The NIH pay lines are terrible, and post-docs are being training in an environment where the PI's are super stressed and can't get funding. This is trickling down to the post-docs who see what the PI's are doing to stay afloat and they are rightfully scared. Who would want that kind of stress? The other big issue is the pay differential between an NIH level 0 post-doc and an industry position. I personally feel this is short-sighted thinking, but it is very prevalent. So the NIH could increase the post-doc salaries as well as the K award salaries to help minimize this discrepancy. So as usual, the issues boils down to funding—both of R01s and grants competitiveness in general, but also funding of their salaries.

Existing NIH policies, programs, or resources

The loan repayment program was a great step—so keep that going and expand if possible. Change policies for level 0 salaries for post-docs would be a big help.

Proven or promising external resources or approaches

No suggestions here.

Response 2159

Perspectives on the postdoc roles and responsibilities

I view postdocs as semi-autonomous research that should guide and manage a project. When they walk out of a postdoc they should be able to take on a managerial position whether that be in academia, industry, or government.

Fundamental issues and challenges

The fundamental issue inhibiting recruitment, retention, and quality of life is the low salary. Postdoc salaries have not kept up with inflation (nor have NIH grant budgets) and it's very hard for postdocs to

live in high cost of living cities where many universities are located. It's virtually impossible to start a family, buy a house, or save money on a postdoc salary.

Existing NIH policies, programs, or resources

The NIH should change the postdoc pay scale with concomitant increases in grant budgets to cover postdocs.

Proven or promising external resources or approaches

The best way to enhance the postdoc job satisfaction, like any other employee, is to pay them a fair market value salary. Everything else is virtue signaling and window dressing.

Response 2160

Perspectives on the postdoc roles and responsibilities

The postdoctoral role should be an opportunity for additional training that makes an early career investigator more scientifically sophisticated and brings their publication record, career skills, and grant-writing skills to a level where they are ready for an independent position (in academia, industry, or any other arena requiring additional training beyond the PhD).

This training period should be brief: approximately 2-3 years for most scholars. Except in relatively unusual situations, longer postdocs effectively amount to an investigator working at the level of a staff scientist or junior faculty but without the recognition or pay of such a position.

Fundamental issues and challenges

- Postdoctoral positions are too long, with many investigators sitting in a "holding pattern" for 5+ years until ready for the increasingly competitive faculty job market. Unrealistic expectations of institutions for the track record of new hires contribute to this, as does a relative dearth of available permanent positions relative to number of trainees.
- Postdocs are, for the most part, paid poorly; this might me a moderate issue if the positions were brief but given the increasing duration of the position in many fields it becomes an economic burden. This of course places a barrier in the way of young investigators from disadvantaged backgrounds.
- The perception of the academic faculty job market as an unstable thing where luck is a huge factor and most fail is a major deterrent.

Existing NIH policies, programs, or resources

The obvious fix of course is a much larger congressional appropriation so that there are sufficient funds to pay postdocs what they are worth and support more junior faculty so those postdocs are not trapped in trainee positions for 5+ years.

Barring that, it seems like it may be time for the NIH to have a serious dialogue with research institutions. A big part of the problem in the academic research career path is that many (and most of the top R1) medical schools and universities have not moved past a model where they can expect faculty to cover their entire salary from extramural funds (thus needing 2-3 R-series grants per lab, which is simply not sustainable with the current available funding). Along with this, there are fewer and fewer tenure-track positions. This makes academia unattractive to many top graduating PhDs.

What if the NIH said to all awardee institutions, "Look, you have to have skin in the game. To be eligible to apply for an R01, an investigator must have XYZ% (not sure what the appropriate number is; maybe 40%?) of their salary committed by the institution." This would move some of the burden for supporting faculty off of the NIH and on to universities, which would then have to find ways to bring in philanthropy or other sources. The immediate effect might be more contraction of positions but in the long term they would be more stable and would grow at places that are committed.

Additionally, super-huge labs with many many postdocs are inefficient both in terms of use of funds and in terms of good training. The NIH should consider revisiting the idea of a soft cap on annual $ to any one investigator, so that junior scientists currently stuck as postdocs can get their own grants instead.

Proven or promising external resources or approaches

No response

Response 2161

Perspectives on the postdoc roles and responsibilities

A postdoc is still a training position with individuals learning how to conduct research independently with the goal of fully managing their own project. This may involve opportunites to train junior researchers. The expected outcome is publications and tangible improvement in project management experimental design and management training.

Fundamental issues and challenges

The major obstacle is salary and benefits available to postdocs. A postdoc just starting after completing the PhD is making 1/2 what they could make in an industry setting. Further benefits for childcare, healthcare and wuality of life are typically better in an industry setting. While it would be nice for academics to be able to retain or recruit postodcs by offering higher salaries, the current budgets of grants do not allow for this>ven though the NIH has raised postdoc stipends a correspoding increase in grants did not accompany these raises resulting in reduced ability to support experimentation. In addition, for postdocs desiring to learn new technologies and leverage cutting edge approaches, these are typically more expensive than traditional experiments.

Existing NIH policies, programs, or resources

Providing more opportunities for researchers returning to science could be beneficial. Limitations surrounding applying for return to research funds while not in the lab make it ddifficult for trainees and mentors to coordinate that return and advise on the content of those supplements. Perhaps allowing applying or up to 6 months after returning to the lab and not limited by funding status of parent grants. Expanding the availability of diversity supplements for international postdocs to encourage more trainees from international backgrounds and not tying to parent grants. Perhaps providing additional methods to obtain salary support outside of traditional grants. Allow for increawed salaries or funding for career researchers so postdocs don;t feel its a tempoorary position with only endpoints of academics or industry for those that want to stay at the bench.

Proven or promising external resources or approaches

No response

Response 2162

Perspectives on the postdoc roles and responsibilities

You can’t even create a form that doesn’t completely erase itself when you click on the NIH “policies” link. I just spent 30 minutes writing a thoughtful response to have it deleted. This is the perspective on postdocs. They’re futile. You are no more than your PIs technician. Just another piece of property that your PI has to “fund and keep happy”.

Read Doug Seals’ take on academia as a business. This is a published work that is so tone deaf it hurts. He compares postdocs to lab technicians. Cool.

Fundamental issues and challenges

Pay. Are you serious? Pay. Your PI owns you. They get the credit and they determine what you do. Also, there aren’t any academic jobs to get. If you don’t want an academic job, you further price yourself out of the private sector. You have a ton of experience, but the private sector will view you as inexperienced and disillusioned.

Existing NIH policies, programs, or resources

You really think that we’re going to view this information? You can’t even click these links without losing all your progress. Make it simpler. Make it simpler. Make it simpler. I’ll say it again until whoever is reading this gets it. Make it simpler.

There's too much information. Like I have time to read, understand and implement 50 different "resources" and vague infographics with links to funding that are irrationally competitive in the first place.

Also, there aren't even statistics on how doing a postdoc will help you. I.e., be open about the prospects after doing a postdoc. As it stands, the infographics say what "could" be done. This doesn't speak to what postdocs ACTUALLY DO for someone.

Proven or promising external resources or approaches

Pay postdocs more. Allow them to negotiate there salary, workload, projects, benefits etc.

Create a postdoc transfer portal similar to the NCAA.

Create opportunities for remote postdoc opportunities.

Give postdocs a housing allowance.

Give postdocs tax breaks.

Give the postdoc practical recourse to retaliate against bad PIs.

Allow postdocs to more easily leave their positions to take other jobs without burning the PI and leaving them with bad LORs that will inevitably further damage their job prospects and invalidate the whole experience.

Give postdocs summer's off.

Don't require postdocs to obtain their own funding.

Create a portal for postdocs to easily transition into industry. This should be setup anytime a grant is proposed that has a budget with a postdoc so the opportunities match the supply.

Response 2163

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1. The job opportunities available for new PhD graduates is so much greater with the expansion of non-research related careers such as science communication, consultant positions and even diversity in the types of PhD level jobs available in industry. I look at my own lab where 5 of the first 6 graduates did postdocs and only 1 out of the last 5 have. I see this in my training grant as well. This has even influenced graduate programs that now try to provide additional information and opportunities outside the academy as students expect to learn about "alternative careers." The NIGMS even ran a program (BEST) for institutions to develop training that includes internships.
2. That changes the question to how do you alter programs to make a postdoc more attractive? Clearly compensation would help but for that to be feasible, the budgets on grants will need to change. With the modular block system has been in place for around 20 years without change, it will be very challenging.
3. There is a perception that the job market for academic positions is very competitive. That is true and can also be discouraging to people, although i suspect that has more of an impact on people who are already postdocs and leaving for other positions than those who are still in graduate school.
4. What may be more of an issue for graduate students than the competition is the work life balance they observe. Students see how grant writing dominates their mentors time and many decide that is not the life for them so they never enter the postdoc pool and because there are plenty of other job opportunities that will compensate them better than being a postdoc for 5 years.

Existing NIH policies, programs, or resources

1. Update grant budgets so we can afford to compensate postdocs better than they are currently paid.
2. Stop putting so much emphasis on training a workforce beyond academia and start celebrating academic careers. After all, its become the new alternative career.
3. This one is probably controversial, but I worry that grants like K99/R00s have created a bit of a class system for competition for jobs. I suspect there are postdocs who take themselves out the pool because they feel as if they are not competitive for positions. This is probably true but clearly there are postdocs without these awards who get jobs.

Proven or promising external resources or approaches

No response

Response 2164

Perspectives on the postdoc roles and responsibilities

To me, a postdoctoral fellowship is a necessary stepping stone for trainees who want to go on to be a principal investigator in an academic setting. This is a time when you can expand your skillset and practice managing and executing an independent research project in preparation for starting your own lab.

Fundamental issues and challenges

I will not be pursuing a post-doctoral fellowship because I no longer see a career in academia as a viable option for myself. I think that completing a postdoctoral fellowship is an incredibly stressful experience because postdoctoral fellows do not receive sufficient financial compensation for the value that they provide and there is no guarantee that they will be able to secure a more permanent job at the end of the fellowship.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2165

Perspectives on the postdoc roles and responsibilities

The role of the postdoctoral research scientist is to gain the additional training that will best position them for the next phase of their career. This role is achieved by an involved mentor capable of providing this training. Training includes responsible conduct of research, new techniques, how to work as a team with shared goals, how to be a peer and how to train more junior scientists. The mentor works with the post-doc to determine their goals and how to achieve them. Goals include primarily academic science but also industry, teaching and other alternative pathways.

Fundamental issues and challenges

Pay for is too low for postdoctoral research scientists. There are too few academic positions available afterwards. Overall, this discourages the whole pathway, as the path to academic positions is seen as the primary reason for pursuing a postdoc.

Existing NIH policies, programs, or resources

Postdoctoral pay must be increased.

Transition K grants to independence should be increased in salary and scope; consideration of “L” grants that support transitions (K to L to R).

Consideration of capping overhead costs for all grants to fund this.

Proven or promising external resources or approaches

The primary mentor is usually compensated as part of the parent funding effort. Consideration of other means of funding this effort or how to add additional mentors needs to be considered and encouraged.

Response 2166

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Several financial issues come to mind immediately. Besides the stipend itself, in many NIH postdoctoral programs, such as the T32 fellowship program, universities treat fellows as different than full-time employees, which presents many barriers to accessing resources that might otherwise be available.

For example, taxes are not withheld from T32 fellows' paycheck, leaving postdocs to arduously hunt down guidance (not forthcoming from most quarters due to liability reasons, I might add) on whether and how much taxes they will owe at the end of the financial year. Then, they have to singlehandedly calculate, schedule, save, and start prepaying their own estimated taxes. This is a burden that sounds perhaps trivial, but in years when you have moved states or universities (a common occurence in academia) or had a significant life event such as a child or a marriage, can take days, if not weeks, to figure out on your own. This burden is not unique to postdocs, and is in fact true for grant recipients at all stages, but it becomes more and more onerous the more complex life becomes, and oftentimes tax advisors do not understand the unique situation that we are in—I have a friend on a fellowship who was audited by the IRS after paying H&R Block to do her taxes, and H&R Block had done them wrong, leaving her on the hook for hundreds of dollars (a non-trivial amount on a small stipend). Creating a mechanism to alleviate the burden on the individual fellow to do their own taxes would improve quality of life significantly for those postdocs to whom this applies.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Postdocs on a fellowship are not given access to any employer-assisted that might enable saving for retirement, such as a 403(b), and of course no matching contribution from the employer. Postdocs are typically at least in their thirties, if not older, and the utter lack of what is in other situations a basic employer benefit is a significant deterrent for some folks. Provision of an external resource, of a supported account for retirement savings that qualified for some basic match benefit, either via the university or outside of it, would significantly enhance many postdocs experience.

Response 2167

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I left academia after completing a postdoc (on an F32) and 3 years as an Assistant Professor at [redacted for anonymity] (on a K01). Although I successfully published, earned NIH grants, and an academic position at an R01 institution, I ultimately left academia because I couldn't financially support my family. These reasons are relevant also for postdocs, and need to be considered if the NIH wants to retain women and those from disadvantaged backgrounds.

The cost of living has dramatically risen across the US, and [redacted for anonymity] is no exception. My husband ([redacted for anonymity] staff) and I made a combined ~$200,000, yet we struggled to support ourselves and 2 children. We lived in a below market rate apartment unit within [redacted for anonymity] housing, but couldn't afford faculty housing, which cost ~$4,000/month, so we requested to live in a student unit (~$3500/month). We send our youngest to [redacted for anonymity] daycare, and our older child attended a private school where we received financial aid. Our income was not enough to be able to

send our youngest to daycare full-time (full time=$3,200/month), therefore my husband and I balanced watching our child 3 days/week, and paid for part-time care (2 days/week = $1400/month).

This was not sustainable for me after 6 months. I was in a period of K to R transition attempting to write grants, wrap up publications from my K award, in order to support the next stage of my career—all with only 2 days a week of childcare. An NIH/[redacted for anonymity] faculty salary should be able to support university-associated expenses, and support junior faculty during a critical and vulnerable stage of their career. Other faculty who were able to stay were either:

1. single,
2. had a spouse who made a considerable amount of money, or
3. an MD who worked nightshifts to earn extra money.

Existing NIH policies, programs, or resources

Provide childcare subsidies to individuals on training grants, including F31, F32 and even K01. This is needed.

Supplements for cities with considerably higher cost of living expenses such as rent and children.

For other ideas, see a recent publication that outlines how to support women in medicine (although pandemic specific, there are a lot of great general ideas as well): https://rdcu.be/cHd4a

Proven or promising external resources or approaches

No response

Response 2168

Perspectives on the postdoc roles and responsibilities

Independent research, demonstration of ability to secure grant funding, manuscript preparation and publication.

Fundamental issues and challenges

PhD students are paid a salary considered below the poverty-line. It is not a liveable wage for a single person, let alone a married couple or students with children or other family members to support. After four years of being in a PhD program (now pushing five to seven as the norm), the appeal to continue with a postdoctoral position is not there. Postdoctoral positions also do not pay a livable wage for their students, who are at a level of experience and qualification that would warrant so. The pay needs to be comparable to what is offered in industry to incentivize students, otherwise, it is an extenuation of unpaid labor that started in the PhD program. Also, the incentive to stay in academia is dwindling as entry-level professor positions are becoming exceedingly selective.

Existing NIH policies, programs, or resources

Better pay for postdoctoral trainees.

Proven or promising external resources or approaches

Better pay for postdoctoral trainees.

Response 2169

Perspectives on the postdoc roles and responsibilities

For me postdoc position is an intermediary step to achieve my career goals. During this position, I seek to get training in various areas such as project management, time management, critical thinking and general scientific skill (improving techniques etc.) among others. At the same time I want to grow in my personal life as well using the experiences I gain as a postdoc.

Fundamental issues and challenges

Postdoctoral trainees are often viewed as cheap labors by the academic faculty. They are expected to work long hours and on weekends and holidays. Work-life balance is never stressed upon and the excuse is

often given that 'you are in training'. This really affects the quality of life because as a postdoc you are also well ahead in your personal life. Therefore, you need time to complete those responsibilities as well. But the PIs refuse to understand this and provide no support whatsoever.

Existing NIH policies, programs, or resources

NIH can start offering H1b visa. It may be difficult because it is a federal organization but it can provide more opportunities to postdocs (exchange program, collaborative short projects etc.) who are international in different ways.

Proven or promising external resources or approaches

The NIH has really done well on defining the pay scale for postdocs according to experience. NIH can devise guidelines for academic faculty to promote work-life balance for their post docs. This can also change the mindset of PIs to view postdocs as colleagues rather than cheap labor who will work more than they are paid for. This is specially evident with international postdocs.

Response 2170

Perspectives on the postdoc roles and responsibilities

The academic postdoc should be eliminated entirely, and recent graduates should be appointed at the rank of assistant professor. It's the same work, why not make it tenure-track?

Fundamental issues and challenges

It's an position most would rather not have if they could be a professor instead.

Existing NIH policies, programs, or resources

Do your job, expand your budget and act for once like you value science enough to not have an abysmal payline. It's the responsibility of the NIH to lobby Congress for additional budget.

Proven or promising external resources or approaches

Direct hire into professor roles sometimes occurs at small liberal arts colleges and teaching schools. Use this model at R1 research universities and Ivy League.

Response 2171

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a transition period between the PhD and a more permanent job (academic, industry, teaching, editing, etc.)

Fundamental issues and challenges

The salary is a problem, specially for postdocs who have dependents and in cities with a high cost of living. A position in industry after the PhD offers a much better salary and many people are choosing alternative careers because of this reason.

Another problem is that international postdocs, who are more than 50% of postdocs in the US, have disadvantages as compared to permanent residents and US citizens. The K99 is the only grant available for international postdocs, but it would be fair to open all NIH fellowships to them too. This is a clear disadvantage when they apply for faculty jobs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2172

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as a training step between graduate student and early-career faculty. It is a chance to expand expertise into a field related yet unique from one's graduate training in order to launch towards an independent career. Successful postdoctoral training should focus not only on technical skills and scientific knowledge, but also professional skills needed to move towards progressive independence.

Fundamental issues and challenges

Postdoctoral training is lengthy and not particularly well paying. The next step, be in K-award and/or first faculty position can feel like a daunting transition, and some trainees spend far too long in the postdoctoral position (i.e. professional postdocs). The model that success is defined by independence is not always no most appropriate next step for everyone. Securing funding to transition can be extremely challenging. Postdocs are often also at a challenging life stage of beginning a family, etc. and seeking balance vs. productivity.

Existing NIH policies, programs, or resources

Programs such as lone repayment, early stage investigator status extension based on qualifying life events, etc. are very good and should continue or be expanded. There is an unwritten mentality, at least in my area, that no one seems to get a K-award their first submission, which really drags out the funding process. It is very easy to have gaps between funding stages (i.e. F to K and K to R).

Proven or promising external resources or approaches

Formal training opportunities centered on career development and professional skills, but for trainees and their mentors.

Response 2173

Perspectives on the postdoc roles and responsibilities

In my point of view, I view post doc as a training that lead to a smooth transition to independent researcher. However, in general perspective, post doc training can prepare a trainee to the future career, either in academic research or industrial research.

Fundamental issues and challenges

Fundamental issues for a post doc life in academic research are that some of the PIs are under pressure for grants, and the pressure from the PI becomes worse to the post docs because they also want publications to make easier transition for their future careers. However, the PI only may focus on the grant, and don't focus on the publication or helping post doc to prepare their future career.

Another challenge is sometimes, some PIs are not good mentors, and they only want the post doc to work for them without preparing them for a future career.

Existing NIH policies, programs, or resources

Although I am still very new and not yet very familiar with all the policies, programs, or resourcesof NIH, So far I think they are good for post docs, the only concern is how the PI helps the trainees to transition to their future careers.

Proven or promising external resources or approaches

The surveys like this and follow-up for post docs life as well as regular reminding the mentors their responsibilities towards their trainees will probably help to keep the mentors mindful to their trainees.

Response 2174

Perspectives on the postdoc roles and responsibilities

My role as a postdoc is to conduct and publish research as quickly as possible while maintaining a high level of academic integrity. This role, as looked at by myself and other postdocs I have spoken with, is transitionary. Often used as a way to maintain pay after graduate school because we were unprepared or

lacked time for the proper networking, application, and interview process that is required for obtaining a job outside of academia. The postdoc position also allows us stay versed in the sciences (no gaps in resumes), while applying for other positions. Personally, I am using this role, in addition to maintaining pay, to gain technique based skills that I believe were missing in my graduate career and would make me a more viable candidate for jobs in the [redacted for anonymity] area.

Fundamental issues and challenges

The lack of adequate pay and benefits for the educational and technical expertise we have earned. The current $68,604 cap, although placing us above the median salary range (after 7+years!) for overall salaries in the country, it is only slightly more than half the median salary $127,774 for PhDs overall and this does not include benefits, which are totally inadequate in a postdoc position. A base salary of $56,484 without 401K benefits, < 2 weeks accrued vacation, and parental leave only being approved at CU Anschutz last week (3/16/2023) makes life as a new postdoc difficult to comprehend, especially when other government jobs such as mail carrier can earn $78,898 base after 8+ years and include benefits with a high school level of education. Simply, the postdoc position makes me feel used.

Existing NIH policies, programs, or resources

Changing existing program rule to NOT include payback time. It is simply creating a more hostile environment where I am essentially trapped in a program for two years at low pay without benefits. This incentives me try my best to get out of the position as quickly as possible and/or search for a job that can compensate me 2x ($112,968) so that I can pay back the government for working for them. These sort of financial penalties (although good for the government, pay a highly educated person as little as possible for work that can impact GDP) discourages new graduates from taking the postdoc role unless they lack other options.

Proven or promising external resources or approaches

Money talks. With inflation at 6% year over year, 15.5% since 2020, why would I want to work for this salary? No amount of training, mentoring, or community building is going to overcome the fact that I can earn 2x the salary + benefits that put me on track for retirement and allow me sufficient time off after equivalent years of work.

Response 2175

Perspectives on the postdoc roles and responsibilities

Training for transitioning from an early career researcher to Principal Investigator.

Fundamental issues and challenges

Bare minimum salary, very few research fellowships available to non-citizens (or permanent residents), age and experience-capped federal funding irrespective of the difficulties in publishing in a particular field, prioritizing publication productivity rather than science which often informs future funding/grants.

Existing NIH policies, programs, or resources

Raise in the minimum salary to make the already difficult research relatively lucrative; more emphasis on guidelines and resources on career development; increasing opportunities for jobs currently identified as ‘alternative career options’ like Science informationists and careers in Science outreach, communication, and policy.

Proven or promising external resources or approaches

Enforcing actual mentoring, happier and safer work environment, and competitive salary would be helpful.

Response 2176

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

When I was looking at postdoctoral positions, I was confronted with the choice of uprooting my family or taking a position that would do little to advance my career and training. I ultimately opted for the former and completed two cross-country moves before settling into a faculty position, which has been incredibly hard on my spouse and children.

Existing NIH policies, programs, or resources

The only people I know who were able to stay in place for their postdocs —and many, eventually, for faculty positions —were those who were connected with large, well-funded labs and received postdocs through those labs' grants. I was working with a small, newly established One Health research center, and there weren't any postdoc positions there. I had funded my doctoral work through an F31, and I would have happily written an F32 or K99 if it meant I could stay and work with this group. However, my understanding was that I needed to demonstrate for those grants that I would be in a different environment than my doctoral environment, and this was the only group doing research in my specific field at my home university (i.e. that didn't require a move). I feel this expectation should be reconsidered. Many people have become successful by deepening their training in a topic rather than starting over in a new lab/research group. The expectation of moving to a new environment excludes non-traditional students who are more advanced in their family lives and not able to move for a postdoc from competing for NIH postdoctoral funding mechanisms.

Separately, fast-tracking postdoctoral funding mechanisms would improve things for postdocs. Right now, if a resubmission is required, well over a year passes between the first submission and funding. The current system seems to assume that you already have a postdoctoral position, and the F32 or K99 is just to free up some of your mentor's funding, so it doesn't really matter how long it takes to get the grant. If NIH wants to actually expand postdoctoral opportunities, these grants need to be obtainable when doctoral students are still students. Faster turnaround times would help immensely with that.

Proven or promising external resources or approaches

Create a mechanism to fund postdocs working with ESIs or other investigators not super well-established with NIH. Many bright, up-and-coming postdocs want to work with bright, cutting edge researchers, even if they don't have lots of previous mentees in high-ranking positions.

Response 2177

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral period as a way to get extended mentorship and training in areas beyond my Ph.D. For me, with the pandemic really impacting my Ph.D. timeline and experience, I felt that I needed more formal training to build upon that and really hone my skills academically to where I wanted them to be before deciding on/transitioning into my next career steps.

Fundamental issues and challenges

For me, the cost of living in major cities vs. the postdoc pay is embarrassingly low for the level of education, training, and expertise. 3/5 of my paycheck is just to keep me alive and housed. There is no adjustment for this for area of living, and even if there was pay of $50-60k is something I could have made with high school degree doing much less. We are trained scientists, and not treated as such. Not to mention that I am having to do the distance with my spouse to find a position that was able to pay me. This, mixed with a lack of guaranteed funding, not knowing if I have a job or not the next year, and the lack of job security. We are usually adults in our late 20's-30's, living as if we are extended students, working a lot of hours while being underpaid, away from family/partners, with the next steps of our career still 3-5 years away. Where, if we go into a mid-level research institution can start a career right away OR go to industry to make 6 figures with the same level of training. I run my own business alongside my postdoc and did my PhD as well to be able to live. I am capable of making $250k+ a year in this, but love research so am still here. It would be a lot easier to beable to know I had job and financial security in ONE job vs having to manage two to live.

Existing NIH policies, programs, or resources

Pay us more. Create more stable funding opportunities for PI's to pay us and train us.

Proven or promising external resources or approaches

Pay us more.

Response 2178

Perspectives on the postdoc roles and responsibilities

I view postdoctoral training as an opportunity to build my own scientific niche, network with my peers and establish collaborations that prove fruitful for my current as well as future research. As an academic postdoc I also expect to gain insight into the hiring process and trained for grant writing.

Fundamental issues and challenges

Lack of funding or fellowship opportunities to international postdocs makes it difficult for postdocs to continue their research, as even PI funding is also very uncertain and sometimes forces a postdoc to be compliant to a PI who may not be a good person.

Existing NIH policies, programs, or resources

As international postdocs who come to the U.S in hope of publishing well, building an academic network and gaining an academic position, I think the cultural barriers sometimes delay these processes as one settles into a new country and into this new role. As a result, lot of funding opportunities are lost since they are very limited and only cater early postdocs. I wish there were more opportunities for senior postdocs (>5 years) to gain funding especially the career awards that intend to support transition from postdoc to PI. I say this because being on non-immigrant visas makes it difficult for international postdocs to obtain funding and continue to do research and gain employment in the US.

Proven or promising external resources or approaches

Ultimately, publications, successful projects and ability to gain a grant seem to be what governs a transition from a postdoc to a PI position. Most postdocs fail in one or more aspects of this sometimes for no fault of theirs. I think postdocs need some kind of job certainty or security in their lives as they are at an age where they have a family and ensure their well-being as well. The biggest stress factor is an uncertainty of future and lack of options in academia.

Response 2179

Perspectives on the postdoc roles and responsibilities

I see the postdoctoral position as a second PhD whereby I gain more experience and insight into conducting research, preferably in a different area than PhD. In more pragmatic terms, the postdoc is a layover and another sifting stage required by the rarity of academic jobs, the aspiration of many of those choosing the option.

Fundamental issues and challenges

The fundamental issue for me is financial. The NIH sets the same guidelines for salary across the US despite the huge variability in the cost of living. In certain areas, the wage is literally a starvation wage. A family with kids cannot live on this wage for rent and basics. I therefore learned from the experience that a person who supports a family is not welcome by the NIH salary policies. Driven by the need, I tried to teach extra time to support my family but other NIH rules prevents more than 100% effort!! Meaning that I have to reduce my research hours to do teaching hours resulting in the same pay!

On one hand, I am happy with the research opportunity I got. On the other hand, the salary and the associated policies are just an insult to the basic human needs. I don’t see it otherwise because the funding is very generous in all other aspects except the postdoc salary. If I would go back in time, I would have gone for an industry job where my economic dignity would have been much more cared for. I would have been way more productive if I didn’t have to battle the financial stress in the same way I did.

Existing NIH policies, programs, or resources

- Salary guidelines should take into account the cost of living and the different conditions of the individuals especially those with families.
- Freedom of postdocs to work more if needed without kneecapping. why prevent me from working more if I have a family and your salary guidelines literally starve us?!

Proven or promising external resources or approaches

The resources available to the NiH are clearly so vast that it doesn't make sense to financially victimize a group of those supported by it. Think of the long journey a person with a PhD goes through and the amount of debt they could have incurred through the undergraduate and graduate education and how they would feel and produce on a postdoc salary.

Response 2180

Perspectives on the postdoc roles and responsibilities

Is the period to solidify the concepts learnt during the PhD about how to do science, and how to develop scientifical thinking. There is a very important part that does not get accounted often and that is the opportunity to learn and develop the leading skills required to become a principal investigator. I really do not understand how someone without that experience, without being mentored on how to be a good mentor can directly jump to have the responsibility to be the leader of other scientists.

Fundamental issues and challenges

Particularly in the USA, there is as an issue with the transition from postdoc to PI. The system favours almost exclusively the people that do short postdoc periods with strong publication record. In order to achieve that most of the times you depend on the the ideas of your PI and the projects already started in the laboratory that you join. So in the end what is awarded is that you came out from a lab with resources and ideas, not that you are really ready to be a group leader which should mean that you have more than a strong publication record. Another thing that is needless to say, is the differences in the salaries between the industry and the academia, I think that is a big issue that needs to be tackled.

Existing NIH policies, programs, or resources

To remove the restriction of a certain amount of years after the PhD is obtained as a criteria to apply for most of the fellowships. That creates extra pressure on the postdoctoral community, and more often than not forces the investigators to leave the academic carreer even at a young age. I think a lot of talent is being lost because of those restrictions.

Proven or promising external resources or approaches

To invest on mentoring the postdocs and PIs on how to be a leader. I truly believe most of the postdocs that become PIs are not ready from the organizational and human point of view to lead and manage other scientists.

Response 2181

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should be one that allows an individual to head their own research under the guidance of a more experienced MENTOR, one who will also help with training and developing new skills. A academic postdoc should be highly encouraged and given the opportunity to teach. Postdocs are responsible for the advancement of their own research as well as assisting/mentoring the entire research group with the advancement of the PI's research. By the two year mark of a postdoc position, postdocs should have the ability/resources/skills to apply for grants as the lead. Post docs should go out of their way to access resources to further develop their professional skill set.

Fundamental issues and challenges

- Insufficient salary for experience/education level (this contributes to all three)
- Lack of respect and appropriate job title
- Not enough research freedom/stuck under PI's research scope/vision
- Little to no recruiting effort
- Academic institutions favoring those with more years of postdoc experience (3+ years) and in more recent years expecting more, makes it difficult/inaccessible to the majority (also no one wants to be a 5th year post doc thats 35 yo making $55k with a baby.not every home has two incomes)—If post docs are staying longer, it hints to potential issues in academic hiring/job availability
- Competition with industry (better salary/HR/accountability/stability/clear path for growth)
- PI's trying to become more interdisciplinary researchers are applying for grants/requesting postdocs but lack knowledge in this new field and have no idea what they are looking for in a postdoc
- No acknowledgment of personal/family life and career demands
- Insufficient pay for assistant/associate professorships—why grow in a career that is so limited/will always be a time/financial struggle
- Overall not really enticing and it no longer seems as though the sacrifice is worth the payoff

Existing NIH policies, programs, or resources

- More accountability on PI's to provide consistent structure for post docs (i.e. NIH check-in's with post docs and their PI's; plan template; timeline; expectations)
- Required training for lead PIs—how to recruit, what to expect of a postdoc, main concerns of postdocs, how to be a mentor, how to mentor a post doc
- Payback agreement—this is very odd and off-putting. This is not acceptable in any workplace as asking EMPLOYEES to payback money for time they have put in by going to work is borderline illegal. While I plan to stay the entirety of my contract, this agreement gave me a lot of doubt and insecurity. As someone who comes from a lower socioeconomic class, things like this can trigger financial insecurities and are deal breakers.
- Student loan assistance should be offered IMMEDIATELY upon start date

Proven or promising external resources or approaches

- I would like to see the NIH take initiative to activity recruit and educate potential postdocs (I didn't know about my current post doc position until the PI personally reached out to me.which most likely means I also didn't have competition and most likely got the position because enough of my background matched BUT I think there are better candidates out there who simply never heard of the opening)
- Required mentoring training for PI's and postdocs (multiple studies have shown that lack of proper training on being a mentor is a huge issue and contributor to lack of diversity). Additionally, postdocs are expected to be mentors in their labs but are normally just coming out of a lifetime of schooling where they were always the mentee and don't have the necessary training

Response 2182

Perspectives on the postdoc roles and responsibilities

Postdocs are the key persons to carry out research in the laboratory. A good postdoc is directly responsible for the success of the lab.

Fundamental issues and challenges

There are less good applicants in recent years. Many graduate students chose to go to industry after graduation. The reason is too few academic positions are available when the postdocs finish their training. Students learn from their mentors that academic career is tough because it's difficult to obtain grants due to large numbers of applicants.

Existing NIH policies, programs, or resources

NIH should increase the minimal salary for graduate students (to $40,000) and postdocs (to $70,000). This will attract more young people into the research labs. This will also reduce the numbers of posdocs competing for academic positions. We have produced too many postdocs in the US and we don't have a matching number of academic positions for them. This will also reduce the number of people competing for grants. NIH budget has increased annually for recent years, however, success rates for grants remain low. This is simply because too many people competing for the limited fund.

Proven or promising external resources or approaches

NIH should evaluate the quality and results of postdoc training by the grant recipients. If a PI received large amounts of grants but none of the postdocs in the PI's lab obtain academic positions, then NIH should take note and take actions to reduce the PI's grants.

Response 2183

Perspectives on the postdoc roles and responsibilities

To learn and transition to independence. To mature intellectually and apply that maturity in an environment that is supportive of my career goals (to become an independent researcher).

Fundamental issues and challenges

Fundamentally, the pay scale is poor and not suitable for the expectations to get funding later on.

Existing NIH policies, programs, or resources

Having to move institutions to increase my odds of receiving funding is an especially taxing, even if unspoken, criterion. I understand that there is more to learn in different institutions but it is a move for privileged people who have the support and resources to change locations. When funding opportunities arise in the future I know that I will be at a disadvantage because I did not change institutions. I can bolster every other aspect of my application but all things being equal, someone who was lucky enough to have the ability to move will be rewarded.

Proven or promising external resources or approaches

Increase pay. We have the highest qualification in our field and have to go through several more years of training before we are considered for faculty positions. We are living through unprecedented times of rampant inflation and uncertainty that is the fallout from a worldwide pandemic where many of us have endured losses and I am seriously considering leaving academia because I have to work towards a life that I can live comfortably. Academia is already a place where you are at risk of being removed at every stage. The added economic pressure isn't necessary.

Response 2184

Perspectives on the postdoc roles and responsibilities

I enjoyed my academia postdoc. I learned a lot of new technical skills and more importantly, it is where I developed as a manager. However, I feel like I stayed too long.

Fundamental issues and challenges

My story is not unique, but after many years of grant rejections, I felt my chances of making it as an academic investigator, especially as a woman, were dwindling. I was also very attuned to the financial drawbacks of doing a second postdoc or even teaching at a university. I wanted to become a foster parent, and this would not be possible if I stayed in academia.

Existing NIH policies, programs, or resources

Pay postdocs better and recognize that these are the people running the lab and writing grants. There is a huge disconnect between the number of academic positions and the number of postdocs. Leaving for a job that provides financial security as well as intellectual fulfilment is not a failure.

Proven or promising external resources or approaches

Mentoring helps, also providing information early about other careers.

Response 2185

Perspectives on the postdoc roles and responsibilities

The role and responsibilities of an academic postdoc should include learning new techniques and skillsets not acquired during doctoral training, mentoring and supervising students, contributing to research funded by their sponsor, and conducting an independent research project under the mentorship of established faculty,

Fundamental issues and challenges

Compared to industry, government, and other positions that are available to new PhDs, academic postdoctoral positions pay significantly less while usually requiring more work hours. In addition, in some cases, postdoctoral trainees are treated like glorified lab technicians or graduate students and not given the independence necessary to transition into their own independent research careers.

Existing NIH policies, programs, or resources

To address the pay gap between academic postdoctoral positions and other equivalent positions, it may be useful to institute a mandatory pay scale for postdocs for all NIH-funded projects and not just F32s/T32s.

Proven or promising external resources or approaches

No response

Response 2186

Perspectives on the postdoc roles and responsibilities

I came into my postdoc as a greener scientist—my PhD consisted of mostly IF techniques so I was looking to expand my horizons. It means, for me, more time to develop my skills before trying to become a leader myself. I very much still consider myself a student in this position.

Fundamental issues and challenges

I feel like the traditional expectations of working day and night are beginning to clash with post-COVID realizations about quality of life. For example, some older postdocs in the lab still work continuously, coming in early in the morning and not leaving until 8-9pm, while others are beginning to balance their work/life and are making an effort to only work 8hrs a day. These clashing mindsets between lab mates and PIs are causing some extra strain. I love science and I love being in the lab, but I'm struggling to reconcile that feeling with also feeling like there's more to life than working. At the same time, I feel like I can't miss this postdoc opportunity since I've been working towards it for years.

Existing NIH policies, programs, or resources

When I started here, there were a few seminars from the NIH about leadership, being your own advocate, and transitioning into a PI role. I thought these were awesome and would definitely attend more workshops for postdocs thinking about going into academics.

Proven or promising external resources or approaches

Mentoring is difficult and largely depends on your PI—oftentimes PIs can be stubborn about changes in the work environment/speed. Is there any credibility to the slowing of scientific progress that everyone is worried about post-COVID?

Response 2187

Perspectives on the postdoc roles and responsibilities

For me postdoctoral position is a transition from graduate studies to an independent researcher. It is an opportunity where a postdoc person could learn from the principal investigator to become a successful researcher.

Fundamental issues and challenges

I believe the main challenge to recruit or retain postdoctoral trainees is the availability of the funding for the principal investigators. But it could also be due to the process of recruiting a postdoctoral trainees most academic institution are using. The criteria at least comparing to the application to the positions in industrial sectors is length and tedious. Another reason that might be the reason is the compensations for academic postdoctoral trainees are not as attractive as you would get if you went to the industrial sectors.

Existing NIH policies, programs, or resources

I think the funding to the principal investigators should be increased and there should be someway of compensation may be increase salaries for the trainees. I would also say that Carrer development for the trainees may help to retain them.

Proven or promising external resources or approaches

The recruitment process and the incentives most biotech companies and other large industries are taking could be a good model.

Response 2188

Perspectives on the postdoc roles and responsibilities

I currently view my postdoc as a chance to slowly build toward an independent position. In my current state, I am working solely on research and developing a review paper. I am learning new research skills, and practicing time management. I anticipate the demands of the position increasing over time, to become more adjusted with the workload of an independent researcher (in my case, professor).

Fundamental issues and challenges

I spent nearly a year cold-emailing professors doing work that interested me, building a relationship via email, setting up meetings and giving presentations on my dissertation work. The majority of the time, if the professor thought we were a good match, they did not have funds to support me. The SART program finally allowed me to connect with a university that matches my values and dedication to diversity. The money provided by NIH NIDA helped, and having a professor willing to teach me new techniques was vital. Professors wanted me to hit the ground running, and produce data for their lab, but I needed training in the more modern techniques being used. This was another barrier to placement.

Existing NIH policies, programs, or resources

I am a successful scientist, and every time I have encountered a road block to my progress I have found a way around. If it weren't for the various NIH programs supporting diversity in science, I don't think I would have been as successful. My own determination kept me going, but the money provided by NIH opened the door. Yet, I was largely unaware of NIH until my Master's program, as I attended a community college when I returned to school (having previously obtained a BA). Perhaps expanding more thoughtfully into spaces where there is higher diversity and need, such as local community colleges, would improve the impact of these programs.

Proven or promising external resources or approaches

Increase visibility of postdoctoral opportunities. There was no one location for me to find professors who work on my area of interest, I had to comb through university websites myself, and then cold email to find out if they would have space for a postdoc. Postings on job search websites, even hosted by NIH, were difficult to narrow down to my field (behavioral neuroscience)—though that may be user error.

Response 2189

Perspectives on the postdoc roles and responsibilities

Post doc position is a advanced training in handling the new projects and learning grant submission.

But joining at wrong place where I learnt that what to do not in post doc, how selfish supervisor are? They are considering post doc as technician especially international scholars.

Fundamental issues and challenges

Highly issues at this stage, especially for those PI, who are throwing arrow in space without knowing the destinations

Existing NIH policies, programs, or resources

Low wages to post doc position will kill the basic science in future due to non availability of Human Resources. So it is necessary to modify the present policies for the betterment of science

Proven or promising external resources or approaches

Conducted feedback from all post doc position quarterly and creating single platform for vitiable ecosystem.

Providing visa for long term for international scholar to prevent them from slavery.

Response 2190

Perspectives on the postdoc roles and responsibilities

Our academic section reviewed this RFI together as part of our standing research meeting. This writing comprises experience from 2 former T32 recipients, as well as 2 F award recipients and two senior T32 faculty members.

Our group members wished to highlight the likely biased feedback NIH will receive in response to this RFI on the basis of distribution primarily to those in academic research careers. We urge NIH to seek feedback from physicians and scientists who were interested in academic research but chose other careers (such as clinicians and industry employees).

A postdoc position was viewed as a critical step in the career of an academic researcher. The postdoc position provides for the opportunity for the individual to gain skills and experience, and to have teaching/mentorship that are distinct from those that were part of the doctoral program. The postdoc experience allows time for the individual to publish completed work, develop funding applications, and consider faculty positions.

Fundamental issues and challenges

The primary obstacles to recruiting and retaining postdocs are: insufficient salary, restrictions that require US citizenship/permanent resident status, and a cultural expectation that researchers perform their doctoral training and postdoc at different institutions, then a faculty position at another institution requiring them to uproot partner/family/home 2-3 times within a few short years.

Specifically, it was noted that T32 salary is too low, especially for physicians who carry a heavy student debt. Participants noted that potential researchers could only accept a T32 position if they were willing to sacrifice financial stability, or had a personal partner who was gainfully employed. This low salary biased T32 participants toward those with greater familial wealth at baseline.

Faculty noted that accomplished clinicians and researchers from outside the US regularly ask to join the group to obtain research experience, but that it is infeasible for many to obtain NIH-funded postdoc positions in the US because of both T32 policy and because visa holders are required to return to their home country in 2 years' time.

Postdocs noted that the position timing typically overlapped during the time in one's life when a person is most likely to start a family, and value stability in terms of income, housing and social supports. Participating in a postdoc often requires sacrificing this stability.

Another concern was that postdoc positions were not consistently of high quality, with some postdocs being asked to perform duties similar to a research assistant, rather than work aimed at their learning.

Existing NIH policies, programs, or resources

It was not feasible for our group members to read the 400+ page policy document. If NIH wishes for feedback on specific policies, they might consider postdoc/faculty focus groups to present and discuss such policies.

Proven or promising external resources or approaches

Group members highlighted the importance of salary and benefits being competitive. NIH may require institutions to establish a full-time faculty position for postdocs, which include standard benefits. NIH may consider a mechanism for enhanced loan repayment or forgiveness for postdocs with high student debt burden. NIH may consider a policy that allows for postdocs who are not US citizens.

Response 2191

Perspectives on the postdoc roles and responsibilities

My expectation from a postdoc included:

1. Transition to independence
2. To pursue research different from my PhD, something with more risk
3. A stepping stone to a career in academia/research

Fundamental issues and challenges

1. Too few grants for international postdocs
2. Immigration is a major hurdle—despite some postdocs being more skilled, talented and qualified we are ineligible to many of the training and transition grants. Some have an intent to stay in the US and contribute to ecosystem here, so I don't see an issue making them eligible for these grants.
3. There is an institute to institute difference in policies and my research is related to NHLBI. I feel NHLBI is least supportive of grants for postdocs and training (e.g., no R21 mechanism).
4. I am competing with senior PIs who have many grants, so there is a system of 'rich getting richer'—there should be a way to fix this
5. NIH payscale is not competitive and very low, especially for someone with a PhD
6. Fortunately my lab was well funded by NIH, so I had money for science (through my PI) but not to support a family
7. A postdoc is more than a postdoc, they are fathers/mothers, have families who need to be supported. Doing a postdoc shouldn't mean it has to come with sacrifices on the family front.

Existing NIH policies, programs, or resources

1. NHLBIs decision to not give out R21s is STUPID
2. More transition grant mechanisms are required
3. You could offer many smaller transition grants than fewer large transition grants (e.g., K99/R00)

Proven or promising external resources or approaches

1. Reduce overheads to universities and pay it to trainees
2. Put a cap on open access journal costs and force that money into supporting postdocs, and allow PIs more flexibility with how they use their grants/money
3. Some private grants offer a no strings attached family support with their transition grants, include it with NIH grants too
4. Some trainees work for multiple NIH grants but there is a cap on their salaries. Provide a provision to pay trainees proportional to their effort, rather than capping their salaries—this involves conversations beyond NIH, but needs to involve NIH

Response 2192

Perspectives on the postdoc roles and responsibilities

As a current PhD student, my impression is that an academic postdoc conducts all aspects of a research project with little recognition, including securing funding, data collection, data analysis, and writing while

acting as a mentor to undergraduate and graduate students. Essentially, the same role as an academic researcher for a fraction of the pay and not being able to choose the subject/focus.

Fundamental issues and challenges

The pay is the primary reason that I do not plan on doing an NIH postdoc. The pay is worse than what I was paid as an RN with just a bachelor's degree. After so many years of study and little pay, why should we continue to work for pennies? We deserve to be paid similarly to junior academic faculty. At my university, assistant professors are paid $120k/year. To me, that means that a postdoc should get paid $100k (postdoc positions I have seen are $40-65k per year).

From what I have heard, there is a culture of overworking and abuse in postdocs. I have no desire to put myself through that when there are other opportunities. CDC offers fellowships that are pseudo-postdoc positions and the pay, while lower than I would hope, is more fair than the majority of postdoc positions I have seen.

Neither industry nor non-profits nor government care about a postdoc in my field. The only career path that I am aware of that does want to hire people with postdoc experience is research-focused academia. Even teaching-focused academia doesn't care about a postdoc. For those of us who care less about choosing what we research, these other career paths are more appealing. I also have not found many postdoc positions in my field as they seem to be geared more towards bench sciences. While I haven't looked extensively, this is also a huge deterrent in why I would seek a postdoc.

Existing NIH policies, programs, or resources

The pay needs to be increased significantly. Someone with a doctoral degree in my field should not be paid less than $100k/year (depending on cost of living, but what I would expect for this metro area). I would tolerate a couple of years at a slightly lower pay, but definitely not less than $80k. It doesn't seem like the pay has kept up with inflation and cost of living.

Mentors should be evaluated by NIH (including previous postdoc/student reviews) so that postdocs are less likely to be working with an abusive mentor. There should be enforced caps on number of hours worked.

Proven or promising external resources or approaches

I have heard wonderful things about CDC fellowships, including EIS, prevention effectiveness, and lab training.

Response 2193

Perspectives on the postdoc roles and responsibilities

As a postdoc, I am working to becoming independent. To work on my own hypothesis and carrying them out. This is a crucial step in my career as an independent scientist.

Fundamental issues and challenges

Biggest issue and challenge is that the pay for postdoc is incredibly low for the incredibly high effort and intensive work that we do. It is essier to go to industry and just work for 100k or more, when some postdocs are only paying around $58k-$60k, we work so hard and put to much of ourselves into our work, to not be valued

Existing NIH policies, programs, or resources

Programs like support for grant writing, professional development would be great! Specially for people that are not part of training programs.

Proven or promising external resources or approaches

No response

Response 2194

Perspectives on the postdoc roles and responsibilities

Biomedical science and engineering students become postdocs after receiving academic training to become experts in their field. What most don't learn are the career success skills to communicate effectively with non-experts, interdisciplinary colleagues, and others outside their domain. Courses covering these essential communication skills are missing from most graduate curriculum and not required for graduation. Further, the opportunity to practice, regularly apply these skills, and receive feedback or coaching is not part of the typical graduate researcher or postdoctoral training experience.

This creates a disadvantage for academic postdocs. They must figure out how to work effectively in new organizations and navigate situations where effective communication skills would be beneficial. In environments where public engagement is encouraged and lab research talks are required, the untrained academic postdoc has a steep learning curve.

