generation. I am 30 years old.

Existing NIH policies, programs, or resources

The solution to improving the postdoctoral experience is twofold. Firstly, postdoctoral researchers should be paid a salary that is comparable to the industry standard for a Scientist 1 position, along with similar benefits. Without this, it is financially irresponsible for individuals to pursue a postdoc. Secondly, the funding climate needs to be revised and corrected, as it is currently in a dire state. The incentives of working in academia are negated when funding, rather than scientific potential, dictates which research is eligible for support.

Proven or promising external resources or approaches

I'm struggling to understand the intent of this question. It's widely recognized that postdocs receive significantly different funding than research scientists in industry. As a postdoc myself, I'm barely able to make ends meet in a costly city like Boston. Recently, I was offered a job in industry that pays 2.3 times my current salary, and I couldn't be happier. If we want to improve the training system for postdocs, we must start by valuing them more and stop treating them as underappreciated resources. Financial compensation is a crucial and proven means of demonstrating that value. It's naive to think otherwise, especially in this economic environment. Consider what your quality of life would be like if you had to survive on a postdoc's salary in Boston or San Francisco, especially if you have dependents to support.

Response 1076

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary is not enough. The only reason I am going into industry is because the post doc salary is not sustainable.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1077

Perspectives on the postdoc roles and responsibilities

In general, a postdoctoral position is one of training, where I can learn new research skills and improve soft skills that make getting a job easier (i.e., publications and grant writing). In practice, there is very

little mentoring and often new skills have to be learned on my own time. I have also found a disconnect from a PIs idea of what a postdoc should be doing (i.e., just research and writing papers). It is very hard to get time to develop my own soft skills (i.e., speaking, writing, leadership). Additionally, I was only allowed to do teaching if I did it on my own time (after putting in 50-60 hrs in the week), which was completely unreasonable. I have found that PIs are just treating postdocs as a cheaper version of a research assistant / staff scientist.

If an academic postdoc is a trainee, then there should be a formal program with professional development during the working week and not on top of research responsibilities.

Fundamental issues and challenges

Biggest issue is salary. I am a computational postdoc, but get paid less than a 3rd of what I would make in industry. If I had a family, I would not do a postdoc for that salary and no family healthcare. I can only do this postdoc because I do not have any other financial responsibilities. Otherwise, I would have left after just one year. Now, it is very easy to skill a postdoc as a computational biologist and I do not see that changing without more competitive salary.

I attempted to get a raise, not market rate but more than 5k increase. My academic institution used the NIH pay scale to deny me. If I wanted to get more money, I would have to leave academic. That was made very clear. I can honestly say that I would not feel comfortable paying a computational postdoc anywhere near the NIH pay scale as a PI.

Another issue is that there are no protections for postdocs against abusive situations. Because the postdoc is only sometimes an employee, this places us in a gray legal area. My PI just decided to move my authorship because they could. I had no recourse. PIs have so much control without any kind of protections for postdocs.

Existing NIH policies, programs, or resources

Modify the NIH pay scale to be tied to cost of living. The government already has a travel per diem that changes based on location, this should also be implemented for NIH pay scale. Increase the pay scale based on inflation and require any institution that accept NIH funding to use this.

Require paid family healthcare for NIH funded programs.

Proven or promising external resources or approaches

There are a number of places that are Unionizing to get reasonable treatment. Look to those situations to see what is not being addressed.

Response 1078

Perspectives on the postdoc roles and responsibilities

I believe that the postdoctoral position should be about learning something that isn’t taught in a PhD. A postdoc should be learning new and innovative ways to consider the field of science and research as a whole. Many PhDs wind up as a keystone cog a machine which they drive forward every day, but my hope for perform a postdoc to learn how to make new machines. Other purposes such as moving into a new subfield of biomedical research could also benifit from a postdoc before moving onto other positions.

Fundamental issues and challenges

BUDGET. I have offers from industry over $200,000 per year for my current skill sets as a 5th yr PhD student, and people want me to take a job that makes 1/4 of that instead. People keep encouraging me that it’s twice the pay that I make now as a PhD student, but they also want me to move to somewhere like Boston that is twice as expensive. Postdocs are not getting a liveable wage.

There are many abusive practices surrounding postdocs as well. Some labs take 3-5 international postdocs on 1 shared salary and barter visas for labor. Many of the labor practices in labs are unethical. Refusing to give lunch/breaks, demanding 10-30 hours of overtime a week just to be considered at baseline. Requiring students to ghost author grants, papers, etc that the PI will eventually take full credit for. There are little to no rules about how postdocs may be treated and it shows in the daily abuse that they experience.

Existing NIH policies, programs, or resources

Raise the minimum salary for postdocs to at least $75,000 for a year 0 postdoc. Put a maximum limit on monthly work hours with a reliable reporting system that requires PIs who over work students to pay them overtime for the extra hours. Make a limit to how long someone can be kept at a postdoc position (5 years is plenty). Help financially with child care, personal extenuating circumstances, and cost of living supplements. Create true accountability for abusive and discriminatory behaviors of PIs.

Proven or promising external resources or approaches

No response

Response 1079

Perspectives on the postdoc roles and responsibilities

The post doc is the engine of the lab and the only clear path to academic independence. Without the post doc, the lab does not train new members, innovate, or discover at a competitive rate.

Fundamental issues and challenges

Salary is the single greatest issue inhibiting recruitment, retention, and overall quality of life of postdoctoral trainees in academic research. The current salary is far below sufficient and abysmally below competitive for industrial positions (often not requiring a phd).

Existing NIH policies, programs, or resources

Improve post doc salary to compete with industrial salary for equivalent work. Improving salary would improve quality of life, recruitment, and retention.

Proven or promising external resources or approaches

People pursue fair and competitive monetary compensation for their work. Pay pod docs more to compete with industrial salaries.

Response 1080

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a job, just as a research scientist in industry is a job. However, traditionally, postdocs are viewed as trainees by the university and left in limbo as they are no longer students and not yet faculty. This may be the result of the failure of the academy to adapt to the changing demographic and needs of postdocs, the increasing competitive nature of the academic job market, and the elevated costs of conducting research and paying researchers equitably. A postdoctoral position should be part of a defined pathway to obtaining a faculty job or an industry job, depending on the individual. For academically-focused postdocs, this involves adequate support to conduct independent research, continuing to develop skills that would lead to successful careers as independent researchers, and focus on skills important for success as a PI such as mentoring and teaching.