Fundamental issues and challenges

Currently, few universities offer formal communication training. One-and-done seminars or workshops fail to provide adequate learning, practice, and performance opportunities. Trainees need to learn how to give effective lab talks, job talks for future employment, how to network, and how to voice their ideas succinctly. Junior scientists without these foundational skills will be frustrated, have their ideas rejected, and be less competitive in the job market. Formal science communication training could improve the success of underrepresented minority scientists, especially those facing English as a second language challenges.

Existing NIH policies, programs, or resources

The NIH can take steps to fill this postdoctoral training gap by supporting skill building programs designed to enable a postdoc to tailor their communication to diverse groups with differing levels of knowledge, create trusted relationships, and work collaboratively in teams where shared goals, clear expectations, and the ability to be understood are essential ingredients for success. All junior scientists and postdocs receiving a NIH training (T), fellowship (F) or career development (K) award should be required to take science communication courses that cover writing and speaking skills. Universities administering these awards must indicate in the application how these requirements will be fulfilled. A core curriculum, based on published papers from noted professors and communication researchers, could be developed to cover the essential skills.

Proven or promising external resources or approaches

Based on my decades of consulting to biotech and healthcare companies, I have observed the challenges faced by smart, young researchers who lack communication skills needed for their ideas to be heard, supported, and drive action. Training in presentation skills, effective science communication, and interpersonal communication (including influence skills) would enable early career researchers to make a bigger impact. Formal scicomm training models exist at several universities (e.g., MDAnderson Cancer, Harvard, Rutgers, Duke, and Stanford). These models can be replicated across all research intense universities if modest funding is available to support the trainers and minimal infrastructure needed. Increased support for studying the sciences (sociology, psychology, and neurology) of science communication would also be valuable.

Response 2195

Perspectives on the postdoc roles and responsibilities

Academic postdoc is a position where I get to apply my knowledge from PhD. in a different area to while acquiring new research skills, serve on review committee for journals, and build a network in research field where I want to work after postdoc. overall I see postdoc as an opportunity to create a path for my future research interest in academia.

Fundamental issues and challenges

Postdocs are extremely underpaid with long working hours, not eligible for retirement benefits, uncertainty of length of Postdoctal training (long years that are contact based), lack of structured training, lack of support from organization both personally and professionally and uncertainty of getting a faculty position

after postdoc. Most organizations don't have a structure in place to protect the rights of postdocs thereby treating postdocs like contact workers including low pay, lack of retirement benefits, long working hours, lack to support to start a family, and lack of job security. Unfortunately most postdocs are at the mercy of their research mentors especially international postdocs which is detrimental to the quality of life of Postdoctal trainees

Existing NIH policies, programs, or resources

NIH should increase postdoc salary to minimum of $74,000 to match the postdoc fellowship offered by ACS, JCC, Helen Hay Whitney etc. It should be mandated that academic institutions follow NIH payscale if they are funded by NIH.

Proven or promising external resources or approaches

No response

Response 2196

Perspectives on the postdoc roles and responsibilities

Its valuable training time. I have a great advisor, mentor, collegues who I do research with. I have learned a lot of new research techniques, gained teach experience, and grant writing experience. But my mental health has tanked because I work close to 60-90 hours a week with dismal pay. The reality that there are 200-400 people applying for tenure track positions forces me to work harder, but at a great cost.

Pay. Postdocs. Livable. Wage.

Fundamental issues and challenges

Pay. Postdocs. Livable. Wage. NIH needs to increase postdoc pay standards.

Existing NIH policies, programs, or resources

Pay. Postdocs. Livable. Wage.

Proven or promising external resources or approaches

Pay. Postdocs. Livable. Wage.

Response 2197

Perspectives on the postdoc roles and responsibilities

In a practical sense, I view a postdoc as a stepping stone between graduate training and establishing an independent career, be that in academia or industry.

Fundamental issues and challenges

Money.

Existing NIH policies, programs, or resources

Increase minimum salary to $70,000. It is demoralizing to be making $54k in your 30's with a PhD (especially in high cost of living areas! I am making the minimum in an expensive city!). Most postdocs are in the stage of life where they are seeing their non-academic friends and colleagues buying homes, starting families, etc., and it is frustrating to feel excluded from being able to reach these life milestones purely because of finances. Before turning your nose up at this large of a raise for postdocs, it is important to consider the broader context as well—the loss of personal wealth during graduate training (instead of being in the workforce) is substantial, especially considering outside work is often forbidden. Many people are choosing not to do a postdoc purely because of MONEY. I came close to this decision myself, and am only continuing with this for very specific reasons, but ultimately feel I am making a major personal sacrifice to do a postdoc. Especially considering inflation, the salary is far below what a postdoc is worth. Increasing wages NOW is the only feasible way I see to help retain anyone in academia.

In addition, creating policies that shield postdocs from having their employee benefits stripped as a result of becoming a fellow. Many institutions do this, effectively "punishing" people for obtaining their own funding. That is absurdly unethical and I do not understand why this is allowed to happen.

Proven or promising external resources or approaches

Money.

Response 2198

Perspectives on the postdoc roles and responsibilities

I believe that you need to have experience with the people in the Real World and understand what they are doing and feeling before you can start working on your Pos-Doc.

Fundamental issues and challenges

Life experiences are a prerequisite to success in the Caring and Treatment of Patients

Existing NIH policies, programs, or resources

The piece of paper is not the only way to learn

Proven or promising external resources or approaches

No response

Response 2199

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The TY32 payback policy for the first 12 months of training salary has created financial complications for our dermatology department and trainees as traineeshave changed career paths during the fellowship. I would recommend discontinuing this policy.

Existing NIH policies, programs, or resources

The TY32 payback policy for the first 12 months of training salary has created financial complications for our dermatology department and trainees as traineeshave changed career paths during the fellowship. I would recommend discontinuing this policy.

Proven or promising external resources or approaches

Response 2200

Perspectives on the postdoc roles and responsibilities

I did a postdoc position at my current university before being appointed as faculty. I am somewhat different than many postdocs —somewhat older, coming back to university for a degree in epidemiology/public health after a long career in the software industry. I wanted to contribute to public health and medical research. The postdoc position I took was in a large diverse research group in which I could work on different types of study designs and people across the U.S. (this group had mentored many people over the years). It was an excellent introduction to the academic world and research; in addition to the work itself, our university has a postdoc society and training in research, ethics etc is required.

Fundamental issues and challenges

base stipend paid for postdocs is low, especially for large cities. Postdocs are explicitly NOT employees and are paid through a separate system intended for contractors. Fellow-postdocs had difficulty affording rent and basics in the Boston area, and the "non-employee postdoc" label was confusing for taxes. Financially a job in a corporation outside of this research track is much more attractive. The postdoc experience really needs to offer more money, and a lot of good experience to make up for the opportunity cost of taking the position.

Although the salary was far below what I had previously earned, I had other resources and could make a financial sacrifice for ~2 years for the experience.

The other issue which directly affect me was health insurance: my husband and I had health insurance through healthcare.gov (Affordable Care Act). The postdoc university program was supposed to re-imbursed the part of the payment for coverage for me —but then about 6 months in they decided the documentation from healthcare.gov was not what they wanted, and refused to reimburse any portion of what I was paying for coverage. Neither healthcare.gov nor the insurance company were going to change reporting from what was required by law. After having several thousand dollars go un-reimbursed as a postdoc , I was forced to switch to an inferior (but no less expensive) plan offered for students. It seemed this was clearly what the university wanted.

I heard about several of these items from other postdocs when I interviewed, but I continued, because I could make a sacrifice for a couple years, but if I was starting out my career and had already spent so much to get here, I would likely skip it!

Response 2201

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is to further develop skills as a scientist to better prepare for a career as an academic investigator, while supporting and mentoring other members of the lab.

Fundamental issues and challenges

The salary of academic post doctoral positions is far too low to support a good quality of life, especially because inflation and academic institution profits have vastly outpaced salary increases. Inflation was over 9% in 2022-2023 but academic post doctoral salaries didn’t even increase by 4%.

Existing NIH policies, programs, or resources

Existing policies and programs need to support higher salaries for academic post doctoral positions. Industry positions often pay double what academic positions do.

Proven or promising external resources or approaches

No response

Response 2202

Perspectives on the postdoc roles and responsibilities

Academic postdocs are the lifelines for most of the laboratories because they all come with a long training record during their Ph.D. We provide platforms for postdocs to train, and publish great work. WE need to promote and help them becoming independent thinkers and scientists such that they can be competitive candidates for academic and non-academic jobs.

Fundamental issues and challenges

There are several road-blocks:

1. CoVID stalled postdoc recruitment.
2. A large number of graduate students leaving academic postdoc options for jobs in other sectors that pays much better.
3. Immigration policies and perceived anti-immigrant feeling/sentiment is possibly discouraging foreign graduate students not to apply to US institutions and head to other countries for post doc work. Long delay in visa processing is also a contributing factor.
4. Less job opening in academia and institutions requiring postdoc to come with funding for Asst. Prof appointment may be discouraging Pd fellows to stay in academic research.
5. Here is the hard fact: The PD fellows don't see the light at the end of the tunnel to stay motivated and work in an academic setting.

Existing NIH policies, programs, or resources

NIH should fund PD fellows directly. NIH is increasing PD salary but is not supplementing existing grants with additional funds to make up for the deficiency this additional pay creates. It's also absurd that foreign PD fellows can't apply for NIH fellowships. Private PD fellowships are extremely competitive and handful. NIH should take a serious look into this most pressing hurdle.

Proven or promising external resources or approaches

NIH should have collaborative PD recruitment (with salaries paid) with other countries such that PD candidates are supported by the host (US institutions) and the countries the applicants are coming from. Some European countries do that. Change immigration policies and fast track processing of PD candidates visa application. Encourage US graduate students to do post-doctoral work in the US and provide direct financial support that is similar to what they may be earning at non-academic jobs. Immediately create and support a pipeline for minorities and under-represented graduates in biomedical research with proper mentors. NIH should Work with national societies (Endo, AACR, ACS, SSR, etc) and private foundations to recruit and financially support all PD fellows and specifically minorities and under-represented candidates using a cost share arrangement.

Response 2203

Perspectives on the postdoc roles and responsibilities

Postdoc is a role that helps you transition into your next career. Even though it's a transition career, it still is a career. There are a lot of roles **and responsibilities** including performing research, mentoring, collaborating, generating new ideas, etc. Especially in an academic position, postdocs usually perform the best in conducting research as they have graduate school training and can learn things pretty quickly. Postdoc is a position where a scientist gets to explore fields outside their comfort zone and still be able to contribute significantly.

Fundamental issues and challenges

Postdocs are undervalued. Severely undervalued. In a literal sense, postdocs are paid at least 2x less than industry positions of similar job responsibilities. In most cases, postdocs work more than scientists at big biopharma. But postdocs aren't paid as much as scientists in the industry. This is the main reason why people do not want to pursue a postdoc career. Financial stability matters especially for people in their postdoc career stage as they start settling down, maybe getting married, and starting a family. Getting underpaid and working long hours aren't job perks anyone is looking for. Unfortunately, for some postdoc is the only option for reasons like applying for a professor position, or for international students it is easier to get a postdoc position than a scientist in industry. The postdoc can then start feeling like a trap as they can't leave because perhaps they haven't published enough or they're not ready to apply for a professor position. This is a big mental burden for postdocs. Postdoc training can be especially unpleasant if

1. the project isn't working,
2. you're being forced to work on a project that you don't want to,
3. the work environment isn't good,
4. there is a lack of support or mentorship from a postdoc advisor. These factors on top of getting underpaid are not why anyone received a PhD degree.

Postdocs are talented and capable workers but are severely underpaid and undervalued.

Existing NIH policies, programs, or resources

Increase the salary!! By at least two folds!! If you want one of the best-talented groups of people to stay in academic research, make sure they are taken care of. Especially financially. When industry positions pay you more, why stay a postdoc? And in the industry you still get to do amazing research, mentor other people, able to publish papers, and go to conferences. Academic research isn't the only path to becoming an impactful scientist. In fact, scientists in the industry do impactful research that is translational and they can see how it impacts society. That's more rewarding. There are rewarding aspects to academic research especially when it comes to mentoring. But the financial benefits provided are so low that sticking with an academic postdoc is not worth it. So, you want to improve the postdoc training ecosystem? Just increase the salary!!! By at least two folds!! I know I started by saying this but repetition is good. So I'll say it one more time: INCREASE THE SALARY BY AT LEAST TWO FOLDS!!!

If you don't increase the salary, you'll keep seeing declining numbers in postdocs. There are current postdocs who are advising graduate students to not pursue postdocs. This is nothing against NIH. But we are scientists who learn so that for the next cycle we can do better. So we are telling future scientists to take a path where they can make amazing scientific breakthroughs while not suffering financially.

One more time hoping it will be charming this time: INCREASE THE SALARY BY AT LEAST TWO FOLDS!! OR MORE!!

Proven or promising external resources or approaches

I know a promising and proven approach that has retained a lot of scientists doing amazing research in the industry. The scientists there are valued. They are getting paid according to their knowledge, skills, experience, creativity, and contribution. If you want postdocs and retain them, it is simple. Let them know that they are valued. How? Pay them according to their knowledge, skills, experience, creativity, and contribution. PhDs who go straight to industry jobs are getting paid 130,000—150,000 salary as a starting point in their career. While postdocs are getting paid 55,000. And when they do 3—6 years of postdoc and go to a professor position, they will make as much or less than the starting industry job salary. That is completely unfair. If you respect postdocs and their contributions, you should pay them what they deserve.

Response 2204

Perspectives on the postdoc roles and responsibilities

When I was a postdoc, I viewed the position as a chance to hard focus on pursuing the scientific question of my choice with zero distractions from classes/committees. I knew I loved mentoring so I aspired to train with the goal of landing a professor position. Thus, I focused my training on pursuing good experiments, writing grants, managing and mentoring students, and building a social network in my field of interest.

Now that I am a professor, I think the postdoc position depends on career desire of the postdoc. Long gone are the days that postdocs automatically want to become professors, nor are there enough jobs to fulfill this. If the postdoc aspires to be a professor because they enjoy science and mentoring, then we should focus their training on building and completing a good research program, grant writing, mentoring, and academic networking. If the postdoc aspires to go to industry, we should also focus on building and completing a good research program but then tailor a training focused on gaining desired skills and building a network of industry connections.

Fundamental issues and challenges

I really enjoyed my time as a postdoc because I loved the science that I was doing and I loved the lab members I called colleagues. However, it's hard not to feel nauseous when I look back at my life as a postdoc, living in a basement with no windows because that's all I could afford for 6 years and without being able to save for retirement. I also feel like those conditions made it incredibly difficult for me to start a family, a thing that I had to sacrifice when my non academic friends did not. I still feel lucky that my postdoc was so enjoyable from a scientific and community perspective, but I can't imagine how horrendous the experience would have been if those two things hadn't worked out as well.

As a faculty member now, I lose sleep at night thinking about how little I can compensate postdocs (and research assistants if I may add this here). Much to my surprise, I don't get to choose how much I can pay people who work in my lab, these rates are set by the university, and the university uses NIH paylines as guidelines.

It's clear that the fundamental issues are:

1. Postdoc salaries in academia are atrocious compared to starting salaries in comparable industry jobs.
2. Exit outcome of postdoc is far murkier than exit outcome of PhD. PhD programs often have career offices that provide job options and resources to PhD. This is far less common for postdocs.

I think point 2 is worth restating. In my experience, and talking to fellow postdocs/grad students, the biggest hurdle to doing a postdoc on top of not being paid enough is the large uncertainty of what working 6 underpaid years nets you.

Existing NIH policies, programs, or resources

Postdoc starting salary needs to go up.

Proven or promising external resources or approaches

No response

Response 2205

Perspectives on the postdoc roles and responsibilities

I have been a mentor of postdoctoral MD and PhD trainees since I started my faculty appointment in 1992. My trainees have met with extraordinary success in terms of funding and independent research careers. This success has been recognized in terms of national and international mentoring awards. The current process for both graduate student and postdoctoral fellowships under the NIH is fraught for many reasons. First, the applicant is expected to write a research proposal independent from their mentors' research and provided with only salary support. The second is that physician scientists are reviewed on an equal playing field to PhD scientists in terms of their research productivity which is unrealistic. The third is the instructions, it is unclear whether the career development plan is supposed to be written by the mentor or the trainee. Of these the most important is that the trainee at a very new point in their career is expected to outline a plan that is realistic, independent and likely to provide productivity in 12 to 36 months. Despite these issues these awards are hugely important. In my opinion, the individual training awards under the F mechanism are exceptionally valuable for the candidate in terms of predicting future fundability and yet they are erratically reviewed. It is not uncommon to have critiques such as one might have for an RO1. Finally, there is the issue of salary and the difficulty that a young individual in their late 20s early 30s might have to live on this paltry sum. I would be happy to contribute to a process for revamping these. I do not believe that dismantling T32 infrastructure which allows young scientists to gain the preliminary data and grantsmanship needed for successful F and K grants is plausible.

Fundamental issues and challenges

The choice of a career in biomedical research is a fundamentally high risk endeavor. We are asking individuals with great academic acumen to choose a career with 10% funding (as such 90% not funded), poor pay, long work hours and high likelihood of rejection of grants, manuscripts, abstracts. At the same time this is the most fulfilling career I can imagine. Still, 30 years in, there are grants and manuscripts that are not discussed or not reviewed. Young people in the field see this happening to their mentors and experience uncertainty. In addition, academic medical centers need to support the first and second year of graduate training prior to entering a specific lab and there is often not institutional support for that either.

It is critical that the expectations are set and that the mentors and the mentees understand the urgency of hard work and the productivity metrics. Increasingly I have seen students who are just seeing this as another step in there education we need to make it very clear that postdoctoral training is very individualistic and the mentor needs to have the ability to support the transition to independence and the fellow needs to use all the tools at their disposal to develop an independent vision of their career.

Existing NIH policies, programs, or resources

Instructions and structure of the grant submission. There are so many little sections that the candidate is unclear how to focus and the reviewers' may weigh different section differently

Proven or promising external resources or approaches

Formal institutional training programs and mock study sections are highly supportive for trainees. The ability to use cores with the expertise provided by the cores directors at either free or highly discounted pricing is a must. Formal training in grantsmanship, writing, negotiation, development of vision statement and professional development statements is crucial. It cannot be the luck of the draw that the mentor actually has the skills to facilitate career transition.

Response 2206

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is an additional training period for those trainees who are not yet competitive for a faculty position.

Fundamental issues and challenges

There is almost no chance that a postdoctoral trainee will secure a faculty position, so it is irrational to do a postdoc for pay which is near minimum wage. Everyone is privy to this now, even undergraduates.

Existing NIH policies, programs, or resources

It is immoral to tell trainees that they are getting ready for a life in academia when this is not true.

Proven or promising external resources or approaches

Pay postdoctoral scholars enough money to survive the years of futile toil, or make it likely that trainees will find a faculty position to do what they were trained for.

Even professors are leaving for Industry.

Response 2207

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is framed as further training required to launch an independent academic career, but it's only necessary because we require it in the biomedical sciences. In many fields, particularly quantitative STEM fields, PhD students can graduate and begin work as TT assistant professors without spending an additional 2-7 years as a postdoc (for a slim chance at landing a TT job once that's over!). I see postdoctoral training as two things:

1. absolutely fundamental to the productivity of modern science, because of the way labs are structured with a single PI, and
2. as a waiting room meant to cause biomedical PhDs to drop out of the running for a limited number of TT jobs.

Fundamental issues and challenges

An analogy (even if you aren't a sports fan): imagine if every college football player, when they "went pro", did not actually play football as a professional but instead were told to coach a team. They would need to recruit a bunch of players from somewhere and these players would have to want to go pro, too. You can see we would quickly have a situation where there would have to be many more players than coaches, and by design most of these players would never get to become coaches because there are a

fixed number of coach spots. We do the same thing to postdocs—they are treated as dispensable, give the sharpest years of their life to the work of a lab that is not their own, and at the end have very slim chance of getting their own lab. They're wisening up and realizing that better opportunities are out there beyond academia, where real science happens too. Given this huge amount of risk postdocs should be funded like NIH intramural staff scientists—the postdoc job should be able to stand on its own as a respectable career and should further the career potential of even those postdocs who don't end up leading labs, which it currently does not. We can pay postdocs more and that's one solution, but the better solution is that not every PI needs to have a lab so we don't create this scarcity in the first place. Promoting multiple-PI labs is good for team science and creativity and minimizes the duplication of efforts and resources required to set up an individual lab.

Existing NIH policies, programs, or resources

Allow co-authors on grants and treat authorship of grants like authorship of any other publication (even if the funding only goes to the PI's lab). Then postdocs (and all other lab members) can have tangible line items for their CV/resume: ability to secure funding is very valued outside of academia and postdocs do this work anyway, so they should be allowed to get credit for it.

Proven or promising external resources or approaches

A postdoctoral position needs to be a real job, simple as that. That means retirement contributions, health insurance, a salary in line with what the federal government pays starting PhDs (GS-11 with locality pay would be great).

Response 2208

Perspectives on the postdoc roles and responsibilities

I think postdoc should be a period for additional training and a career transitions (i.e., to faculty, to industry, etc). That is, postdoc should be a period where scientists' expertise is respected and valued (they are experts in their field, after all!). Yet, postdocs should also be able to get additional training—whether that be mentorship to help the postdoc extend into new research areas, to publish, to develop a mentorship/PI identity, etc. Too often postdocs are seen (and treated) as grunt workers—they are underpaid and are often running PIs' studies without the pay, credit (authorship), and respect due to them. This can lead to abuse of individuals in this role and lead to them possibly leaving academia.

Fundamental issues and challenges

Pay for postdocs in the US has stagnated and is appallingly low. (Really, pay across academia has stagnated and is appallingly low; postdoc pay is one part of this problem). Developmentally, many postdocs will be in their late 20s, early 30s, or beyond—these are years where many US adults get married and have children. These are also transitional years when many US adults begin to develop health problems. I don't think it's feasible or reasonable for postdocs to somehow balance these multiple identities and their associated financial and emotional costs without adequate financial support from NIH and their host institutions. How are people supposed to engage in science full-time, while also (possibly) raising children and/or caregiving, while also balancing multiple personal roles such as that of a spouse, and also maintaining and treating their health—on a barely ~57k/year salary? It's just not feasible. The system needs to change so we can accommodate and support people with multiple identities during the postdoc transitional period. Doing so will improve the success of US science, as well as the success of postdoc trainees of all backgrounds. That is, changes to these policies and systems will benefit everyone. NIH has an opportunity to be a leader in initiating these changes.

Existing NIH policies, programs, or resources

1. It would be amazing if existing (already appointed) postdocs could easily apply for NIH supplements with very short applications with rapid turn-arounds for things like childcare grants, caregiving grants, etc.
2. Programs like the LRP are amazing, but the application is very time intensive (16+ pages), AND it takes almost a year to hear back (and then people can only submit once annually anyway). Having multiple opportunities for LRP submissions, with shorter review periods, would increase retention of clinical and basic scientists, particularly those from underrepresented backgrounds.
3. NIH should consider changing/extending the T/F32 award period from 3 years to perhaps 4 or 5 years, especially for postdocs with career interruptions.
4. I have been excited to hear about career re-entry grants/policies. Many of these are supplements, which means the applicant needs to have maintained academic connections during their interruption. Many people with career interruptions are no longer in their original labs and may not be at an academic institution. Can these awards be applied for via a non-supplement mechanism, with a process in place for matching PIs to institutions, so applicants can successfully compete for these grants and re-enter academic research? Getting people to the PhD is already such a huge financial investment; supporting people with PhDs in their re-entry seems like a relatively small financial cost which could potentially boost the success of US scientific progress and promote retention in research.

Proven or promising external resources or approaches

1. NIH could consider investing in a mentor-mentee matching system to match postdocs to mentors who are able to give them advice based on their unique identities. These relationships might be outside of traditional scientific mentoring. For example, perhaps a bench scientist postdoc has adequate mentoring for their research program, but maybe they are managing disability —can NIH create programs so people with unique unmet mentorship needs are able to get the advice they need? This seems like it could be a relatively small financial investment on NIH's part but could potentially lead to increased retention of US scientists and thus, better scientific progress.
2. NIH T/F32 salaries have a minimum pay scale, but there isn't clear guidance across institutions with regard to stipends/support for health insurance, retirement, etc. At a minimum it would be beneficial for NIH to create policies which recommend minimum fringe benefits of this type; even better would be for NIH to include financial support for postdoc fringe benefits in T/F32 budgets/award packages.

Response 2209

Perspectives on the postdoc roles and responsibilities

I did a postdoc with the whole-hearted intention of using it to further my professional development and to gain independence as a researcher. I worked with my PI to develop an exciting, fundable research project that I would take with me when starting my own lab at a PUI. I attended conferences and workshops, wrote grants to secure funding, mentored students in the lab, and met regularly with my PI to develop my research. My postdoc experience was wonderful and exceeded my expectations, but it was ultimately cut short because I could not afford it. I now work in industry.

Fundamental issues and challenges

I left my postdoc after 1.5 years, even though I had secured an additional 1.5 years of independent funding that paid approximately the NIH minimum in a low cost of living area. I had a child during my first year as a postdoc, but there was no childcare available in my area ([redacted for anonymity]). We spent hundreds of dollars getting on daycare wait lists starting during pregnancy, and we were not offered a space until our child was over a year old. We did not have local family that could help with childcare. In order for me to continue my career trajectory, my husband had to be a stay at home parent. Despite serious efforts to live frugally and modestly, my stipend was not enough to live on, and our savings dwindled.

No one had answers, but encouraged me to stick out the postdoc to faculty path anyway. I was repeatedly told I would be a very competitive candidate once on the job market, and if other people could make it work, so could I! *jazz hands*

I asked everyone I could think of to identify just ONE woman like me who had made it to a tenure track faculty position. Just ONE mother who made it happen without a golden ticket—a spouse that made a lot of money, access to free or heavily subsidize childcare, or family who could help financially or with childcare. Spoiler: we don't exist. We can't exist in the current landscape. So I left, because the alternative was to run our family's finances into the ground in pursuit of a career path that could ultimately lead to a failed job search in a few years anyway. Every single person like me (fathers and mothers without extra external support) has been pushed out of academia.

Existing NIH policies, programs, or resources

Either directly support parents through efforts like subsidized childcare, or dramatically increase salaries. Not just for postdocs, but for grad students through faculty. It's ridiculous to have to choose between staying in academic science and raising a family.

Proven or promising external resources or approaches

Subsidized childcare, parental leave (4-8 weeks is a JOKE), increased salaries and/or benefits.

Response 2210

Perspectives on the postdoc roles and responsibilities

Postdoc is a training period where a candidate gets exposure to different fields of biomedical research

Fundamental issues and challenges

I am more than +13 years of resarch experience candidate from India. I have written all the grants from India but not able to get recruitment in a permanent position in India. There is lot of drawbacks of Indian funding so the candidate loose interest in pursuing his/her research. I have ideas to share for research. I am lacking funding. Other than postdoc science communication jobs should be open so that postdoc scientist can communicate and job opportunities evolve.

Existing NIH policies, programs, or resources

Indian candidates having experience should be welcome where there is exchange of ideas and good science happens. Lot of collboration required . There should be opportunities to work in US for other citizens also.

Indian Ayurveda is an untapped potential for biomedical research. There is lack of funding in Indian research. If NIH opens fund and collaboarate may be good sciene might happen.

Proven or promising external resources or approaches

Since a candidate has to do both experiments and writing I would like to mention scientific writing jobs should also open up and be promoted. Reviewer should also get a remmuneration per paper they review so that they review in a thorough way.

Response 2211

Perspectives on the postdoc roles and responsibilities

I think postdoctoral trainees are mostly looking to expand their skills and achieve independence. Most of them are not being "trained" after a year or two and this should be reflected in their title and pay. Postdoctoral positions are only useful for PI positions and most can go on to industry or other jobs directly after BS or Ph.D. So NIH should help postdocs evaluate their career options on a regular basis so they are not doing 7-8 years of training when the academic market is so competitive.

Fundamental issues and challenges

Academia/science has benefitted for too long by exploiting underpaid postdocs. We may need to reduce the number of postdocs by helping Ph.D. students with career planning and considering why they want to be postdocs.

Postdocs should be trainees for only 2-3 years as most of them will be experts by then and should be converted to a more secure position such as scientist. If a postdoc is not able to gain independence, there

should be a discussion about the reasons and how to help them transition. They can be also retained as technicians/specialists working on a specific instrument or technique based on their evaluation.

Existing NIH policies, programs, or resources

Expand funding programs for postdocs so they can get experience in grant writing and have more independence to prepare for future careers.

Have regular small group grant writing courses like Paula Gregory Grant Writing Course to help postdocs get started on writing grants. PIs should encourage and support postdocs to write grants.

Finally, Having semi-annual or annual IDP with the office of education or OITE to evaluate career options and reassess plans. This will be helpful as PIs are not trained for these discussions. Talking to OITE or the office of education can help postdocs prepare for talks with PI about their career too.

Proven or promising external resources or approaches

No response

Response 2212

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdocs unquestionably need greater support. Academic research is losing our scientific talent to industry salaries and career paths that are more compatible with a high quality of life, even though highly trained and creative people want to participate in the research and educational missions of our academic institutions.

Existing NIH policies, programs, or resources

Following are some ideas that could improve this situation—some of which will require time and higher-level policy changes and others that could be more easily and quickly implemented:

1. Broaden training grant eligibility to international scholars. AFAIK, non-US scholars cannot apply for F/T and can only apply for the K99/R00. The narrow eligibility timeline puts them in a do-or-die positions that makes it impossible to buffer life events (see below).
2. Partner with other countries to co-fund international post-doctoral scholars.
3. Extend K99 eligibility for family events—like the ESI extension that allows extension for life and parental events. There was one for COVID-19, but nothing else triggers the extension.
4. Increase budgets for R01 grants to better accommodate competitive salaries for post-doctoral scientists.
5. Afford bigger raises to post-docs with additional years of experience, given the time needed to produce publications that allow them to compete for a K or faculty position.
6. Support costs for health insurance, parental/family support, mental health resources, etc.
7. Require greater institutional transparency for postdoc training outcomes—including paths to non-academic careers.
8. Recognize that PIs cannot be financially responsible, without dedicated support, to implement these changes. Without it, these challenges disproportionally burden ESIs and EEIs.
9. Provide a grant program to support and incentivize cohort hiring of faculty to make the academic career trajectory a bit more appealing.
10. Recognize that all of these challenges are amplified at smaller IDeA state institutions.

Proven or promising external resources or approaches

No response

Response 2213

Perspectives on the postdoc roles and responsibilities

For those interested in academia, a postdoctoral position serves almost like a sabbatical, in which postdocs focus solely on research and devote time to potentially new methodological training to enhance their research. It is a short period that should be about developing an independent research portfolio and career development.

Fundamental issues and challenges

A major issue I found in applying for postdocs was the lack of transparency for open positions, especially in regard to T32 fellowships. For instance, some positions had a hard deadline when applications were due each year. However, the vast majority had "rolling admission" listed on their website and you just have to email them to find out if there are any openings and hope they respond to your email. I even had one postdoc program (a long standing, well known T32 fellowship) in which I had no contact and there was no public information about potential openings, invite me for an interview simply because a faculty member informally inquired on my behalf. While application processes are not standardized, I believe if a postdoc position is NIH funded, there should be required procedures on announcing openings and deadlines. This makes the process more transparent, equitable, and fair.

Additionally, a website (similar to NIH reporter) devoted to open NIH funded postdoc positions, institutional fellowships especially, would be helpful. As these positions are often just listed on websites, which are often not listed on the institution's career pages, they do not come up in standard job search engines like academicjobs or indeed.

Lastly, a major issue for me when first starting a postdoc and considering where I could afford to move, was the inability for NIH funded postdocs to offer relocation packages for moving expenses. Cross-country moves often cost $5K or more now, and after being in a doctoral program for many years, making very little money, this was an impossible ask, that my position could not help me with regardless of their available grant funds or desire to. I believe that should be a standard part of any postdoc package if moving over 50 miles for the position.

Existing NIH policies, programs, or resources

The fact that there is no adjustment of NIH-set stipends or even institutional allowances for cost of living in different locations is absurd. That is not the case in any other type of job or even at the faculty level. It makes people forced to work extra jobs, be limited in where or how long they can be a postdoc, or whether they even bother to do a postdoc or just go straight to an industry job because they cant afford it. It is inequitable and problematic.

Proven or promising external resources or approaches

No response

Response 2214

Perspectives on the postdoc roles and responsibilities

I see PostDoc as applying the techniques that I got trained-with during the PhD time. Take more challenging project and applying them without much relying on supervisor. It's sort of transition platform from "more supervisor dependent (e.g. PhD)" to independence.

Fundamental issues and challenges

1. Really low salaries for higher degree programs
2. Still considered a training phase and less focus on grooming the independence of PostDocs
3. PIs grant pressure is translated to PostDocs where they end up taking less challenging project so they could rather focus on publications than the outcome of science. But again, without publications no one gets the grants accepted. So its a vicious cycle that needs to evolve to keep postdoc time as fun as PhD time.
4. PhD takes a big toll on most students, in terms of over-working hours, deadlines to publish, thesis submission and defending PhD thesis etc. If PostDoc ends up being same and without much additional skill than just experiments (e.g., training on how to manage funds, how to run labs etc.); they might end up making a good scientists but not good PIs. And that's the current problem where most PIs lack. They are well trained scientists but not well trained PIs.
5. Better recognition, appreciation from more startup-companies that provide better or similar working condition as academia but with better benefits.

Existing NIH policies, programs, or resources

1. International PostDocs are not eligible for most grants
2. K99-R00 program is much limited in terms of eligibility criteria where one needs to transition within 4 years of their PhD. Some fields take more time.
3. Better VISA conditions/options
4. More courses to train researchers to be make great PIs (e.g. How to run a lab, how to manage funds, best practices to train PhD students, different ways to train PhD vs research tech vs PostDocs etc).
5. Healthcare and family benefits for PostDocs
6. Better compensations

Proven or promising external resources or approaches

Decades ago industries had a strong drawback on their policies compared to academia. But a lot more start-up often spin-off from academia has now been able to overcome those challenges very well and attract more PhDs and PostDocs. Perhaps, their new policies and environment changes could be adapted by academia as well.

Response 2215

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a training position meant to allow trainees to perform research under guidance of a seasoned researcher or committee of researchers. The position is educational in nature and enables trainees with access to resources for research and time to explore career development. It is a period of growth and career development. However, in recent times, the educational/training aspect has not provided the career development value that is needed for the current stipend and funding environment in academia.

Fundamental issues and challenges

There are increasing cost of living and lack of opportunities for postdoctoral trainees in recent times. The stipend has not changed relative to increased cost of living as well as the necessity of postdocs in labs. In fact, many labs are dependent on postdocs but do not pay an adequate salary for the value generated as compared to industry levels. It is nearly impossible to have or raise children on a postdoc salary when many female postdocs are at a stage in their life where having children may be more difficult as time goes on. Forgoing children and perhaps owning a house has been a binary choice when choosing to become a postdoc. The difficulty in obtaining funding and faculty positions is a major hindrance to an academic career. The proliferation of twitter and online webinars has enabled spread of information in terms of career development and opportunities for postdocs. Prospective postdocs see the writing on the wall. There has been a shift to explore alternative career paths in industry, government, and services. While

this has been a boon for those sectors, academic research is the foundation for advances in technology and medicine.

Existing NIH policies, programs, or resources

Many institutions use the postdoc stipends set by the NIH as the guaranteed salary levels. Increases in this stipend to accommodate increases in cost of living and competitive salaries in industry is needed for recruitment and retention of academic postdoctoral trainees. In addition, programs that supplement DEI, working moms, and cities with high cost of living will be beneficial to allow postdocs better choice in where they take their careers. Often times, it can be a decision between two locations and the choice comes down to cost of living. Resources can be expanded by providing funding for career development targeted to postdoctoral offices that enable more workshops and training for trainees.

Proven or promising external resources or approaches

Postdoctoral offices are a key support for postdocs. However, not every institution have optimal postdoctoral offices or even has an office. National Postdoctoral Association and ResDev has been conducting a series of surveys to grade postdoc offices. Given that the postdoc offices has power to enable improvements in recruitment, retention, and quality of life for postdocs, it is a critical area to improve. In additional, faculty and PI need additional training in mentoring and recruitment. Oftentimes, PIs do not have adequate training in mentoring and this can lead to miscommunication and misalignment in goals.

Response 2216

Perspectives on the postdoc roles and responsibilities

We do and are relied on a huge amount for the success of departments and individual research programs and don’t get paid nearly enough.

Fundamental issues and challenges

It is quite simple. We don’t make nearly enough money to support ourselves. The stipends need to be increased substantially and then additionally increased for cost of living for the area the position is held (Boulder/Denver, Boston, California are huge hubs of research and aren’t adjusted for cost of living expenses). I pay 3000 in rent and 2000 in child day care before I even begin to address utilities, food, diapers, or anything else. We can’t do anything for leisure or go on vacation. Because of this, we get burned out incredibly quickly. I was initially a sure thing to go to academia for my full time position and now I am daily looking up industry jobs to see if there is a “can’t miss job” to leave and make 100,000 more immediately. I am not going to have a second child because of this issue. I skip meals to make sure my child has enough. I have a PhD. This has to change. Inflation (8-10%) killed us this year and you only raised stipends by 3.0% (actually is was less, it just rounds to 3.0%).

Existing NIH policies, programs, or resources

If you don’t expand the stipend substantially first then no other policy change will matter. It is money. Period. People are leaving in droves because they can make 150,000 immediately instead of 55,000 to start. There is no other reason. I’m within a few months of doing the same. Every person I know as a postdoc in academia is looking for industry jobs. You are losing tenured faculty because they can make 250,000 in industry rather than 125-150,000. They also don’t have to fight for crumbs to only receive an R01 modular budget that hasn’t changed in a very long time. If salaries and research support don’t increase it will only get worse.

Proven or promising external resources or approaches

See above and nowhere else. My responses are real, not harsh. We are struggling.

Response 2217

Perspectives on the postdoc roles and responsibilities

I think the postdoc position is a transitory mentored reserach phase that prepares you for the next level of career, be it in academic, science policy, scientific communication, industry roles, or start-up and entrepreneurship. It help carve out individual reserach to strengthen core and technical skills, networking and collaborations, build mentoring and careerrelated support systems that would help in thorughout the

different stages of carreer path. A postdoc training with a supportive mentor and equally supportive colleugeue and peers would help achieve these objectives. Also, it is this cohesive and inclusive environment and support from collaborators and technical core facilities that help bud off your new research path as you go down the line, and prepare you as an independent investigator, who is suppose to continue this cycle of support, encouragement, and mentorship for the new aspirants researchers, with overall aim of propelling the standard and quality of human life upwords.

Fundamental issues and challenges

There are several key issues that I personally experineced and also learnt from my fellow peers abour theirs experiences.

1. Most invetigators are not trained nor they updated their mentoring skills that hinders the growth and development of a postdoc.
2. As an international postdoc, I often face challenges to find appropriate funding opportunities. They are scarce for us and we need more inclusive funding programs for our growth and independence.
3. Postdoc compensation benefits do not have a place for funds for career development activity, conference or workshops, etc. We must have a dedicated funds that postdoc can utilize for their development outside of their institution.
4. The key issue is finding post-postdoc career opportunity. Most of the international postdoc have to join the academic positions (like RA, research scientist, etc.) that barely provide space for their independence and nor properly compensate for their skills and competencies. We must have a mechanism for obsorbing postdocs into academic system. Currently, a small fraction of postdoc reach to tenure or other reserach-intensive career paths. Most often, the postdocs forced to adhere to the non-tenure positions with poor compensation and long-hours of workloads. These issues are more devastating for the international postdocs.
5. Academic institutions should recognize the contribution of postdocs and junior researchers by annoucing yearly awards and other additional compensations, funding career development activities, inclusive programs for academic and industry partnership, etc.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2218

Perspectives on the postdoc roles and responsibilities

I view the postdoc position as a period of transition that can be helpful for gaining confidence in your skills, research interests, and future goals. It can be a time for additional training in areas that are an extension of or completely different than your graduate research. Additionally, it can provide an opportunity to train under the mentorship of a different person and at a different institution. It can also be a time to enhance specific skills for your career that you did not gain or develop in graduate school. Traditionally and in my current postdoc position, we are not given many opportunities to gain skills or knowledge about non-academic positions and we are often discouraged to seek non-academic positions. In fact, under a T32 training grant, we are penalized if we want to leave for a non-academic position before the 2-year contract ends. This signals that academia is not focused on the wellbeing or true goals of a postdoc.

Fundamental issues and challenges

The primary reasons that I am considering leaving academia after completing my postdoc are lack of financial support, lack of job security, and abundant work-related stress. Financial support is a key contributor to graduate students and postdocs choosing jobs outside of academia, especially for trainees of minority backgrounds who have historically been excluded from building wealth and who often support other family members outside of their immediate family. Additionally, though we are being trained to be competitive for the academic faculty job market, tenure-track positions are very difficult to obtain, and we

are also expected to move wherever the job is located. It is important for me to remain where my family is located for general quality of life and care needs. Lastly, my quality of life as a postdoc has not improved much compared to when I was a graduate student. I am still treated as a machine for production of data and papers. I am expected to work long hours to complete ambitious projects that do not recognize work-life balance. The culture of "publish or perish" is not something that I want to guide my view of success. We do not have enough time as researchers to carefully conduct studies, especially those that involve establishing community partnerships. Rather, we are encouraged to manipulate time (working endlessly) and cut corners to complete projects for publication. I have experienced burn out, lack of sleep, and lack of time for personal priorities. When I talk to colleagues in industry, they often say that having a "9-to-5 job," especially with children, is one of the best reasons to leave academia.

Existing NIH policies, programs, or resources

I have had a lot of difficulty with obtaining NIH funding as an early (1-2 years) postdoc. As most postdocs in my field last 2-3 years, it seems strange that there aren't more opportunities for smaller grants with quick turn-around time. It would be helpful if these aspects are considered, especially since the primary grant for a postdoc is a K99/R00, which is highly competitive and would take over one year to get funding if you have to resubmit the grant. Grants that enable more risk taking during the postdoc would also be beneficial, especially as postdocs are encouraged to begin to form their own research agenda that is separate from that of their mentors.

Proven or promising external resources or approaches

At minimum, all postdocs need employee status. As a T32 postdoctoral fellow, we are limited in our benefits since we are not considered employees. Taxes are also very difficult a a non-employee postdoc; we are not eligible for free tax preparation services (such as TurboTax Free Edition) because we are not given a W-2. I also advise NIH to set standards for other benefits such as comprehensive, quality, in-person mental health insurance coverage. This has been a large gap in benefits, especially for a high-stress job.

Response 2219

Perspectives on the postdoc roles and responsibilities

Intermediate academic appointment between grad school and an academic faculty position where the postdoc strengthens their skills as an independent researcher and typically seen more tangibly as an increase in their number of publications.

Fundamental issues and challenges

The NIH minimum is the base and usually the max PIs pay postdocs and it has not kept pace with inflation, especially in places with high cost of living which is where many competitive NIH funded PD positions are. This is especially harmful for retaining single women (there is a known marriage gap) who cannot support a comfortable lifestyle on a single income. We should be able to have a comfortable lifestyle (free of roommates, ability to save and invest in property, no food insecurity, etc) after dedicating and sacrificing so much to attain the education needed for a PD role. We want pay that matches our current stage in our lives and late 20s/30s and beyond housing is major. Also for women who choose to have children, there is very little support especially financially for retaining them.

Existing NIH policies, programs, or resources

Better advertisement of the NIH LRP for postdocs—may help recruit them to academia. Also why is the application so extensive—if a postdoc is already working on an NIH grant why is that not enough to allow for LRP to be activated? Can this be made into a sort of supplement to the R01 they are funded on?

Extension of NRSA grants to be used to support maternity leave past 8 weeks. FMLA is 12 weeks. 8 is not sufficient.

Increase NIH base to account for HCOL areas, maybe instead of the base being a flat number it should be a multiplier of something like the poverty line associated with the area the PD is working.

Proven or promising external resources or approaches

As for working environment and job satisfaction there should be more funding opportunities past a training grant (F series) for early postdocs that could allow for earlier independent work. Potentially shorter duration grants for collecting preliminary data. And/or removal of the rule that having an R21 makes one ineligible for a K99.

Response 2220

Perspectives on the postdoc roles and responsibilities

The role of a postdoc (in my opinion) is equivalent to an apprenticeship in any blue collar industry position. However, there is a greater emphasis on postdocs supporting themselves through fellowships, teaching commitments, and generating research data for the PIs. I view a postdoc as a way to increase scientific independence, broaden the understanding of scientific techniques, and continue developing professional skills. Postdocs are also expected to be intellectual workhorses for the lab (contribute new ideas for the PI) so if your PI submits a grant on your work/ideas then that takes away opportunities to submit a grant application that would promote independence. A postdoc is stepping stone to establish academic independence and establish a new scientific niche to further scientific understanding.

Fundamental issues and challenges

The glaring issues are the low salaries and lack of academic tenure positions. Postodocs (and grad students) are largely expected to put in significant hours of work towards experiments per week which easily exceed the standard 40hr work week. However, with this increased expectation there is no return in benefits for the postdoc. Postdocs are generally at the age where they are starting families but they cannot financially support a family or pay for childcare with the current salaries. From personal experience I want to pursue a postdoc (and currently have an F31) and an academic career. However, my spouse also works which limits the locations as to where I can work while accommodating their career. While pursuing a postdoc would help me further those academic skills and research interests I would not be able to interview/ secure a job as a professor while still considering the needs of my spouse. With this in mind why would I spend 6 years losing out on income and retirement savings to pursue a job I have a 1% chance of getting? At conferences I have been repeatedly informed that the postdoc experience should be roughly 6-8 years before you have an application strong enough to tenure track positions. Non-traditional students find this career unappealing as that could put them at 45+ years of age before acquiring tenure. Postdocs are not quite government employees but non long term institutional employees so they lose out on investment from either.

Existing NIH policies, programs, or resources

1. Establish cost of living allowances or scale compensation according to the postdoc region. A postdoc position in San Francisco cannot survive on the current stipend however a postdoc in College Station TX will thrive. Many government organizations already do this.
2. Establish more long term academic (non professor) roles that postdocs can transition to. This would increase the value of a postdoc for those who are interested in remaining in academic research but not pursuing a tenure track position.
3. Establish some sort of transition system to other careers. Such as if you conducted a postdoc in academia it gives you preference points for transitioning into government research. This would set up a clear path to non academic careers and allow the NIH/taxpayers to still not lose those trained individuals to industry.
4. Set up required childcare programs for NIH funded institutions. Admittedly, I don't know much about this part but I know that colleagues often complain that University childcare centers are overfull and postdocs generally transition into positions at times that do not let them register a child in advance.
5. Allowing postdocs to transition to research assistants where they can still apply for grants. This would make it more appealing for PIs to allow for long term researchers. Contingency of these grants should be have a PhD and x amount of years of postdoc experience.
6. Set up a retirement system that is not tied to an institution.
7. Set up a job board through the NIH that any investigator with NIH money can post open positions on.

Proven or promising external resources or approaches

The problem is not lack of interest in scientific research its lack of future options and return on education.

Usajobs.gov gives veterans and government employee preference points for careers. Work environment and job satisfaction is what is lacking. There are many successful mentorship and training programs already in place.

https://www.cnbc.com/2019/07/16/perhaps-money-can-buy-you-happiness-at-least-at-work.html#:~:text=The%20biggest%20survey%20disparity%20related,per%20year%20said%20the%20same.

Response 2221

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is to dwell in research with diverse scientific skills to solve the more significant science problems with cutting-edge research and technology. My personal feeling as per my experience is that postdocs are overburdened with experiments to fulfill the expected publications. They do not have real-time to think about the research implication scope and innovation.

Fundamental issues and challenges

Pay-scale, which is not uniform throughout the country (even though funded by NIH or NCI grants). Many are working under reduced wages as low as 47000 USD per annum. Lack of retention may be due to the lab environment, better opportunities with higher pay scales in industries, and an uncertain future. When it comes to the quality of life all the above-mentioned drawbacks reduce the quality of life. They are expected to work for 11-12 h daily and on weekends as well, which results in poor social life and happiness.

Existing NIH policies, programs, or resources

There should be a compulsory uniform pay scale through institutions and research training, which can boost the skillset and networking.

Proven or promising external resources or approaches

No response

Response 2222

Perspectives on the postdoc roles and responsibilities

Additional training on how to think like a PI.

Fundamental issues and challenges

Need a central website for candidates and positions open.

Existing NIH policies, programs, or resources

More funding for matching and support of post-docs.

Proven or promising external resources or approaches

Improving recruitment.

Response 2223

Perspectives on the postdoc roles and responsibilities

Postdoctoral appointments are, or should be, mechanisms for new Ph.D.’s to gain additional experience in research and communication so that they are better prepared for work in academia, industry, or the government. Post-doctoral appointments should allow young scientists to design and carry out their own research, not be low-paid apprentices conducting research designed by someone else. Pos-docs should also receive training in written and oral communication so that they can represent the importance of their research to the public and train their students in the same skills.

Post-doctoral appointments have traditionally focused on research and have given little attention to communication skills. However, communication skills are directly related to a scientist's success as a leader, influencer, and teacher. Modern biomedical research is a very collaborative process. A young scientist must be able to communicate with other scientists, administrators, students, and technical staff. The lack of training in these areas has greatly impeded scientists' ability to communicate with the public, the results of which we see all to clearly in contemporary society.

The importance of communication in science has been highlighted in reports from the National Academies (https://www.nationalacademies.org/our-work/the-science-of-science-communication-a-research-agenda) and the American Academy of Arts and Sciences (https://www.amacad.org/publication/public-face-science-america-priorities-future). Scientists want to become better communicators and, as reported in the just-released Research!America poll (https://www.researchamerica.org/wp-content/uploads/2023/02/2023-January-National-Survey-Results-ResearchAmerica.pdf), 8 in 10 Americans say that a scientist's job should include communicating their research to the public.

Fundamental issues and challenges

Student's applying for a post-doc must know that they will be paid a living wage that allows them to support a family and that there is a clear path to their own job. They must know that they will have time to pursue their own research and grants, while at the same time learning new techniques in their host lab. Their appointment must include training in skills that are directly transferable to their future positions. Chief among these are communication skills, which will directly affect their grant success and prospects for employment. Post-docs caught up in conducting experiments that others have designed and training other people's students are not gaining the skills they will need to be successful in the job market. They must show that they have conducted their own research, obtained grant funding, and are able to communicate their research clearly to a variety of audiences. Poor communication skills inhibit their chances for finding and retaining a job. The inability to communicate clearly undermines job satisfaction and retention both in the post-doc and beyond as the scientist will feel that their work is not being taken seriously merely because they cannot explain it clearly.

Cameron et. al (2020) have shown that scientific communication productivity, and a student's expectations based on this productivity, predict a student's intention to pursue a career in scientific research. This fact, together with the finding that scientific communication ability predicts science identity (the sense that one is a "science person") means that scientific communication training can increase career persistence. See: Cameron, C., et al., The role of scientific communication in predicting science identity and research career intention. PLOS ONE, 2020. 15(2): p. e0228197 https://doi.org/10.1371/journal.pone.0228197

Existing NIH policies, programs, or resources

NIH award applications should be required to include both time for and training in grant writing. They should also require the post-doc to be broadly trained in communication skills, skills that allow them to address both audiences of scientists outside of their specialty, and the public.

In Fiscal Year 2022, the NIH awarded nearly $1 billion on over 6000 training grants, but only 50 of these awards (0.8%) mentioned some amount of science communication training. Of the 873 R25 Research Education Program awards in FY2022 ($208M), only 11 (1.3%) mention science communication. To increase these numbers, NIH could earmark additional funds to be made available to awards that include a science communication training component. This would allow the creation of formal science communication coursework (not just workshops, seminars, or one-and-done training events). Training grant funds could be used to expand existing courses, train more instructors, or set up new programs to help improve junior scientist communication skills. The availability of these funds would help incentivize faculty and their organizations to teach these courses. Training grant applications should require details of how the PI would set up or tap into formal scientific communication training, who would lead the training program, what the program would entail, and how the university/organization would contribute to and oversee the success of the sci comm program.

Proven or promising external resources or approaches

The National Science Foundation already requires applicants to explain how their research has Broader Impacts on society, including the presentation of their research to the public. NSF also funds the Center for Advancing Research Impact in Society (ARIS; https://researchinsociety.org/) with the goal of improving the quality of Broader Impacts work. ARIS provides high-quality resources and professional

development opportunities and creates connections among researchers, community partners, and engagement practitioners.

There are many resources that can be used to lessen the anxiety that many graduate students and post-docs feel when presenting. Using a simple four-part structure for conference presentations and abstracts will greatly reduce anxiety and allow scientists to present with more confidence. The structure in presented in books like "Presenting Scienced Concisely" and "The Narrative Gym" are important resources.

Response 2224

Perspectives on the postdoc roles and responsibilities

It's a career transition.

Fundamental issues and challenges

Income and work-life balance.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2225

Perspectives on the postdoc roles and responsibilities

Post doc are highly skilled scientist in a short term training to gain independent research experience. The post-doc supervisor should treat the post docs as colleagues rather than trainees. The fact that they are in a temporary the career transition stage did not mean that they should be overworked and underpaid. The current academic system is clearly exploiting the postdocs with way below salaries, benefits and with toxic cultures often induced as a consequence of unnecessary competition and the poor management and training skills of Postdoc supervisors.

Fundamental issues and challenges

1. Non-competitive salary; Postdocs are in the age group of 25+ and like any others have family and personal responsibilities, It is really hard to live on a minimum wage to support and build. a family,
2. Poor Benefits package: Vacation, Childcare
3. Living cost in cities (Boston, New York, California etc). It is unfortunate that most universities, be it a city or rural universiyt follow the minimum salary (55k/year for 0 year experience). The universities/departments/labs has policies not to pay more than this salary. The NIH should amend this rule and factor in (minimum wage + proportional living cost in each city)
4. No guarantee in the job market. With the. limited academic opportunities, many students consider this as a waste of time as 1. it is often difficult to find a competitive job with the post doc experience 2. huge loss of income compared to accepting job right after PhD.
5. Toxic culture: The post docs are exploited in the academic system as the next step is often dependent on a good reference letter from the supervisor. this is the same case for grant applications etc. The supervisors take advantage of this and pressure the trainees on multiple levels (job, grant etc)
6. Visa situations—international students are admitted mostly through J1 program which in many cases limits the opportunity to find jobs in the USA
7. Moreover the visa renewal is a stressful problem for the postdocs.
8. Limited postdoc fellowships for international trainees. Compared to the domestic trainees, international trainees have limited grant application opportunities.

Existing NIH policies, programs, or resources

1. Implement new salary policies considering
    a) living cost in the cities
    b) current inflation rates and future inflation adjustments
    c) competitiveness with the similar positions in Industry (current industry starting salary for fresh PhD is atleast 100k/year +bonus +benefits)
2. Introduce benefits package (housing benefits including subsidized housing, childcare benefits, better 401(k) matchings
3. Introduce subsidized and better health care, vision and dental packages
4. Make special visa processing renewal schemes for postdocs so that the international post docs can renew the visa from USA.
5. Make the NIH grants available for early career researchers. Include more grants where internationals are eligible to apply.
6. Include post docs in grant review panels
7. Post docs from new labs gets grant rejections citing "PI has not enough experience". Bring in policies to not let this happen or separate/include grants where only early career PIs are eligible to apply. Update the eligibility criteria on those grants where an application from early career PI is not expected.

Proven or promising external resources or approaches

Response 2226

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

There is very little and declining funding to reasonably support the research training and skills development of academic generalists in health services research. However, primary care is the foundation of our healthcare system and greater primary care ensures more equitable care. Coming out of residency training, most clinicians need courses, such as those offered in schools of public health, to learn the methods needed to conduct high quality health services research. Yet, the tuition for these programs is continuously rising and grant funds to support post-doctoral training in health services methodologies are nearly non-existent. At best training programs may support PhD trainees but PhDs do not have the clinical perspective often needed for high quality health services research.

Existing NIH policies, programs, or resources

The budget of T32s through HRSA need to increase and NIH needs to offer more T32 opportunities for MDs interested in primary care health services research.

Proven or promising external resources or approaches

No response

Response 2227

Perspectives on the postdoc roles and responsibilities

To me postdocs are generally the most productive members of a biomedical science lab. The combination of obtaining a PhD with the common goal of pursuing a tenure track faculty position results in a highly competent and motivated individual. In addition to long hours of laboratory work and publishing high impact papers, postdocs are expected to mentor graduate students, postbaccs, and undergraduate students. The expectations are highest for postdocs compared to anyone else in the lab (excluding the principal investigator). Usually it assumed that someone is pursuing a postdoctoral fellowship to pursue a

tenure-track faculty position. However, these jobs are extremely rare and competitive. Therefore, it is often advised to not consider a postdoc unless you NEED to do it for your desired career (such as tenure-track faculty positions). This advice makes sense because the pay is poor relative to the expertise and training needed to even apply for a postdoc position. This is compounded by the fact that postdoc positions are temporary and have the reputation of having poor work-life balance from the high level of pressure. Most graduate students at my institution have the goal of avoiding the need to do a postdoc and leave academia to pursue higher paying careers.

Fundamental issues and challenges

Postdocs have a PhD, but make less money than most entry-level jobs that only require bachelor's degrees in fields such as engineering and business. The financial burden is amplified by the fact that PhD programs also have low salaries, which are required before a postdoc is even an option. This is a potential 10+ year span without making more than $65,000/year. In addition, postdocs are only a temporary position with no job security. Therefore, postdocs are poorly paid and have no career trajectory to obtain a pay raise without applying for very competitive jobs (tenure-track faculty, industry scientists, consulting) and usually moving geographic locations. Because of the limited timeline on postdoctoral positions, high pressure to be productive, pressure to secure personal funding (F32, K99, etc.), low salary, and bleak job prospects, often postdocs have the reputation of being extremely tough from a mental health and financial standpoint. It is also often a time when people are having children (early to mid-thirties), making this job less desirable as work-life balance is not associated with a postdoc position. Regarding retention, because tenure-track positions are so competitive, a very high impact publication is needed in the postdoc to be a qualified applicant. Therefore, if a postdoc project is stalling or is not likely to result in a high impact paper, it makes sense to simply quit and find another job that pays better and does not have the same level of pressure, workload, and provides work-life balance. Postdocs are also considered "trainees" which sometimes disqualifies postdocs from the same benefits as regular employees even though postdocs have obtained a PhD.

Existing NIH policies, programs, or resources

To improve the postdoctoral training ecosystem, the first thing that is required is an increase in salary and benefits. Benefits that could attract people to this job even without a substantial salary increase may include expanding student debt forgiveness that is currently available. In addition, it is often disadvantageous to apply for F32, etc. because at many institutions you will lose institutional benefits such as retirement, medical insurance, etc. Fixing this issue (government funds to the institution to keep healthcare/retirement, or reclassification of postdocs with these awards) would make these awards more attractive, as currently there are disadvantages to even applying even though it has career benefits. In addition, the "clock" on how many years that are allowed to apply to NIH transition awards increase pressure for postdocs as well as institutions putting time limits on postdocs. A ban of these "clocks" for NIH awards and at institutions would also decrease the intense pressure and increase work-life balance for postdocs.

Proven or promising external resources or approaches

To improve the postdoctoral training ecosystem, the first thing that is required is an increase in salary and benefits. Benefits that could attract people to this job even without a substantial salary increase include free childcare, disability insurance, paid family leave, government administered pension/retirement benefits for postdocs (similar to being a true government employee). In addition, I believe "transition awards" that provide a few years of funding for other non tenure-track careers such as staff scientists, non-tenure track research assistant professors, teaching positions, etc. would allow postdocs to seem more attractive as there would be more available careers after completing a postdoc other than tenure-track faculty. In addition, the "two-body problem" due to couples that are both scientists makes postdocs/tenure-track job searching less desirable. I believe "couples" transition awards would also help retain scientists in academia if a co-submitted award ensured that couples are funded together and competitive in the job market.

Response 2228

Perspectives on the postdoc roles and responsibilities

To generate data and publications with original ideas that fall under the PIs area of research. To mentor students and other lab members. To improve writing, technical, and critical thinking skills.

Fundamental issues and challenges

Too little pay and too many hours. not enough protection for postdocs or any sort of present or future job security.

Existing NIH policies, programs, or resources

A postdoc conference with recruiters, a job board, when special seminars are held have some of the speakers be postdocs, set up mentorship relationships where postdocs can be paired with a PI / someone with a career path they want who will give career advice and help them navigate their career trajectory

Proven or promising external resources or approaches

More blinded reviews of grants, new journals that accept and encourage negative data, more emphasis on good science rather than productivity in the scientific review process. The system is flawed in that it favors those who have connections and those with resources and continues to divide scientists by continuing to fund and praise those who already have research accolades. there is also a lack of turnover in science especially as there are few academic jobs.

Perspectives on the postdoc roles and responsibilities

Postdocs are basically slaves to illegal academic enterprises (aka: universities). They're treated like [redacted], not given typical workforce rights according to standard employment laws, have no future prospects, and get stuck in their roles for the sake of bolstering the careers of their PI and the value and prestige of their university through the prime years of their life. On the other end, there are no jobs and many realize they have no broadly marketable skills because all they did was run assays and write papers.

Fundamental issues and challenges

There is no future for the overwhelming majority of postdocs. This isn't rocket science. Universities should be put on trial for building their value on the backs of underpaid, mistreated scientists wasting the primes of their lives for what amounts to an organized crime syndicate. The universities are the problem here. Look closely at them. They are subsidized by the taxpayers yet have no limits to the amount they will continue to take from citizens or the amount of money they will stuff into their own bureaucratic pockets. If any big company treated people like a university treats its people it would be on the front page of the newspaper within weeks. I know we're talking about postdocs here, but graduate students and (particularly) early and mid-career professors don't have it much better. But at least they can count themselves as either being students with a future ahead of them or some kind of actual employee for something that looks like a reputable organization. Universities should be forced to create actual, good-paying, long-term, scientific jobs with job titles like associate scientist, scientist, senior scientist, etc. Until that happens I wouldn't wish a postdoc position on my worst enemy.

Existing NIH policies, programs, or resources

Get rid of the payback burden for people on T32 training grants. There is no future in academic science and universities do nothing to invest in what actually makes them valuable (i.e. their people). So when postdocs need to scrape together their measly salary on their own, they may end up with one of these toxic waste heaps as a funding source. If they leave early (or maybe other circumstances as well? I'm trying to forget the language in my own T32.) because they realize they are on a dead-end path to nowhere they may need to actually then PAY BACK the money they were paid to do a job for a lab that happens to be part of a multi-billion dollar entity. This is obscene and so fundamentally unethical. What it means is that the university will have had somebody working for them for whatever period of time, providing value to them and their departments and professors, for FREE. The work the postdoc did doesn't somehow magically get undone, and that time of their life cannot be gotten back. They are already being paid less than minimum wage in many cases and should be free to take whatever career path is best for them at whatever point in time is right for them. If you run the math on the time they spent working as a postdoc after payback, then it comes out WAY below minimum wage. How is this allowed? Do not try to control them and if you are going to control them then you better put 10x as much energy into providing the with broadly relevant training during their postdoc and protecting their next level of career opportunities so it actually exists.

Proven or promising external resources or approaches

Put university employment practices under the microscope. The universities are the problem here. Bring universities up to par with any other organization in the modern employment landscape (for example,

obeying standard employment laws and HR practices for a happy and healthy workforce) and for them to actually support a hierarchy of job opportunities with broad relevance to what they are ostensibly trying to do then I think you'll start to see change.

Response 2229

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1. We would like to suggest a separate budget category of "research expenses" for the postdocs, since "Trainee-related expenses" are absorbed mostly or entirely by insurance costs.
2. It may be helpful to require mentors having specific training for postdocs. It is a different experience than mentoring RAs or graduate students, as postdocs are in a different role with different needs. It may improve the postdoc training, work environment, mentoring and job satisfaction.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

It may be helpful to require mentors having specific training for postdocs. It is a different experience than mentoring RAs or graduate students, as postdocs are in a different role with different needs. It may improve the postdoc training, work environment, mentoring and job satisfaction.

Response 2230

Perspectives on the postdoc roles and responsibilities

My post-doc position was about my career and work and i was given freedom on what to pursue and mentored in that process, my postdoc gave me the additional training that i needed to do the research that i wanted.

Fundamental issues and challenges

Salary & benefits. It is not fair that someone with a PhD is being paid so low, and need to live with roommates or find side-jobs to live decently. My postdoc did not include sick leave, nor any other benefit. It is better to apply for industry and other positions that can really provide a living for me and family.

Existing NIH policies, programs, or resources

Allow people to move Post-docs/labs and retain their funding. Stop supporting toxic labs, many people don't leave their toxic labs pending a letter of recommendation or a promise for one.

Proven or promising external resources or approaches

No response

Response 2231

Perspectives on the postdoc roles and responsibilities

It's academic labour. You are expected to do everything, from being a technician, manager, post doc, manuscript writing, presentation, getting data ready for Grants, one always feels to be in pressure situation that too when you are on Visa.

Fundamental issues and challenges

It's very stressful job given huge expectations from a postdoc with nominal salary for the amount of work being done by a postdoc. It's equivalent of being a slave in academia. There is no job security or future security in academic research. You are supposed to work over weekends as well. Majority of the postdocs have mental health issues, develop anxiety.

Existing NIH policies, programs, or resources

This grant based research should be reassessed as PIs want to submit grant in every cycle creating pressure on postdocs to generate data. It's never ending process. Also, there is no job security for postdocs. Once grant is awarded to a PI, he should be asked about productivity in terms of outcome from the grant whether it helped in expanding science and knowledge in that domain, whether any manuscripts were published from that. Strict measures should be taken to assess the conduct of PIs towards postdocs if they only see them as labour or they want to mentor them to make them independent.

Proven or promising external resources or approaches

Emphasis should be more on postdoctoral funding, proper training and mentoring. We sacrifice our time, family, to get trained but after some years we see only grant business with postdocs becoming obsolete.

Response 2232

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position to be an enhanced trainee period where one is able to

1. received specialized training that builds upon one's program of research that one initiated in graduate school,
2. have an ability to produce more research and gain more publications in preparation for the academic job market, and
3. take on more leadership and mentorship roles in order to prepare one for the role of a lab director, professor, and mentor within the academic sector.

I also view the postdoctoral position as a time where more skill-building of research methodology and statistical analysis could take place for those who are not planning to remain in academia.

Fundamental issues and challenges

The stunning lack of adequate compensation for a postdoctoral position is the number 1 challenge that inhibits recruitment, retention, and quality of life for postdocs. It is incredibly difficult to justify to one's self why, as a person with a doctoral degree, one would subject one's self to such long hours (70+ hour weeks), economic cost (postdocs make less than our peers without advanced degrees due to their being able to obtain permanent employment earlier in life), and isolation and instability for a VERY slim chance of eventually obtaining a tenure-track faculty position. It has been my experience that fellow postdocs are leaving their positions for industry due to higher compensation and a better standard of living. Additionally, postdoctoral positions do not do much in the way of enhancing one's chances of obtaining an industry position, and as the academic job market gets more competitive, I find that the postdoctoral position is becoming obsolete.

Existing NIH policies, programs, or resources

Increase the minimum postdoc salary to a competitive rate (at least 75,000 USD)

Proven or promising external resources or approaches

No response

Response 2233

Perspectives on the postdoc roles and responsibilities

First, I see my postdoc position as an opportunity to further hone my research skills, be that in a new model organism or system. I believe that I do this in a quasi-independent status where I work with my postdoc advisor rather than simply for my postdoc advisor. That being said, all of this training is meant to simply augment my current skillset and because of that I feel that postdoc positions should be treated as a highly skilled workforce. Second, the postdoc position is a chance to improve mentorship and managerial skills. Thus, postdocs should help train undergraduate and graduate students and postbac researchers. This is because subsequent positions, be they in academic, private, or public sector, often require some form of mentorship or managerial roles. Thus, it is important to learn how to effectively mentor and manage people from a diverse range of education levels. That being said, the postdoc is meant to

augment a student's training, not totally replace a professor's duty to train and advise students. Last, the postdoc position is a change to further network and hone presentation skills. Being able to effectively communicate is a key to successful research career regardless of whatever subsequent position the postdoc takes. Gaining a solid network of fellow researchers to discuss ideas with and who can support you in your current and next steps is also crucial to a successful career. I also see the postdoc as a temporary role which means the postdoc should not have undying loyalty to their advisor and should be able to move on to their next step at any moment guilt-free (this is largely informed by the abhorrent compensation and benefits that postdocs often receive). I wanted to be a professor but reality made me change my goals to biotech.

Fundamental issues and challenges

There are likely countless reasons for why it has gotten difficult to find postdocs for academic research. First, the pay is often simply abhorrent. Outside of the few labs that are well-funded by private institutes like HHMI, the Hutch, etc., most postdocs cannot afford a single bedroom apartment in their absurdly expensive city. The average postdoc salary seems to be roughly 1/3rd of the average biotech salary. I come from a low economic level family and if I did not have a partner with a high-paying job, I would not have considered postdoc position. Second, the benefits that postdocs receive are often abhorrent. I am currently employed by HHMI and have relatively great healthcare and benefits (however I do not get employer retirement contributions unlike at other jobs). Moreover, postdocs are often pressured to secure their own funding. Frankly, this is an awful position to put a postdoc in, especially one like me where I am currently being paid through HHMI (more than the NIH minimum). If I get an NIH fellowship, I lose my employment with HHMI and become an employee of my university where I am suddenly given worse healthcare, fewer benefits, and suddenly my taxes aren't withheld and I have to pay quarterly. Basically sending a message of, "Congrats on your prestigious fellowship, go screw yourself." This has serious exclusionary implications for people with health concerns who do not want to get lesser healthcare. Finally, the academic environment is simply toxic and I think that many find dealing with it is just not worth the pitiful compensation just to get some additional training and maybe publish a paper for clout points. Private companies are more than happy to train their employees, too (and they pay better for it).

Existing NIH policies, programs, or resources

First, raise the NIH minimum salary. I understand that there are limited funds to go around but maybe some could be policies implemented to better spread the money around. For example, the NIH could prevent someone from getting an F30/31 and then a subsequent F32 to enable funding to be available to a wider group of people. F-series grants should be somewhat needs based. For example, you could implement a ban on HHMI-funded labs from applying to F-series grants. Why are postdocs in well-funded HHMI-funded labs allowed to apply for public dollars? Second, the NIH could require that NIH-funded institutions are to give postdocs the same benefits that the faculty are given. We have the same degrees!? Why are many of us still getting offered student healthcare and benefits? Frankly, it is absurd and an absolute disgrace otherwise. I think that there is a general sense that postdocs are not treated as the highly skilled and educated workforce that they are. By raising salary and standardizing quality benefits, the NIH would establish a step in the right direction that postdocs are being treated as such.

Proven or promising external resources or approaches

Just raise the pay so I can afford to live and eat, and require that postdocs are given benefits commiserate with their educational attainment. Maybe if you did that, more people would be convinced to stay in academia.

Response 2234

Perspectives on the postdoc roles and responsibilities

In its truest form, I view post doc positions as a training opportunity to learn hard and soft skills not required or taught during graduate school -skills useful and necessary to run a lab.

Fundamental issues and challenges

In academia, work-life balance does not exist, and academia always rewards those that grind. PhD graduates do not get paid enough, and too much is expected of them without the training opportunities. Furthermore, post doc and faulty opportunities do not always align with geographic location where they

want to live. Cost of living rarely aligns. If faculty and future workplaces change from the top down, it is irresponsible and irrational to think the problems with lies with post docs.

Existing NIH policies, programs, or resources

Policies, programs and resources also need to align, and be implemented within with future career plans and opportunities.

Proven or promising external resources or approaches

Train faulty members. Change the workspace. Give a voice to post docs. Listen. Remember your (hi)story. Don’t repeat trauma.

Response 2235

Perspectives on the postdoc roles and responsibilities

I see a postdoctoral position as an important step between graduate school and seeking an independent position. It is a great opportunity to have mentorship on one hand, but have some independency on another, moving forward with your project. Supervising students is another important feature of postdoctoral experience, which is also an important step on the way to having your own laboratory.

Fundamental issues and challenges

In my opinion, a postdoctoral scholar’s role is often underestimated. Although we are a key element in advancing research, we have even more responsibilities than some staff in the lab and we work unlimited hours, which is sometimes much more than 40 h/week, we do not have the same benefits as staff. At [redacted for anonymity] and many other universities, postdocs are not eligible for matching retirement plan contributions. Another issue for international postdocs is that DS-2019 forms are made only for the contract period and at least at [redacted for anonymity] it is 1 year. Even though we are eligible to stay in US when our contract and DS-2019 are extended, to visit a home country we have to apply for the visa once again every time, which is a long, sometimes stressful process that also costs some money. And if someone has a family, it leads to quite significant expenses.

Existing NIH policies, programs, or resources

I believe that it would be helpful to extend the period of time during which individuals are eligible for a postdoc position. It might be helpful to have an opportunity to get 2 trainings from different universities/Institutions. However, completing a project and getting a good publication often takes 3-4 years. So people often do not have enough time during 5 years to enhance their research experience by taking training in different laboratories.

Proven or promising external resources or approaches

No response

Response 2236

Perspectives on the postdoc roles and responsibilities

As a 3rd year graduate student, the possibility of becoming a postdoc is looming on the horizon as a step that I am told is necessary for me to become an independent academic researcher. The roles and responsibilities and opportunities of the postdoc position appear, from my pov, to be largely variable from lab to lab. Importantly, there is a clear relationship between funding availability and the roles, responsibilities and opportunities of the postdoc position that clearly effects the pool of potential postdocs, skewing where/who they are willing to postdoc and whether they will leave academia entirely . For older more independent students like me, it is difficult to imagine taking a position under another scientist in a situation where they lack the funding to support my role/my science therefore requiring me to take on responsibilities that won’t necessarily contribute to my growth as a scientist. Postdocs are not lab managers but under low funding conditions they are often forced away from their science to take on tasks of lab managers and/or technicians.

Fundamental issues and challenges

Postdoctoral pay scales are too low for people at this level of experience, and often are insufficient to cover basic needs in this economy. Furthermore, people in postdoc positions are often in the part of their lives where they are building families, and supporting dependents, requiring more money just to get by. These factors drive down recruitment, retention, and overall quality of life before we even consider the pressures and long hours of the the roles and responsibilities of the academic postdoc. So inevitably many people go to industry to meet their financial needs and the needs of their families. Also there's a housing crisis.

Existing NIH policies, programs, or resources

NIH needs to raise the fellowship and training stipends across the board.

Proven or promising external resources or approaches

No response

Response 2237

Perspectives on the postdoc roles and responsibilities

At [redacted for anonymity], the intention of a postdoctoral associate position is to provide a continued opportunity for training in a specialty area for a limited amount of time. We believe a postdoc should receive active mentoring from a more senior scholar and ideally have a team of formal and informal mentors available to support them in their career and professional development.

In terms of responsibilities of a postdoc, we believe while their time will mainly be spent focused on research and scholarship, obtaining teaching, mentoring, and other professional development experiences can be crucial for them to transition to careers of their choosing. Importantly, we support the OMB's uniform guidance of the "dual role" of postdocs as both trainees and employees "[those] in postdoctoral positions engaged in research are expected to be actively engaged in their training and career development under their research appointments" .

At [redacted for anonymity], we categorize our postdoctoral associates as research faculty in our human resources systems and this provides them access to near-equivalent employment benefits as other faculty at the institution. Fundamentally, we believe all postdocs should receive access to reasonable employee benefits and resources while recognizing that they are also in a time-limited, temporary training position. Here, we do not allow individuals to be hired into or remain in postdoctoral positions once they are 5 years removed from receiving their terminal degree. A clear means of "capping" time in the postdoc that relies on an indisputable criteria (date of doctoral degree) helps ensure the position is used appropriately for training and development of early-stage researchers.

We are agnostic as to what careers postdoctoral training prepares one for and believe the skills and abilities obtained through a postdoc can allow one to succeed in a variety of fields post-postdoc.

Fundamental issues and challenges

Visa & Immigration Challenges

A major challenge in postdoctoral recruitment is the current inefficiencies in the visa process in the United States. Processing times and bureaucratic hurdles make it difficult to onboard international scholars in a timely manner. NIH should work with the State Department and USCIS to improve the visa and immigration process for early-career researchers, especially those possessing important knowledge and skill sets to ensure US competitiveness in research and innovation.

Budgetary Practices that Acknowledge Increased Personnel Costs for Postdocs & Staff Researchers that Lead to a More Effective Research Enterprise

The research skills and talents postdocs both bring and develop during their training make them critical components of the US's research and innovation ecosystem. Many would like to continue working in academic researcher roles after their postdoc. Given their advanced training and skills, an individual transitioning from a postdoc to a senior researcher is (rightly) more highly compensated. At [redacted for anonymity], the increase in compensation from postdoc to a more senior research role is 30-50%. Even if faculty wanted to retain research talent through promotion within our research faculty ranks, current NIH

Research Project Grant (RPG) budgets make this difficult. Furthermore, inflation and other costs have risen substantially since the NIH modular budget "cap" was put in place in 1998. The issue of higher personnel costs being necessary to address in NIH RPG budgets equally applies if faculty and institutions seek to better compensate postdoctoral associates to ensure a living and stable financial arrangement for the postdoctoral population.

NIH must strongly consider the message it sends in its RPG budget guidance as it relates to more adequately supporting the scientific workforce. Higher personnel costs should not be seen as a negative during but rather as a condition leading to a more stable, robust, and effective research enterprise.

Existing NIH policies, programs, or resources

Budget Line to Support Postdoc Offices

The National Postdoctoral Association suggests NIH require a percentage of indirect costs on grants supporting postdocs to provide postdoctoral offices with increased resources to foster stronger postdoctoral communities with healthier, sustainable cultures. At a minimum, it seems reasonable to expect NIH Training Grants (T32) and Fellowship Awards (F32) that directly fund postdoctoral training to include a budget line item that supports the postdoc office at their institution that scales with the number of postdocs supported by the grant mechanism.

Access to Fellowships and Training Grants for International Scholars

The 2021 Survey of Graduate Students and Postdoctorates in Science and Engineering found 53% of postdocs at US institutions are on temporary visas. Current restrictions on F32 and T32 support of US Citizens and permanent residents only shuts off international postdocs from additional support mechanisms to help stabilize and enhance their postdoctoral training. While we understand the value of ensuring US tax dollars support the training of US Citizens and permanent residents, there is value in providing means for talented international scholars to maintain support for their postdoctoral training and research.

Equitable Access to Benefits for Postdoc Fellows and Employees

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. This can prevent postdocs from losing employee benefits when accepting an NIH fellowship, making these prestigious awards more feasible. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.

Proven or promising external resources or approaches

Collaborate with NSF Programs, Including INCLUDES and AGEP to Identify Best Practices in Supporting Scientific Workforce

NSF's programs focused on increasing diversity in both the science and engineering workforce and professoriate could be excellent partners for NIH as we seek to support Ph.D.s and postdocs from historically underrepresented groups in their pursuit of employment at US colleges and universities and beyond.

Curation and Sharing of Resources and Best Practices in Postdoc Training and Development

The NIH should work to consolidate professional development resources and make them more accessible and available to postdocs, faculty, and postdoc offices.

The NIH Broadening Experiences in Scientific Training (BEST) awards provided significant resources to a select group of institutions to develop and share best practices with the broader community and, indeed, some data from this program have been presented and published. However, resources to ensure dissemination could continue after these awards' funding ended seems to not have been addressed. One specific example is the website that used to host publications and resources from the consortia of BEST institutions (NIHbest.org) is now defunct.

Building off this point, NIH's OITE provides amazing resources and workshops to aid postdocs in their career and professional development and other organizations such as the National Postdoctoral

Association, Graduate Career Consortium, iBiology, and others have developed tools and resources that can benefit postdocs in their career exploration and planning process.

A well-maintained comprehensive data bank should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. In an increasingly virtual environment, the current and future wealth of resources for postdocs should be curated, sorted and readily-available. This would complement federal commitments to open science by increasing not only the availability and access of federally-funded research but also its community resources.

Response 2238

Perspectives on the postdoc roles and responsibilities

As a postdoc I am primarily research focused. Using previous training, postdocs produce results/publications at a faster rate than graduate students. Simultaneously, as postdocs we are encouraged to learn new skills. We are called trainees, but that's insulting, frankly; it is normal for people in industry to learn new skills, especially when first starting a new job. They're not called trainees or paid ludicrously low wages because they don't already know all the skills in rapidly changing fields. Most PIs don't seem to do any more training than industry managers (who also point to new career opportunities and help employees identify and rectify skill gaps). Again, it is insulting to call experts in their fields, many of whom are in their mid thirties, trainees and then use it to justify low wages.

Fundamental issues and challenges

NIH pay scales are very low and in my case, state law mandates a minimum of 65K for salaried employees. This money has to come from somewhere, and it is my impression that NIH fails to account for this, disproportionately impacting faculty without access to non-federal dollars. Simultaneously, I still experience financial stress. Further, there are many more postdocs than their are suitable academic faculty positions (I would rather be a janitor at a university than an adjunct) —which is why most of us are here, since the postdoc does not equip us to move into industry. I feel hopeless about the state of academia as I see excellent scientists being churned out by what has come to feel like a low paying research mill. Further, it is obvious that these conditions (low pay and low job security) disproportionately impact those with less financial resources and women in their child bearing years.

Existing NIH policies, programs, or resources

Perhaps the number of postdocs in training for academic research pathways should be roughly commensurate with the jobs that will be available. I believe the decline in postdoc numbers is indicative of postdocs voting with their feet —we have poor job prospects and extremely low pay. What are the incentives to stay? Every day I think about quitting and looking for work at a plant nursery, and I'm not alone. This is not to say that postdocs on non-academic pathways should not exist, but currently it doesn't seem like there's a good training model and it feels like we're rolling dice hoping something will work out. Perhaps training programs could be created in collaboration with companies to determine the skills they're actually looking for and incorporate these into hybrid training programs. In order to maintain competitive research programs perhaps we should employ more research scientists and ensure that these positions receive adequate pay. NIH pay scales should take into account high cost of living areas; postdocs shouldn't be rent burdened and they must be able to afford childcare.

Proven or promising external resources or approaches

I had a colleague who did a project with a tech company that I believe was funded in some manner by this organization: https://www.momentalfound.org/. This proved to be the experience that landed him a great industry job, even though the bulk of his skills were built in his academic training. It seems that companies are looking for tangible outcomes beyond academic publications, and it would be nice if there were more opportunities to do hybrid training like he did. Notably, purely industry postdoc positions aren't helpful to maintaining academic research, which is vital for the US. And some postdocs may prefer to keep both paths open —which is why I think hybrid training may be useful. Perhaps this should be the rule rather than the exception if we want to reduce the chance of discrimination in faculty hiring and better train the scientific workforce.

Response 2239

Perspectives on the postdoc roles and responsibilities

My postdoctoral position is simultaneously my first employment as a PhD, and the next step for my academic training. I view it as an both an opportunity to receive training that I was unable to receive as a graduate student to prepare me for my independent research career and time for me to build my own independent research track record. As a postdoctoral fellow I simultaneously lead my own independent research under the advisement of my mentor, mentor graduate and undergraduate students inside and outside of the lab, and lead outreach efforts across campus and the country.

Fundamental issues and challenges

Pay. Explicitly the base pay is too low. First time Postdocs have just graduated from PhD programs where they were already severely underpaid. Continuing the academic track as a postdoc which can last anywhere from 2-6 years is a extremely tough decision to make for most graduates. Especially for first generation PhDs and doctors of color. I personally was only able to afford to do so due to a pilot fellowship that was funded by the NSF that has a required stipend of 75,000 a year (Which is well above the pay for most NIH postdoctoral fellowships). Even still I have to be very careful with my budget and cannot afford basic life milestones such as purchasing a home (Instead of renting) or affording to have children. Milestones that are common for individuals of the same age.

Doing a postdoc for most individuals means having yet again a opportunity cost of living your life for the promise of a academic job that might not even be available. The pay is way too low for the average person.

Existing NIH policies, programs, or resources

Increase stipends/pay for graduate students and postdocs. Require improved healthcare for graduate students and postdocs and provide funding in addition to this pay to afford this health insurance.

Proven or promising external resources or approaches

ASEE eFellowship, Schmidt Science Fellows, and HHMI Hanna Gray Fellowship.

Response 2240

Perspectives on the postdoc roles and responsibilities

Roles:

- Independence in designing experiments
- Independence in asking novel research questions
- Bring new technology/methods into the lab
- Mentoring other newer postdocs, grad students, undergrads that come through the lab

Responsibilities:

- Become the point of contact person for training
- Become the point of contact person for lab management
- Become the point of contact person for grad/undergrad students and prep fellows
- Heavily write grants

Fundamental issues and challenges

Fundamental issues:

1. Pay, pay, pay: academic postdocs are heavily underpaid therefore inhibits recruitment, retention, and overall quality of life of postdoc trainees == at minimum, all postdoc should be making 70,000 and also dependent on the city where they postdoc
2. PI wants already *trained postdocs in their areas of research vs. spending the time to train a postdoc that is interested in learning/enhance their previous grad training
3. PI expectation that research is more important than pay

Existing NIH policies, programs, or resources

Increase postdoc pay scale

Proven or promising external resources or approaches

No response

Response 2241

Perspectives on the postdoc roles and responsibilities

1. A postdoctoral position is a short period (approximately 3 years) of mentored research training to become an independent researcher.
2. Postdoctoral trainees should make decisions regarding the direction of their research projects.
3. Postdoctoral trainees should be viewed as budding researchers, and valued by research mentors for their intellectual contributions to research projects.

Fundamental issues and challenges

1. Current postdoc stipends do not reflect the cost of living; stipends need to be increased to recruit and retain postdocs.
2. Inconsistencies in postdoc stipends across US universities make it challenging for some institutions to retain their postdocs; there needs to be some consistency in postdoc stipends across universities.
3. Greater number of job opportunities in industry versus limited academic positions.
4. Lack of healthcare and retirement benefits for postdocs.
5. Lack of support by some research mentors for the work-life balance needs of postdocs.
6. Fear of taking vacation time, to which postdocs are entitled, due to repercussions/displeasure from research mentors.

Existing NIH policies, programs, or resources

1. The NIH could provide more funding opportunities for postdocs, including international postdocs, so that they are less dependent on their research mentors for funding, and free to steer the direction of their research projects, thus making them better prepared to apply for faculty positions.
2. If possible, international postdocs should be granted a category of visa that does not restrict their research training with a specific research mentor, but allows them to switch mentors and labs should the need arise, without fear of having to go back to their home countries if they are terminated by a research mentor. This will relieve them of an enormous amount of stress, so they can focus on their research.
3. The NIH should mandate that all new postdocs take an NIH-created online training/orientation to better prepare them for their postdoctoral experience. Many international postdocs may not be fully aware of what is required of postdocs in the US.
4. Research mentors should be mandated by the NIH to undergo mentorship training prior to hiring postdocs. This should be followed by an annual refresher mentorship training.

Proven or promising external resources or approaches

No response

Response 2242

Perspectives on the postdoc roles and responsibilities

The postdoc position is designed to help scientists transition into independent research careers by providing training at the bench and with career development with mentorship in things such as grant writing, leadership, budget planning and more.

Fundamental issues and challenges

The fundamental issues include lack of faculty positions, especially tenure-track positions, low wages, relocation requirements to get new training. The postdoc position is designed to train people for an independent academic research position. If those are limited, postdocs have to look to other places for jobs. Industry is a likely place to use the skill set a person obtains from their graduate work and many don't require a postdoc experience and have higher salaries. So it makes sense to move into new position without doing a postdoc to increase a person's earning potential. This situation is more motivating if a person needs to stay in a certain location because of family reasons or having strong community support in their current location.

Existing NIH policies, programs, or resources

Better pay would make the position more competitive with industry. But also a decently paying research career pathway in academia where a people can use their expertise but not be a principal investigator may kept more people in academia. Or honestly more faculty positions because it is not worth delaying getting a higher salary if getting a faculty position is unlikely.

Proven or promising external resources or approaches

Response 2243

Perspectives on the postdoc roles and responsibilities

To me a postdoc is a position where individuals are trained to build skills more akin to developing novel and important research questions others aren't thinking about. Ideally this is done using the most agnostic approaches while upholding the highest standard of scientific rigor. This should be done in tandem with furthering their technical skills in other areas other than what they were trained in during their PhD. This combination of conceptual and technical development should prepare the individual to be a self-sufficient and adept researcher who can effectively guide others down a similar path.

Fundamental issues and challenges

By in large pay scales are not competitive with industry jobs. The skills a postdoc is required to build are more rigorous than those required to attain an industry job. At the same time industry jobs often pay more, and sometimes 2 or 3 times that of a postdoc salary. Many people aim for a healthy work-life balance, and the ability to live comfortably on a postdoc salary in many places, while trying to build a life/ investments for the future is often difficult in most college towns.

This touches on another issue. Universities are ran like businesses. In my opinion, this is the antithesis of what a university is meant to be, as an institution of learning and advancement for the general public much less the rest of humanity. Since universities are ran like businesses, they tend to operate on and infinite growth scheme where the profit margins are expected to be in the black compared to the year before. This causes a constant increase in tuition rates for undergrads and housing costs for dorms. This has a 2-fold impact on postdocs. First, many people graduate with exorbitant amounts of student debt from undergrad, which the current salary rates for postdocs at most universities essentially requires them to accrue more debt through their postdoc(despite loan forgiveness or extension programs). Many people find postdoc positions unreasonable for this reason. Second, as on campus housing costs increase with the infinite growth rate, this causes off campus housing to increase similarly. This impacts the area around the university, not just the undergrads looking for housing. Thus forcing postdocs to choose to either live close

and pay a lot more, or live farther away and pay for a larger commute. Either way causing them to pay more and disincentivizing pursuing a postdoc position.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

There is growing divide in political representations in academia (I am omitting the merit or my personal opinions on the matter in an attempt to be as objective as possible). By in large, academia is extremely democratic or liberal and is largely pushing for greater inclusivity/ diversity and open discussion across many demographics and topics. Yet, a vast majority of those in higher levels of academia are democratic (https://www.pewresearch.org/politics/2016/04/26/a-wider-ideological-gap-between-more-and-less-educated-adults/). This gap increases the higher you go in the academic hierarchy. It is possibly a large swath of the public are intentionally not pursuing postdoctoral degrees as they realize there perspectives on many topics are often at odds with their peers. If there were a way to make academia more accessible in general; or postdoctoral positions more attractive as potential career paths to those with more conservative views a declining population of academic participation might be brought back into the fold.

Response 2244

Perspectives on the postdoc roles and responsibilities

Training position for future science career (academic or non-academic). Temporary.

Fundamental issues and challenges

Many challenges versus other classes of non-tenured researcher. Employment is contracted (often) on a yearly basis which is shorter than the expected training period. Often no support outside the mentored lab (no committee, no co-PI, no network), frequently visa is dependent on employment status. Precarious position. Even if postdocs earn additional awards (e.g. merit-based fellowships through NIH or private sources), stipend is often not higher than base salary (may be lower as well) and have postdocs transition to university "contractors" thus costing them their health insurance, 401K, and other benefits.

Additionally, postdoc phase coincides with the age at which many researchers choose to be parents. There is a "parent penalty" that penalizes the parent that is more involved in childcare (most often women) in addition to the parents who take time off for maternity and parental leave. This, combined with the financial costs of taking care of children and finding adequate, affordable childcare, lead many postdocs to opt out of continuing their academic postdoc in favor of a better compensated role.

Existing NIH policies, programs, or resources

More financial resources to support postdocs (e.g. increased salaries, hardship funds, more parental benefits, retirement funds). In some states such as Washington State, the base salary for postdocs (0 yrs experience) will rise to over 80K/yr. While this level of funding is likely to encourage more postdocs to accept postdoctoral positions, unless PI grants are increased to account for this salary raise, PIs in WA will be incentivized to not accept postdoctoral trainees or contract for shorter periods to conserve grant funds.

While stipulating that NRSA fellows and career-development fellows are allowed to take time off for maternity/parental leave is beneficial, it is unfortunate that the award is not given additional funds to support the fellow (e.g. 3 extra months of funding added for 3 months of leave). Additionally, while parental supplements (e.g. to F32 and K99) are useful, the small monetary level of these awards (2500/yr) may only support childcare for 1-2 months in many locations. Increased funding would be beneficial.

Lastly, there are supplements to various NIH awards for maternity/parental leave that support hiring additional support staff. However, the short duration of these awards (and the fact that these supplements are available for K99 fellows but not for those in the R00 phase) mitigate the potential of the award. Hiring additional staff is laborious and these contracts are usually for at least a year. It is difficult for researchers without another source of financial support (e.g. PI, other personal grant) to find the funds hire support staff for an entire year. More funds should be provided to mitigate these issues.

Response 2246

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a necessary step for pursuing academic careers. It provides space and time for people to be more independent, learn new skills, and develop research programs. However, the fact that many people do not stay in academic positions, primarily due to the paucity in available positions, means that the training as a postdoc essentially serves as time where faculty have access to highly skilled and cheap labor that often leads to exploitation. And this is the result of already tight budgets due to lack of funding and grants for faculty. This issue is the same with graduate students, in that after their "training" period, they are essentially highly skilled labor.

The demands placed on postdocs to perform research and publish and apply for grants means that other important issues (DEI, education, training, family) do not get attention they deserve as none of that work is "rewarded" in that they are not considered important in the faculty hiring process. Caring about and working on these additional issues —issues that should be responsibilities of everyone in academia — means that less time is spent doing the only tasks that are used to evaluate people for the already limited number of positions. This incentive structure results in rather selfish behavior and ends up rewarding said behavior, and these people then go on to become faculty.

Postdoc positions do allow people to explore non-academic careers and institutions are making efforts to allow and encourage people to do so. This, however, ends up becoming very mentor-specific, and in terms of networking opportunities, this sort of work is not considered "part of the role" of being a postdoc, more like an extra activity that you do if you want to explore these alternate career paths.

Fundamental issues and challenges

The biggest issue is money. Money that is not commensurate with the demands, stress and efforts of the work and responsibilities placed on postdocs. Money that does not scale with inflation, that is not performance related, that is not enough in terms of benefits such as retirement. Couple this issue with the fact that childcare is expensive if even available it makes no financial sense for people to pursue a postdoc if they do not intend to go to academia. Compared to salaries of people who have equal training or even less training (people with bachelor degrees are making more in industry science than postdocs make after 5+ years of training), why would people want to be a postdoc, even if "temporary"?

The second biggest, and only slightly less important, issue is the lack of faculty positions. There aren't enough of them, and many people recognizing that do not pursue this "temporary" job that can last 8+ years that doesn't even guarantee a faculty position at the end of it.

Fixing these 2 issues will result in much greater recruitment, retention, and satisfaction, thus improving the quality of life of trainees. And while understandable that the NIH only has a limited budget, the NIH needs to work with congress to increase budgets for everyone.

Existing NIH policies, programs, or resources

As a non-citizen and non-resident, a lot of NIH programs do not apply to me and people like me. Making these opportunities available to us would help with retaining some people as postdocs as there would be more viable approaches towards attaining faculty jobs. And of course, increased funding levels and increased opportunities that go towards people's salaries commensurate to their training, skill and responsibilities will help people both want to do postdocs as well as become faculty.

Proven or promising external resources or approaches

None that I am aware of

Response 2247

Perspectives on the postdoc roles and responsibilities

I am a graduate of postdoctoral programs for physician scientists. A postdoc position is the time to start one's career, write career awards, and contribute to a mentor's laboratory in a way that advances all parties.

Fundamental issues and challenges

We need to pay postdoctoral researchers a fair and comparable rate on their grants. I wish to speak directly about physicians in a postodoctoral and early career status. K23 awards provide an absurdly small amount of money for salary that is supposed to be 75% of time. This poor reimbursement means that physicians must choose to take a pay cut to stay in research; this is disproportionately unfair for those with high amounts of debt or come from disadvantaged backgrounds and minoritized groups. This is causing physicians to not enter research, and drop out more often.

Existing NIH policies, programs, or resources

K23 awards should pay commensurately with local geographic areas for physicians.

Proven or promising external resources or approaches

Fair pay for research will provide an important incentive to keep physician scientists in the workforce. Otherwise they will keep dropping out.

Response 2248

Perspectives on the postdoc roles and responsibilities

Postdocs are in large part the group of workers that do the bulk of the research for any given lab. They are fully trained versions of graduate students without the burden of classes and are like novice PIs without (usually) the constraint of grant writing and class load. Their job is usually to do the bulk of the leg work on their given project, run their lab in absence of their PI, train and mentor graduate students on proper lab procedures, provide progress updates that the PI can manage and relay, and otherwise support the success of their PI. Traditional postdocs usually have milestones for recording their progress in the form of presentations at conferences, publications, and academic awards. Some postdocs have less traditional roles and will take on the job of researching and forming a commercial aspect to the research when the PI is unable to take time away from their institution.