Fundamental issues and challenges

The primary issue with postdoctoral recruitment, retention, etc. is lack of adequate compensation. While industry salaries have kept up with inflation, academic salaries have not, especially for cities with high costs of living. This absolutely must be addressed at the NIH level as many universities report they do not have adequate funds to pay postdocs higher salaries. As evidenced by the difficulty filling postdoctoral positions and recent strikes around the country, this issue will continue to persist as long as it goes unaddressed. The NIH sets the salary standards for postdocs, and universities will continue to use these standards because postdocs have become a form of cheap labor in the academic system.

The second issue is the uncertainty in job security. Completing a postdoc does not guarantee one a future job in academia due to the extremely competitive nature of the academic job market and mobility limitations (ability to uproot them/their family to move to another state). As the demographic of postdocs diversifies, there is less ability and willingness to move locations every 3-4 years to find a new job. This structure (PhD to postdoc to faculty job in different cities) disproportionately affects those who are economically disadvantaged or BIPOC as one must have both the financial means to make these sort of

cross-country moves and also the ability to safely exist in a given location (not all cities are friendly for people of color, transgender people, etc.).

Finally, a lack of universal guidelines and standards for postdocs prevents them from being treated fairly and not exploited by universities. Defined as students by some, staff by others, and neither by many, postdocs are often left out of health care benefits, retirement savings, and find themselves financially disadvantaged as middle-aged adults, many with partners and families to support.

Existing NIH policies, programs, or resources

The greatest impact could be made by NIH restructuring postdoctoral salaries, increasing compensation appropriate for one who has completed a doctoral degree and appropriate for the cost of living in a given city. Further, NIH should provide resources for universities who would like to increase postdoctoral pay but are uncertain how to restructure guidelines and grant budgets to do so. Increasing the size of R01 grant budgets, as well as the size of postdoctoral career development grants would also help encourage postdocs to continue along their career trajectory, as would increasing the number of diversity supplements and access to these supplements for both US-born and international scholars.

Proven or promising external resources or approaches

One approach that could be helpful is implementing a postdoctoral to faculty position pipeline and a NIH-provided guideline for such a pathway. The degree of job uncertainty that postdoctoral positions require has become unsustainable. However, a few universities (see review of such programs and their implementation specifics here: https://www.frontiersin.org/articles/10.3389/fpsyg.2021.733995/full) have started to implement such programs, which offer a 2-3 year postdoctoral scientist position and opportunity for a faculty position upon completion. This would create a more sustainable pathway for postdocs who invest an enormous amount of time and resources into their work at a university by providing them with the opportunity for a faculty position in a defined timeline. Creating such a pipeline paired with adequate salary compensation would most certainly improve retention of postdocs and also help them achieve a more defined status separate from graduate students.

Response 1081

Perspectives on the postdoc roles and responsibilities

Additional specialisation in the field.

Fundamental issues and challenges

Average age of a post doc coincides with average age of a person with small children. Average income is 4 to 5 times less than similar industry position and below poverty line. Obviously not attractive to live with small children below poverty line after 6 years of graduate training.

Existing NIH policies, programs, or resources

Pay more.

Proven or promising external resources or approaches

No response

Response 1082

Perspectives on the postdoc roles and responsibilities

The role of the academic postdoctoral researcher is to drive new discoveries. While teaching and service can at times support this mission, they are ancillary to their primary role as a researcher. Postdocs should be focused on experiments and efforts that unearth new knowledge. For many, this will mean the majority of their time (>90%) is spent in a lab running experiments, analyzing data, composing manuscripts, revising manuscripts. They are the front-line of trained, high-functioning, and productive scientists in the scientific academy.

Fundamental issues and challenges

Low-pay. This is not complicated. They have earned a Ph.D. and deserve to compensated in a way that constitutes a life-long value proposition for each individual. Whilst in their post-doc, many accept lower earnings as part of their continued development as a scientist. This has always and will likely always be the case. However, the economic landscape is always changing and post-docs today face many remunerative challenges that jeopardize the overall lifelong value proposition of post-doctoral research. Here are a few:

1. Postdoctoral (and graduate) stipends as defined by NRSA stipend guidelines should be adjusted annually to account for inflation and costs of living. These guidelines should be specific to the institution and municipality. If necessary they should be negotiated with a local postdoc office or group of postdoc representatives directly with the NIH. Faculty and administrators at universities have too many conflicts of interest and should not be involved in this process. They should, however, be given ample notice of changes to react in grant budgets.
2. Affordable childcare. Universities should be incentivized to provide affordable childcare at cost to postdoctoral researchers in their prime child-bearing and rearing years. Postdocs should not in any way be penalized for their decision to have children. This is a natural and understandable decision that other professionals, often earlier than post-docs, choose to do.
3. Employer matched retirement plans and financial literacy programs. Post-docs should all have access to an employer-matched program. It should be formally codified in NRSA stipend guidelines. As a starting point, post-docs should be encouraged to contribute 3% of their annual pay to a tax-advantaged 403b or 401a account. In exchange, they will receive a matching contribution by their employer. This is on the very low end of most corporate employers or employees with graduate degrees.

Existing NIH policies, programs, or resources

The guidelines for gradate and postdoctoral training for NRSAs have become the de fact starting point for most institutions. Either this program announcement should become more detailed and granular or a new announcement with more detail should be provided.

Proven or promising external resources or approaches

Unfortunately there is nothing comprehensive. I am heartened that the NIH has solicited this input and is taking the initiative for posdocs. This is a very important mission. Thank you.

Response 1083

Perspectives on the postdoc roles and responsibilities

James Baldwin famously wrote "Not everything that is faced can be changed, but nothing can be changed until it is faced" . The postdoc was initially intended to be a short-term training for researchers to gain experience and professional connections to prepare them as the next generation of researchers and professors. The faculty in turn would benefit from having experienced researchers who could train graduate students and who would require less hands-on mentorship to progress the lab's research agenda.