Fundamental issues and challenges

Most of the issues around postdocs stem from the issue of compensation. There are institutions that will treat postdocs like they are still graduate students by giving them some of the same benefits as students, however, they will take away any benefit possible by saying postdocs are not students but more like staff. This leads to the issue of why postdocs will not be treated like staff and at most institutions are seen as "temporary" or "in-training" without providing any form of training metrics for the postdoc and not switching them from "temporary" when they have been employed for 12 months or more. Another issue around postdocs is the attitude those with the power to impact postdoc lives have with regards to postdocs. There are too many people that think since they had to deal with harsh conditions as a postdoc that all postdocs must deal with the same or similar conditions. The part they do not keep in mind is that times have changes since their time as a postdoc and industry is offering roles with 2X compensation and magnitudes better work life balance. The institutions have it in their head that they only want those who

"want it enough" but do not attempt to reward those who are willing to go through the hellscape of postdoc life, therefore driving them away.

Existing NIH policies, programs, or resources

My home institution is one that bases its treatment of postdocs off of the NIH policies released. The NIH needs to be a leader in changing the postdoc landscape making the overall experience for postdocs much more pleasant. NIH needs to try to make itself more competitive and keep up with factors like increasing cost of living, social changes occurring nationwide, benefits industries are offering that they can replicate, and what different occupations might need to be competitive with industry. For example, a biology postdoc funded by NIH vs a biomedical engineering postdoc funded by NIH would need differing levels of compensation to be competitive with the industrial options for said postdoc. There should be a bigger compensation by the NIH for funding projects that have a commercialization aspect as these projects are taking postdocs and PIs that would thrive in an industrial application and allowing for the expansion of science without alienating those bright minds who don't just see the science but see why the science is important.

Proven or promising external resources or approaches

I have no examples of this, but I am sure there are many models that the NIH can pull from to see what is a good way to bring in postdocs, keep them in the academic/research space, and enhance the overall ecosystem. The NIH should not be afraid to look outside of US based systems as well and outside of the science community to find programs that work and NIH needs to be willing to adapt the successful programs they find to their target audience (postdocs). The biggest thing NIH needs to do is see postdoc positions for their true value as the group that truly moves research forward and not just as cheap labor that can be exploited as the only way to academics is presented to be through postdoc positions.

Response 2249

Perspectives on the postdoc roles and responsibilities

Training position for a future permanent position in academic or industry research as faculty or scientist

Fundamental issues and challenges

Pay is generally across the board poor. Number of available faculty positions is very low, making it ultra-competitive to find one. Institutions put out too many PhDs relative to the number of jobs taking PhDs. Pressure from PIs to produce data.

Existing NIH policies, programs, or resources

Expand institutional training grants

Proven or promising external resources or approaches

No response

Response 2250

Perspectives on the postdoc roles and responsibilities

A postdoctoral research position to me means taking the tools that you develop in doctoral training, and gaining additional tools that you need to establish yourself as an independent investigator.

Fundamental issues and challenges

The current structure deemphasizes independence during the postdoctoral training period. Given that postdoctoral trainees only have 4 years to obtain a K99, this requires a project that is ready to go the day the postdoctoral trainees walk into their new lab. There is no room for changing a postdoc mentor, and on the current K99 timeline, there is no room for the trainee to develop their own project. Further, NRSAs on this timeline also have to be pre-casted by the mentor. To reach these milestones, a trainee must rely on the mentor's lab space and personnel while simultaneously completing their obligations to their mentor. It seems under these conditions that receiving a K99/R00 relies heavily on choosing the right postdoctoral lab and correct project (which may be out of the trainee's control).

Existing NIH policies, programs, or resources

Expand the K99/R00 timeline to 6 years. This would allow for project failures, a single mentor change (if necessary), and ample time for longer projects to reach publication. Most postdocs seek a new career once this traditional path to independence expires. I took an alternative route and was fortunate enough to secure a Research Track position to try to secure R01 funding; many postdocs do not have this option.

Proven or promising external resources or approaches

No response

Response 2251

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is to learn how to independently work on various projects and learn the skill sets needed to apply for funding and operate as a principal investigator.

Fundamental issues and challenges

Graduate students have a very clear structure. Postdocs have little to no structure. A major limitation is that most funding opportunities targeted to postdocs who want to become PIs are required for submission by their 3rd year. Most don't start thinking about the next steps until the 4th year of their postdocs, a year too late for funding applications.

Existing NIH policies, programs, or resources

Annual checks required for all institutions with a clear path outlined for how to transition from a postdoc to a next career phase.

Proven or promising external resources or approaches

The biggest loss comes at the end of the postdoc position with no support on available direction.

Response 2252

Perspectives on the postdoc roles and responsibilities

Postdoc is the transition from graduate school to an independent position. Postdoc suppose to conduct research and gain the capability of designing, conducting and writing the manuscript independently.

Fundamental issues and challenges

The salary is low for postdoc comparing with industrial position, which largely hinders the passion of graduate students.

Existing NIH policies, programs, or resources

Need more funding opportunities for international postdocs since not all the postdocs holds permanent residency.

Proven or promising external resources or approaches

Improving salary and increasing faculty positions.

Response 2253

Perspectives on the postdoc roles and responsibilities

I feel like they're extremely underpaid for the level of work and degree they have. They do the same work as an industry position but typically make under 70K a year

Fundamental issues and challenges

There's a lack of academic funding right now which makes positions competitive and requires the worker to take on additional roles within a lab because there's no money to hire extra help (labs are understaffed)

Existing NIH policies, programs, or resources

Create more opportunities for post-graduate funding or increase the number of approved proposals for the ones that exist now

Proven or promising external resources or approaches

No response

Response 2254

Perspectives on the postdoc roles and responsibilities

Responsibilities—generating publication quality data in well established projects and new projects alike, mentoring other members of the lab (grad students, undergraduates, etc), maintaining and setting up lab equipment, writing articles, reviews, commentaries, fellowship, and grant applications

Fundamental issues and challenges

1. Pay and benefits are not commensurate with the level of training
2. Visa process is burdensome for foreign nationals
3. American science is falling behind other counties
4. Long training path and poor job security, "tenure" may be removed from public universities in the not so distant future.
5. Lack of protections afforded to PhD students (through the graduate program), staff scientists (HR), and faculty (tenure)

Existing NIH policies, programs, or resources

Reduce burden for setting up T32-type funding mechanisms across universities

Proven or promising external resources or approaches

I think NIH intramural does a good job of centering the postdoctoral experience, offering alternative job opportunities and training

Response 2255

Perspectives on the postdoc roles and responsibilities

Too much work and pressure, not enough pay or benefits, and no academic freedom. Often doing the work of many graduate student with the added pressure of having to be know everything.

Fundamental issues and challenges

The pay is too low, the hours are too long and not enforced (work/life balance).

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Have more career development opportunities.

Response 2256

Perspectives on the postdoc roles and responsibilities

Leading pre-existing projects and proposing research directions to PI, advising graduate students and lab techs within adjacent projects. Coming in for longer hours than initially listed in job description.

Fundamental issues and challenges

Cost of living is rising and post doctoral researchers don't receive enough salary or benefit compensation for the amount of work expected. Work done exceeds hours listed in initial job description. Labs are often understaffed which results in post-doctorates having to take on more responsibilities.

Existing NIH policies, programs, or resources

Allotting budgets for post doctoral relocation and trial periods not only for the employer, but also for the postdoctoral trainee in order to create more flexibility, which would result in higher job satisfaction.

Proven or promising external resources or approaches

Greater compensations and flexible work schedules by employers could air job satisfaction and working environment. Hiring staff to handle basic lab chores/preparations reduces responsibilities put on post-doctorates. Compensation for relocation by institutions would also improve post doctoral recruitment.

Response 2257

Perspectives on the postdoc roles and responsibilities

The purpose of a posted is to apply graduate training to work as an almost completely independent researcher. It is also with the intention to cultivate a project/technique that can be transferred to your own individual academic lab. Usually scientists intending on being a PI seek a postdoc. But generally a postdoc is useful to increase training even if you want to go into industry. A postdoc writes grants, gets their own funding, designs and troubleshoots their own project. Also, postdocs seem to have more roles of training, laboratory management, and lab chores (more than a graduate student or staff scientist). An important end point of a postdoc is one of more impactful papers.

Fundamental issues and challenges

Lack of payment, heaviest workload in the laboratory setting, ambiguity of length of postdocs (is it 1-8 years?!). Is it actually necessary for any jobs outside of academia?

Existing NIH policies, programs, or resources

General support for postdocs. There are academic groups that protect graduate students, but nothing for postdocs. There should be more pay, benefits (including child care).

Proven or promising external resources or approaches

Postdoctoral salary is no competitive at all. The enticement to work in a new lab (new skills, new environment, unset time frame, insecurity of success) for such little pay is nothing unless someone is completely dedicated to be a PI.

Response 2258

Perspectives on the postdoc roles and responsibilities

Training period to expand your expertise and skills either in preparation to run an academic laboratory (+/—teaching) or go to an industry position. Involves mentoring. Doing things independently.like developing projects, training students, getting grants, etc.

Fundamental issues and challenges

Difficult to have children during postdoctoral years. Difficult to have a PI that will let you develop your own projects. The cost of childcare. Having no agency and ability to advocate for yourself.if your are having a toxic interaction with a co-worker, your career if at the discretion of your boss. Not enough postdoctoral opportunities in places that feel safe for marginalized communities. And places that don't feel safe for marginalized communities are not options.

Existing NIH policies, programs, or resources

K award eligibility of 4/5 years of a postdoc excludes people.

K award is limiting when your PI won't let you write a grant on what you are working on in the lab or develop preliminary data on the project you designed.

K award success rates (as well as everything else during your postdoc) are highly dependent on the support from your mentor.

There needs to be a direct communication from the NIH to the PI and postdoc about what is required to get a K99.i.e. the need for preliminary data.otherwise it is just a waste of time.

I would like to apply for MOSAIC K99 but have run out of eligibility. Applied for K99 (before there was MOSAIC) with a new project and no preliminary data and got a great score. Than ran out of eligibility.

How is this situation going to affect my academic job search?

More funding opportunities for postdocs!!! Especially since demonstrating the ability to obtain funding is a major factor in getting an academic job.

Proven or promising external resources or approaches

No response

Response 2259

Perspectives on the postdoc roles and responsibilities

A period to gain independent research skills that will enable one to open their own research group.

Fundamental issues and challenges

Sufficient financial support. People in postdoc training programs typically have dependents or want to have children during their training period. Not having a salary that competes with industry/other opportunities prevents people who lack other financial support (family, partners, etc) from pursuing postdoctoral training. This can disproportionally impact first generation, low income, and URM people.

Existing NIH policies, programs, or resources

Change minimum salary regulations and force institutions to increase pay according to location-specific cost of living. Institutions use the suggested NIH minimum pay guidelines to justify paying postdocs low salaries in cities with high cost of living

Proven or promising external resources or approaches

No response

Response 2260

Perspectives on the postdoc roles and responsibilities

Perform research projects as well as receive scientific training for future career development.

Fundamental issues and challenges

The biggest issue the current postdoc salaries. The next one is the uncertainty and timeline for individuals who would like to pursue academic positions after postdoc training.

Existing NIH policies, programs, or resources

Increase the current postdoc salaries, especially under the financial burden caused by COVID.

More training opportunities for lab management and Human Resources management for postdoc who would like to pursue academia and for early career young investigators.

Proven or promising external resources or approaches

No response

Response 2261

Perspectives on the postdoc roles and responsibilities

My experience with what a post-doc position means is largely defined with my personal experience with post-docs in the lab I work in, and labs I have rotated in. It seems that post-docs serve an often

vague/ambiguous role within their labs (it seems very lab-dependent). The common thread (besides the ambiguity of the role), I have noticed is that they're expected to carry a large burden of the responsibilities of the lab. This includes research-related responsibilities, mentoring-related responsibilities, lab upkeep, etc. When I started in my lab, we had no post-docs. The addition of a post-doc on my project has made a huge difference in my experience in the lab. They've been a wonderful mentor and resource for me, and also, their work has inspired me to move my work in new directions.

Fundamental issues and challenges

I think the vagueness of the role, mixed with the heavy expectations that professors/institutions have for the work a post-doc can/should be producing results in a very unattractive job. How many years of education do post-docs have? In what other fields do people with that much experience and education have to settle for a job that has such few sick/vacation days, such low pay (that does not track with amount of hours worked), and such negligible benefits (retirement?)

Existing NIH policies, programs, or resources

I think, ultimately, the NIH should try to put in more resources towards the goal of strengthening the NIH's public standing/standing amongst academics/scientists. I think if the issue with paying post-docs more is related to lack of funding, this is a doom spiral. The less post-docs make (as other industry-related job's wages go up), the less people will want to become post-docs, the more exclusive the position becomes, the less people think of academia as an open and public place where scientists can grow and build up their future/ career-prospects. The NIH should support more lobbying for supporting the NIH if that is what is necessary to increase funding if funding increases are indeed necessary for improving job-outlook for post-docs.

Proven or promising external resources or approaches

No response

Response 2262

Perspectives on the postdoc roles and responsibilities

More independent research training. Postdoc is the time to get exposed to research in a more independent manner. Postdocs's main job is to generate data and publish papers and drive research directions in the lab. Besides research, it is also the time to get exposed to funding application ect

Fundamental issues and challenges

Underpayment and poor career trajectory. Postdocs are kept longer than they want to (despite publishing well) by their PIs. In some labs postdoc are used as exploitation.

Existing NIH policies, programs, or resources

Please provide more protection on postdocs!

Proven or promising external resources or approaches

No response

Response 2263

Perspectives on the postdoc roles and responsibilities

Postdocs are the project leaders to lead the specific project(s) under the PI's supervision

Fundamental issues and challenges

Those qualified (top 10%) as project leaders often arrive with fellowships, while the rest of the 90% have no own funding nor are qualified to be hired as a project leader at Year 0 at least. It is very difficult for the PI to support this 90% of people with the high salary set up by the NIH. This 90% of people also do not necessarily want to work harder to be paid higher. The young generations (especially US citizens) prefer balancing work and life and end up leaving academia since they realize the current academic system is structured only for the top 10% of people. To conduct research as a group, however, we need more personnel. The NIH may consider setting up another postdoc career/grade for these people (e.g. less paid

but having more vacations and less responsibility). Or, provide more supplements to the PI to retain these postdocs for a longer term.

Existing NIH policies, programs, or resources

There are many international postdocs who are fully qualified to receive the fellowships but not eligible to apply for the NIH fellowships. Providing them with more fellowship opportunities will greatly help the lab's research progress, which lifts up this nation's research level in the end.

Proven or promising external resources or approaches

A website where the PI can post the available postdoc positions in the lab will be helpful.

Response 2264

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Pay. The most daunting aspect of being a postdoc—to me—is pay. I really want to stay in academia, but I am not sure if I can afford to, after spending 5 years making below living wage. I want to have a family and I can't start a family without any substantial income. I am afraid that I will have to choose between having a family and staying in academia when I graduate.

Existing NIH policies, programs, or resources

Please increase minimum wage for postdocs.

Proven or promising external resources or approaches

No response

Response 2265

Perspectives on the postdoc roles and responsibilities

I view my postdoc as a training position intended to prepare me for a long-term career in scientific research. My responsibilities include:

1. moving my field forward and contributing to the scientific literature,
2. training undergraduates and graduate students in my academic lab, and
3. serving my institution and scientific community by serving on organizational committees intended to support the institutional/scientific community in various capacities (e. g. serving on a department diversity and inclusion committee).

Fundamental issues and challenges

Given our level of training (completed PhDs) and expertise, academic postdocs at a national level are severely underpaid compared to what our peers working in similar positions in the private sector are paid. Most postdocs are paid only the NIH recommended minimum salary with no additional adjustments from their PIs or institutions relative to cost of living. Because of growing costs of academic research, many postdocs are expected by their PIs to obtain individual funding; however, these fellowships also do not provide compensation relative to cost of living.

Existing NIH policies, programs, or resources

NIH should expand postdoc fellowship funding; additionally, NIH should increase the value of R01s so that PIs can actually pay their postdocs a living wage based on the cost of living in the surrounding area of the academic lab.

Proven or promising external resources or approaches

No response

Response 2266

Perspectives on the postdoc roles and responsibilities

My role as a postdoctoral fellow involves research conductance and development, mentoring research assistants and graduate students, and contributing to grants writing along with the PI. In addition to exploring career development opportunities, and independent grants writing.

Fundamental issues and challenges

I am, as a postdoc, face major issues; first my hire depends mainly on my PI grants, when my PI didn't get a grant, I have to look for another position. Second, the salary for the postdoc is very low (around $50,000), which does not match the postdoc responsibilities and duties.

Existing NIH policies, programs, or resources

We, as a postdoc, can benefit from training in:

1. Career development
2. Grant writing
3. Understanding Grant mechanisms and opportunities

Proven or promising external resources or approaches

No response

Response 2267

Perspectives on the postdoc roles and responsibilities

I think the role/responsibility of an academic postdoc is to learn new skills in a lab outside of their graduate experience, while also offering some expertise to the lab/lab members on skills that have been developed previously. Also, to develop a research program to pursue in the future after completing the postdoc experience.

Fundamental issues and challenges

I think one of the first fundamental issues is the lack of sufficient pay. At our institution, the graduate students technically make more money per hour than a postdoc does, which definitely does not seem appealing. Additionally, this is supposed to be compensated by instruction/teaching, but depending on the postdoc position, there are various degrees of instruction/teaching that occur. Postdocs have, historically, been expected to work long hours, but in the current environment, work life balance is important. Some PI's do not understand that postdocs need to have a life outside of the lab as well to be successful in their career.

Existing NIH policies, programs, or resources

I think there should be more guidance for both the postdocs and the PI mentors as to what a typical schedule looks like, what the expectations are of the skill(s) being developed, what the expected timeline of the postdoc might be, and what program(s) are available to apply for extra funding or to seek support. In my experience, I started my postdoc and none of this was really clear. I understand that postdocs vary from lab to lab, but anything that can be standardized should be outlined and any recommendations on how to successfully navigate the postdoc space such as things you should be looking for or doing and what point during the postdoc would be helpful.

Proven or promising external resources or approaches

Response 2268

Perspectives on the postdoc roles and responsibilities

Based on my experience as a postdoc and what I have heard/seen from other postdocs, generally speaking postdocs will be expected to fulfil a variety of different roles for the lab. They will need to

formulate new ideas and perform experiments, and also act a source of expertise for younger students and trainees in the lab. They are also expected to quickly generate usable data and be able to publish papers in a relatively short timeframe from when joining a lab. In addition to to their responsibilities as researchers, they also often must secure additional funding for themselves, and so are expected to devote a significant amount of time to applying for grants, awards, and fellowships, particularly early on in their position. They are also expected to contribute to the general management of the lab. However, I think that postdocs are often spread too thin, and that they should be able to focus more on research and gaining new experience and skills instead, as that is the primary purpose of doing a postdoc, in my opinion.

Fundamental issues and challenges

The single greatest thing that could be done to increase the amount of individuals who want to become and stay a postdoc is to increase their pay. Freshly minted PhDs will have a variety of options after graduating, including going to industry, government positions, and the traditional academic postdoc. However, most options both pay significantly more and have a better work-life balance when compared to an academic postdoc. Thus, it makes sense that most individuals would simply choose not to postdoc, as it does not benefit them. Historically, a postdoc would lead to a tenure-track faculty position, but this is becoming increasingly unlikely due to the low number of available faculty positions, making it an unattractive end-goal for the majority of PhD holders. And since other options pay better and have more reasonable schedules and commitments than a postdoc, it makes the entire concept of doing a postdoc feel outdated. From my experience and from what I know about other postdocs, generally the reason for doing a postdoc is because a better job was not immediately available, or to gain a specific set of skills that were not gained during graduate school, but still with the intention to leave academia once those skills are acquired. In addition to this, I think the idea of what a postdoc is actually responsible for doing needs to be more defined, I think some labs use postdocs as highly experienced, but cheap labor. This makes the whole postdoc experience feel very exploitative. To summarize, the absolutely fundamental issue that is preventing people from even wanting to consider a postdoc is the poor pay and poor work-life balance. Without fixing these two critical conditions, I cannot see how individuals will feel compelled to do a postdoc.

Existing NIH policies, programs, or resources

To my knowledge, most existing programs and resources that the NIH provides revolve around assistance for grants and awards. But this may not be helpful for individuals who are not committed to academia. There needs to be more flexibility in postdoctoral training to allow for future career goals other than academia. In addition to this, despite the so called "need" for postdocs currently, having to constantly secure our own funding feels a little backwards. And considering the small number of postdocs who will actually obtain funding through the NIH or related funding agencies, there is not much incentive for individuals to consider doing a postdoc, as you already feel behind from day 1. I will be honest, I don't know what kind of resources the NIH could provide to enhance the postdoctoral training experience. The biggest issues that postdocs face, mainly pay and work load, cannot always be directly regulated by the NIH.

Proven or promising external resources or approaches

I don't know if there is anything that has been proven to work, but several universities, including the University of California, Princeton, and MIT have announced salary increases for postdocs. While the increases are still well below what a PhD holder would make in industry, it is better than nothing. I am not entirely clear what kind of regulations the NIH can enforce when it comes to salary, but at the end of the day if a postdoc struggles to make a livable wage, then postdocs are going to cease to exist. Postdocs want to feel valued, and right now it seems that academia is showing us just how little we are actually appreciated. If nothing changes, or if the changes are not substantial, I just don't see how the idea of "doing a postdoc" is going to survive the next few years.

Response 2269

Perspectives on the postdoc roles and responsibilities

I expect a post-doctoral position to advance my technical skills, mentoring and management skills, and increase my networking circle. A post-doc should be allowed to drive their own project.

Fundamental issues and challenges

From the academic side, the main issue is salary and student loans. We are mostly in our late 20's or early 30's but we cannot afford to raise a family. We are also expected to work over 40 hours a week. Industry positions offer higher salary so we can start paying down student loans and still have some money leftover for living expenses. Industry also offers better working hours. Quality of life is largely dependent on the PI. If the PI has unrealistic expectations or lacks basic compassion/human decency, then your quality of life and work/life balance will be very poor.

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

No response

Response 2270

Perspectives on the postdoc roles and responsibilities

The postdoc should be a time to hone skills and a program of research. However, how it stands, it places PhDs back into a trainee role where they are often used and taken advantage of by individuals and institutions. Individual "mentors" may use postdocs to further their own work. Institutions may use trainee-related dollars but then refuse to support the hiring of trainees into faculty-level positions.

Fundamental issues and challenges

There needs to be higher pay and support for postdocs. For many places in the US, ~$55,000 is not a very livable wage, especially after the expense of going through graduate school. Additionally, there needs to be better resources and support for postdocs. "Mentors" and institutions often use trainee status to excuse not providing postdocs with the same benefits as regular employees. For example, many postdocs do not get retirement or life insurance benefits. For PhDs with families, this may be heavily considered in whether to stick it out in academia or go find a higher paying position in industry. By not making postdoc positions equally appealing to industry, we truly are missing out on talent that could further society rather than the pocketbooks of the 1%.

Existing NIH policies, programs, or resources

For T32 and like positions, the payback requirement should be eliminated. Additionally, more information about how to complete T taxes and support for how to do them is necessary. I have nearly $4000 in back taxes to pay due to poor communication about the award, and I must pay a tax expert to deal with my unique situation. My T also made it extremely difficulty to be approved for a mortgage —there should be more programs and supports for PhDs to be able to achieve life milestones that those in industry can achieve years ahead of PhDs simply by having steady employment that isn't seen as an "award." Additionally, as a result of the pandemic, I was unable to collect data to make myself marketable for a K99 award (one of the few NIH options available to me) as the guidelines state you must not have more than 4 years of postdoc training, unlike other K mechanisms. Finally, more support for postdocs with families is needed —paid family leave.

Proven or promising external resources or approaches

Better pay, paid leave, advocates for trainee rights

Response 2271

Perspectives on the postdoc roles and responsibilities

I see the postdoctoral phase as a scientist position that should facilitate the transition to an independent scientist.

Fundamental issues and challenges

1. The institute in which I am currently doing the postdoctoral training does not provide easily accessible temporary housing for international students and does not provide at all subsidized housing
2. Until few months ago the current institute was using NIH MININUM salary table as salary table, with very little or no possibility of negotiation. NIH should indicate what are average and median salaries publicly in their website to show transparency and demonstrate to other institutes that those MINIMUM were really MINIMUM and not suggested salaries. Especially for institutes in much more expensive cities like Boston.
3. NIH should support salary transparency to have a more positive completion and fight the offering of minimum salaries. This will be pivotal to retain people into basic science.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Ask IRS to have postdoctoral fellowship to be taxed by the institutes.

Response 2272

Perspectives on the postdoc roles and responsibilities

To me, a postdoctoral position is an opportunity to learn new skills. The goal of which is to complement my graduate training, to create a unique skillset for me as a potential investigator.

Fundamental issues and challenges

Academic postdoctoral salaries are typically very poor compared to other career options, and the expectation of hours worked is much higher. It can be very difficult to justify spending 3-5 years in this environment for the slim chance of obtaining a faculty position.

I joined the Army in 2006, used my GI Bill to attend undergrad, and I still left school with >$100k in student loans. The cost of undergraduate tuition exceeded the per-semester cap set on the GI Bill in my 2nd year of undergrad, and congress de-funded the GI Bill 3 times while I was in undergrad (2012-2016). These loans earned $14k of interest while I was a predoctoral student. If not for the current moratorium on student loan interest, I would not have been comfortable accepting an academic postdoc position last year.

Existing NIH policies, programs, or resources

The NIH LRP program is very helpful toward righting the imbalance between the cost of education and the comparatively poor salaries that most institutions offer. If this program were modified to be automatically awarded with a mandatory payback, I believe it would make academic postdoc positions much more appealing to my generation. If I'm not selected for an LRP award by the end of my second postdoctoral year, I will be leaving academia for a higher-paying position.

Separately, the NIH postdoc salary guidelines need to be adjusted for cost-of-living in several areas. Government postdoc salaries already do this based on zip code, NIH could easily use the same adjustment chart on a per-university basis.

Proven or promising external resources or approaches

This survey is an excellent start. I have often felt that the NIH guidelines are "out of touch" with the experiences of my generation of researchers. I love this job, and I hate that I'm in a position where I feel pressured to choose between my passion and my finances.

Response 2273

Perspectives on the postdoc roles and responsibilities

The postdoctoral (PD) position is an essential and crucial step in the career progression of young scientists. It is a transition phase in which scientists are integrated into an existing laboratory and are encouraged to develop an independent research trajectory that can culminate in several different career

options. It is considered a pre-academic step, where successful post-docs wish to stay in academia and progress their career as principal investigators. I don't think a PD should only be considered as a step into the academic world, but I do agree that it should still be considered a "training" phase rather than employment. Successful graduate students stepping into PD are hopefully trained to be excellent and rigorous scientists; they lack training in several other aspects of academic life. PD should be a phase in which they gain operational experience and are trained in fellowship writing, grant writing, administration, and team leadership.

Fundamental issues and challenges

1. Salary expectations are not met. The increasing cost of living, inflation, mortgages, rent, child-care, etc. etc., make it impossible to plan for a stable life, for a family or just for a serene existence. This is aggravated by some big-hug cities being even more expensive than other regions.
2. Grant money is too little for PIs to significantly increase PD salaries.
3. Quality of life for PDs is scarce. Even if PD should be a phase transition, the number of years required to achieve publishable results is increasing exponentially (aka, top-tier journals require more data and have processing times that can easily reach years from initial submission to acceptance).
4. Available positions in academia are limited, and competition for funding is cut-throat.
5. Private can offer salaries immensely higher, so candidates are not willing anymore to "try it out" given that the rate of success (interpreted as employment in a principal investigator, tenure track position) is so low.
6. Offering additional attractive recruitment perks is unattainable by most investigators. Nothing, from relocation expenses, computers, subscriptions, bonuses, and interview costs, is supported by NIH grants, so it has to be from discretionary money. This pool of money is almost impossible to secure, and most of the time is just offered as a startup to new faculties that need that money to start their activities.

Existing NIH policies, programs, or resources

1. Grant budgets have to be revised. The total direct costs of a standard R01 haven't changed in decades. While PD salaries are rightfully being increased, this comes to the expenses of reagents and other fundamental sources for the laboratories. This not only restricts creativity but also doesn't allow us to make any compelling offers when compared to private industries.
2. Supplement for PD recruitment should be offered where after the selection of proper candidates, interview costs can be covered. Additionally, relocation expenses and other forms of bonuses should be allowed as budgetable costs.
3. Job posting pricing should be regulated, and NIH should be running its own official "job board", cutting out scientific publishers like Nature and Science that charge thousands of dollars per job ad.
4. ESI policy should be revisited given the increasing numbers of PD required to acquire first-name publications. Being ESI during the first rounds of NIH grant submissions is essential to survive.
5. Paid-off maternal/paternal leave should be included in a PD contract.

Proven or promising external resources or approaches

Following Twitter "altac" conversation is an excellent instrument to understand what motivated current PD, or prospective PD that abandon science, to abandon science. This could inform on priorities to be satisfied to make the academic postdoc more compelling. In >80% of the cases, the low salary would be cause number one.

Proven resources are to offer a protected path to tenure positions and compelling fellowship packages, but only big (and few) institutions can do so.

Response 2274

Perspectives on the postdoc roles and responsibilities

I view postdoctoral positions as apprenticeships for becoming full faculty members and running a research lab or performing research in another non-academic capacity. This means further time to build my

publication record, learn new technical skills, and develop the "soft skills" required to run a lab and manage the grant application process necessary to fund a lab.

Fundamental issues and challenges

The largest issue is how little postdocs are paid. Our salaries are massively un-competitive compared to industry and are so low that it is a struggle to survive in any semblance of comfort in many major US cities. I have known that I want to pursue the academic research route since starting my undergrad, and I remain dedicated to this pursuit. However, even I have doubts on the logic of my choice when faced with decisions such as if I can afford to repair my car's AC system or when I can reasonably expect to be stable enough to start a family. This is made worse by the fact that I am aware it will only get worse over the next couple of years if things don't change. My salary increase this year was not even enough to cover my rent increase, meaning that I am effectively getting paid less than last year not even considering the increased cost of other areas of life due to inflation. With this in mind, choosing to pursue a postdoc is an incredibly poor financial decision that comes with costs in many other areas of life. It is understandable that many smart people see this as a losing proposition and choose not to pursue a postdoc position.

Long story short, the exceptionally low pay scale for postdocs (well-trained researchers with PhDs) that is not keeping up with the cost of living is a major challenge in the recruitment and retention of postdocs and dramatically decreases our quality of life.

Existing NIH policies, programs, or resources

Increase the NIH minimum postdoc payscale amounts.

Proven or promising external resources or approaches

No response

Response 2275

Perspectives on the postdoc roles and responsibilities

A postdoc is a training position where you further expand your skillset and experience beyond the phd. Postdocs should have a higher level of independence with their research project.

Fundamental issues and challenges

Poor work life balance. Grossly underpaid for the education-level. Often disrespected and taken advantage of, relative to graduate students who generally get more support and respect. The success of a postdoc is measured solely in publications, which can be inhibitory in advancing in your career. Toxic work environments can exacerbate these issues.

Existing NIH policies, programs, or resources

Better career development opportunities. It's difficult to transition to non-academic careers after an academic postdoc (since you are simultaneously overqualified and underqualified having extensive education/training but only in an academic setting). It would be beneficial to have opportunities to gain direct experience in alternative career paths during the postdoctoral training.

Proven or promising external resources or approaches

No response

Response 2276

Perspectives on the postdoc roles and responsibilities

Although not for all, postdoctoral research is still an essential component of academic training for most graduate students. Postdoctoral research is a period for gaining more independent research experience, e.g. thinking independently, designing experiments, acquire the necessary resources and skills to carry out experiments/analysis. Some graduate students are already experienced—especially those who have done independent research before entering graduate school—thus may not need such an additional period of training. As a lab head and PI, I would like to help postdocs who need additional training to foster their independent research skills so that to achieve their career goals, no matter in academia or industry.

Fundamental issues and challenges

Low income, and the huge social pressure of their peers in other fields. Postdocs are generally ~28-35, at their best age of doing frontline research, and might be forming their own families and possibly having babies. Peers of their age in other fields are all making great contributions to their companies, and are being paid much higher than postdocs. Moreover, research associates who just graduated from college are making the same or similar salaries in many places—how ridiculous! All these experiences are making postdoc research a last option for many great young scientists.

I know many professfors/PIs, including myself, who really want to increase salary for their postdocs, but just cannot do that due to NIH grant restrictions. If NIH does not support for higher salaries in their grant budget (especially those fixed grant amount budget), these PIs just could not increase salaries for their talented postdocs.

Existing NIH policies, programs, or resources

https://www.niaid.nih.gov/grants-contracts/salary-cap-stipends

Attached is the NIH NRSA Stipend Levels for postdocs. The suggested salary is so low that it cannot guarantee a sustainable life for postdocs, especially for people in San Francisco, New York, and Boston. Please increase this suggested salary cap to (a suggested) $75,000/year, and more importantly increase the budget for existing grants. Another suggestion is to set region-specific recommended living costs according to institutions/regions, and to calculate the budget during grant application.

Proven or promising external resources or approaches

https://www.science.org/content/article/postdocs-need-raises-who-will-foot-bill#:~:text=The%20push%20to%20raise%20pay,postdoc%20salary%20will%20be%20%2465%2C000.

Response 2277

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should be focused on training academic PhDs to run labs of their own. As a PhD, we do not need to learn basic science techniques because getting this degree proves we can design and execute experiments. I see the postdoc position as a place to gain confidence in securing funding and budgeting. In general, I believe this time is the most important time to further developing your managing and mentoring skills rather than focusing on your research. It shouldn't feel like a second PhD, it should be to train on how to successfully organize a lab and set up your future lab for success.

Fundamental issues and challenges

I think it's fairly obvious majority of PhDs don't stay in academia due to low pay and low quality of life and with inflation this will only add more stress on the system. Healthcare isn't included and most people are one health emergency from adding to their already existing student debt that they haven't been able to pay off on their graduate stipend and won't be able to pay off with their postdoc salary. This results in financial stress. Further, there is no incentive to stay in academia when industry pays more than double and has better benefits and quality of life. On top of that you are not forced to jump through hoops to get funding.

Existing NIH policies, programs, or resources

I think it's clear more money needs to be allocated for postdocs and early career scientists if you want rigorous research programs to be retained by early career scientists.

Proven or promising external resources or approaches

If you pay a livable wage (meaning you can reasonable start paying off student debt, afford to live without roommate, feed your family) this will incentive more PhDs to stay in academia. Everyone worked hard to get a doctorate and then you're welcomed to the world at a salary lower than friends without degrees it's pretty depressing.

Response 2278

Perspectives on the postdoc roles and responsibilities

It is a great opportunity to gain more independence and different skillset from PhD training. For me, it was an opportunity to explore and learn a new field, while considering whether I wanted to pursue a career in academia or industry. I developed new research directions in the lab for myself and mentees. The role of a postdoc is also to provide mentorship to students, which I had many more opportunities for compared to when I was a graduate student.

Fundamental issues and challenges

Lower quality of life, low financial income, and lack of professional development support are all challenges that afflict the postdoc recruitment and retention issues we are facing in academia. We can easily double or triple our income by pursuing a different career with a better work-life balance. Many have family considerations to take into account as well. For international postdocs, fellowship opportunities are severely limited and further disadvantage us in this career path.

Existing NIH policies, programs, or resources

More fellowship, training grants, and professional development programs would help to support positions in lab that are not as well funded. An increase in the NIH postdoc salary scale is urgently needed to address inflation and the rapid increase in cost of living. However, it is also critical that NIH establishes a salary scale that is also adjusted for COL since the majority of departments look to NIH to set postdoc salaries. This also should be reflected in the personnel costs of grant budgets.

More transition and early career investigator awards should be made available to help ECIs succeed in obtaining competitive funding.

Proven or promising external resources or approaches

No response

Response 2279

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a temporary research position that is undertaken after the completion of doctoral studies. This position provides an excellent opportunity to gain additional research experience, develop new skills, work closely with experienced researchers, and most importantly, develop grant-writing skills. During the postdoctoral training period, postdocs are expected to conduct independent research, publish scholarly articles, and often teach or mentor students.

Overall, a postdoctoral position can be a valuable stepping stone in an academic or research career. It provides numerous opportunities for professional growth, networking, and further development of research skills and expertise.

Fundamental issues and challenges

Recruiting and retaining high-quality postdoctoral trainees is essential for the success of academic research. However, there are several Fundamental issues and challenges that hinder recruitment, retention, and the overall quality of life of postdoctoral trainees in academic research.

One major issue is the lack of job security and career advancement opportunities. Many postdocs are hired on research grants, and PIs often expect them to work as graduate students without considering their career development. This creates uncertainty and instability, making it difficult for postdocs to plan their future and make important life decisions.

Another significant issue is the inadequate compensation for postdoctoral trainees. Many postdocs receive low salaries and minimal benefits, making it challenging to afford basic living expenses, particularly in high-cost areas. This causes financial stress, leading to burnout and attrition.

Finally, there is a need for better mentorship and professional development opportunities for postdoctoral trainees. Many postdocs report feeling isolated and unsupported, with a lack of guidance and mentorship to help them navigate their career path and achieve their goals.

Addressing these Fundamental issues and challenges will require a concerted effort from academic institutions, funding agencies, and the broader scientific community. Funding agencies should require progress reports on postdoc career development from PIs if postdocs are hired on funded projects. Additionally, institutions and funding agencies should ensure proper career advancement opportunities, fair and adequate compensation, and provide better mentorship and professional development resources.

By addressing these challenges, we can help ensure that postdoctoral trainees are supported, valued, and able to contribute to the advancement of academic research.

Existing NIH policies, programs, or resources

There are several policies, programs, and resources that the National Institutes of Health (NIH) could modify, expand, or improve to enhance the postdoctoral training ecosystem and academic research career pathways.

One approach could be to require progress reports on postdoctoral career development from principal investigators (PIs) if postdocs are hired on funded projects. This would ensure that PIs are actively supporting the career advancement of their postdocs and provide accountability for their professional development.

NIH could also enhance career development opportunities by offering more resources, such as workshops, training programs, and career counseling services, to help postdocs identify career pathways and acquire necessary skills. Additionally, NIH could promote collaboration between academic institutions and industry partners to expose postdocs to diverse career opportunities and facilitate transitions into non-academic careers.

Another area that NIH could improve is the compensation and benefits for postdoctoral trainees. One way to address this issue is to increase the stipend levels for National Research Service Awards (NRSAs) to better align with the cost of living, as stipend levels have not kept up with inflation. NIH could also expand eligibility criteria for loan repayment programs to include postdocs, and consider other benefits such as health insurance and retirement plans.

Finally, NIH could strengthen the mentorship and professional development resources available to postdocs. This could include requiring PIs to undergo mentorship training, creating networks of postdocs and alumni to provide guidance and support, and establishing mentor-mentee matching programs to promote productive mentor-mentee relationships.

By implementing these changes, NIH could enhance the postdoctoral training ecosystem and help postdocs to achieve their career goals, leading to a more successful and diverse academic research community.

Proven or promising external resources or approaches

There are several proven or promising external resources and approaches that could inform NIH’s efforts to enhance the postdoctoral training ecosystem:

1. The National Postdoctoral Association (NPA): The NPA is a non-profit organization that provides resources, advocacy, and networking opportunities for postdoctoral scholars. NIH could work with the NPA to develop and implement policies and programs that support postdoc career development and job satisfaction.
2. The Postdoc Academy: The Postdoc Academy is an online platform that provides professional development resources for postdocs. The academy offers courses on topics such as grant writing, career planning, and communication skills. NIH could work with the Postdoc Academy to provide postdocs with access to these resources.

By leveraging these external resources and approaches, NIH could enhance the postdoctoral training ecosystem by improving postdoc recruitment, training, working environment, mentoring, and job satisfaction.

Response 2280

Perspectives on the postdoc roles and responsibilities

I went into my current post doc with the intention to develop projects, lead projects, and to produce high quality research.

Fundamental issues and challenges

Most post docs and graduate students want to stay in academia but the pay for a post doc is way to low. When I talk to other post docs their minimum salary to stay in academia starts at around 80000 and more depending on where you live. Also the demand of research is steep compared to non academic jobs and from the horror stories I have heard it is quite understandable that people jump to non academic fields when one is underpaid and over worked. I was interviewed by several PIs that want a researcher to work 70 hour weeks for 56000. This is the reality that I hope gets rectified soon.

Existing NIH policies, programs, or resources

PI training and increase in salary. As biotech is only on the east coast and west coast primarily and academic institutions are all around the country. People want to make a decent salary and live in the city of their choice. As a way to help with cost academic institutions may have to consider removal of overhead cost to the academic institution.

Proven or promising external resources or approaches

No response

Response 2281

Perspectives on the postdoc roles and responsibilities

In response to this RFI, [redacted for anonymity], a public health research and implementation company, is providing our perspective and experience gained from working with postdocs, early-stage investigators, biomedical faculty, and research education program advocates. From our vantage point, we assess the role of the academic postdoc as vital to the research engine of higher education as well as government and commercial scientific enterprises. Without the academic postdoc role, the responsibility of investigative discovery would fall to faculty fully engrossed in the teaching, administrative and mentor responsibilities dictated by colleges and universities. The responsibilities of an academic post doc are traditionally focused preparing for an academic and/or research career. By virtue of this dedicated time and targeted training, a post doc can fully realize their scholarly potential within the academic community. We view postdoc training as a significant pathway to career progression in an individual's chosen field. It provides additional and invaluable preparation and development for academic or research positions under the mentorship of an established and accomplished Principal Investigator (PI). Mentors offer direct experience and guidance to postdocs, helping them to better understand the academic and scientific communities and work environments, as well as the research funding landscape that is so essential to a successful career in research. Advanced training affords postdocs the time to develop or sharpen critical skills to support their research goals and interests, as well as identify and address areas for improvement. The academic postdoc role is and should remain an imperative career stage to ensure scholars, institutions, and society benefit from their enhanced skills, knowledge, and innovation.

Fundamental issues and challenges

Although there are many benefits for postdoc trainees in academic research, there are also issues that challenge postdoc recruitment, retention, and quality of life. In general, the postdoc experience often lacks structure and collaboration across universities and organizations, even within internal departments or research groups, which can result in providing insufficient clarity of role, purpose, and support to postdoc trainees. Furthermore, postdoc status at an institution can be unclear—the postdoc is not regarded as a student but is also not regarded as a faculty or staff member, sometimes even in the Principal Investigator's (PI's) research group. This can result in an identity crisis for the postdoc, professional isolation, and a less than positive experience. In addition, the level and style of mentoring among PIs varies widely regarding research development, guidance, and preparation for work after the postdoc, which can affect career development negatively. Low pay and lack of benefits (postdocs are not always treated as full-time employees in academic settings) also factor into recruitment, retention, and quality of

life issues, as well as treatment of postdocs by PIs and other faculty members. This includes unrealistic expectations about deliverables and timelines, which can lead to extremely long work hours. Recruitment is also impacted by jobs that do not require postdoc training experience. Postdocs, especially those from racial and ethnic minority groups, can often feel isolated in their research groups. Not every institution has PIs or other faculty and researchers who represent minority groups who can serve as role models and demonstrate what career success looks like. In addition, not all institutions have an established community of practice that facilitates information exchange and provides support for postdocs, especially those from racial and ethnic minority groups.

Existing NIH policies, programs, or resources

Policies:

1. Require PIs to submit mentoring plans with NIH proposals for review and evaluation;
2. PIs must provide updates about their postdocs' progress/development in grant reports;
3. Require a suitable postdoc minimum salary supported by NIH funding (research awards);
4. Collect postdoc demographic information (if not already collected) to observe national trends; and
5. Create a database where academic semesters and new PI contact information is stored and exchanged by research agenda and location.

Programs:

1. Provide funding for postdocs as supplemental awards to a research award (Postdoctoral Supplement Award Program). NIH determines logistics for the supplemental awards (postdoc salary, duration of award, cohort training and development). Logistics are similar to the Trainee Fellowships, but the awards are supplemental to the PI (directly associated with a PI's research award);
2. Facilitate a program that funds/supports establishing or strengthening Postdoctoral Support Offices on campuses or at organizations;
3. Biomedical Training Faculty Incentives. Underrepresented Minorities (URM) have an expressed desire to teach but junior faculty roles do not compensate enough to service the enormous student loan debts;
4. Funded URM Biomedical Research Cohorts comprised of multiple academic institutions' junior faculty that provides support for mutual research agendas;
5. Provide funding for innovative multi-disciplined academic postdoc programs;
6. National Research Mentor Corps designed to offer long-term (2 to 5 years) support to URM Biomedical graduate students and postdocs; and
7. Evaluation for postdocs and mentors to determine strengths, opportunities, and areas for improvement regarding the postdoc training system.

Resources:

1. Conduct a long-term study of postdoc program impacts and opportunities for improvements;
2. Consider issuing a contract to adapt pilot/tested approaches for enhancing postdoctoral training, including improving/expanding diversity, equity, and inclusion (DEI) policies at institutions. This could be a RFP or sole-source requirement for 8(a) companies such as Peers.

Proven or promising external resources or approaches

Peers' recommends the development of policies to promote diversity, equity, and inclusion (DEI) to better support underrepresented minority (URM) researchers in seeking federal research funding. This is critical for a successful start to a career, when young researchers are tasked with securing federal funding that can often take one year or more to achieve. Peers partnered with the American Public Health Association's Faculty Development Initiative and developed a framework for mentorship and professional development that increases the scholarly productivity of URM faculty and likelihood for career retention, progression, and success. The project pairs minority faculty researchers at minority serving institutions with faculty at host research institutions who have demonstrated significant success in securing federal funding. The project also creates space for minority faculty to connect (formally and informally) and support each other.

This innovative model can be adapted to improve postdoc training and provide critical support to early career researchers. Other recommendations include:

1. Collaborate with organizations that support and enhance the training experience such as the National Postdoctoral Association;
2. Investigate initiatives at established Postdoctoral Affairs Offices (academia, industry) and recommended by groups such as the National Academies' committees;
3. Conduct a bi-annual national survey of URM graduate students and postdocs on barriers and facilitators to biomedical research careers;
4. Foster public-private partnerships that include interactive forums and collaborative research projects for academic postdocs and
5. Convene an annual meeting that brings new faculty together and fosters an environment that supports exchange of information and experiences.

Response 2282

Perspectives on the postdoc roles and responsibilities

A transition phase to greater and better things, but also a privileged time during which I can use the skills I learned during grad school to perform my most interesting and productive research.

Fundamental issues and challenges

Salary. Compared to industry peers, the salary is often 2-4 times less—to me this is by far the main reason why it has become so difficult to hire postdocs.

Additionally, postdoc who receive training grant funding (among other sources) do not receive W2s. This is a HUGE problem for us because we are at a phase of life during which we start families and often need to buy a home. Lenders do not recognize stipends as income, meaning "successful" postdocs who acquire funding are unfairly penalized and cannot secure home mortgages.

Getting stipends also means we lose eligibility for employee benefits such as health insurance, dental insurance, vision, and importantly, the opportunity to fund retirement 401k accounts.

I have brought up these issues many times with my institution and the answer always is "we can't do anything about it". I hope the NIH can.

Being a postdoc is a lot of work for very little reward—we will soon all be gone if you do not address these issues.

Response 2283

Perspectives on the postdoc roles and responsibilities

Acquisition of highly specific skills and train to become an independent, highly competent scholar in a specific academic topic (research or else).

Fundamental issues and challenges

- Need for child care and long-term support for postdocs including maternal leave, insurance coverage, alternative long-term staff positions (i.e., semi-independendent positions with resources associated to a lab) given the difficulty to obtain faculty jobs.
- Lack of professionalism in many of the young body of postdocs create a mismatch between the demands that postdocs have and what is expected from them. Previous training to match expectances would help/force institutions to match their demands.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2284

Perspectives on the postdoc roles and responsibilities

A transition between PhD student and PI, where research projects are developed more independently but with the support of the PI and without the responsibility of a whole lab on my shoulders

Fundamental issues and challenges

Salary ridiculously low compared to same job in industry, not much evolution possible within the postdoc position itself, and very low chance to get a permanent job in academia.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

I would hope for more permanent research jobs, not just PI positions but permanent scientific positions with competitive salary and benefits. Increasing these positions would also help labs to maintain a pool of permanent researchers, thereby enhancing their stability and making sure the expertise acquired during the training of PhDs and postdocs doesn’t just leave with the people who developed them.

Response 2285

Perspectives on the postdoc roles and responsibilities

My perspective on the role of the academic postdoc is that it is a training position for scientists who already have already accumulated years of experience through their PhD program and usually other research experiences as well. I think that the way academic postdocs are trained is to feed into faculty positions, which few will actually obtain. My own personal experience of being a postdoc is a positive one, as I have used this time to not only further my research skills and bolster my CV, but I have also developed other skills (including doing freelance writing) in an attempt to widen potential career options. Ultimately, I think that the modern academic postdoc position should serve as an incubator period for recent PhDs to further develop and prepare for a wide range of career opportunities. While I am happy with the responsibilities from a research and skill development (written/oral communication, mentoring, etc.) standpoint, I do think that there should be a more conscious effort to help academic postdocs develop realistic career plans and identify opportunities to develop the skills needed for their preferred career options.

Fundamental issues and challenges

From my perspective, finances are the fundamental issue driving PhDs away from the academic postdoc workforce. While many scientists love their work and enjoy the intellectual freedom that academia affords, we are still human. Postdocs have accumulated a high level of skill and experience and put so much of themselves into a demanding position. The compensation for that position should be higher than what it currently is. I have over 11 years of research experience and a doctorate, I should not be making roughly $10,000 more than the technician in our lab who has two years of experience. If my partner and I decide to start a family, I will have to go to industry because my current salary would not cover child care costs. Overall, I believe that the compensation for academic postdocs does not match the the skill/experience that postdocs have earned and their job responsibilities. Coupled with the slim prospects for continuing an academic career after your postdoc and the existence of more lucrative opportunities, an academic postdoc position has become a losing proposition for many PhDs.

Existing NIH policies, programs, or resources

I will focus on two main ways that the existing system can be improved

1. expanding opportunities like K awards that offer experienced postdocs financial support to transition and start their own lab and
2. allowing postdocs to be compensated from multiple funding sources. The first is self-explanatory and would expand the number of postdocs who are competitive for faculty positions, even if the outcome is more postdocs end up transitioning into research assistant professor roles within their postdoc department.

The second part is more nuanced and born out of the idea of wanting to increase postdoc compensation but not wanting to limit the number of fellowships awarded by the NIH and other funding agencies. Therefore, postdocs who receive fellowships should be rewarded by the program by allowing the PI to continue paying some stipend support (ie $20,000/year) alongside the fellowship, thus rewarding that postdoc with a raise. This opportunity would allow PI's to reward deserving postdocs, while providing incentive for the postdoc to remain in their current position.

Response 2287

Perspectives on the postdoc roles and responsibilities

It is supposed to be a training position to gain valuable experience in independent science. However it is frequently used as a low-paying science job.

Fundamental issues and challenges

Postdocs are frequently hired well below market price for their expertise and do not get to explore their own ideas. Even when they are able to secure external funding they are frequently forced to juggle independent projects with PI projects and are not rewarded sufficiently for the labor provided. International postdocs make up the majority of some fields (despite not being accurately represented at the tenure level) because domestic scientists will leave for industry or other higher-paying fields while international trainees have their visa sponsorship held above their head. Postdocs who have poor relationships with their advisor are frequently given trouble when finding new jobs which creates a systemic power imbalance and leaves postdocs very vulnerable to abuse in their relationship with their advisor.

Existing NIH policies, programs, or resources

Encourage budgeting postdoc wages at least commensurate with your fellowship programs for all NIH-funded grants. Make fellowships, training and career transition awards aimed at postdocs less biased (i.e. a trainee should not be discounted because they do not want to move to a new institution; this discourages postdocs from having personal priorities factor into their living situation).

Proven or promising external resources or approaches

No response

Response 2288

Perspectives on the postdoc roles and responsibilities

I viewed the postdoctoral position as a training ground/environment where the mentor would provide the postdoc trainee with training necessary for the postdoc to become a successful, independent principal investigator. In this environment, the mentor would provide at least one defined project that the trainee can work on and resources for the trainee to develop their own project. The defined project would help the trainee learn new material in the field of study. It would also benefit the mentor as their project can move forward from the trainee's output. It's important for a postdoc to be able to come up with their own project(s) that can be taken into their future career but that is not possible without funding (i.e. from their mentor, because let's face it, there's not enough T32 awards for everyone). This benefits the mentor as well, as they would be co-authors on any publications.

Fundamental issues and challenges

The simple fact of being a junior scientist who didn't come from a well-recognized lab puts any mentor at a disadvantage. Without a track record of mentorship, their trainees are often dinged on their grant training applications (e.g. T32 or the VA Career Development Award). An astute trainee will recognize this problem and seek to join a more affluent lab to advance their career, but much like T32 slots those are far and few in between. So in the end, the trainee will likely remain in that lab despite their potential to become independent at an early stage. This is usually taken advantage of by the mentor because the trainee advances their own projects at a low cost long-term. In the end, the trainee finds themselves as lab managers and their careers as academic researchers is dead. We need to normalize postdoc trainee grant applicants against mentors' track record of trainees, educate postdocs on what their training should look like (make this mandatory for all NIH funded institutions! because most places do not care what happens to postdocs), create career tracks for postdocs (because let's face it, not everybody really wants to or has the potential to do academic research), create better rules that prevent mentors from capitalizing on postdocs (especially at the expense of their career).

Existing NIH policies, programs, or resources

We need to normalize postdoc trainee grant applicants against mentors' track record of trainees, educate postdocs on what their training should look like (make this mandatory for all NIH funded institutions! because most places do not care what happens to postdocs), create meaningful career tracks for postdocs (because let's face it, not everybody really wants to or has the potential to do academic research) so that their career trajectory is obvious in the first few years (don't let them keep busting their chops to climb the ladder of an imaginary ivory tower when it's just not within their capabilities because that is a disservice to them and it wastes resources), create and implement rules that prevent mentors/institutions from capitalizing on postdocs (especially at the expense of the trainee's career), provide more information on the NIH website about what it means to be a postdoc trainee, what their career options are, etc. Create a method of reporting postdoc abuse without fear of retaliation from the mentor. I received an R21/R33 grant and had my mentor as Co-PI since the idea was partly theirs; they did absolutely nothing for the duration of the R21 but took funding from it and claimed percent effort on it, and to this day they are expecting me to include them in follow up grant submissions. I am afraid to say anything because I know how they are and what they can do to ruin my academic research career.

Proven or promising external resources or approaches

Look closely at what has made early-stage investigators successful and remove the impact of their mentor from that, then think about how we can apply that to postdocs who are genuinely interested in an academic-based research career. If I could give you an example of what is proven to enhance the postdoctoral training program, I wouldn't be crying as I write these suggestions. If we can have policies in place to protect research animals (OLAW) and human subjects (OHRP) in research, why can we not have policies in place to protect postdoctoral trainees? Leaving this to the HR of institutions results in very limited actionable options.

Response 2289

Perspectives on the postdoc roles and responsibilities

As a social work PhD interested in translational and interdisciplinary science, having a postdoc has been instrumental in moving me closer toward the goal of being hired on as faculty in an academic medical center rather than in a school of social work. This also has provided me the best opportunity to become an independent scientist since it connects me to phenomenal mentors and helps me launch my career.

Fundamental issues and challenges

I'm a mom of two children under the age of 3 (my youngest is 6 months). I notice that there are very few new moms in the postdoc space because it is so extremely difficult to maintain productivity while trying to care for yourself and your family postpartum. I am lucky that I have a partner whose salary can help support our family, but without that—and without a significant side-job that I do in the evenings after my children are in bed—we would not be financially solvent. I know that it would be difficult, if not impossible, for a number of reasons to just increase the postdoc funding level, but even living in a relatively affordable midwest town I know that there's no way I could provide for my family on a postdoctoral stipend alone. It is stressful because it means that I have to maintain other work and effectively work two jobs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2290

Perspectives on the postdoc roles and responsibilities

I am using a postdoc as a stepping stone between my PhD and starting a company. Therefore, the postdoc position means to me an opportunity to learn about the commercialization process of the university and how to transition the technology outside of the academic space. Along with this, the postdoc position is an opportunity to publish papers and refine any applicable research skills and broaden my network.

Fundamental issues and challenges

Pay compared to cost of living. Comparison of the postdoc salary versus other PhD roles doing very similar tasks. Lack of moving assistance or partner recognition/placement. Lack of signing bonuses which make the transition between jobs attainable.

Existing NIH policies, programs, or resources

The NIH minimum postdoc wage increased. NIH R01 and other PI level grant budget increase to account for inflation and the increase in university overhead percentage taken.

Proven or promising external resources or approaches

No response

Response 2291

Perspectives on the postdoc roles and responsibilities

The role of an academic postdoc is to act as an independent researcher while under the mentorship of an established lab head, in preparation for a future faculty position, or possible role in research outside academia and/or hybrid career encompassing both academia and industry (which should be encouraged to become more common in the future.)

Fundamental issues and challenges

NIH salary cap is not competitive and has not kept up with current economic trends. There is a huge disparity between what is expected of a postdoc and how they are compensated, which can be hard to

reconcile. The demands are high, proper compensation will encourage more postdocs to meet these demands instead of going to industry in search a better effort to reward tradeoff.

Existing NIH policies, programs, or resources

Increase the salary cap to provide a competitive wages to postdocs, preventing talented researchers from going to industry due to monetary concerns.

Proven or promising external resources or approaches

Forge more partnerships with industry, it should not be "either/or", industry should not be so separate from academic research. Provide more training resources at institutions where postdocs are, so that they can learn how to be successful as a postdoc and beyond. Currently these resources are few and can be hard to find, and sometimes are only available to trainees that have been selected for awards.

Response 2292

Perspectives on the postdoc roles and responsibilities

It seems to me that a post-doc is another, very long delay in being an independent and stable academic. The application process is long and arduous, you almost always are not being compensated enough for your incredible level of training, and in many cases it doesn't seem to be all that different from graduate school.

Fundamental issues and challenges

In the institutions I've experienced post docs are not very integrated into the community and the institution doesn't have any hand in changing that. It's the responsibility of the post docs themselves to do it. Academia is taking their own fully trained PhDs and gatekeeping career advancement for an additional 4-7 years AFTER a PhD and that leaves the persons entire young adult life completely unstable and underpaid. Academia should be rewarding those that stay in the environment that trained them more than a job that only requires an undergraduate degree. The entire time a trainee is in grad school and doing a post doc they are losing opportunities and stability in establishing a career elsewhere. The environment is also designed to belittle anyone who hasn't achieved tenure, which extends this problem of instability.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2293

Perspectives on the postdoc roles and responsibilities

Postdocs contributions are important and pivotal in biomedical research. They are the crucial and important workhorses pushing the frontiers of research by developing cutting-edge research techniques needed to put the US at the forefront of global innovative discoveries.

Fundamental issues and challenges

These include poor remuneration. Postdocs have already completed, on average, more than 7 years of training after high school. Unfortunately, they are paid less than fresh undergraduates that had only 4 years of post-high school training. Some universities are not even contributing to the pensions of their postdocs.

The working hours leave no room to engage in leisure activities; therefore, they are stressed while poorly paid.

Lack of upward career mobility (i.e., securing a faculty position) is endemic. Some principal investigators also exploit their postdocs, especially international postdocs.

Existing NIH policies, programs, or resources

The salary scale needs to be reviewed upward to be commensurate with MD fellows and reflect the years of working experience that postdocs have.

More early career awards with eligibility for international postdocs that are yet to have permanent residency or citizenship should be established. The current K99 is not enough for the 4-year post-PhD condition in most NIH organizations. Most of these international postdocs, who make up the bulk of postdocs in the US, are just getting their research started and might not have enough publications in their new lab here in the US to support their K99 application and have a chance at being funded.

PhD's lose their early career status 10 years post-PhD compared to 10 years post-fellowship for MD's. Including the postdoctoral training periods for PhDs is not fair, as they are neither independent nor running their own labs at this stage of their career. This is penalizing PhDs for working as postdocs and discounting their contribution to the biomedical field while being poorly paid. Early career status for both PhDs and MDs should be the same, i.e., until they have a junior faculty position.

Principal investigators should be held accountable for the career trajectory of their postdocs while receiving NIH grants. The lack of intentional and meaningful mentoring is a major contributor to the challenges of recruiting and retaining postdocs.

Proven or promising external resources or approaches

There's a dire need to improve the pay package, mandate payment of a contributory pension by all institutions receiving NIH support and create a way to hold both the principal investigators and the postdocs accountable for their career progress—or lack thereof. A mentoring team, including the primary mentor and other PIs should be set up at each institution. Postdocs should set their career goals for the year in consultation with their primary mentor. This document should be signed by both parties and discussed with the mentoring committee at the beginning of the job year. A progress report should be submitted at the end of the year in a meeting with all members of the mentoring team. This progress report should be included in reports submitted for the renewal of NIH grants that support the postdocs.

Response 2294

Perspectives on the postdoc roles and responsibilities

Academic postdocs are primarily transitional roles to prepare an individual scientist for their independent career. In the past, this career was typically pursued in academia as tenure-track faculty. However, due to the large disparity between available faculty positions and graduate students/postdocs, it has become increasingly normal to complete a postdoc before transitioning to industry. But the primary roles and responsibilities of postdocs remain the same. We pursue and complete scientific endeavors with much greater independence and experience than normal students. We also maintain a responsibility for mentoring and aiding the next generation of undergraduates and graduate students for their future scientific careers.

Fundamental issues and challenges

The answer is simple. Higher salaries. How can any institution expect to retain postdocs when they can pursue alternative paths to more lucrative careers. The minimum postdoc salaries mandated by the NIH are still below $55,000. The average industry salaries for newly minted PhDs are $100k+. This is not rocket science.

Existing NIH policies, programs, or resources

There is still much confusion revolving around what qualifications industry or academia are looking for in their candidates. There is also extremely limited information regarding alternative career paths for new graduates and postdocs. The sheer flexibility and plethora of available choices that one can take is almost paralyzing in its breadth and scope. Without a more standardized system put in place governing postdoc salaries, benefits, expected responsibilities, enforceable rights, and potential career paths, most students will consider becoming a postdoc as a "waste of time and money."

Proven or promising external resources or approaches

The recent salary increases mandated by the postdoc union in the UC system and Harvard/MIT is probably the best example of an approach with a realistic chance of achieving the desired goals. There are plenty of universities where postdoc pay is barely above those of graduate students. Ridiculous.

Response 2295

Perspectives on the postdoc roles and responsibilities

I view postdoctoral positions in the US as transient jobs meant to help make them more competitive for academic and non-academic science positions; however, it seems that these positions are becoming lengthier and more demanding, making them less transient and more draining. Regardless, many use their postdoc position to strengthen their professional network and to publish their work, although neither of these are guaranteed. The responsibility of a postdoc should be to learn to become an independent scientist, and to be able to demonstrate these learned skills through applications and interviews for their next position. Even though they are often called trainees, I do not see them as trainees—they are researchers that produce world-class scientific work. I also view these positions as unnecessary for many, as faculty positions are scarce and training is minimal to non-existent (e.g., postdocs are viewed as workhorses, and receive very little didactic instruction), and advancement in non-academic careers often do not require workers to have completed a postdoctoral position.

Fundamental issues and challenges

The most fundamental challenge for postdoc recruitment is salary, both in amount and in classification. Most institutions view the NIH minimum salary as a de facto standard, whether the NIH agrees with this practice or not. This means that many postdocs, many whom are family planning at this stage in their lives, often do not make enough money to support one child in their respective city (see MIT living wage calculator). What other field pays so little after >5 years of training and a terminal degree? Additionally, being awarded an NIH fellowship often leads to increased taxes (due to employment reclassification), and loss of already abysmal retirement options (often no contribution matching before the award, and then no employer retirement option after the award). I know many postdocs are nearing their 40s and have yet to contribute to retirement during these most crucial years of financial life. As for retention, since being a postdoc, I've been inundated with personalized industry job interview requests offering over three times my current postdoc salary—it is very tempting. In fact, many of the best early-stage scientists that I know have left for non-academic positions and it makes me question my current situation constantly. Am I making a poor decision by choosing to stay in academia? On top of it, there is often no help with moving expenses, costing many postdocs thousands of dollars just for the privilege of working in a lab that is not at the same institution where they trained as a graduate student. In a nutshell, the postdoc position selects for those who already have some financial advantage or are willing to place themselves at a financial risk—and because of this inherently selects against URMs.

Existing NIH policies, programs, or resources

NIH could alter the minimum postdoc salary to be city-dependent (this is already done for federal per diem rates, for example). In fact, the NIH pays its intramural postdocs more than the extramural minimum, demonstrating that even the NIH acknowledges that the current minimum is not enough pay their own postdoctoral workers. NIH policy could also stop referring to postdocs as "trainees" and instead acknowledge that they are highly trained scientists that complete work for the NIH by conducting science for the grants or fellowships that pay their salary, and often serve mentorship roles for graduate students, research assistants, etc. Additionally, the payback obligation for the postdoctoral NRSA is downright draconian, and only serves to punish individuals who are likely already in extreme situations—this policy needs to be abolished immediately. It's worth underscoring this point: at my institution, if I was awarded an NRSA, I would now have to pay additional taxes on my health benefits, would not experience a pay bump, and would lose access to employee retirement plans. Further, if this became too much of a financial burden (e.g., health, family) I would be obligated to pay my salary back to the NIH depending on my overall time as a fellow. Why would I put myself in that situation? NIH could also require institutions on T grants to create postdoctoral committees that consist of their mentor and other faculty at their institution. Doing so would increase postdoc success by providing more diverse mentorship and would increase networking and collaboration opportunities. This is important because many postdocs are at new

institutions and in new environments that lack the community building often found in graduate school and even at the faculty level.

Proven or promising external resources or approaches

The most effective approaches to bolster career retention have been implemented in non-academic (e.g., industry) positions, which, non-coincidentally, are the positions that most new PhD graduates pursue in lieu of a postdoctoral position. In fact, all five of the PhD students in our lab do not plan to pursue an academic position after graduation. Most of them have competitive publications and fellowships (e.g. NIH NRSA, HHMI Gilliam Fellowship, NSF GRFP), yet the fear of financial insecurity is so rampant that even these metrics of success are not enough to retain these students. I believe that the reason new PhD holders favor non-academic environments are the following:

1. guaranteed paid parental leave, often for 6 weeks or more;
2. competitive (>$100K) salaries;
3. more reasonable hours in larger companies (i.e., "9 to 5"); and
4. employment status (salaried employee vs contractor).

The reason why postdoc retention and recruitment are at an all-time low is abundantly clear: postdocs are paid too little for the amount of work we are expected to complete (see https://doi.org/10.1038/d41586-023-00332-6, and doi.org/10.1038/s41587-023-01656-4). I do not believe that the issue of retention and recruitment is greater than this singular fact. While improvements in training, working environment, mentoring, and job satisfaction would be a boon to academic postdocs, unless we are provided financial stability that is equivalent to industry careers—and soon—postdoctoral interest will continue to decline.

Response 2296

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should help you find your topic of interest and should encompass a learning environment for your future career.

Fundamental issues and challenges

Salary is the biggest current issue, affecting quality of life. Not knowing if you will be able to obtain an academic posterior after completing the post doc is also a big issue. Benefits during your postdoc are also affecting quality of life. Unknown expectations or unattainable expectations for PI's while salaries are so low is also an issue.

Existing NIH policies, programs, or resources

Modify and establish a higher minimum salary for postdocs.

Proven or promising external resources or approaches

HHMI and other fellowships that have clear paths for postdocs and guarantee a good quality of life.

Response 2297

Perspectives on the postdoc roles and responsibilities

A postdoc is a position to continue researching and to prepare yourself for an independent tenure track position

Fundamental issues and challenges

Postdocs are ridiculously underpaid

Existing NIH policies, programs, or resources

Pay us more

Proven or promising external resources or approaches

Raise the minimum salary

Response 2298

Perspectives on the postdoc roles and responsibilities

Postdoc is doing graduate school again, but more is expected of you. It means terrible pay, long hours, and sacrificing what should be the best years of your life in the pursuit of publications. Without a productive post-doc that consumes your life, your hopes of ever becoming a professor is near 0. And even if it does consume your life, circumstances will often fail you.

Fundamental issues and challenges

Terrible pay, long hours, incredible pressure to publish, and uncertain outcomes afterwards.

Existing NIH policies, programs, or resources

Increase the pay.

Not (essentially) requiring previous funding to get funding from the NIH.

Proven or promising external resources or approaches

Higher pay improved retention and wellbeing across jobs.

Response 2299

Perspectives on the postdoc roles and responsibilities

I am a late-stage graduate student. I defended my dissertation last week and have secured a postdoc position at an academic institution. I see the academic postdoc as a pathway to gain greater expertise in a chosen field. If a trainee wants to learn specific skills in a chosen field, it is going to be easier to justify this goal in academia than it would be in an entry level position at a company. Perhaps the greatest merit of academic science is the independence and individuality that it provides the scientist. I see the responsibilities of a postdoc as similar to that of a graduate student, but with greater independence. There is more freedom to establish ones own collaborations and side projects. There is an expectation that the postdoc can work more independently on grant and paper writing. The conceptualization for a paper should be done by the postdoc with supplemental input from the mentor.

Fundamental issues and challenges

While technically any person from any background should be able to access and succeed in academia, we all know this is not the case practically. Low wages during graduate school are a deterrent, and do not provide any kind of safety net for emergencies. If a student is not fortunate enough to have a generous family member to help with unexpected expenses, this can mean 5-7 years of counting pennies, never traveling, missing weddings and other fun events. Additionally, it forces the trainee to put off family planning home buying. While the postdoc salary is better than the student stipend, it is still far, far less than what a PhD level scientist can make in industry. Again, we see trainees choosing not to have children, or to have them and deal with the immense stress and cost of childcare on a 55 k per year salary. With inflation, the times are getting tougher. Meanwhile, just over the fence lies the green, green grass of industry, promising a better work life balance and better compensation. However, if a trainee leaves academia, they give up the incredible opportunity to work on what is most meaningful to them scientifically. This is why I chose to stay in academic for a postdoc. But I am painfully aware of the sacrifices required to do this. If not for the financial strain, I would absolutely want to be on the faculty track. Realistically, I doubt I will be able to do that.

Existing NIH policies, programs, or resources

The NIH should increase the recommended salaries for postdoc fellows.

Proven or promising external resources or approaches

No response

Response 2300

Perspectives on the postdoc roles and responsibilities

The postdoctoral phase is a critical role in the development of researchers, and it is incumbent upon us to provide the resources, tools, and support that people need to thrive in their careers. Because postdoctoral researchers are responsible for advancing research and scholarship, effective communication is important to their work.

Fundamental issues and challenges

There is a lack of research-based science communication training opportunities for postdoctoral researchers. As [redacted for anonymity], I understand how important it is to provide well designed, research based science communication. My organization supports thousands of scientists to learn how to communicate more effectively with diverse audiences. Science communication training is essential for interdisciplinary collaboration, reaching diverse public audiences, supporting leadership development, enhancing teamwork, and working effectively across a range of institutions. We can no longer afford to leave it to chance that scientists learn to communicate effectively on their own—science communication training should be part and parcel of how we build the future scientific workforce.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

All junior scientists need to receive science communication training as part of their NIH awards. Creating standards based in the research on science communication should undergird training efforts so that postdocs receive training that has been developed and assessed by experts. It is hard to overstate the importance of science communication, especially in areas of research funded by NIH.

Response 2301

Perspectives on the postdoc roles and responsibilities

- I view the PostDoc position as someone who is experienced well enough that s/he can run their project independently. With their wider knowledge of the subject they have gained during their grad program, they are equipped to run high-risk long term projects.
- They are are also a step closure to their PIs and are well equipped to carry their extra load by helping them in writing research grants, guiding the grad students and handling the lab duties.
- It is also the time they are trained to understand the duties **and responsibilities** an independent faculty carries.
- It the best phase of a researcher when s/he has a lot of new ideas to implement and execute them by themselves.
- It is the time they can produce their best results in terms of publications. They are energetic and experienced both at the same time and do not carry the extra responsibilities of a young faculty member. That allows them to spend their time in executing their projects.
- But this should not go beyond 3 years, otherwise this can steadily inculcate the depression in absence of career advancement.

Fundamental issues and challenges

- PostDoc life is delicate in terms of job security. While NIH frequently uses the term “trainee” but PIs don’t see it that way. They see PostDoc as an employee whose job is to work for them so that they can advance their own career. Their is no room for exploration or research. They often say—Publish or Perish in a limited time! Things are worse for international scholars whose visa is tied to the position. The moment they are fired, they need to pack up. I was fired by my PI in the middle of the pandemic despite I worked with him for more than four years and had published numerous papers. He did not like paying someone when lab was closed due to lockdown.

- Corporate often have a norm to pay 2 to 3 months extra salaries after an employee is laid off as a compensation. The Postdocs don't get that financial security. NIH can think of implementing such norms.
- The PostDocs are highly underpaid. If one compares with their peers in the industry, they feel less worthy to the society. Considering most of the Postdocs are married and are in the phase of having children, they find it hard to meet their ends financially. On top of that managing an expensive health insurance for the family, particularly when one of the parents is home maker, is super hard.

Existing NIH policies, programs, or resources

- The first and foremost step NIH should do is to raise the compensation.
- A big problem that all the postdocs face is to get a faculty position. The vacancies at the level of Assistant Professor/Independent PI is disproportionately low in comparison to the number of PostDocs. Quite clear, not everyone is going to be absorbed into academia/scientific institutions. Academia doesn't have a clear career path for them. What will they do if they do not get a position of an independent PI? There is no escaping route for postdocs, they are trapped in the vicious cycle.
- Oftentimes, the faculty/research track positions in the academia go to grads and PostDocs from big brand universities. NIH can help create and fund more positions of independent careers for the senior PostDocs working in the tier 2 and tier 3 universities.
- The new grad students when they see our situation, our low pay, our day-to-day struggles they feel discouraged to join postdoc. That when coupled with no clear career pathway after a certain years of experience, they become inclined to join industry where annual raise is much higher and job securities are better than a postdoc's.
- PIs often find ways to not continue with a senior Postdoc after certain number of years as they have to pay more to them per university rules. NIH should find ways, if needed support the PI/Postdoc with extra funds that will keep save their career until they find secured positions.

Proven or promising external resources or approaches

Well, I don't really understand what this question is expecting. I am answering based on my best understanding.

- NIH when funding or paying for grad or postdocs in a lab, always seek their report that details about the next job they have taken up when they have moved out and if they are satisfied with their career progress.
- Did they get enough support from their PIs? The role of PI is important in academia as it is highly driven by reference/ network/ personal connections.
- If they are in the Postdoc for too long, always ask what holds up them. What are their future plans?
- Open a channel in NIH where PostDocs can seek their advice on career related questions.
- A big shortcoming of the academia is that it is highly Reference letter driven system. You can not seek a new position unless you produce a letter of recommendation from your past supervisor. This further limits the career options for the postdocs.
- Try to mitigate this culture of reference letter. This provides a tool of exploitation and generates a system of sycophancy in the hierarchy. PostDocs are hesitant in asking for a letter from their PI every time they apply to a new place. If you ask me one immediate step that NIH must take to help PostDoc, I would suggest you to get rid of reference letter culture!

Response 2302

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a pathway to doing scientific research, which I enjoy doing. In order to stay in academia to do research, I must be passionate about science. The position requires me to use skills acquired through my postgraduate study to find solutions or insight into complex problems.

Fundamental issues and challenges

Relocation for a temporary position (one or two years) with low pay and lack of retirement contribution matching is discouraging.

Existing NIH policies, programs, or resources

Higher salaries, better benefits and mandatory retirement contribution matching.

Proven or promising external resources or approaches

Higher salaries would improve recruitment. More benefits packages would improve retention.

Response 2303

Perspectives on the postdoc roles and responsibilities

I see the postdoc as the primary driver of biomedical academic research progress. Without postdoctoral researchers, the development and implementation of new technologies in the neuroscience field would be significantly reduced. Currently, cutting edge techniques require significant technical skills that can only be developed by years of academic training. Without researchers who have this training, we would not see the developments we are currently experiencing.

Fundamental issues and challenges

I am constantly having to choose between forwarding my progress in life (securing housing, financial stability, having children) and my career. I don't expect all careers to compensate equally, but leaving graduate school with in demand skills it is becoming more difficult to justify a career in academic research. Current and future prospective postdoctoral researchers are aware of the significant opportunity cost of a postdoctoral position, and are increasingly pessimistic about the upside. The majority of trainees in my graduate cohort did not consider a future in academic research even in their first year of graduate school. I don't think this is a bad thing, as higher-level education is and will continue to be a major economic driver in our technology and service-centered economy. However, I do think that academic research will need to at least attempt to compete for recruitment if there is any interest in maintaining a fraction of the current biomedical research pipeline.

Existing NIH policies, programs, or resources

NIH salary guidelines for postdoctoral researchers need to be increased. The current level is not sufficient to retain or recruit talented, in demand researchers. In addition, there needs to be clarification of the difference between a guideline and a minimum. The NIH minimum salary is often communicated by University staff as a "guideline", and I have been told that they cannot pay more than that salary. This is obviously false, but inaccurate communication from NIH allows this obfuscation. Additionally, NIH salary guidelines should be changed based on cost of living. This could be tied to indirect cost negotiating. While NIH does not negotiate indirect costs, my understanding is that institutions receive different indirect costs based on their own negotiations. The same institution should not be requesting higher indirect costs while turning around and paying researchers the NIH minimum in a high cost of living area. I think that it would be wise for NIH to reexamine how indirect costs are awarded if it is interested in maintaining this form of research support. Changes to indirect costs has had support in both Democratic and Republican White House administrations. If I were interested in reducing budget expenditures or moving money to where it could be better used, I would go straight for that money. Some institutions are pulling in billion dollar returns on their endowment while pocketing 62% of a federal grant. Imagine the political support for reducing that money.

Proven or promising external resources or approaches

You can work as hard as you want increasing training, mentoring, work environment, but you will get very little return compared to what you would get from increasing salaries. In my experience, initiatives focused on increasing these aspects at both the federal and university level are a complete waste of money that could go toward paying researchers what they are worth.

Response 2304

Perspectives on the postdoc roles and responsibilities

At [redacted for anonymity], postdoctoral positions provide up to five years of mentorship and training under the supervision of a principal investigator. The primary goal of postdoctoral fellows at [redacted for anonymity] is to develop and implement an independent research project that expands the postdoc's technical and intellectual expertise. Together with opportunities to engage in service, teaching, and professional development activities, the postdoctoral training program at [redacted for anonymity], aims to provide the experience and knowledge essential for career advancement.

The purpose of the postdoctoral position is twofold—training and research. Postdocs are simultaneously trainees and highly skilled professionals. They design, execute, analyze and disseminate research. Their innovative ideas and their skilled work are critical to the U.S. biomedical research enterprise and to our institution.

Because of the high value we place on postdocs and their contributions, [redacted for anonymity], provides competitive compensation, benefits and professional development to all our postdocs. We pay well above the NIH NRSA minimum levels, offer the same benefits we offer other employees, and fund a multi-person Office of Postdoctoral Affairs to ensure our postdocs receive rigorous, comprehensive and personalized training.

Fundamental issues and challenges

[redacted for anonymity], has struggled to recruit postdocs for the past few years. The decline in applications started a bit before the COVID-19 pandemic but was certainly exacerbated by it. From our experience, new biomedical science PhDs are now asking how specifically postdoctoral training will benefit them and their careers. Whereas it used to be a default career stage, graduate students are now approaching the postdoc more intentionally.

This intentionality is a good thing; we want postdocs who are at [redacted for anonymity], purposefully. However, prospective postdocs are now much less likely to accept issues that have existed in U.S. postdoctoral training for a long time—low pay, meager benefits, poor work-life balance, exploitation, and unclear job prospects. [redacted for anonymity], has worked very hard to fix these problems through high pay, good benefits, appropriate oversight of postdoc training, comprehensive career development, and career paths for scientists with postdoc training. However, many institutions have not, and this impacts all of academia as graduate students decide not to pursue postdoctoral training.

Existing NIH policies, programs, or resources

Postdocs should be paid more than a living wage. They are highly skilled professionals critical to the biomedical research enterprise. Academic science is heavily government-funded and not-for-profit, so we do not think postdocs can expect salaries commensurate with industry. However, they certainly should be paid more than the current NIH NRSA minimum, which is commonly used by many institutions. We recommend that NIH consider increasing the NRSA levels with cost-of-living adjustments based on geographic location (e.g., in similar fashion to the OPM salary locality tables). We also recommend that, for postdoc NRSA awards, NIH consider decreasing the allocation for training-related expenses and adding this to the stipend amount.

Postdocs are typically in their 20s and 30s. Many are married with working spouses, have children and/or are supporting relatives. They should receive the same benefits as other employees. NIH policy has made this particularly difficult for [redacted for anonymity],. We want to employ all our postdocs and offer them our comprehensive benefits package, but NIH's ambiguous policy on NRSAs precludes us from doing so. We recommend that NIH update the NRSA policy to explicitly allow institutions to employ NRSA postdoctoral fellows.

Multiple reports have called for more permanent, doctoral-level research positions (e.g., research or staff scientists). [redacted for anonymity], greatly values our research scientists, and this is a clear and well-used next step for our postdoctoral fellows. We recommend that NIH expand the R50 mechanism to recognize and explicitly fund this important position.

Proven or promising external resources or approaches

One of the best approaches to improving working environment and job satisfaction is happening right at NIH in OITE. OITE has developed an outstanding model for supporting intramural postdocs and disseminating effective approaches outside NIH. [redacted for anonymity], who leads our postdoc office, has attended train-the-trainers sessions on facilitation and on advising, and has implemented what she learned at [redacted for anonymity],. We recommend NIH continue and expand this type of programming, which is of great benefit to extramural institutions.

The Entering Mentoring program from the University of Wisconsin Center for the Improvement of Mentored Experiences in Research (CIMER) is an evidence-based training program that has been shown to improve mentoring. At [redacted for anonymity],, we offer this training to both PIs and postdocs. We realize that requiring training for PIs places an additional burden on institutions and on PIs, who are already overburdened. However, CIMER's recommended training modules are eight hours and cover key topics such as setting expectations, providing feedback and culturally responsive mentoring. We believe this training is worth the time, money and effort because it improves our postdocs' job satisfaction and working environments. Our PIs who have completed this training indicated upon evaluation that it was a valuable use of their time as well.

Response 2305

Perspectives on the postdoc roles and responsibilities

It is like a training and learning new skill and advancing the already known skills.

Fundamental issues and challenges

Salary is very less.

Existing NIH policies, programs, or resources

Should consider the competitive salary as per the market.

Proven or promising external resources or approaches

Should implement the timing and if working extra hours than should be paid for that.

Response 2306

Perspectives on the postdoc roles and responsibilities

I view my role as a semi-independent researcher. I have to have ownership and take responsibility for my projects, and learn what it means to be truly independent.

I need to figure out my strengths and weaknesses, and improve upon them.

I should learn as many techniques as I can, attend meetings to network, and become a specialist in my field.

Fundamental issues and challenges

1. Almost every graduate student and postdoc I have ever talked to feel that PIs see postdocs as cheap labor. Did I go through 6 years of a PhD to get paid 55K? It feels like schools specialize in ways to avoid paying NIH minimum anyway, but maybe those are post-docs who started before NIH minimum was raised.
2. Most postdocs are in their 30's, have been putting off having children, and there is a lot of social and biological pressure to have children at this stage. If you are a bench scientist and want to have children, few PIs will accept you.
3. PIs seem to fondly remember the few weeks where their projects required them to work 80+ hours and carry that expectation forward for everyone who works for them. It is not realistic to support a whole family or pay for childcare on a postdoc salary.

Existing NIH policies, programs, or resources

Universities primarily select PIs based on their ability to get grant funding. Other traits seem to be marginal. I think there have to be required trainings on how to be a mentor. I think a lot of PIs truly do not know, and schools don't care because there is always a fresh crop of bright-eyed students and postdocs who think they can avoid previous problems. Mandatory trainings on mentorship that someone from NIH sits in on or leads, are the only reasonable thing I can come up with.

Proven or promising external resources or approaches

No response

Response 2307

Perspectives on the postdoc roles and responsibilities

The role of post-doc is designed to fill any gaps in training necessary for someone to become an independent investigator in their own right. This typically means taking on larger project administration roles (and if someone is lucky, project design roles), as well as mentorship. Postdocs are often also beginning seeking independent funding for their future roles. That's the best version—in the worst version, it's an exploitation of someone's expertise in service of a "mentor's" needs for underfunded labor.

Fundamental issues and challenges

The three primary issues in quality of life of post-doctoral training are

1. funding;
2. requirements for relocation;
3. irrelevance for many career paths.

First and foremost, the funding for NIH postdocs is abysmal. Generally speaking, postdocs are incredibly underpaid for the level of expertise that a person brings to the role, and the funding has not nearly kept up with cost of living/inflation. Especially given that so many graduate programs are severely underpaid and many post-docs start with either debt or significant financial instability, such low salaries can impede financial stability, retirement, and the ability for post-docs to progress in other domains of their lives (e.g. starting a family, caring for aging relatives). These are compounded by the requirements for relocation, which also bring social disconnection, and impair research grounded in community. Finally, postdocs are becoming increasingly irrelevant for many career paths that graduate students take. Further, many of those paths are accessible immediately out of graduate school, and don't require relocation (or if they do, they promise much more permanence than a postdoc does), and are often compensated around twice as much as a postdoc would be. All in all, the opportunity cost of a postdoc is becoming less and less worth the slim chance that someone will progress to tenure-track faculty.

Existing NIH policies, programs, or resources

Substantially better pay (think a minimum of a 20,000$ increase to be remotely competitive). Shorter turn around for funding cycles (e.g. I applied for an F32 December 2022, but won't find out until May 2023 if I received it—which makes it difficult for me to line up other positions when my current graduate position ends July 2023 and I'm stuck in limbo—I'd like to take it if I get it, but I need to have alternative options, but may end up leaving them in a bind).

Proven or promising external resources or approaches

No response

Response 2308

Perspectives on the postdoc roles and responsibilities

Post-docs should be viewed as apprentices. I do my best to set them up for success, either by giving them (supervised) leadership roles on projects/grants or empowering them to take their next steps with confidence in whatever task/role/capacity they believe is consistent with their own personal career goals (not mine).

Fundamental issues and challenges

There are proximal and distal challenges: NIH-set stipends that do not meet the cost of living in the local area, the bleak prospects of academic careers (low supply of positions), and availability of alternative careers. I think my trainees are just more knowledgeable of and confident in their value outside the typical academic career path, and many other trainees are taking advantage of it. There are a lot of pluses to academia (flexible schedules, intellectual freedom) so I try to be as transparent about those things.

Existing NIH policies, programs, or resources

- Improve stipends to reflect local cost of living
- More pathways to academia (more funding for F/K awards)
- More pathways for physicians to engage in research (without institutional punishment for not meeting RVU targets)
- More opportunities for physicians-in-training to compete for research funding

Proven or promising external resources or approaches

No response

Response 2309

Perspectives on the postdoc roles and responsibilities

Take my career to higher levels.

Fundamental issues and challenges

- Matching retirement benefits (Postdocs at [redacted for anonymity] are not eligible for retirement benefits)
- DS2019 which is issued only for 1 year at [redacted for anonymity], creates a lot of complications and stress surrounding visas for international postdocs
- The salary increases each year, according to the postdoctoral NIH table do not accompany inflation. Moreover, Postdocs pay many taxes, mainly the Federal tax, which becomes the academic salary minus attractive if compared to the industry.

Existing NIH policies, programs, or resources

Response 2310

Perspectives on the postdoc roles and responsibilities

As a postdoc I independently led and pioneered many avenues of research leading to high profile publications while receiving F32 funding. I had a very successful postdoc, a great advisor, awesome results. So I hope you can take this perspective as the clear-eyed assessment that it is. Like most, I was more or less prepared to be a professor after my PhD training (as we can agree historically is the case, and remains the case in many disciplines), but we know that's not how the game is played any more. Too many PhDs, too few positions. So to me, the postdoctoral position is a holding place and a job. A PhD is training (arguably also severely underpaid), but a postdoc is your job. And it is not a great job for having a rich life and it is generally a bad return on investment. You do research, as much as humanly possible, and you wait. It is essentially a way to exploit more labor out of young scientists for less pay for longer. See also: the rise of the postbach. I thank God that postbachs were not normative in my undergraduate days. But now I see great students forced into postbachs to the NIH's glee. In neuroscience, very few areas in industry take a postdoc into consideration. It's basically like it didn't happen. So, what makes it a training position? Well, maybe if we consider living your life and the lessons that provides. sure. then under that definition I agree. The postdoc is a training position. However, using this logic. a job that pays

a living wage, a job that allows you to have time for a family. that is a training position too. Arguably you would learn more in the latter.

Fundamental issues and challenges

THERE IS NO NON-ACADEMIC TRAINING IN A CAREER PATH WHERE FEWER THAN 10% OF PEOPLE HAVE A TENURE TRACK POSITION AVAILABLE TO THEM. REQUIRE NON-ACADEMIC TRAINING. REQUIRE IT. IT'S SO OBVIOUS YOU COULD PROBABLY ASK 5 PEOPLE.

Sorry for shouting, just want to make sure the obvious thing is available to you. Now maybe a bit of satire?

40 years ago. somehow. people in biology created labs, published high profile papers, won Nobel Prizes. and nobody received "postdoctoral training"! Isn't that something? Isn't that. incredible? The NIH must really wonder how that was possible! It's almost like.modern day postdoctoral positions are completely fabricated to allow passion exploitation and wage suppression, sometimes indefinitely, on highly trained, highly skilled scientists? No. Surely, SURELY not. Imagine how much money in training the NIH would save if you could recreate a system that didn't require postdocs! I think it's worth setting up a few Funding Calls about. Hiring a few program officers to sort out. It could amount to billions of dollars saved in a short period of time. It could even have trickle down effects to over-sized PhD programs. and knock-on savings! In addition, imagine the improved quality of life: fewer people paid $30,000 / year for 5-7 years in the most expensive cities in the world before being forced into an arbitrary system of prolonged "training" until the age of 40! Could NIMH fund a study on the mental health benefits of such a plan? Is it possible that a less exploitative system would also lead to less sexual harassment and psychological abuse? It's a fundable hypothesis.

Existing NIH policies, programs, or resources

REQUIRE NON-ACADEMIC TRAINING IN F31/F32 GRANT SERIES. REQUIRE NON-ACADEMIC TRAINING IN DOCTORAL TRAINING GRANTS. REQUIRE NON-ACADEMIC TRAINING IN K SERIES. REQUIRE NON-ACADEMIC INTERNSHIPS. WHO IS RUNNING THIS SYSTEM? YOU ARE.

Proven or promising external resources or approaches

1. Pay more.
2. Adjust for cost of living in the pay.
3. REQUIRE NON-ACADEMIC TRAINING. REQUIRE IT. It's not a little line item somewhere. REQUIRE IT.

Response 2311

Perspectives on the postdoc roles and responsibilities

I think a postdoc period should be purely about de-risking ideas that will start an academic lab or perhaps a biomedical startup. I think in an ideal world, a postdoc would not need to publish papers to successfully de-risk a future research plan, and that the implicit requirements that postdocs publish papers before looking for their next job forces the postdoc period to be unnecessarily long.

Fundamental issues and challenges

1. retention—it's really hard to raise a family with an academic salary & workload, or even 2 academic salaries, until one parent has a faculty salary and/or a career stage where their research doesn't require 7-day x 12-hour attention.
2. quality of life—I am facing the reality that I will be a very successful postdoc and get a great faculty job and STILL not have a realistic chance of living where I want to live. it's very hard to picture the next phase of my life without knowing where I'll live, and so I have been hesitant to start a family without knowing what network / resources will be available to my family when I move to a faculty job.
3. quality of life—there is no "cohort" mentality, and it's difficult to identify peers who can support me intellectually or professional. I think perhaps some training grant programs for postdocs could assuage that problem, i.e. encourage universities to develop some kind of postdoc curriculum that helps postdocs identify collaborators among their peers.
4. general thoughts —I think that most postdocs hit a point ~3 years in where they have gotten maximum value out of their postdoc time, and the rest of the time after that point comes at considerable personal cost (low wages, long hours) but doesn't make a postdoc a better scientist. after postdocs hit that point of diminishing returns, they should either transition to academic jobs or staff scientist jobs, but the zombie-phase of a postdoc (i.e. ~3-6 years) is just extractive. postdocs in that phase are working in lousy conditions, and their labor benefits their boss more than it does their own education.

Existing NIH policies, programs, or resources

I think the path to early independence award could be restructured to discourage unnecessarily long postdocs. I think the first ~2-3 years of a my postdoc were extremely high-value —I learned a LOT about a new field in biology, I developed new technology to de-risk future experiments, I networked with tons of people in my new field and I started to make some surprising discoveries using the new technology I developed. But it will still take ~1-2 years to turn my progress into an academic paper, and build the kind of CV that would get me a good faculty job. I think there should be a way for candidates like me to apply for faculty jobs, and re-purposing the early independence awards could help. I'm at Whitehead, and I have a very negative impression of the whitehead fellows program, which takes new PhD grads and lets gives them an independent lab, but does not place them on a tenure track or let them advise PhD theses. even though the biology community considers un-mentored whitehead fellows to be highly accomplished, I have found their ideas generally immature or uninteresting. By contrast, I think that many 3rd year postdocs who have the benefit of mentorship have extremely mature and well-developed ideas, and would be much more prepared to start an independent career than the people who took unmonitored fellows positions. I think that the NIH's "early independence award" should be a grant given to a university to hire unconventional applicants, i.e. people with only 2-3 years of postdoc experience and no publications. the jobs would be tenure-track and eligible to advice PhD theses, but would come with an extra ~2 years of deferred academic responsibilities and a ~2-year delayed tenure clock.

Proven or promising external resources or approaches

No response

Response 2312

Perspectives on the postdoc roles and responsibilities

I view postdoctoral positions—especially those via T32s—to be protected periods for individuals to REFINE their skill sets and research programs, not as periods of extended or continued training.

The larger context to this sentiment is the ongoing 'role creep' or 'job creep' in academia; given both economic constraints and exponential growth of methodology and scientific knowledge, the roles and responsibilities are sliding. For example, graduate students today are asked meet the metrics and responsibilities of postdocs 10-15 years ago, postdocs are asked to meet the metrics of early career faculty, etc. As such, graduate students are exiting PhD programs with more skills, experiences, expertise than in previous years. For success as an independent researcher, the postdoc period offers protect time and (perhaps) additional mentoring or economic/institutional support to further refine and practice various skill sets (e.g., methods, grant writing, mentorship) and establish themselves in their substantive area of

interest (e.g., via publications, talks, service). In some cases, where an individual is shifting to a new substantive area, more formalized training will be necessary. Even in non-T32 settings, where perhaps the postdoc requires working on grant specific aims, the postdoctoral position again offers opportunity for refinement & honing of already developed skill sets.

I believe the categorization of postdocs as "trainees" is a hindrance to equitable conditions for postdocs overall, as it devalues their labor, expertise, and abilities.

Fundamental issues and challenges

Compensation is the number one issue that inhibits recruitment, retention, and overall quality of life for postdocs. To be frank, I believe the NIH is already aware of compensation related issues. Various associations and unions have been advocating for improved compensation for postdocs for over 10 years. A compounding concern is graduate student stipends, including the NIH graduate student pay cap. Graduate students nationally eke out a living on low stipends, weathering economic shocks, enduring periods of psychosocial stress related to low compensation all while developing skills and expertise. Postdoc positions used to be a reasonable risk—another 2-3 years of depressed compensation traded for the opportunity to land a tenure track position with high job security. With the decline in availability tenure track positions, decline in tenure, and depressed compensation of at the faculty level, postdoc positions are no longer a reasonable risk. It is is simply too little pay compared to industry positions where PhD graduates are being adequately compensated for their skills and expertise. For example, I have received an offer for a postdoc position next year with a compensation of $54,000 (NIH pay), while my two industry offers are $120-160,000/year. With longer time to degree and more individuals working between undergrad and graduate school, the graduate & postdoc work force is older than in years past. We have young children, elderly parents, are more enmeshed in communities. We cannot ignore or further postpone financial security. The low pay only increase moral injury and burn out—why stay, why contribute to a system that does not value you?

Additional factors include expectations of moving/transiency for short term positions, lack of health care benefits, and low supplementary funds (e.g., training related expense funds that cover health insurance or small research costs, but not both).

Existing NIH policies, programs, or resources

If the NIH will not broadly increase the pay scale, the pay scale can be adapted for place of residence and cost of living. For in-residence postdoctoral positions the NIH could offer pay at X% above living wage for that area. The starting postdoctoral pay of $54-55,000 in the midwest may be $10-15K above living wage, but for large, urban centers in California, New York, or Washington the pay is only barely above living wage status (see: https://livingwage.mit.edu).

NIH T32 could offer separate pots of money to fund health insurance and research-related expenses. T32 programs includes support for training-related expenses which can be used to cover such things as health insurance, travel expenses to professional meetings, textbooks, software, computer, or other research-related expenses. Individuals who require health insurance may have little to no additional funds to cover other actual research/"training" related expenses for program required activities. By only having one pot of funds for both health insurance and research-related expenses, the policies of the T32 benefits postdocs with spouses over single individuals as they may be able to use spousal health insurance and preserve more research funds.