The NIH, other U.S. funding agencies, and American higher educational institutions continue to hold up rose-colored glasses to the postdoctoral system. It's time the NIH and the US science community as a whole faced that this model is no longer working. It's time that they faced that continued reliance on the postdoctoral model for doing science is structurally flawed, extremely inefficient, and has often led to injustice and the exploitation of an entire generation of researchers. It's not even a little bit controversial to point out that this disproportionately affects underrepresented researchers. Or that it is biasing the postdoc towards foreign researchers, who barter several years of their lives as indentured servants, to gain a green card or to garner publications by avoiding time-limits placed on postdoctoral experiences in their native countries.

It's time that we as a community faced that the postdoc has morphed into a years-long holding period, where researchers are extremely underpaid relative to their experience, and more often than not, pushed out of the field by the reality of economics and the lack of job opportunities. It's time to recognize that relying on postdocs, whose work forms the backbone of major research laboratories and the progression

of science, unilaterally benefits those at the top of hierarchy far more than it benefits the postdocs themselves.

Fundamental issues and challenges

1. The length of the postdoc. Stop pretending it's a two year long training period. Recognize that most researchers are required to be postdocs for far longer than 2 years if they wish to stay in their field (because of the reality of the job market), and pay them according to their experience, and to the reality that they are adults in their 30's and 40's who want to have job security, fair pay for their work, and benefits.
2. Cost of living. The fact that there is no cost of living adjustment in grants for high cost of living areas is ridiculous. A postdoc in NY or CA should not be making the same as a postdoc in Oklahoma or Iowa.
3. Require institutions that hire postdocs to treat them as employees rather than short term contract workers. My institution regularly doesn't pay postdocs for weeks or months (because they don't process appointments on time), they regularly treat postdocs as disposable employees and do not value their skills, and they regularly prioritize administrators over researchers with years of specialized training. Institutional overhead rates have gone up significantly, but none of that is translated into improving the quality of life or take how pay of the researchers who are actually doing the majority of the research.
4. Bullying and exploitation. Create a mechanism to report problematic PIs, labs, and institutions. Stop giving bad apples funding. Make postdoc placement and experience a requirement of grants and create a reporting mechanism to the funding agency. Have exit interviews or some time of reporting mechanism for postdocs as part of the grant cycle.

Existing NIH policies, programs, or resources

These all just appear to be putting bandaids on the major structural problems of the postdoctoral system. What really needs to happen is that science stops relying on the postdoctoral model and instead creates more senior research roles, and actually provides funding for these positions.

Proven or promising external resources or approaches

Stop treating people who have more than 2 years of experience beyond their Ph.D. as though they are being trained. Create more senior roles and prioritize funding these positions.

Try looking at how Tech companies treat them employees. Pay postdocs and researchers appropriately, provide them with a certain amount of time that they should be allowed to work on creative endeavors of their own, and prioritize their work life balance. Silicon Valley has known for a long time that long hours, poor pay, and indifferent retention strategies lead to the best talent going elsewhere, and does not lead to the types of creativity and innovation that actually makes major changes.

The US has been the world leader in science for many years. It can exhibit that leadership now, by moving science towards a model that is more human and more just. Moreover, it could do better science by actively progressing researchers to their next career stages, rather than pushing researchers out of the field into industry just as they have gained the experience to contribute significantly to their fields.

Response 1084

Perspectives on the postdoc roles and responsibilities

It meant a lot to me as this is a transition phase to being an independent researcher.

Fundamental issues and challenges

There are fundamental issues that are causing the decline and inhibiting recruitment, retention, and overall quality of life of postdoctoral trainees in academic research:

1) Low pay scale
2) Higher workload
3) Few chances of scholarships and fellowships for international postdocs
4) Overall low-quality and stressful life

Existing NIH policies, programs, or resources

1) Increase the payscale
2) Increase the number of fellowships and grants for international postdocs working in the USA.
3) Remove the cap of years being eligible to apply to grants and fellowships
4) Give training to early career faculties how to train postdocs

Proven or promising external resources or approaches

Please see my above suggestions.

Response 1085

Perspectives on the postdoc roles and responsibilities

Opportunity for protected research time and academic coursework to develop one's career from early stage investigator to independent investigator

Fundamental issues and challenges

As a clinician scientist, the challenge remains balancing one's clinical duties (greatly reduced on the training grant) with research and academic coursework.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1086

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is meant to be a training opportunity for individuals that have been trained to be independent investigators with the goal of practicing project development and learning new skills. A postdoc should only be a launch pad for academic faculty positions.

Fundamental issues and challenges

Issues stem from disconnects between expectations of trainees and principal investigators. Many trainees are not prepared or wise to the goals of the postdoc and are often misled by investigators who have their own interests in mind. This leads to postdoctoral experiences that are not fruitful and that persist longer than they should. All of this also happens while postdocs often have little institutional or financial support, making this career transitional difficult and often not rewarding.

Existing NIH policies, programs, or resources

Since many postdoctoral researches are international scientists, more training programs should be provided for resident and non-resident aliens aside from the K99 fellowship. Additionally, higher budgets for shorter periods of time could enhance quality of life for postdocs and encourage short and structured training windows. Lastly, workshops for postdocs and PIs could assist in establishing appropriate expectations for both parties.

Proven or promising external resources or approaches

No response

Response 1087

Perspectives on the postdoc roles and responsibilities

Learn new skills and enhance my current ones

Increase networking with fellow scientists

Do science that motivate me

Fundamental issues and challenges

1) Salary and benefits
2) Visa processing for international postdoc
3) Shortage of fellowship for non citizens or permanent residents
4) Imbalance between professional and personal life

Existing NIH policies, programs, or resources

1) Increase salary and benefits substantially and adjust according to living expenses based on geographical location and family members
2) Making visa processing more flexible so an international postdoc is not stuck
3) Create more networking opportunities
4) Care about mental health
5) Increase fellowship opportunities for international postdocs
6) Creating scope for transitioning from postdoc position to other permanent roles

Proven or promising external resources or approaches

https://www.nature.com/articles/s41587-023-01656-4

Response 1088

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The average age of investigators receiving a first R01 is 44 years old. Women's fertility declines rapidly after the mid 30s. Therefore retention of women investigators in academic medical research requires that it should be professionally and financially feasible for women to have and raise children during the years of their postdoctoral research. A large fraction of talented researchers could be driven out of academic research if they are effectively forced to choose between postdoctoral research or having a family life alongside their career.

While recognizing that salaries will differ between for-profit (industry) and non-profit (universities) sectors, postdoctoral positions could improve peripheral support for raising children such as childcare, maternity leave, and health insurance (without huge out of pocket expenses for pregnancy and dependent care that are inconsistent with postdoctoral salaries). Improvements on these fronts—making it possible to have a family while remaining in an academic career track—will go a long way to solving the 'leaky pipeline'.

These issues are especially important in an intersectional perspective, because the challenges of child-raising during postdoctoral research are lessened by being independently wealthy, but often exacerbated for researchers from less privileged backgrounds.

Response 1089

Perspectives on the postdoc roles and responsibilities

I see three main angles to my roles as a postdoc:

1. gaining more training from academic mentors to deepen and expand my expertise,
2. helping train and mentor new graduate students and undergraduates interested in pursuing a career in research, and
3. beginning to set up more independent research projects that can take me toward the direction my future lab will take.

Fundamental issues and challenges

Parenthood seems incompatible with postdoc life. I had a child early in the pandemic; all daycares were closed and we could not afford in-home nannies; they were so in-demand with everything closed, that their hourly rates were above my pay as a postdoc. There was no official maternity leave nor any stipend to help with childcare. We paid for as much childcare as we could, but it came nowhere close to enough hours to allow me to be productive in my research or advance my career; it was not even enough to do the bare minimum. I was constantly exhausted. In the end I just gave up on the idea of being a PI. I did not feel I could be both a mom and a scientist. Had it not been for my PI, who was extremely supportive and patient, I likely would have quit academia.

Ultimately daycares opened again, which helped. But I am still dealing with the consequences of burnout, am far behind where I should be in my publications and projects, and there are still few external resources to enable me to be as productive as non-parent peers. Furthermore, rents have exploded in our area over the past 3 years and prices jumped up on food and child supplies, but our incomes (my husband and I are both in academia in similar positions) have barely increased. (eg, our monthly rent hiked up by $500 compared to 2019, but our salaries went up by about $100). I also lost all retirement benefits and other employee benefits when I got an NIH grant. Being a postdoc is mentally exhausting and financially a terrible choice, and I'm definitely encouraging my graduate students to not pursue this path.

Existing NIH policies, programs, or resources

Increase salaries. The average monthly rate for 2-BR in our area is about 75% of my postdoc income. Daycare costs are about 75% of my husband's postdoc income. We had to save for about two years to be able to afford a secondhand, 10-year old car.

Also, paying benefits to postdocs on grants. We are all literally losing money being on grants, when universities cut all our benefits. Retirement seems the biggest general concern, but things like emergency childcare costs were also critical to me personally.

The childcare stipend that kicked in in 2021 was a good initiative but it is not enough ($2500 per year? daycare is $400/week), and, critically, it doesn't cover emergency childcare due to daycare closures. Between June 2021—June of 2022, our daycare closed for 5-10 days several times due to do COVID cases. The stipend should be able to pay for babysitters in these emergency cases.

Supporting careers for postdoc parents. We are exhausted, burned out, have no money and have no time to publish enough to be competitive. Half the women I know in academia quit academia (usually postdocs) after having kids. This is a reflection of a terrible lack of support for working moms in postdoc positions.

Proven or promising external resources or approaches

Finland has a great policy for parental leave, which includes parental leave of better length for both parents, fully paid, as well as much more flexibility in when and how the leave is taken. Some workplaces have in-house childcare centers to enable employees to be both parents and workers. Setting up policies for universities to guarantee access to childcare for postdoc parents would be a great first step.

Response 1090

Perspectives on the postdoc roles and responsibilities

I had hoped when I started my postdoc at [redacted for anonymity] that I would be trained on how to be an independent researcher. Instead of promoting independence, I found the position irrevocably yoked me to a self-aggrandizing and arrogant person who dismissed my input and coerced me to work on a project I had little interest in pursuing. My view of the postdoc position, informed by my personal experience as well as those of my friends and colleagues, is that it is exploitative. PIs, especially at leading Universities, hire driven and talented people because they hope to exploit their passion as a way of enhancing the PI's own prestige and ability to gain grants. If the postdoc is productive, the PI is happy and supportive. If the

postdoc encounters challenges, as is common in science, the PI is dismissive and castigates the postdoc for what the PI perceives to be a personal failure. The fact that success or failure of postdocs is tied to the personal relationship between PI and postdoc (a fact my PI constantly belabored) makes this particular position rife for exploitation. Additionally, the fact that foreign nationals, the bulk of whom are from despotic nations like China, are dependent on the good graces of solitary individuals to stay in a free and prosperous country, makes this position the most exploitative position in academia. Graduate students can appeal to their committee. Technicians can migrate to other labs. Postdocs find themselves in a position where their entire career can be stymied by a single person. If that person is supportive, lucky you! If that person acts like a tyrant, there is no institutional support for the postdoc. They are stuck. That's what it means to be a postdoc: being stuck.

Fundamental issues and challenges

Compensation is a joke. The lack of institutional support to help navigate or mitigate deteriorating working relationships between postdoc and PI means that when problems do arise, they will dominate the postdoc experience. The very nature of the position: a medieval master-apprentice relationship, is itself a deterrent for entry. Additionally, the political monoculture in most academic contexts is a severe barrier for entry for those who do not conform to that monoculture. There is a major bias against religious faith and practice. Adding to this the increasing use of ideological litmus tests and fealty oaths in the form of DEI initiatives makes academia an off-putting work environment for people who think critically about simplistic explanations for social disparities. This synergizes with the master-apprentice nature of the postdoc position. If your PI is the type of jerk who frowns upon you taking time off for religious observance, who starts group meetings with highly charged political discourse, and who directs their employees to contribute to their pet ideological causes, it creates a hostile work environment that is difficult to overcome. And now you're stuck with them, because everyone knows that leaving a postdoc without a paper looks bad, and your PI can keep you from getting an academic position elsewhere. Ultimately, the only reason people pursue postdocs is for career advancement. You "pay your dues" in a terrible work environment until you get your own lab or leave academia. I'm not surprised fewer and fewer people are interested in doing this, especially when industry is paying twice as much. Academia literally lies to trainees about the nature of industry work (its boring, its routine, there is less academic freedom) to retain postdoc trainees. Consider that for a moment—the entire appeal of academia is based on a lie about industry.