Proven or promising external resources or approaches

No response

Response 2313

Perspectives on the postdoc roles and responsibilities

Time to learn new skills while exploring additional research interests beyond the scope of my dissertation. Also, building up my CV for another shot at tenure-track faculty job postings.

Fundamental issues and challenges

I have a family, so needing to relocate for an ideally short term (i.e., 2 year) position was a deal-breaker for me. I was very lucky to find a fitting postdoc position (via a previous collaborator) that is mostly

remote. However, I have a 1.5 hour commute and need to pay for expensive parking on days when I need to be in person. The pay is also quite disappointing and provides selection pressure against choosing a postdoc. Though I enjoy my current position, I simply would not have taken it if I did not desire a tenure-track job, as I could otherwise be making at least $120k in industry for my field. I can only afford to do the postdoc because my spouse make a reasonable salary.

No response

Response 2316

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is an important stepping stone for transitioning between a graduate student role to a faculty position. During this time one can gain soft skills such as refining their grant writing skills and honing their mentorship and leadership skills.

Fundamental issues and challenges

Pay scales that do not account for the cost of living in major cities, nor inflation. Indeed, NIH pay scales, though intended as a minimum, are often used by institutions as a “maximum” for what is deemed an acceptable salary.

Existing NIH policies, programs, or resources

NIH policies regarding minimum pay, should ideally control for the fact that certain cities have a higher cost of living and be adjusted for inflation.

Proven or promising external resources or approaches

Funding opportunities that are not limited to US citizens or permanent residents, and moreover empowering international postdocs to more easily move between labs (as right now most are hired on a J1 visa which makes this impossible).

Response 2317

Perspectives on the postdoc roles and responsibilities

Training to become an independent researcher

Increase salary

Proven or promising external resources or approaches

Increase salary

Response 2318

Perspectives on the postdoc roles and responsibilities

Robust designing of experiments and ensuring that relevant animal colonies are maintained, by liaising with the technician that handles animal husbandry of high quality in ICM. In addition, train my juniors, technicians, summer interns, medical students and Master's students from [redacted for anonymity] or other universities in affiliation or collaboration with [redacted for anonymity] and bring them up to speed in terms of conceptual foundation, technique, analysis and other required skills that will help wrap up our projects within the justified time in our project proposals. And to finally put together the results and analyses by getting the content together for the manuscript to be submitted in relevant and high-quality journals. My other pivotal duties comprise of presenting the summary of findings from aforementioned projects at conferences/webinars/ symposiums and related platforms. Lastly, to put together grant proposals and fellowships for securing funds to keep the existing projects rolling until required and for additional/ auxiliary projects that will keep the lab functioning and flourishing.

Fundamental issues and challenges

Recruiting excessive number of PhDs than required. Not enough mentorship/exposure for candidates who are interested in non-tenure track paths so that they can plan their modus operandi of being successful in non-tenure track options as well, Inadequate funds and benefits allocated for postdoc salary, misplaced priorities towards various categories of workforce within academia, not enough protection against visa restrictions for international scholars

Existing NIH policies, programs, or resources

Liaison with USCIS or appropriate regulations for visa related restrictions for international scholars

Doubling funds for postdoc and phd salaries, especially postdocs

Mandatory time allotted to postdocs to spend time in projects/ experiments that will help them carve their niche instead of arduously being involved only in the grants of the PIs which will deter their path to independence by not trying anything new

Proven or promising external resources or approaches

Mandatory collaboration with industry so that more funds can be furnished and additional technologies can be utilized that will expedite the process

Obviously double the salary for postdocs and please do not act like this is an unreasonable request; bad quality of life is the mother of bad creativity due to lack of calm and peace and stability; if one is constantly in the survival mode, there will be zero creativity and there will be not much breakthrough regardless of millions being pumped into the project. So better housing, doubled salaries, more protection for international scholars (or don't recruit them at all if you cannot do the needful to international scholars)

Response 2319

Response 2320

Perspectives on the postdoc roles and responsibilities

Cheap labor

Fundamental issues and challenges

Low pay

Long work hours

Limited benefits compare to staff and graduate students.

Existing NIH policies, programs, or resources

We need to be better paied from NIH, nothing else.

Proven or promising external resources or approaches

University is full of empty promises, we don't need any trainings all we need is to better pay. The is inflation going on for years. we want to be treated just like other workers. Increase our salaries.

Response 2321

Perspectives on the postdoc roles and responsibilities

Postdocs are meant to be independent, highly trained researchers in the sciences.

Fundamental issues and challenges

The primary issue with postdoc recruitment is the extremely low value placed by the NIH and institutions on having a PhD. A salary of approximately 55k is not adequate, especially for members of marginalized groups who may not have a stable financial foundation after several years of slave wages in graduate school. In the biomedical sciences, a six-figure salary is not uncommon for fresh PhD graduates, especially those with valuable skills or live in high cost of living areas. As a postdoc who started when I did in 2022, my salaries for the first 3 years would be 54.8k, then 55.2k, then 55.6k. While the starting salary is already poor, the total absence of salary growth in these years makes a postdoc position even harder to swallow versus an industry one. I am fortunate in that I do not have student loan debt, children, car payments, or other financial obligations, though I do live in a high cost of living area (Chicagoland). I am able to make ends meet, but I am not able to meaningfully save for retirement, a house down payment,

or achieve other financial goals. The presence of even one additional financial obligation would be completely crippling to my ability to maintain a reasonable quality of life here.

There is a secondary issue which does not directly affect me, but pertains to the penchant of some advisors to use postdoctoral scientists as an excuse to underpay skilled workers in glorified technician roles. These postdocs receive little to no mentorship, no training opportunities, and their career goals are deprioritized to suit the current needs of the PI or lab project. This is also a huge problem, but the fault lies with the PIs and thus would be challenging to solve by simply changing the postdoc programs.

Existing NIH policies, programs, or resources

NIH needs to fund more early stage investigator programs—the ESI-MIRA is a good program for this, but it should be far easier for PIs to obtain these sorts of grants. This would further fatten the academic pipeline and help support the development of more tenure-track positions, which would make postdoctoral training have a greater purpose.

Proven or promising external resources or approaches

No response

Response 2322

Perspectives on the postdoc roles and responsibilities

Research role

Training role for future academic prospect t

Fundamental issues and challenges

People may not be interested due to funds

Existing NIH policies, programs, or resources

Stipend needs increment

Funds for research needs etc. has a strict timeline that you are almost unable to use it for anything. For example, mine goes away by February while the year ends in June. Money is not well utilized.

Proven or promising external resources or approaches

More resources are needed for training.

Accountability is needed for both mentors and mentees.

Response 2323

Perspectives on the postdoc roles and responsibilities

Assisting PI with ongoing grants and studies, while also forging independent research interests. This includes writing grants and manuscripts for publication, conducting data analysis and preprocessing, running experiments, and mentoring graduate and undergraduate students.

Fundamental issues and challenges

The largest challenge is fair pay. Right now, the NIH sets a nation-wide rate for how much postdocs can be paid off of NIH grants. This leads to unequal pay, since different places in the country have a large variability in cost-of-living. This effectively leads to less expensive places getting favored over more expensive places. It also exacerbates economic inequalities (see https://www.nature.com/articles/d41586-019-00587-y). Moreover, as a postdoc, it is often extremely difficult to convince graduate students to pursue academia given how low the NIH set salary is, even for inexpensive cost-of-living places. The incoming pay for a first year postdoc works out to be about $29 an hour, compared to about $39 in industry (https://www.science.org/content/article/price-doing-postdoc). Finally, the relatively low salary set by the NIH sends a significant message to the public, and does little to motivate youth from wanting to pursue science. While I understand that this will require some effort (see https://www.science.org/content/article/postdocs-need-raises-who-will-foot-bill), it seems that scientists are all united in an awareness that postdocs, frankly, get paid too little.

Existing NIH policies, programs, or resources

The NIH postdoctoral salary is in dire need of a raise, particularly given recent inflation in the US.

Proven or promising external resources or approaches

Response 2324

Perspectives on the postdoc roles and responsibilities

To develop research projects alongside the PI, gaining more and more independence as the years go by, with the possibility of pursuing own research interests. Learning how to apply for funding. Training graduate and undergraduate students.

Fundamental issues and challenges

Cost of life versus salary is a problem. Sometimes salary falls short and there is no time to get a second job to be able to get more money. Also, the uncertainty of having a secure job once the post doc years are over. Another issue for international people is support and help to transition between visa status or even residency.

Existing NIH policies, programs, or resources

Perhaps enforcing the salary guidelines for universities.

More accessibility to the current policies, programs and resources. Some of us don’t know they exist.

Proven or promising external resources or approaches

Keeping a competitive salary with benefits would improve things.

Response 2327

Perspectives on the postdoc roles and responsibilities

Postdoc position is inherently a training period to prepare an individual as an independent scientist/researcher in their respective field. This requires to have a fundamental knowledge from not just an academic research but also the managerial skills that encompasses wide range of skills from managing funding, prepare and acquire funding for their own future works, managing lab and people associated with the work including time management. Moreover, one requires to have a good creative thinking ability to find the niche in their own area of research that is unique and novel in itself that has a therapeutic potential in the long run.

Fundamental issues and challenges

Financial

Postdocs are creative thinkers and are mostly the people who are married and have children and this means it comes with a whole lots of responsibilities and supporting them —either it be a national or international postdocs. Managing both work and life balance does not just mean time management but also financially and emotionally and this requires to have a balanced mind —as everything originates from there —from the creative thinking for the research pathways, funding and other things to emotional wellbeing. This critical not just for the postdocs but for all those who are associated with them and this requires good finical support so that they do not have to struggle thinking about everything and anything related to money —from visa fees, status, EAD for the dependents, schooling kids and expenses associated with all these. However, unfortunately, the salary of the postdoc is so meagre that they could barely support their family and their basic needs. This becomes even more difficult if the position is secured in a very high expensive cities like California, New York, Boston, Chicago and others. And, because of this everything goes haywire as they can’t think anything creative with that kind of enormous pressure. Basically, the first thing that needs to be fixed is a descent salary that they can easily support their family without struggling financially too much.

Work

Believe it or not, the common shared story of all the postdocs are that they are unfairly treated —and they are treated worse than even a graduate students (PhD).

Existing NIH policies, programs, or resources

Fair salary, fair treatment as a colleague and fair working hours flexibility. Since, this also depends on the area of research, biological postdocs that have wet lab associated should have a flexible working time so that they can manage it themselves and should not be restricted by the 9am—5 pm working culture. Even though this is in the written statements, basically they are expected to work during the weekends to produce the results —this means sacrificing their family and social life. I would personally like to work in the lab for the wet lab works, while I would prefer to go and do the writing and reading stuffs from home or somewhere quite while not being judged that I am not in the lab. Basically, this means they need space to be more productive. There should not be one-size-fit-all methods to treat them.

Proven or promising external resources or approaches

None for now.

Response 2328

Perspectives on the postdoc roles and responsibilities

Perform the necessary experiments/simulations to achieve the research project goals. Additionally, be a supporting figure for the grad student in the research group

Fundamental issues and challenges

From the perspective of a foreign postdoctoral fellow the fundamental issues are essentially two:

1. The economic instability
2. The uncertainty due to immigration policies.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2329

Perspectives on the postdoc roles and responsibilities

It's honestly not very clear what a postdoc is or should be. I spent a lot of time working on my mentor's projects. It was difficult to put time, energy, and resources to developing my own. I also split clinical and postdoc fellowships and this made it very complicated to manage my time.

Fundamental issues and challenges

I am a clinician and a researcher. There is not enough support for physicians to do research, period. Academic institutions do not provide structure for training or administrative support. They do not make clear career paths accessible for physician scientists. Physician scientists need additional support staff because otherwise they spend all their time doing the administrative work of submitting papers, grants, etc. It is never clear what is the responsibility of the physician scientist postdoc and when it should fall on someone else, so it always seems like everything is their responsibility, head to toe, in nearly everything and it's very overwhelming and difficult to be productive and advance your career and move the science forward.

Existing NIH policies, programs, or resources

Programs dedicated to developing physician scientists seem pretty sparse. The ones that are available don't always have a lot of MDs that can actually provide longitudinal support for new physician scientists.

Proven or promising external resources or approaches

No response

Response 2330

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low pay. No sponsorship for green card. Little to no accountability for PIs who are abusive and/or allow for a toxic work environment within the lab.

Existing NIH policies, programs, or resources

More pay.

Proven or promising external resources or approaches

More pay.

Response 2331

Perspectives on the postdoc roles and responsibilities

Post-doc position is a really very hard job because you need to cope with mental as well as physical stress, so many responsibilities, no stability, and are usually underpaid!

Fundamental issues and challenges

There are lots of challenges in postdoc life, they do not have stability in their life especially because of the nature of their job, after every 2-3 years they need to look for a new job, and opportunities. They are paid very less, if we compare the level of mental and physical work they are doing.

Existing NIH policies, programs, or resources

I would recommend maybe they should get a good salary

Proven or promising external resources or approaches

No response

Response 2332

Perspectives on the postdoc roles and responsibilities

A postdoc is a professional position that should be viewed similarly as a senior scientist position in industry. A postdoc should be given considerable autonomy in their work, coupled with thoughtful mentorship from a faculty advisor. They should be financially compensated in a way that is competitive with comparable industry positions.

Fundamental issues and challenges

Extremely poor financial compensation and the notion that postdocs are "soft money" employees. Universities and the NIH need to provide more financial support to postdocs, both in annual salary and in duration of commitment to funding.

Existing NIH policies, programs, or resources

Training grants and individual fellowships should provide more money (at least 80k/yr) and greater duration of funding that is consistent with the length of a typical postdoctoral position in biomedical science (5-6 yrs). Support for childcare is also currently minimal (e.g., in [redacted for anonymity], the childcare support provided by NIH covers ~8.5% of annual daycare costs).

Proven or promising external resources or approaches

St. Jude.

New PhDs will continue to leave academia until they are appropriately valued.

Response 2333

Perspectives on the postdoc roles and responsibilities

It is a bridge program to help newly trained scientists think through the logistics of being a principal investigator. Even if you're very good at the science, there is a need to be further trained in grant writing, managing students, running a lab, hiring and firing of people etc.

Fundamental issues and challenges

Largely money and guarantee, the academic track right now is low paying and unstable, meaning you can train as a post doc making no money and not be guaranteed a faculty position in a location that you like. Even if there is a position you like and you're on tenure track, there is a possibility you might not achieve tenure track, and then you're out of a position after sacrificing so much time, money and effort.

Existing NIH policies, programs, or resources

Raising the salary to be competitive with industry scientists, encouraging tenure track to include industry partnerships, could bring in more money that could pay post docs and could incentivize more PhDs to stay in academia.

Proven or promising external resources or approaches

No response

Response 2334

Perspectives on the postdoc roles and responsibilities

My view of a postdoctoral position is as a research fellow part of the institution, and they should not be considered as trainees. The postdocs are essential players in academic research and they consist the main qualified work force in the field.

Fundamental issues and challenges

The main issue that inhibit recruitment and retention of postdocs is in line with I described above. As they are considered trainees, they have no benefits and the salary is not adjusted according to high cost of living. For example, there is no automatic/mandatory retirement contribution from the employer side. Additionally, a postdoc living inexpensive big cities doesn`t earn enough to live. The main reason for the lack of postdocs applying and the increase of postdocs leaving is that the salaries are too low.

Existing NIH policies, programs, or resources

Retirement contribution from the employer and increase the salaries according to the city living costs.

Proven or promising external resources or approaches

The mentoring is also a key factor to support postdocs in their career paths.

Response 2335

Perspectives on the postdoc roles and responsibilities

I believe postdoc position should offer all those expertise to the individual to be able to conduct research independently. PI should not look at the postdocs as skilled laborer. Everyone should promote and encourage an inclusive environment. Otherwise, what's the point of achieving academic excellence but at the personality level if a person is not empathetic enough to understand and lead a group of people.

Fundamental issues and challenges

Low Salary, No work life balance, dissatisfaction at the workplace

Existing NIH policies, programs, or resources

Financial stability is very much needed. If a person cannot be able to feed and fulfill basic requirement for his/her family at the age of 32-25, then romanticizing science sounds shallow and hollow in real.

Proven or promising external resources or approaches

Problems are real and existing widely everywhere, but I am very hopeful NIH would take appropriate steps to improve the conditions.

Response 2336

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are highly responsible, and their training and work dictate the country's future. Postdocs are exceptional individuals who are enthusiastic to discover new information and wish to significantly alter the world by scarifying their best years of life.

Fundamental issues and challenges

Given their existing funding and salaries, postdoctoral fellows are constantly weighing their options and leaving research. A postdoc's existence is not normal, even after earning the highest degree possible. Due to the nature of research, it is a well-known fact that most science PhD and postdoctoral students work more than 40 hours per week, often as much as 65 hours per week. Despite their best efforts, most postdocs simply cannot afford even a one-bedroom apartment within walking distance of their laboratories, which is very important for the research work. Salary increases for postdocs are typically in the range of 150-200 USD a month (in hand amount), but rent hikes alone typically run between $100 and $200 per month. A simple calculation reveals that postdocs' salaries actually drop on an annual basis since their raises are far lower than the cost of living increases. It's strange that the NIH, which knows all

this very well, has chosen to remain silent for so long. Postdocs are typically paid less than other employees with fewer qualifications and skills. Postdocs who are hungry for research and want to pursue a career in science are being forced to shift into the industry because of these inequalities. The current situation is so dire that principal investigators have started suggesting to their postdocs that they look for jobs in the industry.

Existing NIH policies, programs, or resources

Increase salaries by at least $15,000 per year over the current salaries of postdocs at every level. Postdocs do not expect a luxurious life, but at least give them enough money to survive and let them focus on research and not on their monthly rent, food, bus passes, and clothes.

Most researchers experience various levels of exploitation from their PIs, which begins with the doctorate and continues through postdoctoral training. There must be a publicly visible internet portal where postdocs can rate their PI's lab environments on a 1-5 scale after leaving the PI's lab for a year on the following questions:

1. Does the PI require/wish for their lab researchers to work overtime?
2. Does the PI take advantage of their researchers by delaying manuscript submissions and other paperwork?
3. Does the PI help postdocs advance their careers or just use them for specific tasks?
4. Does the PI consider and listen to postdoctoral research challenges and fresh research ideas?

This will compel PIs to provide a conducive learning environment in their laboratories, which will create better scientists for the future. It will also prevent researchers from being imprisoned with poisonous PIs.

Proven or promising external resources or approaches

15 days of training per year on cutting-edge technologies should be mandatory for postdocs. They must attend one conference or workshop located outside of their home country.

Response 2337

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The NIH stipend levels for postdocs (and predocs) are way too low. Many faculty would like to pay TG-funded postdocs more than the NIH stipend levels, but the majority of their funding is NIH grants and can't pay a postdoc more from those funds. I work as an administrator and don't even do science, and it's really disheartening to see that salaries are so low for people who have spent an enormous amount of time and energy earning a PhD—especially a STEM PhD, which is supposedly a "more secure" field of study. Many students and postdocs leave academia to go to industry because they can get paid so much more working in industry; they're basically turned off of academia at the start of their career. We had vaccines for the COVID-19 pandemic pretty quickly because there were scientists who were able to work on research that contributed to the development of the vaccines, and that work took place for years before "COVID" was even in our lexicon. It's disappointing and frankly insulting to see that the people trained to do important scientific research that will benefit everyone in our society are being offered incredibly low salaries, still, after we all just saw how we benefitted from their work with fast vaccines after the entire world shut down due to the pandemic.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2338

Perspectives on the postdoc roles and responsibilities

Gain more experience (e.g., research, grant application, mentoring) that would lead to an independent career.

Fundamental issues and challenges

The postdoc salary is quite low, especially considering the cost of living is really high in cities.

Existing NIH policies, programs, or resources

Increase the salary cap

Proven or promising external resources or approaches

No response

Response 2339

Perspectives on the postdoc roles and responsibilities

It is a step to try novel research ideas and use your skills from PhD in a different field. It 'should' be a step to advance your career in research whether in academia or industry. It also could be trying ideas in advancing the same research field as your PhD. It is an opportunity to expand your skillset by mentoring students, involve in lab/personnel management, grant writing. However, unfortunately, all of this is not guaranteed in all the lab and most of the positions offer only a place to perform research. In addition, in some cases, you already get exposed to certain degrees to grant writing, mentoring, supervising at the PhD level.

Fundamental issues and challenges

Lack of financial stability by providing inadequate salary is a huge challenge. The model of providing NIH postdoc salary across all the cities and states in US just does not work. People with just undergraduate degree earn almost twice as much in industry in comparison to a postdoc. One gets a debilitating feeling to have to work more than their industry peers and earn so much less than them? The current model clearly needs replacement with a better one.

I would just not use the word 'trainee' for a postdoc. I am not sure why this word is being used for a postdoc? What is it that i am learning as a trainee?

You learn so much more by yourself, fortunately from PI if you have a good one or from the surroundings during your PhD. From that pool, exceptional PhDs already have the capability of directly being group leaders/assistant professors. So, I do not understand the justification of 'trainee' word being used for a postdoc. In my experience, I am not learning anything new from my postdoc.

Most of the PIs are not interested in mentoring and/or helping in advancing career of their postdoc. There is no clear direction from the mentors on how to plan for the next steps in a postdoc's career.

Existing NIH policies, programs, or resources

NIH salary policy.

NIH policy that gives directives to institutions and PIs on their responsibilities towards a postdoc.

There is a clear lack of awareness of NIH resources available to a postdoc. Better awareness campaigns might help.

Provision of flexibility to move labs with the projects that the postdocs intitiate to other academic labs. Currently, the institution policy dictates the ownership of ideas of a postdoc. Postdoc should have some power and say.

What trainee word entails? What is the postdoc learning? Is there a way to ensure that the training is being undertaken as expected? IS there a policy and if yes do the stakeholders know about it?

Proven or promising external resources or approaches

No response

Response 2340

Perspectives on the postdoc roles and responsibilities

As an international. non-native speaker of English language, it means being an underdog in negotiations and collaborative efforts. Do what you're told! Being kept on my toes all the time and feeling like walking on egg shells and feeling afraid of raising any issues because contracts are linked with visas.

Fundamental issues and challenges

Long working hours, toxic culture of churn churn churn.

Existing NIH policies, programs, or resources

Standardize contracts. At the moment there is a huge variation in terms of salary and benefits. Especially many international postdocs are treated unfairly.

Proven or promising external resources or approaches

Promote the right to switch off, and healthy work-life balance.

Response 2341

Perspectives on the postdoc roles and responsibilities

NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills. Postdocs should be required to develop a plan with their PI to develop specific expectations around these training goals (different time and energy allocations to each area plus research depending on the career goals of the postdoc) and be supported throughout their training period. Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth. Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings.

Fundamental issues and challenges

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas 2with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit. Academia contains remnants of structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups still today. Postdocs from historically-marginalized groups and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. Examining and acting on these power imbalances is key to creating a more inclusive and safe environment. Postdoc training often falls within the optimal fertility window for childbearing/family planning. The NIH should increase support and develop enforceable guidelines for paid, protected parental leave (6 weeks minimum) and increase support for all postdocs who provide child or family care.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. (Other implications, such as tax, do not stem

from NIH.) Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income. To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be especially cost-prohibitive for researchers from low socioeconomic backgrounds, those with increased familial commitments and internationals. Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs, while providing clear differentiation between these positions and postdocs.

Proven or promising external resources or approaches

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library. We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

Response 2342

Perspectives on the postdoc roles and responsibilities

Fundamentally, postdocs (and PhD students) do the research. We actually implement it. The PI directs us and sometimes tells us *what* to do, but we are the ones who do it.

Fundamental issues and challenges

I am leaving my postdoctoral position at the end of this week because of some of the issues I'm about to describe.

Primarily: low pay, poor benefits, complicated taxes, the persistent messaging that I am a "trainee" (despite 23+ years of education including 6 years of PhD and 2 years of postdoc). I feel that my skills are taken advantage of in the academic system. I have more skills than academia gives me credit for, financial or otherwise. I was offered a salary 2.5x what I'm currently getting when I applied places in industry, and I feel that this is a better reflection of my worth as a worker and employee than what I'm being offered now. I would like to start a family in the near future, and I'm not able to do that on my current salary in the area where I am living. I am unwilling to sacrifice this in order to pursue academic research.

There is also an issue of mentorship. I get along well with my PI, but I feel dependent on her because she is my only supervisor. I do not feel that there is a system other than my PI that supports me. I'm afraid that if my relationship with my PI turns sour for some reason, there would be nothing I could do about it. The power imbalance--along with lack of checks-and-balances--makes me fear for both my short-term and long-term career security. I refuse to be dependent on a single person.

Existing NIH policies, programs, or resources

Raise NIH standard. Other than that, I'm not sure. These are structural, systemic, institutional problems that are larger than any one committee, mandatory training session, or zoom meeting.

Note: word limit exceeded for my description of fundamental issues, so I'm continuing that here

When my father was dying of cancer, I was told by the benefits office that I was not eligible for paid family leave because I am not an employee of the university. I had to rely on the generosity of my PI in order to

care for my dying father. After my father passed, I was told that I "officially" had 5 days of paid bereavement. Again, I had to rely on the generosity of my PI in order to mourn my father. I am not OK relying on a single person in this way. Even though my PI was supportive, this is not enough. I need an institution that supports me.

Proven or promising external resources or approaches

Take a lesson from industry. I can't point to specifics, but the feeling I get interacting with those bureaucracies is much better than academics. We are valued there. We are given director-level roles, run teams, and get paid commiserate with that. My new salary is 126k (as opposed to 54k that I started with as a postdoc at a university). We are treated like real employees, rather than this nebulous "trainee," "fellow," or otherwise non-employee-non-student-functioning-as-an-employee.

Response 2343

Perspectives on the postdoc roles and responsibilities

To me, a postdoc position is a training position preparing you to be an independent investigator and move into a faculty position or scientist position. The role should involve developing your own research projects, at least one of which you can take with you as you start your independent laboratory. You should be gaining skills in grant writing, manuscript preparation, mentoring, and teaching during this time. You should *not* be in a lab manager role or doing service line work.

Fundamental issues and challenges

The number one obstacle for recruitment, retention, and quality of life is salary. Postdocs are severely underpaid. At this point it's possible to have a research role outside of academia, and the pay there is substantially higher, so it makes zero sense for anyone who is not specifically aiming for a faculty position to do a postdoc. And in many cases, there are industry supported postdocs as well, which can lead to faculty positions eventually. Unless the pay increases, academia will be losing this labor force.

The number two obstacle is likely poor treatment of postdocs. Unfortunately there is very little oversight of PIs, and there is rampant abuse of postdocs, particularly international postdocs. This is yet another reason people flee to industry, as professionalism and ethical treatment of employees is more enforced there. I think the NIH would do well to model some of the strategies implemented by our MD colleagues and the ACGME, such as institution wide survey's of postdocs that ask about work environment, duty hours, obstacles to training, etc and then programs with failing ratings can be put on probation and potentially face loss of funding.

Existing NIH policies, programs, or resources

If the NIH has existing programs targeting postdoc wellbeing they need to advertise them better, as I've been a postdoc for 3 years and am unaware of any. If by resources you mean things such as F32 training grants, there are a few areas these can be improved--do not weight PI funding as heavily, as this severely limits those from smaller labs or labs without substantial NIH funding. In some cases, those who obtain an F32 are no longer eligible for benefits at their own institution since their employment status changes. This is a huge problem that should be addressed.

Proven or promising external resources or approaches

As I mentioned above, I think the NIH would do well to model some of the strategies implemented by our MD colleagues and the ACGME, such as institution wide survey's of postdocs that ask about work environment, duty hours, obstacles to training, etc and then programs with failing ratings can be put on probation and potentially face loss of funding. Unless there is some sort of negative punishment associated with poor treatment of postdocs, the current working environment will not change.

And I would mention again that salary is the number one obstacle for postdoc recruitment, retention, and well-being. A newly minted PhD can make double in the industry what they'd make as a postdoc.

Response 2344

Perspectives on the postdoc roles and responsibilities

The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

Per the NPA's 2023 Postdoctoral Barriers to Success report, more than 90% of postdocs are negatively affected by the lack of clarity in transitioning to next positions. More than ever, postdocs are paying a significant opportunity cost for limited faculty positions and 86.6% are impacted by job security concerns. Additionally, 'disenchantment with academia' is trickling down from overburdened faculty, making these positions less desirable to early career researchers. Career outcomes and tangible benefits of pursuing a postdoc are often misunderstood. NIH should provide early career scientists with actionable information and transparent data to make informed career choices before and during their postdoc periods, including increased awareness of career options (e.g., academia, industry, government).

Existing NIH policies, programs, or resources

Many PIs lack formal training in mentoring and personnel management. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors. I personally have experienced damaging mentorship with a former-PI on an NIH training award, and I believe that improved oversight of and accountability for mentors and PIs is necessary.

Proven or promising external resources or approaches

Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.

Response 2345

Perspectives on the postdoc roles and responsibilities

The postdoctoral fellowship should be appropriate as a learning opportunity, limited in scope and time, for obtaining additional skills which will aide in advancement through a career in academia.

Fundamental issues and challenges

Postdoctoral fellows are not treated as early investigators in many cases, they are treated as cheap labor, asked to perform mundane tasks (which are not limited in scope to the skills which they are seeking to learn as part of the fellowship), asked to commit to long term projects (which are not limited in time) which decrease long term quality of life by financial stagnation, and asked to work significantly long hours. The stipend amounts should be in line with the degree status, or the position should be clearly demarked and treated as a short term learning opportunity.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

The stipend amounts should be in line with the degree status, or the position should be clearly demarked and treated as a short term learning opportunity. By ensuring that the positions are learning experiences limited in scope and time you will avoid young investigators "burning out" and improve job satisfaction.

Alternatively by increasing stipend amounts to be in line with degree status you will ensure that PIs and institutions value the time and current experience of postdoctoral fellows and stop viewing them as catch all cheap labor to use for any purpose that pops into their little minds, ad infinitum, all hours of the day, without benefit in any way to the fellow.

Response 2346

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Most postdoctoral positions offer salaries that are minimal and low, especially for international citizens.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2347

Perspectives on the postdoc roles and responsibilities

An international Ph.D. (in the Biomedical field) may not have the same exposure and expertise as a Ph.D. in the US. Therefore, a postdoctoral position in the US is a gateway to exposure and exploring different career paths while learning new skills or improving the ones already gained. These skills could be benchwork-related or soft skills like project management, grant writing, etc. Therefore, an academic postdoc should include these experiences when working on an NIH-funded grant/ fellowship.

Fundamental issues and challenges

Two major challenges are being faced by postdoctoral trainees in academic research. The first is a lack of a mandate to ensure that all postdocs being funded through an NIH grant are being paid at least the stipends at amounts being prescribed for NRSA fellowship awardees. Such a mandate will help to increase recruitment and improve the overall quality of life of postdoctoral trainees. The second challenge is the lack of funding avenues to obtain a postdoctoral fellowship or a career development grant. The eligibility to apply for an NRSA fellowship or the K99/R00 MOSAIC awards is restricted to US residents only. While the majority of the postdocs working on NIH-funded grants in the US are internationals, who may still not be US residents, such restrictive eligibility criteria are counter-indicative of NIH's otherwise agency-wise push to improve Diversity, Equity, and Inclusion. Therefore, widening the eligibility criteria for these funding avenues to include anyone who is working in a US-based institution would significantly improve the retention of postdoctoral trainees.

Existing NIH policies, programs, or resources

Two significant programs that could be expanded to enhance the postdoctoral training ecosystem are the F32 and the K99/R00 Awards. The first area that could be modified in both these programs is widening the eligibility criteria to apply for these awards to anyone who is working in a US-based institution. Currently, both awards are restricted to be applied by US residents only (F32 and K99/R00 MOSAIC award). The second area where the current programs could be modified is increasing the cap on the number of years as a postdoctoral researcher for the K99/R00 award. Many of the postdoctoral researchers applying for these awards experience life-events like childbirth during their tenure as postdoctoral researchers. Such events result in the individual (woman or man) not being able to make significant progress during that time. Therefore, increasing the cap for both women and men who have experienced childbirth during their initial years as postdoctoral researchers would help to augment the ecosystem. Another reason supporting

such an increase in the cap is the amount of time required by postdoctoral researchers to demonstrate excellence and develop their expertise in a newly established lab. The increase in the number of NIH-funded early-career independent researchers is excellent for the research ecosystem. However such independent researchers take a significant amount of time to successfully establish their research program in the new institution, usually with the aid of postdoctoral researchers. However, this results in the postdoctoral researcher falling behind their peers, who may have joined an already established lab, in terms of their ability to develop a grant for the career development awards. Therefore, increasing the cap on the number of postdoctoral years, especially for those applicants who may have been mentored by an early-career independent researcher helps to level the playing field against applicants mentored by established researchers.

Proven or promising external resources or approaches

Collaborating with or utilizing guidelines shared by associations representing a large number of postdoctoral researchers like the National Postdoc Association (NPA). The NPA continues to provide resources to enhance postdoctoral training experience on its own. A joint exercise with the NPA would help NIH better understand the needs and aspirations of the postdoctoral trainees and improve or modify its policies accordingly to benefit the postdoctoral training ecosystem.

Response 2348

Perspectives on the postdoc roles and responsibilities

Enhancing the potential to carry out independent projects, venturing into colloborative research, increasing the academic network, writing grants, perfecting and increasing technical skills.

Fundamental issues and challenges

Low pay, job insecurity, visa problems, less work—family balance.

Existing NIH policies, programs, or resources

Elevating the pay scale for postdocs, increasing the number of grants that can be applied by non-immigrant visa holders.

Proven or promising external resources or approaches

Improve the training, a system for mentorship access, a quality check of job satisfaction, subsidized access to workshops and conferences for postdoctoral researchers.

Response 2349

Perspectives on the postdoc roles and responsibilities

1. A career step necessary to become an independent PI
2. An opportunity to find/define one’s own scientific niche; gain additional scientific skills / leadership / teaching skills; build a professional network

Fundamental issues and challenges

1. Work life balance: I am in academic science because I enjoy it. Nonetheless, I also appreciate "non-productive" time outside of the lab. However, I currently experience academia as a hypercompetitive environment where one's met with an (un)spoken expectation of being available 24/7, "sacrifice" everything for the greater scientific good, and where—at least I perceive it that way—it's almost a badge of honour if one doesn't have a non-lab life. Other interests are almost proof that one doesn't truly care about science—it's either an all-in passion, or one isn't serious about it. For me this creates constant guilt: when not doing anything lab-related—I should be, am I not dedicated enough? But then also when I am in the lab at midnight because I rationally know that this is unsustainable in the long run. That said, I think this issue is not limited to the postdoctoral level. It's maybe exacerbated at this career level because one has to answer to a PI and is more dependent. Also, I say this w/o even having to manage a family and/or children.
2. Financial: As I don't have anybody who is financially dependent on me, I am ok with the current salary. That said, my institution is in NYC i.e. cost of living is very high for even a moderate standard. Long commutes outside of the city for cheaper rent is adding to the above mentioned work life balance issue. Talking to colleagues with families, financial concerns paired with limited job security and massive time constraints are the main reason for leaving academia for a higher-paid 9-5pm industry job. It becomes a question of if one can justify a lower family income (e.g. no college fund for the kids) "just" to follow one's academic dream.

Existing NIH policies, programs, or resources

I appreciate all the opportunities and programs provided by the NIH that I have had the opportunity to profit from (e.g. career development sessions, grant writing courses etc). For me personally, it's more a mentality shift on the institutional level that has to happen rather than an expansion of NIH programs/policies as such. Where science is recognized as an important part in someone's life but is not equaled to one's life. Where we move away from this perception that science and the pursuit thereof has to be ones greatest (and only) passion, otherwise one isn't a legit scientist. I think this might help to improve work life balance, in the long run might also help e.g. women to not having to decide between a family and a scientific career, and where it becomes ok to say that one requires adequate compensation for long working hours & an expensive education (and is not met with the "oh well if you only do it for money." stigma).

Proven or promising external resources or approaches

No response

Response 2350

Perspectives on the postdoc roles and responsibilities

Postdoctoral position means training after your doctoral degree which includes advancing your skills, knowledge and more importantly professional development. It comes with different roles and responsibilities, like

a) a key player to execute a project;

b) mentor and train new employees in the group/department; c) managerial quality to lead the team; d) friendly with colleagues (inclusive) and so-on and so-forth.

Fundamental issues and challenges

Fundamental issues postdoctoral trainees are facing in academic research:

1. Most of the US academic postdocs are immigrants, so they come into the US with lot of expectations, personally and professionally. Therefore, they need that surety that their position should be fixed (or not terminated by PIs using their favorite "at-will" phrase) for at-least 2 years during initial recruitment because taking a new project and adjusting to a new place takes a time, and most PIs lose their patience and are expecting them to publish or show positive results. This leads them to frustration and they feel vulnerable or insecure.
2. Salary is another issue. Most institutions/PIs follow NIH guidelines for salary, but not all. So, there should One salary (according to experience) for all Institutions/PIs, without any bias.
3. Work-family balance is another issue. Most of the postdocs start their postdoc position by the age they are married or reach marriage age, so there should be immigration law to allow their spouses live their life freely rather than restricting them to four-walled room and get frustrated and home-sick all time, which in-turn causes negativity to the spouse who comes to the US for working on postdoc position with high expectations in every aspect.
4. After years of experience in their respective fields, most of the institutions should adopt the policies to recruit the best ones who served their institutions for a longer period.
5. Also, Institutions should involve them in different extra-curricular activities by which they exchange ideas and meet different cultural people and develop personally-This should be adopted without needing the permission from PIs, because most of them won't allow.

Existing NIH policies, programs, or resources

Career awards for postdoctoral applicants should not be time bound, because most postdocs take 2-4 years to completely execute a project and publish in reputed journals and by the time they feel confident to advance in their careers especially in academia, they want to write their own grants, their postdoctoral training is over the required eligibility years for all these career grants.

Salary should be improved for sure-And should be one for all institutions/PIs without any bias.

Proven or promising external resources or approaches

Immigration documentation should be eased, rather than making it complex.

Response 2351

Perspectives on the postdoc roles and responsibilities

Training position to learn specific skills in a certain field of academia, how to work and manage projects independently, mentor others, develop new ideas and critical thinking skills, space/time/opportunities to network with scientists in and beyond academia, and to identify a research niche that I can develop as my own, be it in an academic or non-academic space.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Increase postdoc salaries. I shouldn't have to look for part-time jobs to have a decent quality of life in Boston. Salaries should be adjusted for cost-of-living in different places.

Training for supervisors/mentors. This seems to be a leading cause for satisfaction/dissatisfaction (at least in my case), and it has a huge impact on the productivity of postdocs and where they go.

Ultimately, there simply aren't enough academic positions for all postdocs. So more training and eduction of postdocs for non-academic roles is necessary.

Proven or promising external resources or approaches

No response

Response 2352

Perspectives on the postdoc roles and responsibilities

On behalf of the National Center for Science Education (NCSE):

NCSE encourages scientists at all career levels to engage in outreach activities that help ensure K-12 students across the country get the accurate, effective evolution and climate science education they deserve. Giving K-12 students the opportunity to interact with research scientists helps students understand how science works and imagine the possibility of becoming scientists themselves. Furthermore, in an era of science skepticism, direct interaction with scientists is an important way to build trust in science among young people. The younger the scientists, the easier it is for students to relate, so postdocs and other junior scientists are especially valuable in this role. But interacting with K-12 students is very different from communication with fellow research scientists; specialized training in science communication would make these scientists more effective and more confident in interacting with K-12 science teachers and students.

Fundamental issues and challenges

On behalf of the National Center for Science Education (NCSE):

NCSE is frequently contacted by young scientists who would like to visit K-12 classrooms. But the scientists have little training in how to communicate with young learners. Optimal outreach is achieved when a scientist accrues science communication skills before engaging in outreach activities. Right now, science communication training for most postdocs is often informal, infrequent, sporadic, or entirely missing. Building relationships with local schools and teachers is a source of pride and satisfaction for scientists; poor communication skills inhibit their ability to succeed at this kind of outreach. Learning to communicate well helps the researcher think clearly, explain science clearly, and build trust with the audience. These skills are essential to combat science disinformation and misinformation in or outside K-12 science classrooms. Scientists trained to communicate with the public and teach students are better prepared to stand up for evidence-based scientific data that informs policy and public health. Scientists can be taught to be clear, confident speakers, but this takes coursework and practice. A fear of public speaking (and engaging in outreach activities) is a disincentive for scientists to interact with K-12 students and teachers. A scientist with good communication skills improves the overall image of the university or corporation and of the scientific enterprise in general.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

On behalf of the National Center for Science Education (NCSE):

A recent Research!America poll indicates that the public wants to hear researchers talk about their science and careers in science. Americans are concerned about the impact of misinformation/disinformation on public health (88%), climate change (79%), and stable democracy (85%). NCSE's ability to help scientists become better teachers is elevated when the scientists already have good communication skills. Scientists who have good communication skills can better serve as outstanding resources in combatting misinformation and disinformation to K-12 students and the general public. Distrust and denial of science threatens support for all of science. Scientists must learn the skills to be seen as trusted and truthful. This is particularly salient with regard to climate change. Ignoring the solid evidence of climate change can block timely actions to stop it. Effective communication skills are needed to overcome this disregard. Direct interaction with climate scientists is especially effective, but personal interactions with scientists from other specialties who can effectively communicate how science works and why they accept the reality of climate change is also valuable.

Some universities and research centers already have science communication programs that offer formal courses, certificates, or graduate degrees, which could serve as models. Examples are:

Harvard Chan's Center for Health Communication

Rutgers Science Communication Initiative

Duke University STEAHM Forum

University of Maryland Science Communication

University of Oregon Center for Science Communication Research (SCR)

Stony Brook Alan Alda Center for Science Communication

Response 2353

Perspectives on the postdoc roles and responsibilities

A postdoc role is that of a scientist who has protected time to perform research and hone the skills they learned as a graduate student through additional training. I no longer view this position as training to become faculty, although that is what it is most widely used for (including myself). There are just not enough faculty positions within academia to accommodate postdocs who wish to transition to that role. However, they are the workhorse of the academic research pipeline. This means that mentors often hold onto their postdoc trainees for as long as they can, de-incentivizing the transition of postdocs to faculty or other positions.

A postdoc should be a short-period extension of training after a PhD. "Postdocing" for periods longer than 5-6 years occurs far too often, even for highly qualified postdocs who should transition to faculty. There just seems to be no incentives to advance promising trainees.

The time it takes to become faculty, and then receive first R01s, has continued to lengthen. This starts even before grad school, which requires more research experience for admittance (i.e. 2-4 year stints as research techs, post-bacc programs, etc.). Then graduate programs require 5-6 years, with an additional 5-6 years of postdoc experience. Thus, the training time before "independence" could take upwards of 15-20 years. This is unheard of in nearly every other industry outside of academia. While the drift seems small, it adds up over time with a loss of lifetime earnings and career opportunities.

Fundamental issues and challenges

Salary and benefits are (and have been) the fundamental issues. The idea is that postdocs are trained scientists able to execute the research vision of their mentor (occasionally including their own). Postdocs are relatively low-cost for their level of training; most postdocs take on this low compensation because they believe that the postdoc position will set them up for future success. However, this is no longer the case. Individuals that transition to industry immediately following their PhD actually make significantly more compensation over their lifetime/career than if they completed a postdoc first. Thus, the vast majority of postdocs are losing out on lifetime income (~25%). This does not even account for the lack of retirement savings. Between my PhD and now postdoc, I have lost out on 10 years of retirement savings. Neither my time as a PhD student nor postdoc paid well enough to put my own money towards retirement, especially since neither institution match any savings. So much compound interest lost.

Further, most individuals (myself included) choose a postdoc based on a mentor/lab. Many great labs are in metropolitan areas with a high cost of living. I chose my postdoc mentor's lab in NYC due to what it could do for my training and career. but this meant taking a huge hit in the cost of living compared to a postdoc in many other locations. Mandate cost of living adjustments for postdoc salaries.

A cost of living adjustment and increase in salary based on years of experience should also be implemented for graduate trainees. This could help incentivize mentors to transition their trainees to the next phase instead of keeping them held in a position longer than needed due to the cheap cost of their labor.

Existing NIH policies, programs, or resources

Expand F32 fellowship and K transition award programs. Remove the 4-year timeframe for applying for a K99/R00. Time limits without exceptions only hurt those that suffer such misfortune. Generate a specialized funding program for trainees experiencing hardships during their training that derailed their promising careers.

Expand the childcare stipends for postdoctoral trainees. This was an excellent choice by the NIH to help defray the cost of childcare and support scientists that are starting (or started) families. It should be raised to at least 4-5K per year.

Expand research support for Research Scientists positions, who may not wish to move to independent faculty positions themselves but want to stay in academia. Much of the NIH funding is for "training" but

not necessarily "sustaining" research careers outside of established/independent PIs. The research scientists I have worked with were important contributors to lab culture, resourceful, and capable of leading their own projects. Some of these scientists choose to stay in such roles, and academic research would benefit from expanding funding to sustain and retain these individuals. Generating research programs so these individuals could apply for funding not only for salary but also to fund projects (or maybe sub-projects under an established PI/R01) could help facilitate their transition to independent faculty positions should they choose to one day lead their own research program.

In addition to plans for fellowship training that are included in application materials for fellowships (i.e. F32s for example), maybe add (or alter to include) a "plan for transition" in which mentors actively discuss what the expectations for "completing" the postdoc are and their plans to help facilitate the transition to the postdoc's stated career path. This would help actively encourage the difficult dialogue between postdocs and mentors in terms of expectations and goals.

Response 2354

Perspectives on the postdoc roles and responsibilities

A postdoctoral position can still be a good start of an academic career, in particular for candidates on a training grant that allows them explore their own interests rather than performing work for their mentor.

Fundamental issues and challenges

On the training grants (T32, F grants), the pay offered to the postdocs is completely insufficient to support them in any metropolitan city on the East and West Coast and in Hawaii. Not only is the overall pay not sufficient, but the stipend should be replaced with a salary and appropriate fringe benefits.

The second major challenge is the pay line for R grants, anything below 20th percentile is intimidating and makes it impossible for a large proportion of postdoc to be successful researchers.

Existing NIH policies, programs, or resources

Please see above: change stipends to salaries on institutional training grants, offer pay that allows postdocs to be above the poverty line in all parts of the US.

Proven or promising external resources or approaches

No response

Response 2355

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions in academia are a "requirement" to enter academia. The role of a postdoc is much like a grad student, assist in writing grants, train new lab members, complete research, and assist with general lab duties. A postdoctoral position to me means becoming more specialized in a different field to "prove" that you have an academic research-focused mindset. I view it as a step in enter academia but not one that I personally would like to take.

Fundamental issues and challenges

Funding requirements (being required to apply for funding to enter a program), stipend (pay is much lower than entry level industry), grant writing (writing grants in my PhD has taught me that I do not enjoy this portion of science). Among my peers, the main issue I've heard is making a survivable independent living. A postdoc is do-able with financial support (for example a parent/spouse) but without it does not seem reasonable. Also low pay and long hours (much like grad school) is not ideal, a 9-5 industry job with a higher pay sounds much better than continuing to work weekends post-PhD.

Existing NIH policies, programs, or resources

More programs that support postdocs and train them to become something other than a researcher. More programs focused on leadership/mentoring/finance. government groups hiring PhDs to build future leaders instead of focusing on benchwork.

Proven or promising external resources or approaches

Improve postdoctoral working environments by setting reasonable hours, obviously this varies from lab to lab, but my understanding is that it seems to be more of an extension of a PhD and after 4-5 years of working 50 hour weeks/weekends, it becomes exhausting.

Response 2356

Perspectives on the postdoc roles and responsibilities

As a postdoc, I have multiple roles and responsibilities. First, I need to be an independent researcher capable of conceptualizing and executing a relevant project. Second, I am part of a lab, a team. I might also work closely with collaborators in different institutions. I am also a mentor to some young colleagues. Finally, I have responsibilities as a part of the larger scientific and academic community.

Fundamental issues and challenges

The first issue I would like to stress is retention. Many costs are involved with moving to different institutions (in my case, on different continents) that range from finance to time, relationships and other resources. With all that, we don't get job security and usually are paid less than our counterparts in the industry. So I would like to see universities offering more job security and opportunities for permanent positions once you are recruited as a postdoc.

Existing NIH policies, programs, or resources

I am not very familiar with NIH yet, so I will have an answer once I know more.

Proven or promising external resources or approaches

Job security and providing support for financial costs associated with scholars moving cities and countries.

Response 2357

Perspectives on the postdoc roles and responsibilities

I view the academic postdoc as a staff member that works on the lab conducting their own experiments, trains students, and applies for grants to become an independent researcher. Hence, the postdoc responsibilities would include conducting their experiments, mentoring students, and applying for funding (hopefully getting it).

Ideally, since the postdoc position is a training position, the postdoc would get technical training in the techniques or procedures they are conducting.

Ideally, the postdoc would also get training on how to become attractive to get a job in industry, since 90% of postdocs end up leaving Academia.

Fundamental issues and challenges

As a postdoc that has been recently looking to start another postdoc, I can tell you what inhibited my recruitment:

1. Unreasonable requirements from the PI: A PI from one of the labs that reached back to me told me they needed every postdoc joining their lab to have their own research line before joining the lab. Since I do not have any useful preliminary data from my first postdoc, I could not join that lab.
2. Inability to fund H-1B visas: Several of the labs I applied to, told me upfront that they did not sponsor H-1B visas. Most postdocs are foreigners, so this may be an issue to consider.

About retention:

1. Salary: Overall, the postdoc salary is way lower than the salary of a scientist in industry. I would not put much effort into staying at the same institution when I know I don't really have a great position.
2. Lack of training: Postdocs are supposed to be on a training position, but there is generally no training offered to us, or way less training and guidance than what PhD students get. In theory, we get paid less than in industry because we are on a training position. But we are not really getting much or any training. So. we just get paid less. It makes you think.
3. Infantilization/Lack of respect: The examples of infantilization abound. The idea that we are "students" (but without the perks of being a student, and without the training and attention that students get) is prevalent.
4. Gatekeeping: Since we are "students", we depend on our PIs for many things. They get to control a great deal of the opportunities we may get or not. But they don't necessarily think about us and our training (since we are "not really students" and we do not graduate)

Existing NIH policies, programs, or resources

It is almost impossible to apply to any research grants as a foreigner (from NIH, I think only the K awards are available to us). Since most postdocs are foreigners, could it be possible to expand some of the current programs to include us? Notably, I think none of the training grants are available to us, contributing to the lack of training that characterizes our position.

It would be nice to warn foreign postdocs that the FDA and other government organisms don't sponsor H-1B visas, therefore if we want to get that experience, we need to apply within the first 3 years of our J-1 (since the positions tend to last for at least 2 years). Nobody warned me of this, I wanted that experience and now it is too late for me.

I have appreciated the NIH OITE trainings on how to be a Resilient Scientist. I hope it can be offered again, or perhaps having the recordings constantly available.

Proven or promising external resources or approaches

I think it would be great to diffuse the website Cheeky Scientist. It gives really great advice about how to get a job in industry, and it is necessary for us postdocs, considering that about 90% of us will not be able to remain in Academia. Part of the training that we don't get is comprehensive training about applying to jobs and going through the whole application process. Cheeky Scientist explains that and gives useful tips to use on each stage of the process.

Response 2358

Perspectives on the postdoc roles and responsibilities

Postdocs are in their final period of training to become independent scientists, they direct their own research agenda and are often listed as PIs on their fellowships, and they assist in training graduate students, technicians, etc.

Fundamental issues and challenges

Salary, salary, salary, you must increase to the minimums suggested by st judes/hhmi/stanford, etc.

Existing NIH policies, programs, or resources

Increase the federal budget to cover this, as it will be impossible to use a current grant to cover these additional costs, supplements will be required short term.

Proven or promising external resources or approaches

Recruitment and job satisfaction will be substantively improved.

Response 2359

Perspectives on the postdoc roles and responsibilities

Post-doc training is critical to success in my field, and offers and opportunity for people to develop deeper and broader insights into their field to prepare themselves for future work.

Fundamental issues and challenges

In my view, the key challenges are salary and mentoring. Post-docs need to be paid enough to afford to live, do their science, start families, etc. In addition, it's critical that post-docs get good mentoring to set them up for success.

Existing NIH policies, programs, or resources

The base salary level should increase to the level that is now set by HHMI: $70k for first year post-docs. It should also be possible to supplement salary from NIH sources from training grants for high cost of living places.

Proven or promising external resources or approaches

Again, raise the salaries. That alone will go a long way.

Response 2360

Perspectives on the postdoc roles and responsibilities

Scientists are moving to private industry instead of working as researchers.

Fundamental issues and challenges

Very low salaries of post-docs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2361

Perspectives on the postdoc roles and responsibilities

Postdocs play an absolutely crucial role in the research of the US and in the training of future scientists.

Fundamental issues and challenges

The NIH salary scale must be increased to match, for example, the HHMI scale.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2362

Perspectives on the postdoc roles and responsibilities

Academic postdocs are essential to academic science as they represent the pipeline for future faculty.

Fundamental issues and challenges

Salary—Postdoc salaries need to be raised to a higher scale starting around 70K, as recently outlined by HHMI, and R01 budgets need to be expanded to fund the new scale

Existing NIH policies, programs, or resources

Postdoctoral fellowships and K99 grants—expanded to allow for higher salaries

Proven or promising external resources or approaches

No response

Response 2363

Perspectives on the postdoc roles and responsibilities

Postdocs are not just the workhorse scientists in the lab, but they are the next generation of independent PIs. If we do not deal with the issue of diminishing scientists entering academic science, American science will eventually fail.

Fundamental issues and challenges

Perhaps the most pressing issue is the low salaries that postdocs are currently paid. This needs to change if we are increase recruitment, retention, and their quality of life.

Existing NIH policies, programs, or resources

Two things MUST happen. First, the NIH scale for salaries must be increased significantly (similar to what HHMI is now doing). Second, and perhaps even more importantly, NIH grant support must be increased significantly beyond the current $250,000 modular limit. This has been the limit for the past 3 decades and it is becoming no longer feasible to run a productive laboratory with grant support that has not kept up with inflation and salary increases (not just for postdocs, but for everyone!).

Proven or promising external resources or approaches

The Howard Hughes Medical Institute’s new initiative for enhancing the postdoc experience is the place to start.

Response 2364

Perspectives on the postdoc roles and responsibilities

Postdocs are crucial for running an academic lab and making the fundamental discoveries that drive biomedical advances.

Fundamental issues and challenges

I have not been able to recruit a talented postdoc in the last two years; the high cost of living in the Bay Area and the competition with industry means that we are no longer seeing graduates doing postdocs as frequently as in the past. Also, my last 2 postdocs left early because they had families and were tempted away by higher paying industry jobs. Both postdocs expressed that if the salaries were higher, they would have considered staying in academia.

Existing NIH policies, programs, or resources

A modular budget at NIH no longer can support postdocs on a project, given the recent needed increases in postdoctoral salaries.

Proven or promising external resources or approaches

We need to be able to pay postdocs higher salaries. That is the number one factor that will keep talented scientists in academia where they can make important contributions to fundamental science.

Response 2365

Perspectives on the postdoc roles and responsibilities

As someone who has been interviewing the experiences of postdocs from a higher education perspective, I see the postdoc as in need of overhaul. I have presented at multiple conferences and published papers related to these experiences and have more in my research agenda.

Fundamental issues and challenges

Isolation and lack of sense of belonging

Existing NIH policies, programs, or resources

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step.

Similarly, the NIH should promote minimum salary that provide a living wage adjusted annually for inflation, location, tenure and merit.

Academia contains remnants of structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups. Postdocs from historically-marginalized groups and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. Examining and acting on these power imbalances is key to creating a more inclusive and safe environment.

The NPA's 2023 report shows a majority of postdocs are negatively impacted by a lack of healthy workplace culture (70.8%) and harassment/abuse (54.9%). Postdocs often cite high instances of isolation and poor mental health. NIH should hold institutions accountable for fostering inclusive and supportive training environments, including expanding the current requirement for institutional commitment to preventing discrimination and harassment (https://grants.nih.gov/grants/guide/notice-files/NOT-OD-19-056.html) to include provisions for mental health and wellbeing support.

Postdocs deserve equitable benefits regardless of funding source. NIH should work with the State Department and USCIS to simplify the visa and immigration process world-class early-career researchers.

Proven or promising external resources or approaches

Effective mentoring, professional development, better salary and benefits, support offices, postdoc associations at the institution level, clear pathways to career

Response 2366

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant writing, new experimental techniques, career exploration, and other transferable skills. Postdocs should work in an inclusive and equitable environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth. Postdocs should have protected time and funds to attend at least 1 scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network. Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PIs regarding their role and how it differs from staff scientists will alleviate misunderstandings. Requiring postdoc and PI participation in formal performance reviews as part of an NIH award will better define, formalize and

evaluate factors of role, mentorship, and professional development, while differentiating postdocs from staff scientists. The National Postdoc Associations' 2023 Postdoctoral Barriers to Success reported most postdocs are negatively impacted by a lack of professional development opportunities and intellectual freedom. NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring, and professional development activities. This will assist postdocs, principal investigators, mentors, and postdoc office leaders in creating a climate for and of success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

Compensation, insufficient DEIA, hostile work environments, and lack of support for international postdocs are some of the fundamental issues inhibiting recruitment and retention of postdoctoral trainees. Higher postdoc salaries will benefit those who wish to continue conducting research but struggle with supporting themselves and their families, especially in high cost of living areas. Therefore, the NIH should increase its stipends to postdocs on NIH training/grants/fellowships to match GS-10 federal pay schedule including locality pay for the year of award. Also, the NIH should pay postdocs a living wage that is adjusted annually for inflation, location, tenure and merit. With regards to DEIA, academia continues to contain structural biases and institutional barriers that hinder the success of scholars from historically-excluded and marginalized groups. Therefore, examining and acting on the power imbalances (lack of inclusion, reduced resources, implicit biases, loss of community) is key to creating a more inclusive and safe environment. The NIH should continue to expand its DEIA initiatives and instate rigorous and impactful annual mandatory DEIA training for postdocs, mentors, principal investigators, and postdoc office personnel. NIH should ensure that DEIA training materials are current and evidence-based, while developing accountability and outcome measurements. The NIH should also hold institutions accountable for fostering inclusive and supportive work and training environments for postdocs. Additionally, the NIH should require a percentage of indirect costs on all NIH grants to support postdocs with postdoc offices that foster stronger postdoc communities with healthier sustainable cultures.

Existing NIH policies, programs, or resources

Postdocs need equitable benefits, quality mentorship, and increased opportunities regardless of funding sources. NIH should issue written guidance explaining that postdocs receiving NIH grants or fellowships should be categorized as an employee at the host institution. Currently, postdocs can lose employee benefits when accepting NIH grants or fellowships, making these prestigious awards less feasible. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship/grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. Also, NIH should allow PIs to supplement fellowships from their NIH funds/grants, especially to accommodate differences in cost of living that vary by state. NIH should also expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. To increase equity, NIH should provide postdocs with moving allowances. With regards to mentorship, because many PIs lack formal mentoring and personnel management training, the NIH should institute reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding. Also, postdocs should develop essential skills for their career transition and the NIH should mandate all NIH-funded postdocs develop an IDP and PIs should support and submit documentation of progress. With regards to increasing opportunities, the NIH should create and expand programs, like MOSAIC and IRACDA, to support postdoctoral training. Metrics should also be collected on postdoc satisfaction on an annual basis to allow the NIH to adjust policies accordingly based on postdocs needs. Additionally, collecting postdoc satisfaction data anonymously will provide key insights that can help determine if policy changes are effective without postdocs fearing retaliation.

Proven or promising external resources or approaches

The National Postdoc Association (NPA) has a wealth of resources developed by committees consisting of postdocs, postdoc office leaders, and other contributors.The NIH working group should refer to the following resources: NPA Recommended Postdoctoral Policies and Practices, the triennial NPA Institutional Policy Surveys from the last decade, and other pieces within the NPA Resource Library. Currently, academic institutions and the NIH each develop their own professional development resources, leading to inequities. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance postdocs' personal,

scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources. I encourage the NIH to work closely with key stakeholders, and institutions, that host postdocs to consult on institutional policy adjustments and tool development that is needed to complement public policy change. There is a need for increased policies and programs that train postdocs, like MOSAIC and IRACDA as well as opportunities that support reentry and reintegration supplements for scientists with careers gaps. I also want to thank the NIH for this platform that allows the scientific community to come together to share on how postdoc training can be improved.

Response 2367

Perspectives on the postdoc roles and responsibilities

Experience, independence, flexibility, freedom, excellent science

Fundamental issues and challenges

Salary, paid-time off, maternity leave, retirement, work-life balance

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase in salary will also help mental health, postdocs having families struggle to earn enough money and provide for their kids

Postdocs that do not have kids yet will not consider starting a family due to the inability to provide enough and have a proper work-life balance

Response 2368

Perspectives on the postdoc roles and responsibilities

Conduct original research with some supervision by a mentor. Disseminate results and publish in peer-reviewed journals as well as present at national conferences. Submit funding applications to obtain grant funding. Hone in on research area of interest. Prepare for next role as independent investigator.

Fundamental issues and challenges

The salary of a postdoctoral is less than many entry level positions in research that do not require an advanced degree. Many PhD level positions include a relocation stipend, which would help with recruitment. No computer is included in the T32 grant.

Existing NIH policies, programs, or resources

Resources: Update and increase the stipend to an appropriate living wage. Modify to include relocation expenses.

Proven or promising external resources or approaches

Competitive wages would improve job satisfaction.

Response 2369

Perspectives on the postdoc roles and responsibilities

Postdocs (along with graduate students) are the primary generators of experimental data and analysis that support virtually all academic research publications and funding. Postdocs are highly skilled and experienced scientists who are central to the success of most labs. In theory, the academic postdoc should be a time of extended training and support that equips you for an independent research career--whether or not your end goal is to become a PI. In practice, this “training” is not enforced or even supervised, so postdocs are often expected to focus entirely on generating data and aren’t particularly supported in expanding their skills/knowledge or building their network for future career success. The degree of actual

training and support is highly dependent on the individual lab environment, and I think "the roles and responsibilities of the academic postdoc" are quite variable and poorly defined in general.

Fundamental issues and challenges

1. The pay scale! Academic postdocs come in with many (often 10+) years of research experience already under their belt. It is difficult to support such a long period of "investment" in one's future career while continuing to get paid far less than your experience--and the value of your contributions to the research enterprise--should merit. I love doing science, but I'm not sure I could choose this career if I didn't have a partner who earned a very good salary, family financial support that left me debt-free after college, and no kids or other family members to support. I see this as a huge barrier to diversifying the workforce as well.
2. Work-life balance. Academic research has a pervasive culture of prioritizing work above all else. I have heard senior women scientists advising younger women not to have children if they want a successful research career. It is also true that most of the senior women scientists I know either
    a) do not have kids, or
    b) have a stay-at-home partner. Spending 10-15+ years in training to become an independent scientist overlaps with prime childbearing years for women, and there is very little allowance for taking time away from research to have children. In fact, there can be major penalties for anything that is perceived to negatively impact research productivity (e.g., a longer gap between publications can hurt grant scores).
3. Insufficient employee protections. Postdocs at my university have different (more expensive) benefit options than other employees. Before this, NRSA-funded postdocs had to change their benefits due to the change in funding source, which is very disruptive. PIs receive W2 income and standardized benefits regardless of their funding source. Postdocs should too. My peers at other institutions have highlighted similar concerns, so this is a general issue.

Existing NIH policies, programs, or resources

I think the 4-year clock for K99 eligibility is too limiting--particularly given that COVID caused disruptions for several years. And why not allow eligibility extension for lab circumstances that delay research productivity? Many postdocs will be negatively impacted by this, and the value of imposing a 4-year time limit is not entirely clear to me. The K01 award is a helpful alternative, but it does not offer the same level of support during the independent faculty phase as the K99 does, and it is therefore potentially less helpful for landing a faculty job.

Some universities use the NIH NRSA pay scale to determine what their postdocs get paid (whether or not they are supported by an NRSA). NIH should increase this funding scale to $65-70,000 minimum for a year 0 postdoc. NIH could additionally mandate that postdocs supported by any NIH grant receive salaries that are in line with the NRSA pay scale.

Proven or promising external resources or approaches

It would be nice to see NIH implement some kind of oversight process for the training of postdocs (at least those who are supported by NIH grants). For example, requiring yearly IDPs or some other form of documented career progress check ins would encourage at least some amount of training and investment from the PI. As it stands, some PIs really make an effort to support their postdocs' development and others make no effort whatsoever. Narrowing the gap between what academic postdocs get paid vs. people with a PhD who move on to different careers is also absolutely crucial to enhance recruitment and retention of academic postdocs. Such changes would demonstrate to postdocs that they are truly valued in the overall research ecosystem, rather than sending the message that a postdoc is just one more period of suffering (financial and otherwise) one must endure if they want to be an independent academic researcher.

Response 2370

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is an opportunity to expand one's research experience and skills coming out of PhD training. It also offers the opportunity to hone one's research trajectory, which is critical for ESIs who

are seeking academic research positions at R1 institutions. I think of it as a bridge to an early career faculty position.

Fundamental issues and challenges

Coming from a PhD program at a teaching-heavy institution, I wasn't quite prepared for how quickly I needed to narrow down my methodological research interests. I applied for training grants within my first postdoctoral year in new skills areas that were interesting and competitive, but which I've found over time that I have little interest in. I felt that I needed to apply to training grants quickly because living on a postdoctoral salary was unsustainable for me as a primary breadwinner in my 30s. Also, because postdocs tend to run for a 2-year period, I was trying to avoid immediately moving to another institution; both because moving my family is a logistical challenge and because moving interstate as a postdoc is expensive.

As such, I wanted to attain more stable funding as soon as possible, so that I could compete for a hard-money supported faculty position. I successfully received funding in a substantive area that I am very passionate about. However, I may have set myself on a methodological trajectory that may feel less satisfying for me in the long run, which could contribute to burnout. If I'd felt more secure in my position, with competitive salary and benefits as a postdoc, I think I would've slowed down and thought more about my long-term research program.

I benefitted as a postdoc from having an involved mentor who brought me onto projects and connected me with other researchers. As such, I've done fairly well in publishing and have made solid progress toward grant writing/awards within my first year as a faculty member. However, it was challenging advancing my own research as a postdoc without the funding to support student researchers or other staff. "Doing it all" isn't sustainable.

Existing NIH policies, programs, or resources

I have found the NIH training, career development, and loan repayment programs to be additive to my career. They supported my postdoc training and transition into early career faculty.

With respect to the K99, I've heard mixed experiences with respect to the timeline. Committing to an additional two years as a postdoc can be a financial challenge. However, it seems like most applicants are encouraged to apply for 2 years on the K99 and 3 years on the R00—even if they go on the faculty market early. In the event of an early transition to a faculty position (e.g., after 1 year on the K99), it would be helpful if the R00 could transition to a 4-year award, so that research aims could be completed on the original timeline. Otherwise, we risk sacrificing the robustness of the original aims, or unduly burdening ESIs who are now completing aims initially proposed over a 5-year trajectory in a compressed 4-year timeframe. Even with additional financial and staffing resources, it's a stretch.

Another concern I've seen colleagues experience as postdocs and early career trainees, is the strain of not knowing how personal events (personal or family illness, parental leave, etc.) are supported (or not) under NIH training grants or career development grants. In my early postdoc, on a training grant, I had no PTO benefits. When COVID hit, I was constantly worried about what I'd do if a family member fell seriously ill or developed long COVID. Having guidance for training grant recipient institutions for sick time/PTO/short-term disability for postdocs could ease that burden on individuals.

Proven or promising external resources or approaches

Early training/coaching on developing a long-term program or research, and how to leverage postdoctoral training grants and career development grants to that end, would be additive.

Opportunities to connect with mentors at NIH (perhaps POs?) outside of a specific grant application to talk about trends in research and NIH funding, developing fundable research programs, and strategies for maintaining a competitive work life / healthy home life, would be also be appreciated. I think that having exposure to the training, mentoring, and work environments outside of our home institutions could help postdocs/ESIs to better imagine how they want to put together their future research programs and the types of academic and research positions that might be best suited for them.

Response 2371

Perspectives on the postdoc roles and responsibilities

This is a time to both develop new skills that will be relevant to your future roles and to begin to establish your independence in your future area of study. Do to already gained expertise in a given area as well as from your academic journey, the role of postdoc can also make you almost like an assistant manager to your PI in also helping with certain aspects of the group development. For this reason postdocs wear many hats. Skill development in this role happens at an accelerated level that is more targeted than conventional learning during a PhD. This aligns more with the development seen for any new position (academic or industry), which is why postdocs should not be considered students. Professional development in this position goes hand in hand with the types of responsibilities that postdocs typically have within a group. This can include training and/or supervising undergraduate and graduate students, maintenance of certain administrative aspects (group documentation, etc.), and aiding in general group morale. In addition postdocs should be leading their own projects that align with their own research interests.

Fundamental issues and challenges

The largest challenges are short contracts and low pay. In order to maintain a healthy lifestyle and be successful postdocs must have a certain level of stability. This means an income and/or benefits that allow them and their potential family to comfortably live in a given geographical location. Postdocs should not have to choose between their academic career and having a family, getting necessary medical care, or being financially stable. The current standards in relation to this are absolutely unacceptable and embarrassing compared to other countries or industry standards. Standards made by the NIH should include clear suggested guidelines for COLA expenses. If these issues are not addressed there will continue to be a decline in the number of PhDs who decide to continue with academia.

Existing NIH policies, programs, or resources

Increased guidelines for how salaries should incorporate COLA nationwide and minimum standards for benefits. This includes outlining expectations of familial leave. Increased communication that postdocs are NOT students and their salary should NOT be reduced for their this reason.

Proven or promising external resources or approaches

Not sure if I understand the question. It would be interesting to see a study that compared life satisfaction (not job) and productivity.

Response 2372

Perspectives on the postdoc roles and responsibilities

Temporary position to extend US visa until a proper job position was applied and accepted.

Fundamental issues and challenges

A post doctoral fellow is a highly educated individual in 30 to 40 years old likely with a family to support. However, the salary is not even enough to pay the day to day life cost and there is no savings for future and retirement. Post doc position is very different than the phd positions where the goal is to learn as a young individual. In post doc the goal is not to only learn but also the goal is to achieve a scientific break through and either promote to a faculty position or join the industry within a year or two. Despite the low salary and vague future, there is a high pressure work, most of the time more than 8 hours a day, with no breaks or vacations to meet deadlines. There is very few opportunities to apply for a grant as a non US residents and no guarantee support from the employers for the opportunities after joining as a post doc. The length of the post doc position is not set. There is no promotions after a year and very few courage to continue fighting for a position in academia. There is no guarantee support for affordable physical and mental health insurances from the universities. Affordable housing or rental locations are not possible in many cities including cities in California.

Existing NIH policies, programs, or resources

The minimum salary for postdoc has different meaning for HR in universities. Even the faculty want to pay more than the minimum salary set by NIH, the University HR doesn't allow it. The cost of living is different across US and need to be modified accordingly.

Considering that major population of postdocs are internationals, there should be more opportunities for grants for non us residents.

Proven or promising external resources or approaches

No response

Response 2373

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I am an international postdoc in the US. I have lived in the US for almost eight years now, but originally from what people in the developed world call a "third-world country". I am a first-generation student. My parents didn't graduate high school and we lived in poverty growing up. We thought the only way out of our poverty was to save our money to provide me an education in what's considered to be the best place in the world and where hard work pays off and the system is fair-—US. Although there have been many wonderful aspects of being a scientist here and I am not gonna discount any of these, I don't understand why a woman of color from a developing nation is not considered an underrepresented minority. Why is NIH's definition of diversity so politically driven?! I am sure if I ask each one of you individually to answer if a person like me is considered underrepresented, you will say yes. so why as a system we are punishing internationals for something that is not even in their control. I didn't have any control over where I was born but I do have control over how hard I work and I know I deserve to be a scientist here. So why am I still being punished because of my citizenship? Why am I competing with people who have way more resources and opportunities than I do? The argument is usually these are tax dollars but I am sure I have paid as much taxes (if not more) as someone my age and a US citizen. I wanna leave by asking you all by asking. Do you really think you are being inclusive?

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2374

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdocs are dramatically underpaid for the work that we do and the areas we live, which creates a huge amount of stress surrounding finances that takes away from our work. Postdoc compensation needs to be tied to actual cost of living in the area surrounding a university/institute, as well as include benefits that allow postdocs to live on the relatively low salary, such as fully-funded childcare options, low-cost health insurance, transit subsidies, and subsidized housing. Being a postdoc is already hard and often demeaning, we should at least be paid enough to afford to live.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2375

Perspectives on the postdoc roles and responsibilities

Independent researcher working to further personal research project and support greater lab/group efforts

Fundamental issues and challenges

Pay—just moving to an industry job in my area would be an approx. $30,000 annual pay raise, with better benefits like retirement and stock options.

Existing NIH policies, programs, or resources

Open up more potential to pay research staff positions for higher trained professionals, like PhDs, in labs run by current PIs. Provide competitive wages and benefits that other university staff receive like percent-matched retirement contributions, etc.

Proven or promising external resources or approaches

Open and develop upper level positions that are not PI-centric.

Response 2376

Perspectives on the postdoc roles and responsibilities

The are the driving force of most biomedical research labs.

Fundamental issues and challenges

Poor salaries that barely allow them to make a living in most regions on the USA. This is particularly critical for those that want to start a family. The NIH and the federal government appreciate research and scientists, a highly skilled work force that keeps USA at the cutting edge, they have to be able to compensate them appropriately. Given alternatives, PhDs are now moving to industry and basic research is going to suffer. USA risks loosing the science race to other countries

Existing NIH policies, programs, or resources

I do not know

Proven or promising external resources or approaches

A number of institutions have now increased the stipends of their postdocs. With a few exceptions, though, the cost will have to be accommodated by individual labs with budgets that will not increase accordingly. So, the number of researchers will have to be reduced and the scientific output will suffer the same fate. NIH needs to see an increase in its budget to assimilate the cost of increasing postdoctoral and graduate student wages. No one can do the same with less. Something has to give.

If we do not want to see the American scientific out decline, the right investment in people has to be made and the time is ticking.

Response 2377

Perspectives on the postdoc roles and responsibilities

To me, a postdoc is the final stage or refinement for a researcher so that they can become a leader in scientific field.

Fundamental issues and challenges

Postdocs are laughably and egregiously underpaid. This is *THE* fundamental issue causing the decreasing recruitment, retention, and quality of life we see today. To pursue a postdoc at an elite coastal university is to knowingly sacrifice hundreds of thousands of dollars in future income for a chance to pursue a passion. This currently means living in substandard and sometimes unsafe housing, putting off having children, not taking care of your health, and placing your own financial burdens on the shoulders of partners and loved ones. That a person with least 22 years of schooling at elite institutions in lucrative STEM fields is only payed 50,000-60,000 dollars can only be described as cruel and sadistic comedy.

Existing NIH policies, programs, or resources

Pay postdocs 100,000 dollars a year. Adjust all RO1 grants for the inflation of the past 25 years to accommodate this. Everything else is a band-aid on a bullet wound.

Proven or promising external resources or approaches

Pay postdocs 100,000 dollars a year. Adjust all RO1 grants for the inflation of the past 25 years to accommodate this. Everything else is a band-aid on a bullet wound.

Response 2378

Perspectives on the postdoc roles and responsibilities

The academic postdoc should conduct rigorous science in a stimulating environment toward the goal of becoming an independent investigator. Postdocs are not cheap labor to promote the goals of principal investigators.

Fundamental issues and challenges

Pay is too low. Expectations of individual productivity are too high. Collaborative support structure is lacking, such that too much is expected from postdocs in terms of physical work hours, rather than building sufficient infrastructure and support to foster a productive working environment. Benefits are not guaranteed. Collaboration among postdocs is not sufficiently incentivized.

Existing NIH policies, programs, or resources

Funding mechanisms for collaborations among postdocs across disciplines should be created. Letters of support from principal investigators are often not sufficient, as postdocs in the systems neuroscience field typically provide the plurality of intellectual, technical, and analytical contributions to their projects.

Pathways for training postdocs to become full-time scientists and funding mechanisms to retain those scientists should be created. Often postdocs lose support or are forced out of academia at the peak of their technical skill, expertise, and productivity. Academic labs can thus be incentivized to build collaborative teams of experts and build momentum to solve difficult problems in their field.

Proven or promising external resources or approaches

No response

Response 2379

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdocs are essential to our research but because of the funding allotted to us as investigators, we can’t recruit and retain them. The best students now go to industry because the postdoc salary doesn’t allow them to pay their bills. Meanwhile, my grant size doesn’t allow me to pay postdocs even at a sub-ideal level. We can’t match industry salaries but this isn’t needed. We just need to give PIs enough that they can pay postdocs enough to live. NIH must increase grant size for this purpose. We are now at the breaking point where asking young Pis to figure out how to do keep doing more with less is no longer possible

Existing NIH policies, programs, or resources

Increase grant size to allow us to pay trainees and do research

Proven or promising external resources or approaches

Increase grant size so that postdocs can be paid enough to live

Response 2380

Perspectives on the postdoc roles and responsibilities

The postdoctoral position entails managing projects independently, obtaining grant/fellowship writing experience, and developing a mentorship style (by mentoring trainees on your project(s)).

Fundamental issues and challenges

1. Salary
2. Success rate of getting an academic faculty position after training

Existing NIH policies, programs, or resources

Regarding issue #1 listed in the previous question, the top-ranked institutions for biomedical research in the United States are in major cities. It is more expensive to live in any of the major cities compared to other parts of the country. Further to that, inflation has resulted in an even higher cost of living in the country in general. NIH should increase the average postdoc salary to overcome this fundamental issue.

Regarding issue #2 listed in the previous question, I think it is exacerbated because of 2 things:

1. There is no formal training on how to successfully become a tenured faculty member at an academic institution, and
2. There is no "cap" on years of service as a faculty member/Principal Investigator (PI).

If there were both formal training for postdocs and a system in place similar to a service retirement pension system, then there would be more positions available due to a higher turnover rate and likely more successful applicants for these positions.

Proven or promising external resources or approaches

No response

Response 2381

Perspectives on the postdoc roles and responsibilities

As a professional research scientist. My role was to develop and take a practical leading role on the progression of projects of my own, as well as mentoring and training of junior trainees. In most labs it is not practically feasible for the PI to take on project management of all projects in the lab. This role is almost always assumed by the post doc. I also mentored junior postdocs and graduate students in addition to my own research projects. A postdoc felt like a senior scientist role. I think we should view it through this lens. In no other career does the fact that a person may in the future assume additional responsibilities devalue the current role. Post-PhD should be staff scientist, with some moving on to lead their own labs and others staying at that position.

Fundamental issues and challenges

The pay was too low for me to sustain my family alone. We were only able to do this because my husband also had another, higher paid job. This was a practical decision, he had previously also considered a postdoc position, but it was not a tenable option for our family. It also felt devaluing to feel like I was a highly skilled researcher leading novel and dynamic projects, getting paid less than half of what he was being paid in a position with much less responsibility. Colleagues who would have stayed in academia, chose to pursue industry jobs, which was not their first choice, because the pay discrepancy was so high. This is particularly true for colleagues with computational experience.

Now as a PI in a computational field I am finding it extremely difficult to attract postdocs with the appropriate skills due to the pay discrepancy. When the [redacted for anonymity] mandated pay raises arrive, I am unlikely to be able to afford to pay them and also pay for other items in the lab with the current per annum funds available from the NIH. The dollar amount per NIH grant needs to increase to cover this cost.

Existing NIH policies, programs, or resources

Increase the per annum funding for RO1s so that it is possible to fund postdocs at a higher level. The current funding level does not allow for this option. Provide location adjusted payscales that actually account for differences in the costs of living in different areas.

Proven or promising external resources or approaches

HHMI postdocs have the option of becoming staff. Having the ability to recognize postdocs who are contributing as leaders to the lab with additional titles and pay makes a huge difference to retaining excellent postdocs who are not ready or interested in setting up their own labs. This whole structure of "up or out" is really hurting science. We need ways to allow for progress in place. When people view that they have no options or hope for progression it is hugely demotivating and demoralizing.

Response 2382

Perspectives on the postdoc roles and responsibilities

Academic postdoc is a more advanced training period to gain more experience in experimental design, techniques and mentoring.

Fundamental issues and challenges

The main issue that we are facing the Bay Area of California is the competition with industrial salaries. Many graduating Ph.D. students are forgoing postdoctoral training to get jobs in biotech right after graduate school. Not fixing this problem will prevent the training of the next generation of academic scientists and teachers.

Existing NIH policies, programs, or resources

Both the pre-doctoral and post-doctoral stipends need to be raised to be more competitive with the private sector. The NIH funded training grants only support about half the stipend that we need to pay to be competitive with UCSF and Stanford. Moreover, HHMI just raised their postdoctoral stipends to $70K, while first year NIH postdoctoral stipends are $56K.

Proven or promising external resources or approaches

Look to the private sector and philanthropy (e.g. HHMI)—this will also be a problem for the NIH intramural program.

Response 2383

Perspectives on the postdoc roles and responsibilities

Postdoctoral research and training is essential to broaden and deepen the scientific skill set of a newly-minted Ph.D. and, for those who elect to do so at an institution or institute different from the one that awarded their doctoral degree, the postdoctoral experience is an opportunity to be exposed to a fresh and distinct scientific culture and environment, as well as to a new constellation of individual investigators / mentors and their novel research problems.

Fundamental issues and challenges

Many newly-minted Ph.D.'s are attracted to employment in the biotech, pharmaceutical, chemical and related commercial sectors because of the ENORMOUS differential between the compensation they can receive in industry and the pittance, relatively speaking, that they can be paid in a typical lab at most academic institutions. Thus, instead of replenishing the ranks of academic scientists, many of the best and brightest are abandoning any interest in becoming academic investigators. I've heard it said that many Ph.D.'s these days view an academic career path as a "vow of perpetual poverty."

Existing NIH policies, programs, or resources

If a candidate is able to garner a competitive NIH Postdoctoral Fellowship, the annual stipend should come within at least 5-10% of what the going salary rate would be for a comparable starting staff scientist position, averaged over, say, 20 of the most stable and well known corporations in the life science sector (Merck, Pfizer, Lilly, Genentech, Amgen, etc. etc.).

Proven or promising external resources or approaches

Extra funding for childcare services would go a long way to attracting outstanding young persons into a postdoc track in academia, rather than industry.

Response 2384

Perspectives on the postdoc roles and responsibilities

I view it as a way to gain skills that can distinguish you from your grad lab and transition to independence, skill wise, mentorship wise, and research topic wise

Fundamental issues and challenges

Money. People can not be good scientists if they are worried about resources needed to survive. Work life balance, if people do not have the time and space (and money) to grow as people, what is the point of any of this.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2385

Perspectives on the postdoc roles and responsibilities

Postdocs are vital to the academic research enterprise. It is also a critical training period, as it is often the first time in a scientist's career when they are ready to tackle a largely independent research project (e.g., as opposed to graduate school). Postdoctoral training also provides an opportunity for scientists to pivot in their focus area, to broaden their experience beyond their doctoral research.

Fundamental issues and challenges

I think postdocs have been underpaid for many years. This financial stress comes during the time of life when many postdocs are starting a family. For those without additional financial support, the situation can be untenable, forcing many to leave for positions that pay more. Postdoc salaries are finally rising at some institutions, but NIH budgets do not reflect these increases. Thus, PIs are asked to the same work with fewer personnel.

Existing NIH policies, programs, or resources

The NIH should increase the modular budget to reflect increased costs of research and to support higher salaries for postdocs. The amount of support for F32 fellowships should also be increased.

Proven or promising external resources or approaches

No response

Response 2386

Perspectives on the postdoc roles and responsibilities

Postdocs design, carry out, analyze, and publish cutting edge research. They write grants on behalf of their PIs and train graduate students and undergraduates on behalf of their PI. They are responsible for the day to day success of research in America.

Fundamental issues and challenges

The only issue is pay. Everything else stems from that. NIH needs to at a minimum double the postdoctoral minimum. Not one single other thing written here is important and all others can be solved with increased pay.

Existing NIH policies, programs, or resources

Increase the postdoc minimum salary to 110000. That way we can find housing. Take the risk of doing a postdoc and failing to get a tenure track position and not be 40 with 0 dollars in savings. We can not have to defer having children into our 40s for the hope of a tenured position.

Proven or promising external resources or approaches

Pay pay pay pay pay nothing else matters. Double our salary spend every single dollar this survey cost on post doc salary.

Response 2387

Perspectives on the postdoc roles and responsibilities

Postdocs are the workhorses of academia: they are highly skilled in science, already trained during their PhD. It is a misconception and belittling to consider postdocs as trainees: they are highly skilled workers who perform at the most productive time at their career. A postdoc is currently not a training position, unfortunately it is an underpaid mid-career stage necessary to become an academic faculty member. The current system is tailored to keeping postdocs in their position for too long with limited chances of progressing their career.

Fundamental issues and challenges

The academic postdoc salary is too low given their level of skill. Also their growth opportunities into academic faculty / Principal Investigator (PI) positions are too limited / competitive, simply because the ratio of postdocs to PI positions too high.

Existing NIH policies, programs, or resources

The NIH minimum salary needs to increase with at least 50%. Furthermore, the salary could be made dependent on the living location, since postdocs in the big cities (e.g. NY, SF, LA, Boston) have a lower standard of living due to their salary than postdocs who live in areas where the cost of living is lower. Childcare support, either financial but even better through free of charge daycare facilities organized within research institutions, would also help a lot, since many postdocs postpone having children due to the financial burden it imposes. It is also necessary to support postdocs financially in their savings for retirement, which is currently lacking.

Proven or promising external resources or approaches

Yalcin, E., Martinez-Corral, R. & Chugh, M. Retaining postdocs by recognizing their worth. Nat Biotechnol 41, 296-298 (2023). https://doi.org/10.1038/s41587-023-01656-4

Response 2388

Perspectives on the postdoc roles and responsibilities

A postdoctoral position offers a scientists the opportunity to pursue independent research questions without financial risk so they can gain the experience necessary to run an independent lab.

Fundamental issues and challenges

Salaries are just too low when the chance of a tenure track faculty position is also low. Actually at this point, salaries are so low that postdocs need some other source of income to live a decent quality of like in expensive markets. I just learned that my new postdoc paid at NIH scale was getting food from the food pantry set up for food insecure students on campus.

Existing NIH policies, programs, or resources

Higher salaries would help relieve the stress postdocs feel while pursuing their training,

Proven or promising external resources or approaches

F32 and K99 are fantastic resources for postdocs to give them some confidence that they are on track.

Response 2389

Perspectives on the postdoc roles and responsibilities

To examine and research the field that I wanted to study.

Fundamental issues and challenges

Culture differences, but really minor one

Existing NIH policies, programs, or resources

Sounds good

Proven or promising external resources or approaches

NIH helps a lot to settle in US for foreigner researchers.

Response 2390

Perspectives on the postdoc roles and responsibilities

Related to NIH goals, temporary training period to prepare a PhD-level trainee for a career that will impact biomedical sciences and engineering.

Fundamental issues and challenges

Salaries are too low for trainees with this expertise and enter into phases of life with added responsibility for family, from children to caring for aging parents and grandparents, particularly as PhD degrees and postdoc training is taking longer and longer

Existing NIH policies, programs, or resources

NIH needs to increase R01 and MIRA R35 support to PIs to cover increased costs, as well as minimum stipend for NRSA and K99 grants. International applicants, particularly ones that did their PhD degrees in the US, should be eligible for F32 NSRA and related awards

Proven or promising external resources or approaches

Mentor training, and funds to support moving costs, short courses for career development

Response 2391

Perspectives on the postdoc roles and responsibilities

It is weird that we are considered in training yet we write the grant, form the students, manage our projects with our ideas. Work full time after years of grad school, stress and tuition fees yet we make less than most and can barely live

Fundamental issues and challenges

Money, stress, respect

Existing NIH policies, programs, or resources

More money, more defined tasks that fit what a postdoc is considered. Now we run labs and are treated as "in training"

Proven or promising external resources or approaches

Unions are a start. defining clearly what our tasks are ment to be so we dont do all the PIs work

Response 2392

Perspectives on the postdoc roles and responsibilities

For me, a post-doctoral fellowship is a period of higher academic training after completing a doctoral program.

Fundamental issues and challenges

I believe that the biggest problem with postdoctoral research is that the postdoctoral position is fixed-term and the salary is not sufficient.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2393

Perspectives on the postdoc roles and responsibilities

Post doc is similar to grad school, but without a clear goal and little input about improving one's skills.

Fundamental issues and challenges

Low wages and very little 'training' for the post doc.

Existing NIH policies, programs, or resources

Have a longer window of time to be eligible for certain grants as a post doc.

Proven or promising external resources or approaches

There have been post doc offices at both universities that have had some activities and career advice, but the offices are small and didn't focus on policies.

Response 2394

Perspectives on the postdoc roles and responsibilities

As a postdoc, you are the day-to-day lead of the lab. You contribute ideas, train graduate students, techs, and undergraduates, and write grants. We are the primary driver of the day-to-day activity and discourse in the lab, and yet underpaid, in many cases half as much as an industry equivalent position.

Fundamental issues and challenges

Pay. We are expected to take leadership roles in the lab, roles comparable to research scientists in industry, and are woefully underpaid in comparison. It is the main reason my peers have left academia, and the main issue I have in wanting to stay.

Existing NIH policies, programs, or resources

Postdoc minimum salaries should reflect industry salaries if academia wants to retain high quality candidates. More funding opportunities for postdocs and opportunities that cover both salary and benefits. Postdoc often lose salary and benefits if they are successful in the grant application process.

Proven or promising external resources or approaches

People are happier when they are paid what they are worth.

Response 2395

Perspectives on the postdoc roles and responsibilities

As a T-32 post doc at my university and in life, my role is often undefined and feels confusing. It is like I am in purgatory between being a student and being a researcher minus the benefits of either. Please see frustrations section.

Although I am grateful for the opportunity to work on my research, meet some new friends, learn a few new skills, I feel like I have taken a step backward in entering this position. I am constantly frustrated by a lack of organization in my program, negative reaction from administration when we provide feedback on the program, the financial burden of reduced pay by entering the T-32, lack of autonomy in my work that I

enjoyed in my PhD, and juggling health issues with very little PTO. It is not a path I would recommend to others. Several of us in my program have been searching for jobs and are considering leaving before the program is over because of our frustrations.

Fundamental issues and challenges

Financially the T-32 is a killer—especially since I worked full-time during and after completing my PhD. I took a pay cut to be in this program.

Examples of the financial burden:

1. Taxes: not eligible for student tax breaks nor am I eligible to have tax breaks for w2 income.
2. My insurance is more expensive since I'm not eligible to have an HSA.
3. T-32s are not eligible for contributing to retirement.
4. No FMLA, disability, or leave—I had a major surgery and I had to come back to work much earlier than my doctor wanted.
5. At my university, employees are eligible for 50% off classes, fellows are not.
6. As I am no longer fully "employed" , it has affected my PSLF status,
7. Antiquated pay scale that doesn't include pre-doctoral experience,
8. At my university, T-32s are generally not able to be PI's for grants (something I didn't know going into the program),
9. T-32s are not eligible for loan deferral status like students

The T-32 also affects mental health: With ever changing demands, financial burdens, juggling physical health, and our productivity being "pitted" against each other. Despite asking, we did not receive accurate information prior to entering into our program. When we suggested making this change for future T-32s, we received resistance. Constant uncertainty has hurt our motivation and lead to undo stress.

The fact that many universities now have hiring freezes is terrifying.

Many of us are stressed, depressed, or have had issues with anxiety. We discuss this among ourselves and have taken steps to seek help. It does not have to be this way.

Practical factors: Thank you for parental leave but what about other health issues? 4 weeks PTO is not enough for other health issues or for family leave.

Existing NIH policies, programs, or resources

1. There needs to be paid extended health leave BEYOND parental leave
2. Retirement
3. Adjust pay scale for fulltime work prior to PhD
4. DS2019 which is issued only for 1 year at [redacted for anonymity], which creates a lot of complications and stress surrounding visas for international postdocs
5. Require universities to allow post-docs to be PI's to apply for grants that allow it
6. Require universities to issue tax documents (1099 misc) to make taxes easier
7. Establish pathways for careers after the T-32; many of us feel lost—especially since many universities are putting hiring freezes
8. Post-doc programs need to be up-front about benefits and program expectations; no one should have to feel bamboozled like I do (I asked but received inaccurate information)
9. The idea that a mentor must have larger grants is antiquated. My secondary mentor who was PI on smaller grants has been the superior mentor to the person who is "more accomplished."

Proven or promising external resources or approaches

No response

Response 2396

Perspectives on the postdoc roles and responsibilities

Postdocs are crucial for academic research laboratories. Even though their numbers are smaller compared to graduate students, their contribution to research is likely equal to that of graduate students. With graduate students, the feeling is that just as you train them to become proficient researchers, then they leave the lab. This is especially true given that biomedical research is becoming increasingly interdisciplinary and requires longer training time. Without postdocs, it is going to be hard to work on something that is challenging and high-impact. Postdocs also help to train graduate students.

Fundamental issues and challenges

In the past five years or so, all my graduate students find pharmaceutical or biotech industry positions without doing postdocs with a starting salary of $120K per year. With this situation, current postdoc salary level is way low to attract postdocs to academia and to become future academia faculty.

Existing NIH policies, programs, or resources

NIH really needs to raise the postdoc minimum salary and accordingly, the funding of regular NIH research grant to make academic research sustainable.

Proven or promising external resources or approaches

No response

Response 2397

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The fundamental difference between working as a postdoc or working at a company is the type of employment offered to you. This is not news to anyone, but the 'fellow' status that is often given to you as a postdoc minimizes benefits and makes it difficult for you to continue life as an adult. The salary is minimal in comparison to your non-academic peers. You can not afford to buy a house, have a child (because of lack of benefits and expensive childcare etc), afford a car or a dog, and you feel a bit stuck as a constant student, even though you have reached your mid thirties.

Existing NIH policies, programs, or resources

I think other types of employments, staff scientists etc, should be promoted by the NIH through grant opportunities etc. Vey few of us postdocs are going to make it in academia as assistant professors, and not everyone wants to go down that path. Right now however, very few other opportunities exist, because PIs can't afford to hire you as a 'regular' scientist.

Proven or promising external resources or approaches

No response

Response 2398

Perspectives on the postdoc roles and responsibilities

Academic postdoc is a temporary training position which should:

1. prepare the postdoc for next career stage by providing enhanced technical training and intellectual support while protecting time to develop independent ideas;
2. help postdoc develop professional skills in management/leadership and the agency to perform at a high level in academic AND non-academic career paths;
3. provide mentor's lab with advanced skills and expertise that come from postdoc's Ph.D. training and contribute to research and training missions of the lab/department.

Fundamental issues and challenges

In my opinion, the biggest current challenges to recruitment/retention and quality of life are:

1. low compensation for postdocs, especially in light of rising inflation and cost of living in larger cities;
2. actual and perceived lack of career advancement in academia vs increased hiring of new PhD graduates by industry (i.e. no staff scientists positions with good/sustainable income);
3. US political climate discouraging international postdocs from coming here;
4. negative social media narrative RE: postdocing and academia in general, which is based on:
5. increased competitiveness of academic career path combined by no adjustment to modular R01 amount in >20yrs and decreasing institutional support of academic investigators

Existing NIH policies, programs, or resources

1. More investigator-initiated R01s with larger budgets. Less moonshots and consortia that seem to routinely go to large labs/institutions and increase the wealth gap between large and small labs. If postdocs are to be supported at equitable rates by PIs, then PIs need grant support that can fund increased postdoc salaries and still run a lab. Current modular R01 is soon to fund only a postdoc, part of the PI's salary, and not enough science to renew the R01.
2. Outreach and training opportunities to reframe postdoc as a chance to develop broad skills that are applicable to academia and industry vs. perception of postdoc as a "academic only" path. PIs need training in how to mentor in this way as well; I think most of us who are starting our careers as faculty now understand the challenges of the current system and want to help trainees succeed regardless of career outcome, but we need a little more guidance on how to facilitate this—and much more importantly, the funding to actually pay postdocs what they're worth. No amount of programming/mentoring will overcome the rapidly declining buying power of the R01.

Proven or promising external resources or approaches

No response

Response 2399

Perspectives on the postdoc roles and responsibilities

Could essentially be described as a (mostly) independent scientist within a research group

Fundamental issues and challenges

Salary is insanely low compared to compensation for the same academic roles 20 years ago. Usually, janitors will make more than scientists in academia now, since salaries have remained stagnant for so long.

There's also the obvious issues with toxic labs, abusive PIs, unfair administration, the entire system essentially being a pyramid scheme etc. but the fact that the salary is so low is literally absurd when you look at it in context.

Existing NIH policies, programs, or resources

You need to pay people more fairly, that's the biggest thing.