Existing NIH policies, programs, or resources

Give up. Its over. Academia is dying. For academia to retain relevance, it needs to shift to formalized training for scientists and ditch the medieval master-apprentice nature of postdoc work. The primary goal of academic institutions should be on training PhD scientists. Additional training for postdocs needs to become much more formalized. Instead of being hired by individual PIs, postdocs should be hired by academic intuitions and given the freedom to sever toxic PI-postdoc relationships while retaining the ability to continue their training at that institution. This is especially true for foreign nationals. Ultimately though, any improvements are rearranging deck chairs on the Titanic. Academia breeds conformity—say the right things about politics (especially the DEI stuff), tailor your research focus to the most hyped and sexiest topic, network with the right people because they're the ones reading your grant submissions and your manuscripts. This is stifling. And there is no way that academia can provide competitive compensation, especially considering the never ending supply of cheap labor from abroad. There is no way PIs are going to give up their power over the most productive people in their workforce. Perhaps the ideological monoculture can be broken, but this seems so deeply ingrained in academic culture—it is central to the identity of many academic intuitions.

No response

Response 1091

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The number one issue hampering the recruitment and retention is wages. Postdocs do not make enough money to live let alone live comfortably. The prospects of academic freedom in your research is not nearly as appealing if it means dealing with housing and food insecurity. The pay doesn't need to match industry but it should be at least comparable. As it stands now the average postdoc pay is less than half what a PhD can expect to make in even the most basic industry role.

Existing NIH policies, programs, or resources

The NIH should reevaluate their salary structure from the bottom up. Fundamentally the first step in retaining more postdocs is to increase their pay.

Proven or promising external resources or approaches

No response

Response 1092

Perspectives on the postdoc roles and responsibilities

I view my postdoctoral position as a training position necessary for me to build a career as an independent investigator. My responsibility within the lab I work is to lead multiple NIH-funded research projects with my PI, manage and train graduate and undergraduate researchers, and prepare our findings for presentation and publication.

That said, as a skilled researcher I also realize that by pursuing my postdoctoral training, I have sacrificed the increased salary and retirement benefits I would have if I took a job in industry following graduate school.

Fundamental issues and challenges

In my opinion, the main issue facing postdoctoral trainees are the low salaries (compared to our market value in industry), lack of retirement benefits, and the strong possibility that our work will not culminate in the tenure-track PI position for which our training is designed. There is of course nothing that can be done about the possibility/likelihood of not obtaining a tenure-track position, but I do think that salaries should be increased and retirement benefits granted to maintain a strong postdoctoral work force.

Existing NIH policies, programs, or resources

The NIH's existing programs and resources are quite good, in my opinion. I think this is really only a question of financial compensation--current salary levels and retirement benefits fall well below postdoc's market value. As cost of living continues to increase, it will become harder for individuals to justify continuing their postdoctoral training.

Proven or promising external resources or approaches

I find the NIH's current recruitment and training to be quite good, as indicated above. I think the concerns are more narrowly financial.

Response 1093

Perspectives on the postdoc roles and responsibilities

I view postdoc as an opportunity to develop scientific independence and prepare to transition to group leader position in academia or industry

Fundamental issues and challenges

Less pay, especially in expensive cities, long working hours, limited opportunity to be assistant professor, high stress to publish as quickly as possible

Existing NIH policies, programs, or resources

NIH pay minimum should be adjusted to reflect cost of living in local areas, more funding for transitioning into assistant professor jobs, more oversight on work hours

Proven or promising external resources or approaches

https://www.nature.com/articles/s41587-023-01656-4

Response 1094

Perspectives on the postdoc roles and responsibilities

The role of an academic postdoc is to be provided training to supplement/augment the training that they had received in their PhD. I believe the position should be short in duration (three years or less), and it should provide a solid, promising platform to launch a career in academia or industry. Unfortunately, many people spend upwards of 6-7 years in a postdoc (or multiple postdocs), belying the "trainee" status, and waste years of a critical time in their lives to build careers, families, and savings for retirement and a home.

Fundamental issues and challenges

The number one issue, in my opinion, is the lack of viable academic jobs for postdocs after training. Postdocs are spending more and more years in a supposedly "trainee" position with low pay, few benefits, and few prospects. Tenure-track assistant professor positions are so competitive that many talented scientists drop out. The bottleneck is funding. There is an urgent need to raise the amount of fellowships available for NRSAs and (especially) K99's, which makes one competitive for a faculty position. There is research showing that the top 20% of grant applications are equivalent in scientific merit and likelihood of success, and therefore who gets awarded above that point is basically a lottery. Furthermore, the timeline to hearing back about fellowships after application is much too long —this wait is exacerbated by continuing resolutions where exact funding levels are unknown (and therefore people on the edge of the funding score line are kept waiting), due to Congress failing to pass a budget. Postdocs are often at a point in their lives where they have started or think about starting families —they cannot afford to wait months and months to hear back about their future.

Existing NIH policies, programs, or resources

First, the NIH minimum salary must be raised. Many universities' compensation for postdocs are pegged to the NIH minimum, and even though it's called a "minimum", it in reality presents a maximum of what universities are willing to compensate postdocs. At my former institution, postdocs who tried to negotiate a higher salary upon receipt of an NIH fellowship (which is allowed by the NIH fellowship rules) were denied by the department, on grounds that it would be "unfair" to the rest of the postdocs. This shows that the NIH minimum is really a maximum ceiling for many institutions, and therefore must be raised.

Secondly, retirement benefits should be provided to fellowship awardees. That this is not the case is truly astonishing and discounts the consideration of postdocs as adult human beings who need to plan for their future.

Finally, the funding line for NIH fellowships and transition grants like the K99 should be raised, and the timeline from application to NOA must be shortened considerably to respect applicants' time.

Proven or promising external resources or approaches

Some external resources that could be considered is more partnerships with industry to establish postdoctoral fellowships that provide a transition to industry/non-profits. It is a reality that most postdocs will not become professors. However, they should not have wasted years of training and prime years of their lives. Academic programs often do not provide any sort of internship/training opportunities for non-academic organizations, but a postdoc would be a good platform to do so. After 4 years in an academic postdoc at a university, I am now completing a 1-year postdoctoral fellowship at a nonprofit. My current postdoc provides MUCH higher compensation than my academic postdoc did, and it's providing me with so many more relevant skills/knowledge for a future career. Positions like my current postdoc should be more broadly available and advertised to trainees.

Response 1095

Perspectives on the postdoc roles and responsibilities

Execution of independent research at all levels.

Fundamental issues and challenges

Time commitment and pay.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1096

Perspectives on the postdoc roles and responsibilities

It's an opportunity for more training, either to learn new technical skills or more translational skills such as proposal development/writing and management/mentorship.

Fundamental issues and challenges

The biggest fundamental issue is the compensation, especially for an academic postdoc. The required long hours and increased responsibility is not reflected in someone with a higher degree, earning barely over minimum wage in some states. The poor job prospect is also a major issue, the limited number of principal investigator openings, and the highly competitive funding opportunities, creates an environment that is not desirable for a lot of PhD graduates.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1097

Perspectives on the postdoc roles and responsibilities

Additional training focused on becoming more independent and growing as a leader in preparation for leading a lab in the near future. Generating data to support the lab they work for as well as their future career.

Fundamental issues and challenges

The pay is abysmal and hours are irregular, many PIs have very high expectations that do not match the salary. A lot of people may want to start a family at that age, requiring better pay and more regular hours and can make more money on a better schedule in industry or other fields.

Existing NIH policies, programs, or resources

Raise grant amounts, they are not adjusting to inflation.

Proven or promising external resources or approaches

No response

Response 1098

Perspectives on the postdoc roles and responsibilities

I think of a postdoctoral position as a period where researchers are transitioning to becoming fully independent investigators. The opportunity is unique in that it allows scientists to develop a research program that can be further developed when the postdoc starts their own lab.

Fundamental issues and challenges

Scientific research that is needed to develop a research program demands long hours in the laboratory and postdocs are not financially compensated for the hours that they spend in the lab. Often, we hear that

being a scientist is a hobby and not a job if you are truly passionate about science. Postdocs often have families and if they can financially support and sustain a family, there is little room for maintaining the passion for science in an academic environment.

Existing NIH policies, programs, or resources

1) Increasing the NIH postdoc pay line is critical in improving postdocs' quality of life.
2) Another important aspect that is being neglected is the limited eligibility period for transition to independence awards (e.g. K99/R00). Under the current scheme, postdocs are eligible to apply only if they are under 4 years from the start of the postdoctoral period. Given that current postdocs are living through an unprecedented global pandemic which has caused immense emotional and financial burden, it'd be great if NIH increases the eligibility period to 6 years. Even if this is for a limited period or if it is applied to postdocs who have started their postdoc in 2020-2023.

Proven or promising external resources or approaches

No response

Response 1099

Perspectives on the postdoc roles and responsibilities

Postdoctoral scholars are skilled researchers who spearhead the majority of published research in the biosciences at any given time. Like academics of any career stage, they continue to learn, innovate, and add to their skill sets throughout their work. At the same time, they are fully realized scientists in their own right, capable of executing a research study from start to finish and training undergraduate/graduate mentees. Notably, postdocs have attained a terminal degree and are not trainees.

Fundamental issues and challenges

Postdoctoral researchers are chronically underpaid for the work that they do. Moreover, the fact that postdoctoral scientists are often referred to as "trainees" (as in this very questionnaire), despite the fact that they hold a terminal degree, is *demeaning* and contributes to their continued exploitation as skilled academic researchers. As a PhD candidate who is currently exploring career paths, I cannot consider postdoctoral positions given the current academic job market. Despite the fact that I enjoy performing research and the academic enterprise, there are too few jobs that pay far too little for me to continue. And, as a woman, I cannot afford to sacrifice my personal life (children, etc.) in order to continue in the current hyper-competitive environment. Most graduate students in my program feel similarly. The academic biosciences will soon see a massive exodus of skilled researchers moving on to non-academic industries that simply offer better job and lifestyle prospects.

Existing NIH policies, programs, or resources

NIH guidance on postdoctoral salaries needs to be updated so that standard salary rates continue to increase commensurately with inflation. Additionally, the current hyper-competition for postdoctoral jobs is, in large part, derived from the fact that the R01 grant mechanism is also in dire need of an update. The standard R01 grant amount has not changed in over twenty years, despite massive increases in inflation in that same time frame. With less money to go around with each passing year, PIs are unable to hire as many staff as in the past. Everyone who relies on the R01 mechanism is feeling the financial hurt.

Additionally, postdoctoral researchers are not trainees. The word "trainee" appears eleven times in this RFI alone, where the word "researcher", "scientist", "fellow", or "scholar" would be far more appropriate. The NIH must discontinue the word "trainee" when referring to postdoctoral researchers.

Proven or promising external resources or approaches

As described above, increases in the standard award amounts for existing NIH grant mechanisms are long overdue and would greatly improve the state of postdoctoral jobs.

Response 1100

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Despite increases in NIH postdoc salary scales, the pay is still too low and the benefits at most institutions are minimal (less than both graduate students and permanent staff). The major constraints I see are

1. research grants for basic research have budgets that are both too low, and don't increase year-to-year to accommodate cost-of-living raises and
2. institutions may have low minimum salaries (campus-wide) that create inequities if biomedical postdocs are paid more than they are now.

NIH could fund most postdocs directly through fellowship instead of having most postdocs be paid from limited grant funds.

Existing NIH policies, programs, or resources

expand eligibility for fellowships to international postdocs as they have for the K99s

create funded senior scientist positions in academia (NCI does this with R50s) so it's possible to remain in academic science without needing an independent faculty position.

Proven or promising external resources or approaches

No response

Response 1101

Perspectives on the postdoc roles and responsibilities

In my experience, the post doc is supposed to provide you with the ability to do independent research that can launch your career.

Fundamental issues and challenges

Non-competitive pay and to competitive faculty positions that require applicants to have secured highly competitive funding. Typically have to do multiple post docs before getting a chance to land a competitive faculty position.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase pay. Higher pay = higher applicant pool = higher quality of applicants. Dedicate more funding sources and awards to early career scientists. This is not new information. This is how many recent phd grads think and this is what would have kept many in academic research.

Response 1102

Perspectives on the postdoc roles and responsibilities

Advanced research skill acquisition and sharing.

Fundamental issues and challenges

J1 visa should not be given for 1 yr but rather for any postdoc position a minimum retainment of 3 yrs default.

Existing NIH policies, programs, or resources

Add the postdoc experience to reduce tenure time

Proven or promising external resources or approaches

Have multiple PIs

Response 1103

Perspectives on the postdoc roles and responsibilities

I am really glad to get a chance to work on human genomics during my post-doc although my previous research was on plant genomics. It is indeed a great learning stage of my life and career. I was not only introduced to state-of-art research in human genomics but also got a chance to know and meet the people in my research community.

Fundamental issues and challenges

There are several issues that sometimes make me think that I should have done something else than a post-doc.

I think the post-doc salary is now a well-known issue. I now have a family with a kid and the salary is very low to live a quality life with minimum standards. I was alright for some initial months as my spouse was working, but she lost her job due to the current lay-off process and it was hard for her to get a job with the H1B visa status. I would like to continue my post-doc work for a few more years but with this salary, I am thinking to switch to a job where I can get a standard salary.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 1104

Perspectives on the postdoc roles and responsibilities

Post-doc for me was an opportunity to gain additional research training, develop research interests & learn how to start & manage a research lab. I was expecting more clear, concrete guidance on how time should be spent.

Fundamental issues and challenges

Compensation, didactics, career development & guidance on setting fees (e.g., invited speaking engagements) & collaborations. Structural support for neurodiverse postdocs (coaching/planning support for the dramatic change in schedule from

Pre-doc to post-doc), support for postdocs with young children, better guidance on taxes, more programs which encourage postdoc peer support & communication. Also more frequent evaluations/feedback & mechanism for providing feedback on mentorship.

Existing NIH policies, programs, or resources

The NIH websites are a visual nightmare for someone with ADHD. Especially someone like me, who comes from a disadvantaged background (growing up) & does not have the familiarity with how to navigate the websites and/or identify opportunities for postdocs. The huge blocks of text, the buried links to even more text, lack of audio options & unclear guidance on a contact for more info. The non-research application requirements are also excessive & burdensome (e.g., rec letters).

Proven or promising external resources or approaches

Provide financial relocation support, increase wages, improve clarity of funding opportunities, structural & organizational support for neurodiverse applicants. There is guidance on neuroinclusive workplace environments. More visuals and less text pls

Response 1105

Perspectives on the postdoc roles and responsibilities

For one thing, it's not a training position; trying to act like it's a training position is disingenuous. We do most of the actual scientific work.

Fundamental issues and challenges

We're not paid enough. Industry pays more.

Existing NIH policies, programs, or resources

Really, just pay us more. I'm an AI researcher. I want to stay in academia because that's where I can do the most good. But MGH pays under $60k and Google pays about $150k.

Proven or promising external resources or approaches

Postdocs are treated as though we're expendable. There's almost zero oversight on how PI's treat us. And—I cannot emphasize this enough—we're paid very little. Academia doesn't respond appropriately to the demands of the economy, which is why it's kind of suffering right now.

Response 1106

Perspectives on the postdoc roles and responsibilities

Academic postdoc is a key for the development of academic institutions. However, in most cases the way they are managed makes postdocs feel that they are abused in terms of ownership of their work, management of their time and the amount they are paid.

Fundamental issues and challenges

Ownership/leadership is very important since every thing is dependent on the PI.

While the amount of time academic postdocs work is higher, they get less and have uncertain future compared to industrial postdocs and people who are outside of science. This forces them to leave their jobs whenever they get little chance.

Existing NIH policies, programs, or resources

NIH sets the salary of post docs in [redacted for anonymity] which is far less than other universities in the USA like in California and New Jersey. And it is difficult to appeal this given the NIH's power for the decision.

Proven or promising external resources or approaches

No response

Response 1107

Perspectives on the postdoc roles and responsibilities

I had a 4 year postdoc position. I knew I likely was not going to be staying in academia but was willing to take a Postdoc if it would provide me learning in the area I wanted to take my career next. For instance, my graduate work was in Human Genetics but involved bench work and computational interpretation of the lab work. I knew I wanted to move into clinical genetics and took a computational biology postdoc in clinical pediatric oncology genetics. Mostly, because I wasn't abtle to get an industry position in clinical genetics without some kind of formal training. To me the postdoc is another route of formal training.

Fundamental issues and challenges

Pay! Hours! No Human Resources Department to file complaints to! No ability to speak up. There is a fundamental issue in academia that PIs can continue to get away with poor mentoring skills and there is no retribution in doing so. PIs need formal training in mentoring, managing, and communication! Provide opportunities for PIs to get formal training in management. In industry if you are a poor manager you lose that position, but in academia if you are already tenured it doesn't matter how you manage even if it's awful! The only draw to academia right now is job security.

Existing NIH policies, programs, or resources

The NIH has spent lots of time on trying to improve the communication between PIs and mentees with the online portal system involving the mentees career goals etc. However, I have never ever discussed this with my mentor. My mentors don't care. Stop focusing on the mentor and instead focus on the mentees and provide them with resources for the opportunity to get training on mentoring, managing, etc to succeed in the next steps of academia. The grant system for trainees sucks. I got a low grant score because my MENTOR HAD POOR Mentee history! HOW IS THAT MY FAULT?!! I wasn't even given a chance!! Rate trainees grants on their science!! Not on who is or isn't on their mentoring committee! Mentoring is a joke! I got more mentoring from my peers than actual PIs during my postdoc.

Proven or promising external resources or approaches

Pay raise will help with retention. Let trainees be part of the grant review process. Honestly, I'm not sure how you fix this when the bigger academic system is just broken. A real human resources program is absolutely needed! If I could give real feedback on my postdoc mentor to my previous institution I would! There needs to be a system where institutions receive feedback on how PIs mentoring/managing is and whether those PIs need more formal training. If I could provide feedback so that others wouldn't make the same mistake I did, I would! There's no process for me to provide feedback!

Response 1108

Perspectives on the postdoc roles and responsibilities

Postdocs are the life-blood of academic research. We run the labs, write grants, give talks, etc, etc. And yet, we are compensated very poorly. Without drastic changes, the mass exodus from academia will continue, the United States' dominance in STEM will disappear, and humanity will suffer.

Fundamental issues and challenges

more. money. for. postdoc salaries. stop calling us trainees. stop treating us like trainees. We are highly skilled employees doing highly skilled work and should be compensated accordingly. Call us and compensate us for the role that we actually fill (senior scientists). Nobody wants to shoulder the responsibility for paying postdocs what they deserve. PI's blame the institutions. Institutions blame the government. Nothing changes.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Minimum salaries need to be raised at least 40%. The universities and PIs won't budge without this mandate or heavy unionization. The union movement seems to be gaining steam. Not ideal for the government. I'd imagine it would be easier to get ahead of this now.

big city universities offer heavily subsidized housing options (some of them, and not all for the duration of the postdoc). It's not enough, but it's enough to go from completely untenable to barely living paycheck to paycheck. Maybe a housing credit of some sort could be applied nationally. Or a tax break?

Response 1109

Perspectives on the postdoc roles and responsibilities

A postdoc position is supposed to provide additional training and time for a recent PhD to develop their own career. This could mean a line of research that could lead to a faculty position down the line, or training that could provide a stepping stone into an industry career.

Fundamental issues and challenges

1) These are short-term, soft money positions that are usually dependent on short grants or awards that prevent postdocs from having a source of stability. This makes it hard to plan for the future at an age (typically 27-35 or so) when you would usually be considering getting married, buying a house and having children.
2) The lack of tenure-track faculty positions for postdocs to move into has made recent PhDs less interested in pursing additional training or staying in the academic lane. Relatedly, those jobs that are available are preferentially given to people who are well connected with labs and mentors that look out for each other. This kind of career nepotism has made the scientific community more cliquish and is slowly undermining the quality of work.
3) Salaries are low compared to jobs for PhDs in industry.
4) The additional years of postdoctoral experience can actually be a disadvantage in the job market: Many employers prefer recent graduates or non-PhDs who have industry experience. By spending more time in the academic circle, one can impede their likelihood of getting hired into an industry job.

Existing NIH policies, programs, or resources

Currently fellowships do not provide for benefits outside of health insurance. As a F32 awardee, I became a contractor within my university and lost my retirement benefits. Because my health insurance was technically part of my salary, I was also taxed on the amount that the university would normally have provided. Thus, I was financially worse off for having received a fellowship than had I been paid directly off of my supervisor's grant. Changing the fellowship program to include benefits, or preventing universities from turning fellows into contractors (and thus allowing them to remove benefits), would be a substantial improvement in the postdoc fellowship program.

When I applied for a K99/R00 I was also prevented from asking for a higher salary because of university policy. I would then have been fixed to the NIH minimum salary. The NIH should encourage higher salaries for awardees to provide real financial incentive to apply for these awards. As it is, we are currently financially disadvantaged for receiving awards. This is a very retrograde policy that helps keep people from less financially well off backgrounds from entering the sciences and applying for awards.

Proven or promising external resources or approaches

We are producing a lot of highly trained scientists in the US who have an interest in working on solving fundamental problems and improving the quality of human life. Unfortunately, we are losing many of them end up using their skills and expertise for developing marketing tools and recommendation algorithms, or writing propaganda for pharmaceutical companies. This is a net loss for the NIH and the country, as money that is meant to be used to train the next generation of scientists to carry on the NIH mission is wasted as a slim few stay in the sciences. NIH needs to consider what this training is meant for and ensure that the future roles that these fellowships and awards are meant to provide for actually exist.

Response 1110

Perspectives on the postdoc roles and responsibilities

Fundamental issues and challenges

We need to have NIH research grants, when awarded, linked to the cost of living in different parts of the USA. This would help tremendously. In Kansas, for example, a postdoc can rent a house with a salary of $60,000/year. In Boston, New York City, and San Francisco, a postdoc can't even rent a studio on such a salary, so postdocs must have roommates even when they are in their late 20s and 30s and want better living conditions. Or they just give up on a postdoc and move directly to industry. This has been happening more and more in the past decade.

Existing NIH policies, programs, or resources

Are the states eligible for NIH Idea grants picked on the basis of total NIH funding/per population of the state, or just on total NIH funding per state without adjusting for the population of the state? If it is the latter, you are really disadvantaging the states that have taxed their residents to build a biomedical

infrastructure and educational systems. You are rewarding states for not funding education by giving extra resources to those states that don't have as much NIH money. This is unfair and discriminatory against states like California and New York. IDeA-eligible states include: Alaska, Arkansas, Delaware, Hawaii, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, New Hampshire, New Mexico, North Dakota, Oklahoma, Rhode Island, South Carolina, South Dakota, Vermont, West Virginia, Wyoming, and Puerto Rico. We now need a similar program for NIH grant awardees in states with high costs of living-more money per grant! NIH postdoctoral stipends should NOT be the same throughout the country.

Fundamental issues and challenges

I am a PhD student who is not considering a postdoc. Although I enjoy research and would have liked to continue along this career path, the fact of the matter is that our current system does not provide a stable career path for researchers. I do not want to spend 5 years working long hours for mediocre pay, just for the slim chance of obtaining a faculty position. My skills are simply more valued in other industries.

NIH needs to stop pretending that postdocs are trainees and pay accordingly. NIH also needs to greatly expand the number of staff scientist positions so that more talented scientists can be retained. It is simply not realistic for every postdoc to become a PI. More people would be willing to do a postdoc if they had a strong chance of obtaining a staff scientist position.

Existing NIH policies, programs, or resources

Greatly expand the amount of available funding for staff scientists.