Proven or promising external resources or approaches

No response

Response 2400

Perspectives on the postdoc roles and responsibilities

In my view, Post-doctoral students are expected to have a level of expertise in one multiple specific techniques that they bring to the lab for either further development or for application to a different research question that they develop in the lab. The postdoc is at a level of training where the person can work independently in many aspects but need different level of supervision in other areas. Complementary

to this hands-on research training, post-docs should be immersed in the relevant literature and the active neuroscience community to engage with other researchers and clinicians to gain diverse perspectives. They should engage in teaching of students or leading journal clubs to foster the critical thinking and discussion of literature. I view the position as a preparation for a junior faculty position in an academic position running a federally funded lab or obtaining a K—award for additional mentorship in the junior faculty position.

Fundamental issues and challenges

In my experience, graduate students are discouraged from moving on into a postdoctoral position because they witness the high level of competition about funding during their education. They opt for a more secure and better compensated income in industry.

Existing NIH policies, programs, or resources

I think that the training awards for junior faculty and postdocs are very helpful and should be expanded. It would help to create a more financially secure environment for the PI/mentor that would allow the training of postdocs more independent of his or her own funding. This would allow the acceptance of postdocs at times of little funding.

Proven or promising external resources or approaches

No response

Response 2401

Perspectives on the postdoc roles and responsibilities

A genuine postdoctoral fellowship in my opinion is a *pre-faculty position*. A postdoc's responsibilities include project design, management, and execution (with the assistance of junior trainees and technicians in some cases). The key outputs are journal publications (research and reviews). What *should* be included during the postdoc's tenure are resources for future faculty training (grant writing workshops, teaching & mentorship training, lab management training, interview training, etc.).

Fundamental issues and challenges

Many PhD graduates do not want to become faculty, but they are applying for and getting postdoc positions because other options for a post-PhD science career are limited. Instead they want to be career academic scientists. I believe that this has been the case for a long time, before the recent recognition of a "postdoc shortage." I also believe that there is nothing that can be done to change this as long as academic tenure-track faculty responsibilities remain high-stress and hyper-competitive with precarious funding (the feast and famine funding cycle).

The result is a pool of applicants slotting themselves into postdoc jobs, but not actually fulfilling the responsibilities and expectations of a postdoc. They function as 9-to-5 workers (technicians), don't care about the long-term impact of their own publications, and tend to quickly leave the postdoc position to secure an industry job as soon as there is an opportunity. I don't believe they are to blame; non-postdoc post-PhD options would be useful and are in very short supply.

Existing NIH policies, programs, or resources

I am currently running a postdoc search, which includes a "staff scientist" option that is more senior (post-PhD) than an entry-level technician (B.S./ Masters) and offers the same pay as a postdoc, except there is no pre-faculty training or publication expectations. The staff scientist is an official position at my institution with standard salary and promotion policies. My top 5 candidates are currently postdocs at other institutions, are either first—or co-authors on papers, and ALL of them are opting for the staff scientist position. One of them said that they initially chose my postdoc option only because they didn't understand that the staff scientist option was more senior than a typical technician (see my point in the previous section).

There is an opportunity for the NIH to clearly define a non-pre-faculty position with pay commensurate with the postdoc. Staff scientists can serve an extremely valuable role in the academic research ecosystem. They are highly skilled, prefer the academic environment over industry, and their expertise grows alongside the leading-edge scientific advances that are unique to academia. If the NIH establishes

this standard, this would provide a model to be adopted by universities. Pre-faculty postdocs should be the exception, and not the rule. There are too few faculty positions and too many "postdocs" (genuine academic or technician) anyway.

Proven or promising external resources or approaches

No comment.

Response 2402

Perspectives on the postdoc roles and responsibilities

Produce high quality data and learn new skills/techniques that will prepare me to a next higher position in academia or in industry.

Fundamental issues and challenges

For international postdocs, the yearly renovation of DS2019 generates instability and stress. Frequently (if not the main rule), contracts last for 3-4 years, so the DS2019 renovation becomes only a formality that causes uncertainty.

Existing NIH policies, programs, or resources

Not that I am aware of.

Proven or promising external resources or approaches

An anonymous online tool where mentors (and why not postdocs too?) could be evaluated. This could be a revenue for information that is not in recommendation letters and formal e-mails. A platform like that -if well administered—could guide recruiting and better job choices.

Response 2403

Perspectives on the postdoc roles and responsibilities

The roles and responsibilities of postdocs have ballooned from a visiting scientist like position where young researcher could network and learn a new technique in 6 months to 1 year to a lab manager/staff scientist that is kept in the position for years. I have done 2 postdocs more than 4 years each and had to bring ideas that my PI would not let me leave with for my new position. This is the second problem with the changing role of postdocs, they are now used for the generation of ideas, which should be squarely on the PI.

Fundamental issues and challenges

Science in general needs more staff scientists. Postdocs should not replace these vital workers. They are looking to become professors not technicians. As someone who has spent 8 years as a postdoc, it is not ok to dangle professorship in front of a student for years only to pull the rug out from a hard working student. I think the problem comes down to a lack of mentorship or understanding about the relationship between a postdoc and PI. There used to be an investment in academic progeny, PIs should be selling their students (postdocs and graduate students) for their next position. Taking them to conferences to network, connecting them with people hiring positions but I do not see this. I only see increasing demands and fewer payoffs for students. It looks like an entitled one way street, where the people in power are exploiting scientists interested in research.

If postdocs remain in this new exploitative role then they should be paid similar wages to industry and not expected to work exorbitant hours. At [redacted for anonymity], my PI required me to be in from 8-5 everyday even if I worked weekend or overnight for experiments. That is abuse.

Existing NIH policies, programs, or resources

There should be oversight. If a PI is blowing through postdocs and does not place them into academic positions ever, then the universities or NIH should consider if funding for such position under the PI can continue. Clearly the old incentives of research legacies are no longer working as research has pivoted to only being interested in funding. Making mentorship contingent on dollars would be the best way to change attitudes.

Proven or promising external resources or approaches

Allow postdocs to unionize and discuss their situations with one another. At [redacted for anonymity] I was part of a [redacted for anonymity] program which allowed me to see how other postdocs were being manipulated or mistreated, including visa treats for non-citizen scientists, this let me reflect on my own relationship with my PI. [redacted for anonymity] was an extremely toxic place for postdocs, as the PIs were people of substantial power within their respective fields. My PI retaliated considerably when anyone tried to leave her group (for faculty positions or otherwise), myself and then within months of me leaving another postdoc spoke with [redacted for anonymity] but it felt like nothing ever came of it and her behavior of abuse only continues.

Response 2404

Perspectives on the postdoc roles and responsibilities

To me, an academic postdoc is a temporary position that is supposed to offer the postdoc researcher additional time to publish and to build their resume for a professorship. I think it was always a pretty challenging position to be in, especially as the expectations for professorships and publications grow.

Fundamental issues and challenges

I think that a postdoc is an inherently unstable unsecure position which was exacerbated by the COVID-19 pandemic. It made working in the lab much more challenging and less efficient. I think many graduate students were unwilling to take on a position with increased risk during an uncertain time. For graduate students who did decide to become postdocs during the COVID-19, I think that there were not any real accommodations made. Postdocs still operated under the same timeline (i.e. you have 5 years) and now that the pandemic is over, we have to make up for lost ground.

Existing NIH policies, programs, or resources

Extend the length of time that postdocs are eligible for F32 grants

Proven or promising external resources or approaches

I dont know of any, which is damning in and of itself

Response 2405

Perspectives on the postdoc roles and responsibilities

The postdoc position for me in a research space where we have the opportunity to carryout a large research project with minor supervision from our PI. It is also a space where we have the opportunity to learn about leading a lab including grant writing, paper reviews among other things.

Fundamental issues and challenges

The fundamental issues in my opinion is the lack of support for career development from PI. Most postdoc get zero mentorship from PI and the expectations are that you should work 60+ hours in an effort to only support the lab demands and PI needs. Postdoc most of the time have to become, mentors, managers, lab supply techs, technique innovators and still do their work with the expectation that all these additional roles have no effect on the workload.

Existing NIH policies, programs, or resources

The most important will be the minimum postdoc salaries to help cover for cost of living and family needs. The second will be generate more clear instructions for money allowances to ensure postdoc have the ability to seek out opportunities for professional development. Most times PI force their postdoc to use all allowances to cover health insurance policies. Thus, leaving people dependable on the PI to promote their career path.

Proven or promising external resources or approaches

working environments, mentoring and job satisfaction are all crucial to help postdoc feel value. Implementing more postdoc activities and making PI accountable for all development proposal should be crucial to ensure that postdoc are getting some of the training that is proposed in paper.

Response 2406

Perspectives on the postdoc roles and responsibilities

Postdoc is a training phase where a major shift to independence happens. Depending on the field of study, this shift is faster or slower based on how much independence was achieved during doctoral training. The majority of the effort

from all the parties involved in postdoctoral training must be spent on developing the capacity for independent scholarship and research.

Fundamental issues and challenges

Postdoctoral mentors view postdocs as highly skilled laborers to contribute to their own research program. This is the mainstream view and therefore doesn't confer opportunities to grow. This approach should be an exception as opposed to the norm. Until then, postdocs will be exploited, and their mental health will be in jeopardy as they are in a constant battle between developing independent research versus working for the PI.

Existing NIH policies, programs, or resources

PIs must be incentivized to allow the postdocs to grow as independent scientists. Fewer citizenship restrictions on career development grants would certainly be helpful for the large numbers of international postdocs in USA.

Proven or promising external resources or approaches

Elimination of the subtle threat of job insecurity due to the provision of annual contracts would be a great start. Grants that allow postdocs to establish international collaboration would benefit science as a whole. For example Canada's International Development Research Centre has a special grant—Joint Canada-Israel health research program—which has allowed researchers to establish labs in low and middle-income countries with promising prospects of increasing diversity and inclusion in science worldwide. Postdocs have more time and energy than PIs to get involved in such grants, which will boost their experience and capacity and help them foster new collaborations.

Response 2407

Perspectives on the postdoc roles and responsibilities

A postdoc should be an opportunity for scientists to grow in their independence and develop their own ideas as they move forward into whatever career path they choose.

Fundamental issues and challenges

The absolute insanity that a postdoc should only be a certain amount of time, and limiting funding opportunities to years post-PhD is infuriating. Sometimes good science takes time!! Not everyone worthy of a career in science is a hotshot, fast-burning superstar, and that should be okay! There should be more room for slow burns. Sometimes the coolest science comes from the least flashy beginnings, but the system continuously rewards what's "hot" right now, and trainees who have certain pedigrees or have gotten lucky and have a bunch of high impact factor papers in collaboration with other well-supported trainees/PIs. There are so many factors outside of postdocs' control that can impact their ability to check certain boxes of the NIH required for to receive funding, and it's wildly disheartening to feel like you don't have a chance because of a decision you made almost 10 years ago (in a graduate program or a graduate advisor), especially when that decision was not a bad one! Some things are just luck, and by rewarding the only lucky ones, you are not going to retain a lot of people who are frankly just tired of needing to be resilient in the face of failure after failure after failure. At some point, most people I know are just over it, and know they can make wayyyy more money in industry. Also, my PI barely gets to mentor me because he is so consumed with trying to get more funding for the whole lab, then I try and I'm literally single digit points away from the payline to get my own funding and we're all just screwed. We're trying to do good science, and the world just won't let us apparently.

Existing NIH policies, programs, or resources

Get rid of arbitrary time limits to funding. I got my PhD literally a week before reports came out of China about a new respiratory virus, and the entire start to my postdoc was consumed and destroyed by the

pandemic. But now I'm "aging" out of fellowship opportunities, right when I'm starting to hit my stride as a postdoc after years of discombobulation and lack of in-person interaction to begin my postdoc. Allow postdocs more funding opportunities outside the F32. Stop funding only what's "hot" right now. Have more objective standards for grant review, it is so dishearteningly subjective and honestly feels like a crapshoot that depends on the mood of your reviewer the day they read it. Also, someone needs to get the government to increase the NIH budget, because it's a joke. It's literally no wonder at all there's a "postdoc shortage." Especially when in the face of this "shortage" I still won't get funded because I'm a handful of points outside the payline.

Proven or promising external resources or approaches

Industry pays more money! Maybe try that?

Response 2408

Perspectives on the postdoc roles and responsibilities

To me, a postdoctoral research position is meant to be an intermediary position between graduate school and a professorship in which a postdoc gains additional research and publishing experience. Post-docs are often the workhorses in the research of the lab, needing less supervision than graduate students and often mentoring graduate students and/or technicians.

Fundamental issues and challenges

Post-docs are not paid what they are worth, and they are not paid enough to expect them to work long hours independently, publish, assist PIs with grants, and mentor students and trainees. As someone who wants to stay in academia after graduate school, I am hesitating too simply because I want to start a family and that is extremely hard if you don't have a partner who makes significantly more money than a postdoc. Often after a postdoc pays for health insurance for their family they are making approximately as much as graduate students, while they hold a doctoral degree and are experts in their field.

Additionally, they are not given the respect that they deserve as qualified and proficient scientists. I have personally heard PIs say that a postdoc "is not a real job" so they should not expect to get paid a livable wage. Postdocs are not 22-year-olds fresh out of undergrad, these are 30+ year-old adults, experts in their field, who are attempting to start families and save for retirement. An equivalent job in industry would not be given the same disrespect.

Finally, at any career level below a professor there is a massive power imbalance between trainees and their PI. Postdocs in particular are left with little avenue for improving working conditions. By the time you get to the level of a postdoc you are often in an incredibly niche field of study, any "burnt bridges" between a postdoc and toxic PI could leave a scientist essentially exiled from their field. You also rely on letters of recommendation for years to come for grants, jobs, etc, this leaves trainees indebted to their PI no matter the treatment they received while working in their lab.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Pay them more.

Response 2409

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The minimum pay for postdoctoral trainees set by the NIH is not competitive with industry and even other fields within the same institutes. It fails to take into account the expertise a postdoctoral trainee brings to a lab and makes retention and recruitment difficult.

Existing NIH policies, programs, or resources

Provide a stipend levels that reflect the cost of living of cities and reflect the training received during graduate school.

Proven or promising external resources or approaches

No response

Response 2410

Perspectives on the postdoc roles and responsibilities

The postdoctoral position allows one to acquire additional skills outside of the PhD that ought to be used to formulate a solid faculty research plan. The opportunity to experience different mentorship styles outside of your PhD mentor is also a plus.

Fundamental issues and challenges

For me retention issues are focused around the lack of support for parents and families. This could be improved by increased Maternity/paternity leave, better child care support (the benefit from My F32) will not even cover one month of daycare in my area), retirement benefits associated with F awards, and educating institutions on how to design their program to support and not alienate parents i.e. scheduling seminars at times that don't interfere with young children's breakfast/dinner time, holding family-friendly events etc.

Existing NIH policies, programs, or resources

More flexibility with family leave and extended leaves from F awards surrounding birth and early years.

Proven or promising external resources or approaches

No response

Response 2411

Perspectives on the postdoc roles and responsibilities

Finding a job in academia as an assistant professor is difficult for sure.

Fundamental issues and challenges

We are not paid enough, therefore the quality of life and stress levels are high.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2412

Perspectives on the postdoc roles and responsibilities

I view a postdoc as a trainee position, but with a greater managerial role and autonomy than a graduate student. A postdoc should conduct research for a primary investigator, but strive to conduct more independent research as more years are gained. There should be some differentiation between the roles and duties of a postdoc compared with a graduate student, and maybe act with more lab management role and work towards more hands-off in order to gain leadership experience along with adopting more of a principal investigator role later in postdoc stage. A postdoc should be 3-4 years in duration.

Fundamental issues and challenges

There are fewer and fewer job opportunities for a highly trained biomedical scientist with postdoc experience. The amount of experience is really only necessary if seeking a faculty principal investigator position, and there are fewer and fewer of these positions available. The ability to get funding as a

principal investigator is also diminishing, and as a postdoc, we see that, which makes the academic faculty position less appealing. Industry pays much better, has a better work-life-balance, and has more reliable pay, and therefore is becoming much more appealing. Additionally, there is so little pay, and postdocs are supposed to be these highly educated and valuable employees, yet get payed less than many bachelor's type positions. With the increase in number of years a person needs to be in a postdoc position (up to 7!), this is a significant amount of money lost over time, especially with most fellowships not providing retirement. Lastly, many people are at an age during postdoc when, if they are going to have kids, that is the time. There is very little support for parental leave, many research positions are very time-demanding, and returning to position with this high of a time demand having young children is not everyone's cup of tea. These issues, along with the high cost of childcare, the difficulty getting childcare, and most postdocs living in an area with little social/family support, this job becomes nearly impossible.

Existing NIH policies, programs, or resources

Parental leave, increased pay, childcare benefits, reduced duration of support or limits to number of years a person can be considered a postdoc, more leadership training, training for postdoc mentors on roles of a postdoc.

Proven or promising external resources or approaches

Link postdoc positions to faculty positions (similar to industry training positions that lead to a job).

Response 2413

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1. The anti-immigrant posture of the Trump administration and the Congressional GOP caucus are perceived by postdoc candidates in Europe as a deterrent in applying for postdoc positions in the US, according to colleagues in Europe.
2. The anti-US posture of the Xi regime in China has stopped Chinese students from coming to the US.
3. US born graduate students are skipping postdoc training because they prefer careers in biotech rather than academia. Biotech companies hire graduate students without postdoc experiences and pay them twice as much as academia. This generation of students are used to the Jon turnover of a gig economy. They do not value the job security offered by tenure in academia.

Existing NIH policies, programs, or resources

1. Raise the pay levels for postdocs to match those offered by the biotech industry.
2. Provide foreign postdocs with a clear and simplified path to green card and citizenship.

Proven or promising external resources or approaches

No response

Response 2414

Perspectives on the postdoc roles and responsibilities

The shared NIH and NSF postdoc definition is "an individual who has received a doctoral degree (or equivalent) and is engaged in a temporary and defined period of mentored advanced training to enhance the professional skills and research independence needed to pursue his or her chosen career path."

[redacted for anonymity] believes an academic postdoc position ideally:

- Is a short-term, defined, transitionary period to independence;
- Recognizes the scientific expertise brought by the highly trained individual appointed;
- Has clear expectations between the postdoctoral scholar and research advisor for progress in both research and transferrable skills that enables the postdoc to take the next steps in their desired career pathway in a timely manner;
- Centers development of additional scientific expertise and professional skills as on-the-job training;
- Respects work-life integration and balance, giving appropriate consideration to the human aspect of a healthy, sustainable career in the biological and biomedical sciences enterprise.
- A postdoc may be perceived, but [redacted for anonymity] asserts should not be viewed, as:
- A trainee lacking research proficiency;
- An inexpensive staff scientist;
- An individual automatically assumed to be pursuing a tenure track academic research career.

As NIH further explores the role of academic postdocs and potential changes to the definition and culture, [redacted for anonymity] encourages caution for potential downstream negative effects on vulnerable populations—particularly postdocs who are temporary visa holders.

At present, professional development beyond additional research skills varies widely for academic postdocs across the country by the individual, research advisor, and opportunities at the institution. Participation in such programs and activities may also be limited based on citizenship. Development during the postdoc period should serve as a bridge to the desired career.

Fundamental issues and challenges

A postdoc is not a career, it is a bridge to a career. This relatively undefined period is rife with instability. The "trainee" moniker assigned to postdocs could be harmless, but has routinely been used to justify treating postdocs poorly. Similarly, the "temporary" appointments of postdocs are also sometimes used as an excuse not to invest in postdocs. Some fundamental issues for recruitment, retention, and postdoc quality of life include:

- Variable strategies for employment classification and pay are used for postdocs across and within institutions, usually leading to inequities;
- Postdocs on fellowship, often classified as "trainees," typically lose access to employee benefits, which can create disruptions in health insurance and other benefits;
- Postdocs can be in family planning and child-rearing years, making variable access to benefits, including parental leave and priority access to affordable on-site childcare, a particularly large barrier;
- Some postdocs have reached this life stage without any meaningful financial stability; differences in employment classification, including "temporary" status, may prevent postdocs from having an employer matched retirement account—vital for long term financial health;
- Newly minted PhDs are not treated as trainees in a vast majority of work sectors; this attitude in academia can have harmful effects for the overall inclusivity of the environment;
- There is no robust data on postdocs paid from grants—specifically, data on the national landscape of postdoc salary when not on fellowship and if any clear disparities exist for vulnerable populations;
- One-year contracts for postdocs can create unnecessary hurdles, especially for postdocs on temporary visas;
- Faculty jobs may have decreased appeal in an increasingly competitive funding environment;
- Scholars may feel expected to move institutions to advance their career, and acting on this belief can mean physically moving away from support networks, leading to increased potential for feelings of isolation.

Existing NIH policies, programs, or resources

As the primary funder of biological and biomedical sciences, NIH is well-positioned to create positive change. The current system for funding postdocs is not conducive to a healthy scientific ecosystem. [redacted for anonymity] recognizes many key issues are primarily a result of actions by the employer, yet encourages NIH to explore creative solutions to better support postdocs. For example:

- Adjust the Grants Policy Statement (GPS) to expand allowable costs for benefits beyond health insurance and allow fellows to be supported from multiple federal sources—noting that had they not received the fellowship it is highly likely they would be carrying out the same work/project;
- Clarify GPS language, as possible, such that individual fellows can maintain an employer-employee relationship with the extramural institution and receive standard benefits;
- Change existing fellowship funding mechanisms to include meaningful experimental funds;
- Evaluate the purpose and function of traditional funding mechanisms such as the F32 and T32; following analysis, potentially shift focus to more innovative funding mechanisms;
- Create funding mechanisms that do not tie postdocs directly to individual advisors, and ideally do not require substantial preliminary data, akin to the Katz ESI award, to foster research independence and dampen power dynamics;
- As feasible, create individual funding opportunities for international postdocs;
- Increase community awareness and utilization of NIH Re-entry Supplements Program to support retention and career progression of postdocs with caregiving responsibilities;
- Use IRACDA as a model program for ushering postdocs into a chosen career by further investing in IRACDA and piloting similar programs for transition to other employment sectors;
- Explore methods for senior PhDs to obtain postdoc positions more equitably, relying less on networks of their research advisors;
- When examining potential new programs and funding opportunities, emphasize improving the experience of the postdoc itself rather than only the end career goal.

Proven or promising external resources or approaches

Many impactful resources for postdocs occur at the institutional level: postdoc specific policies pertaining to appointment process and orientation, term limits, salary, benefits, and more; maintaining and funding a postdoc office and postdoc association; tracking postdoc alumni; having family and retirement benefits; and similar. The human aspect of the postdoc, beyond the science, must be respected and supported as possible through benefits that increase work satisfaction such as adequate access to childcare, mental health care, wellness resources, and similar. [redacted for anonymity] recommends NIH consider:

- Strengthening relationships with extramural organizations dedicated to improving postdocs' quality of life, such as the National Postdoctoral Association, and partnering to encourage widespread adoption of already identified recommended policies and practices;
- Working closely with extramural institution partners to ensure updates to the Grants Policy Statement are broadly communicated and appropriately understood, noting that university general counsel typically interprets language as conservatively as possible—often to the detriment of postdocs;
- Revisiting, and potentially altering, the NIH Broadening Experiences in Scientific Training awards with an emphasis on supporting postdocs, to bolster resources and infrastructure that may not otherwise exist at extramural institutions;
- Assess and possibly support institutional programs that emphasize postdoc conversion to tenure track faculty;
- Incentivize extramural employers of postdocs to be true partners—committing to supporting postdocs financially, rather than relying one-hundred percent on soft funds for postdoc stipend/salary—while ensuring this does not result in postdocs being overly concentrated at highly resourced institutions.

Response 2415

Perspectives on the postdoc roles and responsibilities

A post-doc position to me is a way to get more work experience in a lab without having all of the responsibilities of a PI. In this step of your career, you enhance skillsets for project management and development. In addition, you often train younger students, write grants, and contribute vast amounts of intellectual property to a lab. It is a step in a career path, but not a training program.

Fundamental issues and challenges

The biggest challenges inhibiting post-doc recruitment, etc, is money. Post-docs are people that have the highest level of degree and have spent years being educated. However, they are often paid ~$56k. These scientists are often 30+ and looking to start families. The salaries do not allow for this to happen, period. There is no negotiation on salary and Universities fight raising minimums. In addition, while funding is by far the most inhibiting factor, the culture of academia is not supportive to minorities. It is harder to retain and recruit when university policies often make access to higher education harder.

Existing NIH policies, programs, or resources

The pay minimum should be increased. Post-docs are highly trained and often are doing the hands-on work for a lab. Lab managers and other members of the labs that are not "post-docs" often make 1.5-2x more than a post-doc for arguably less work. In addition, mandated guidance on family leave and vacation should be included to protect members of the post-doc community. Post-docs should also be mandated to have insurance as fellowships often strip them of their status even though that are earning a prestigious title and money for a lab.

Proven or promising external resources or approaches

I believe St. Jude's example of raising all post-doc salaries to $70k will provide a strong example of this idea to the NIH

Response 2416

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The main issues are:

1. Postdocs are treated as expendable and are not fairly compensated for labor.
2. Postdoc incomes are low, especially in academia relative to industry. This is especially an issue with cost of living increasing drastically everywhere. If we can't afford to be a postdoc, we won't be a postdoc!
3. Postdoc positions come with fewer benefits than "real jobs". For example, I don't have a retirement program because I'm not "real staff" despite other staff at the university having retirement. Postdocs at my university didn't even get medical leave until recently at my university!
4. Expectations, particularly for "traditional" postdoc positions are toxic, relative to work-life balance. There are all kinds of perspective pieces on this in top-tier journals over the past few years.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2417

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

We can't save for retirement, we're underpaid, there's little guarantee of becoming a PI, and the hours are too long for our compensation.

Existing NIH policies, programs, or resources

Allow for postdocs to put money into retirement. Increase salary to be competitive. Make incentives other than the remote chance of becoming a PI.

Proven or promising external resources or approaches

Don't bother with increasing recruitment until you fix the issues; it will do you no good.

Response 2418

Perspectives on the postdoc roles and responsibilities

I am currently 18 months into my 2-year T32 postdoc. This position has given me invaluable in depth research experience in my area of expertise and has enabled me to fill publication and research training gaps necessary for a research career. However, the landscape of academic research has changed dramatically and no matter how good the training and how qualified I am to be an academic the job market is saturated and extremely competitive. The sacrifices in quality of life required for me to obtain a job in academia (e.g., low pay, long hours, living in undesirable locations) are not worth it for me and my family. I am grateful for my postdoc and the opportunities it has provided but am pursuing a nontraditional career that affords me and my family a better quality of life.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

As mentioned above, adjusting pay to meet cost of living, I think, would be huge in improving recruitment/retention of NIH postdocs. Modifying the payback obligation to expand the definition of what counts as research to encompass industry, clinical, and government work (i.e., the job I turned down was a government position in learning and evaluation where they do not use the term research) and acknowledging that these roles do not operate on an academic calendar in the expanded definition would also help.

Proven or promising external resources or approaches

No response

Response 2419

Perspectives on the postdoc roles and responsibilities

Postdoc position should provide further trainings to improve skills of scientific research. At the same time, postdocs should be allowed to be more independent and considered as a scientist with an advanced degree.

Fundamental issues and challenges

Very low annual income, toxic environment of academia, treated poorly by PI or science community (viewed solely as a continuance of training period instead of an early-stage scientist), and no protection from academia or institution (PhD students/candidates and postdocs are considered as "exceptions" in terms of workhour, compensations, benefits, etc. in most of the cases).

Existing NIH policies, programs, or resources

I am personally not sure where it is written, but I believe the annual income and work environment including benefits of postdocs should be comparable to industry in order to help postdocs debate between academia and industry as one's career path.

Proven or promising external resources or approaches

Same as answers above. A guarantee of better compensations and working environment (including demanded workhour and benefits) would start to attract more PhD graduates to stay in academia in the future. I strongly believe we need to start from there instead of offering more training programs or more competitive or non-appliable fellowships.

Response 2420

Perspectives on the postdoc roles and responsibilities

Postdocs have proven to be an intricate part of every academic lab community. They are mentors, people whom you can seek out for guidance and support. They take on a multitude of tasks outside of their own research—including training graduate students on novel instruments or practices, hosting lab events, helping the PI manage their workload, etc.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2421

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a training position meant to provide further training in the skills required for the next position for that individual. This could mean training for a faculty position or an industry position. Because it is a training position, a large portion of the postdocs effort should be towards career development. Postdoc positions should be somewhat independent, especially for those seeking faculty positions.

Fundamental issues and challenges

Cost of living. I considered offers for postdoc positions in great labs that I turned down because of the high cost of living. This is particularly challenging for people without generational wealth to support them during their postdoc. It is even more challenging for people with children. The cost of childcare can be prohibitive in many areas. The fact that most universities don’t subsidize the cost of childcare for postdocs only adds to the challenge. Related to both of these issues is the poor benefits many postdocs receive. Depending on the institution and how the postdoc is paid, they may be required to pay for their health insurance with out any cost sharing with their institution. Additionally, many institutions have policies that prevent postdocs from contributing towards retirement. Those that allow postdocs to contribute often don’t math their contributions as they would for other employees. This is a huge burden for postdocs without generational wealth. The postdoc years are a time when they really need to be contributing to retirement if they want to have a chance at retiring.

Existing NIH policies, programs, or resources

Childcare benefits for all postdocs on T32s, F32s, K99s. Require faculty paying postdocs through NIH funds to subsidize childcare. Some mechanism to allow for retirement savings.

Proven or promising external resources or approaches

No response

Response 2422

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism. "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate.

NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.

Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth.

Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings. Requiring postdoc and PI participation in formal performance reviews as part of an NIH award will better define, formalize, and evaluate factors of role, mentorship, and professional development, while differentiating postdocs from staff scientists.

The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

NIH should increase postdoc stipends NIH training and fellowships grants to match GS-10 federal pay schedule including locality pay. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas 2 with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases to the next GS-10 Step. The NIH should promote these minimum salary requirements for all NIH-supported postdocs.

Postdocs are paying a significant opportunity cost for limited faculty positions and 86.6% are impacted by job security concerns. Academia contains structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups. These postdocs and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. NIH should expand DEIA initiatives and instate rigorous, impactful annual mandatory DEIA training for all those impacting postdocs (mentors/peers/PIs/PDOs) similar to research ethics. NIH should ensure training materials are current and evidence-based, while developing accountability and outcome measurements.

NIH should encourage contracts with lengths commensurate with the intended postdoc periods, longer termination notices, and ties to institutions not PIs. NIH should also support adoption of policies such as vacation accrual rollover to support international travel, subsidized visa costs, and insurance with dependent coverage while prohibiting the use of part-time postdoc positions to avoid provision of benefits.

NIH should work with the State Department and USCIS to accelerate and simplify the visa and immigration process for these world-class early-career researchers. NIH should also expand funding opportunities to visa holders through K99/R00 and new programs.

NIH should require a percentage of indirects on all NIH grants supporting postdocs to go to postdoctoral offices to increase resources and foster healthier postdoctoral communities.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the host institution cannot categorize postdocs funded by NIH grants or fellowships as employees. Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible.

NIH should require all postdocs to receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.

NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be cost-prohibitive for researchers from low socioeconomic backgrounds, familial commitments, and internationals.

Many PIs lack formal training in mentoring and personnel management, and many postdocs lack an understanding of how to succeed as mentees. NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs and menteeship training for postdocs.

Postdocs need to develop essential skills for their career transition, whether teaching and grant writing for an academic career or program management and public engagement for careers outside of academia—mandating IDP could help.

NIH should create or expand programs to support staff scientist positions in academic labs. This maintains the continuity of lab knowledge and provides career options for postdocs—providing clear differentiation between staff scientists and postdocs.

Collecting metrics on postdoc satisfaction on an annual basis will position NIH to be nimble in its response and adjust policy accordingly based on the needs of postdoctoral researchers.

Proven or promising external resources or approaches

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an 5 increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.

We encourage NIH to work closely with institutions that host postdocs and NPA on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change.

We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

Response 2423

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Increasing cost of living for postdocs and compensation costs for research budgets are a severe problem and NIH is not keeping up. Current F32 stipend is 9,000 less than [redacted for anonymity] UAW contract and [redacted for anonymity] and other institutions in higher cost areas, with difference growing to 19,000 over next three years. F32 level needs to increase. Research grant budgets for postdoc salaries should be increased outside of competitive renewals to make up for rapid increases in costs. Max mod 250,000 and pre-approval 500,000 limits should be raised, and NIGMS cap should be raised to allow budgeting for higher postdoc salaries.

Response 2424

Perspectives on the postdoc roles and responsibilities

I use my postdoctoral position to gain new research skills, to make collaboration/networks, and to learn a new field. I use this position to learn all I can before moving on to my next career goal of a tenure-track faculty position. In my opinion, postdocs are university staff akin to staff scientists; however, we are not paid as such. In many places, postdocs are not even considered staff. Postdocs are backbones of research and spend much of their time driving projects AND training others in the laboratory. Because of this, postdocs control most of the day-to-day attitudes and progress in labs, as most PIs are not engaged at this level.

Fundamental issues and challenges

The biggest issue I encounter is pay. I want to use the postdoctoral position to learn as much as I can to support my next career goal (tenure-track faculty position). However, the main reason I consider leaving a postdoc and not pursuing my goal is pay. I have a roommate and I live in a college town, but my roommate and I barely make 3x the rent (combined). This is generally a financial requirement for renting, so my pay as a postdoc is not enough to meet the basic necessity for safe housing. I cannot perform my best and give my all in research if my basic necessities are not met. Money is a constant stress in my life and I live paycheck-to-paycheck. I do not have savings or family money to life off of. I am also considered "underrepresented in science" based off the NIH interest in diversity statement, but myself and my underrepresented peers are not staying in science, and the biggest factor is money.

Existing NIH policies, programs, or resources

The main point is higher pay. In addition, more options for loan repayment for academic researchers, more funding for childcare costs, more opportunities for training and transition awards. It would also be beneficial to have more career support (i.e. making postdocs a staff position rather than a strange position in between student and staff).

Proven or promising external resources or approaches

No response

Response 2425

Perspectives on the postdoc roles and responsibilities

The ideal academic postdoc is meant to contribute to the research goals of the mentor while simultaneously developing an independent research program as a future investigator. Being in the penultimate stage of an independent research career postdocs are the main cogs that drive biomedical research.

Fundamental issues and challenges

The biggest reason is the current compensatory scheme for postdoctoral trainees which is completely out of pace on multiple fronts. While a lot of elite institutions are based in big cities the postdoctoral

fellowships don’t reflect the cost of living differences (especially housing costs) between such cities and smaller university towns. This adds massive and disproportionate financial strain on postdoctoral trainees in big cities compared to those in university towns. This stress is further compounded by the fact that postdoctoral candidates are usually in the age group where they can/want to start families and have to make hard choices about starting a family, affording day care or schooling. All this stress and the resulting compromises distract trainees from their research and career developmental goals which are already quite considerable considering the ever shrinking availability of faculty positions and funding. This leads to pervasive unhappiness, mental health crises and an inevitable retention problem. Since the research done in pharma/biotech industry has ever increasing overlaps with academic research talented postdocs find it to be a rather easy choice to quit their training for better pays and work/life balance. Also, postdoctoral trainees in biomedical sciences who don’t have a medical degree are harder hit due to MD-PhD degree holders being able to secure better compensation. Thus the most effective way to increase recruitment and retention is to make the compensation fair and in line with current living costs.

Existing NIH policies, programs, or resources

Since NIH awards early and late career postdoctoral awards are highly competitive they should also come with an increase in salary compensation to the awardees. This would in itself add motivation in securing these awards and a better post doctoral experience for the awardees.

Proven or promising external resources or approaches

On site low cost childcare in institutions/universities, inflation adjusted salaries, affordable housing especially in major east/west coast cities or a housing allowance.

Response 2426

Perspectives on the postdoc roles and responsibilities

To me, the postdoctoral position is an opportunity to expand my training. This means learning new techniques, acquiring new knowledge in a new or adjacent scientific field, improving on my mentoring skills, and learning the logistics of running a lab. In a sense, this is almost like a graduate school part 2, but without the usual academic requirements (qualifying exams, thesis writing, etc.) This is really an opportunity to get the training and mentoring necessary to step into the role as an academic advisor running an independent lab. Ideally, this would be the focus of an academic postdoctoral position for me. In reality though, I feel as though many postdoctoral positions really don’t emphasize this mentoring and training aspect. Instead, the postdoc is treated like a graduate student that doesn’t need to be mentored and is just expected to get as much data as possible to crank out publications.

Fundamental issues and challenges

Amongst my graduate student peers, the biggest deciding factor that seems to be pushing people away from going for a postdoctoral position is pay. Of the ones who are on the fence between going towards an academic postdoctoral position or going elsewhere, most would be convinced by better paying postdoctoral positions to go for this path. This is something that for myself as well is pushing me towards other career paths. After nearly 7 years of working as a graduate student with about the minimum pay, it seems inconceivable to me to want to spend even close to the same amount of time in an even higher expectation position without better compensation. For myself and many others, we are also starting to have dependents to support—an elderly family member in my case, but I know spouses and children are more common amongst my peers. Without better pay, it just wouldn’t be sustainable for me to pursue a postdoctoral track. To me this is the key to these issues: better pay means better recruitment, higher retention, and better quality of life for postdoctoral trainees.

Existing NIH policies, programs, or resources

Response 2427

Perspectives on the postdoc roles and responsibilities

- Defining a postdoc. The AAMC defines an academic postdoctoral researcher (postdoc) as an individual who has received a doctoral degree (or equivalent) and is engaged in a temporary and defined period of mentored, advanced training. A postdoc position is undertaken as an intermediate that bridges predoctoral training and an independent career. STEMM doctoral degree recipients enter a wide range of careers in academia, industry and other sectors including academic administration, law/policy, consulting, writing and research. While we recognize that some postdocs have still not decided on their career trajectory, we encourage individuals to pursue postdoctoral positions as an intentional choice to further an academic or industrial research career, rather than as a default 'next step' in the training pathway.
- The time in postdoc positions should be delimited. A postdoc should be utilized as a time-limited position that allows for the development of research, mentoring, and professional skills. We recommend NIH discourage the use of a postdoc position as an ill-defined step without a predetermined end.
- Effective, responsive mentoring and career development is necessary. A postdoc's ability to develop original research and move towards greater independence necessitates a strong mentoring relationship between the postdoc and the principal investigator and other mentors. In addition, postdocs should have career development opportunities to prepare them for multiple career options. NIH should support the development and dissemination of shared program resources and assessment tools to understand what programs work and what does not.
- Research is international. Any solutions for attracting and cultivating postdoc careers must recognize the importance of international talent. In addition to domestic trainees, more than half of the U.S. postdoc population is comprised of talented, international individuals who contribute to the intellectual and cultural vibrancy of the U.S. biomedical enterprise.

Fundamental issues and challenges

- Academic research careers must remain attractive. The research environment is a decisive factor influencing the career choices of young scientists. Despite the benefits of an academic research career, postdocs will be discouraged from academic careers if they see mentors and early career scientists struggling against long-odds in grant support or in sustaining laboratories, coping with excessive administrative burden, and being out-of-balance with work/life matters. NIH should continue to emphasize programs to improve the research environment and support early-stage investigators and recently established investigators. These efforts include monitoring paylines, identifying investigators at risk for losing grant support, and supporting career development and recruitment programs.
- Recognize the value of a postdoc. Postdocs are highly skilled individuals that should be compensated as such. NIH should recommend that research institutions ensure that all postdocs, regardless of funding source, receive at least the NRSA stipend level with experience level increases. NIH should strengthen programs that aid postdocs directly, including childcare benefits.
- Promote a safer and more respectful research environment. NIH should continue to monitor awardee institutions to reduce harassment under various forms and ensure that institutions have a grievance policy in place. There have been too many reports of scientists who left academic research over abusive or unfair work experiences.
- The importance of cultivating the next generation. Not every reform needs a new program or mechanism; the NIH should use its prominence to communicate the excitement of a biomedical research career to those interested in this career. This is especially true for international scientists. The ability of US research to attract international scholars remains one of our most important and distinctive assets. The implementation of research security efforts should protect federal funding and research assets against undue foreign interference without targeting individual scientists based solely on country of origin.

Existing NIH policies, programs, or resources

- Strengthen mentorship. Regardless of funding sources, institutions and mentors should provide scientific guidance and access to professional development opportunities in order to support career development. NIH can encourage strong mentorship by requiring a mentorship plan to be submitted for every postdoc (and graduate student) funded on a research project grant and by providing guidelines on its research awards as to the expectations of the institutions, advisors, and trainees. The [redacted for anonymity] suggests that a percentage of trainee time (5 to 10%) be supported from resources outside of a research grant, or that specific funds be designated in a research grant for training, e.g., toward centralized institutional postdoc support.
- Increase the diversity, equity, and inclusion of the research workforce. The academic research career should be made more attractive and inclusive for scientists underrepresented in research through community building, networking opportunities, and increased transparency. The NIH should consider developing a funding mechanism to promote the development of these activities and create centralized resources that can be shared across institutions.
- Ensure that stipends and benefits are equitable. NRSA-funded postdocs should have the same access to benefits as employee-classified postdoctoral researchers. The NIH should more clearly communicate guidance on how NRSA-funded postdocs are classified, as the current language is being interpreted by many institutions to mean that this subpopulation of postdocs cannot be classified as employees.
- Raise the NIH NRSA stipend scale. The NRSA stipend scale has increased over time, but has not kept up with inflation. In certain US regions, despite institutional supplementation, postdoc compensation does not meet the living wage threshold. Many institutions use the NRSA stipend scale as their institutional scale. AAMC supports an increase while recognizing that by raising the stipend scale there will likely be fewer postdocs in academia without a substantial increase in the overall NIH budget.

Proven or promising external resources or approaches

- Cohort-based postdoctoral programs. The [redacted for anonymity] applauds the NIH for launching the Maximizing Opportunities for Scientific and Academic Independent Careers (MOSAIC) program that brings together a cohort of K99/R00 postdoctoral scholars from diverse backgrounds as they transition from postdocs into academic research faculty positions. Along with MOSAIC, institutional postdoctoral cohort recruitment programs, such as the Stanford University PRISM program and institution-organized postdoctoral research symposiums, such as the Intersections Science Fellows Symposium provide valuable networking, peer-to-peer mentoring, and access to additional career and professional development opportunities. The NIH should consider expanding funding for cohort-based programs, particularly those that touch multiple institutions.
- Targeted fellowship funding. The NIH-funded Institutional Career and Academic Career Development Awards (IRACDA) has been successful in facilitating a diverse group of postdoctoral scholars to develop academic and teaching skills. Using this program as a template, the AAMC encourages the allocation of additional resources to help institutions develop and implement similar programs that may focus on other career development areas.
- Appropriate treatment of research trainees. A working group of the AAMC Group on Research, Education, and Training (GREAT) developed the Appropriate Treatment of Research Trainees (AToRT) guide to promote inclusive and supportive training environments for postdoctoral researchers and graduate students. The [redacted for anonymity] encourages further dissemination of this resource.
- Use of postdoctoral compacts. In recognition of the importance of defining and sustaining the commitments necessary for a high-quality training experience, the AAMC developed and endorsed the Compact Between Postdoctoral Appointees and their Mentors. This document provides program directors, administrators, and faculty with models to help initiate discussions at the local and national levels about the trainee-mentor relationship. It also recognizes the institutional commitment to establishing and maintaining high quality training programs. The NIH should encourage institutions to utilize existing models and resources to engage postdocs in these important conversations.

Response 2428

Perspectives on the postdoc roles and responsibilities

The hybrid professional/trainee position is a tough tightrope to walk. F32 and K99 reviewers seem to expect applicants to have good data with proven methods, but still have significant training components.

The postdoc period is often a fulfilling experience. One has a significant base of experience, expertise, and skill, and can use the postdoc period to simply do science without worrying about coursework or academic standing.

Fundamental issues and challenges

Pay is too low. The NIH minimum is at or below what one might expect with a bachelor's degree. This is compounded by opportunity cost. It is even worse if postdocs are not provided benefits like retirement and health insurance. This is worse for international postdocs who may not be able to speak up.

There are more postdoc positions than there are faculty positions. One could make an argument for a graduate degree being worth it for someone who has no intention of a career in academia, but postdoc positions should be a pathway to an academic position, not grease in the wheels of the machine of science.

There is an assumption that there are two paths to independence, be a rockstar and win an F31, then an F32, then a K99, or endure the low pay of a postdoc position for years until you get lucky. It's demoralizing.

Existing NIH policies, programs, or resources

Increase the base salary

Change the way F32 fellowships are characterized so that fellows do not lose benefits

Require R01s that budget for postdocs to have a pathway to independence plan for all trainees. Require mentoring training on R01s along with CITI and FCOI training. In general, PIs should have more accountability for monitoring the career goals of all of their trainees and working toward those goals.

Limit the number of concurrent postdocs per PI

Limit the number of concurrent R01s per PI.

Increase the number of K99 awards, expand the K01 program

Proven or promising external resources or approaches

No response

Response 2429

Perspectives on the postdoc roles and responsibilities

To me, a postdoc is the early career investigator that aims to transition from being a student towards starting their own research line and group.

To me, a postdoc trajectory is not so much training anymore. I view it more as a stage where you are guided towards independence.

Fundamental issues and challenges

For where I work, at [redacted for anonymity] in the Boston area, truthfully, this paper recently published in Nature says it all: https://doi.org/10.1038/s41587-023-01656-4

The far most important issue is that our salaries are not only not competitive (AT ALL!), they are not even enough to live a normal life in the Boston area. As scientifically studied and very clearly reported in the linked paper.

Existing NIH policies, programs, or resources

The first thing to worry about is the salary.

Proven or promising external resources or approaches

See attached paper.

Response 2430

Perspectives on the postdoc roles and responsibilities

To me the postdoc position is a period of transition. An opportunity to further expand and inch towards an independent researcher. I think your postdoc is suppose to be and feel like you have upgraded in the lifestyle, mindset, capabilities from being a grad student. An expansion of a person's role **and responsibilities** in the lab now as a postdoc. I do think it is a kind of a last opportunity to see academia (decide whether faculty is right for them) hopefully in a more deeper perspective because they may have an opportunity for grant writing, mentoring, teaching, meetings, etc. as a postdoc. While at the same time a chance to figure things out and set yourself up for next steps in a person's career. I think because it will come down to individual lab and/or institution, the postdoc experience is so varied.

Fundamental issues and challenges

A big issue is that in most institutions we are placed in a weird in-between as an employee/not-employee that may be a disservice to us. We are no longer students since we have obtained our degree, but yet not full employees either. When opportunities for career development are brought to campus, they are heavily grad student focused and feel like post-docs get lumped in as an afterthought. At the same time we are still lag behind being able to take advantage of things like retirement saving/employer match, health insurance, etc. because we are not full employees. While we have already delayed such benefits due to us choosing to pursue advanced degrees in the first place. I think more recent worldly events have further shined a light and for those who are able to, pivot towards alternatives early than go through with doing postdoc. The lack of intangibles (full benefits, daycare coverage, relocation fees, etc.) on top of the pay as advanced degree holders especially in high cost of living areas is no longer an attractive sale as previously. Additionally, for those who may not be interested in no-tenure track positions there does not appear to be any effort to promote and/or match those with interested postdocs. The numbers have been pointing in the direction of not enough faculty positions, but yet want to push the narrative of independent researcher/having your own lab. It is madness and not in touch with reality. Sometimes it feels like the blind leading the blind.

Existing NIH policies, programs, or resources

The R01 funding mechanism being adjust to accommodate the possibility of raising postdoc salaries. Expansion of the T32 funding mechanism being offered to more postdocs or even a separate T32 with just postdocs. Establishment of additional funding mechanisms, geared toward those who want remain in academia, just not on the tenure faculty track. Some type of rule/regulation pertaining to the "employee" designation of postdocs; consideration of us being considered full employees. Removing the wording or references to "training" in the language use to describe the position title.

Proven or promising external resources or approaches

No response

Response 2431

Perspectives on the postdoc roles and responsibilities

In my field, postdocs are expected to define and conduct research under the supervision of a faculty mentor or principal investigator.

Postdocs are expected to spend some time running experiments that are not their own to support the lab and/or mentor and train students.

Postdocs in a good institution/location will have a chance to go to conferences and do some networking for the lab and promote research. Some encourage postdocs to have active social media and build their expert voice through that, which can be very time-consuming and uncomfortable for some people.

They also spend some time writing papers and catching up with the scientific outcome of the labs. They do not get help with or are not encouraged to establish new collaborations, especially with industry. They are expected to follow the existing research grant's framework.

The postdocs often act as on-call hands-on experts and are expected to be available for mentoring, supporting teaching courses in case of prof unavailability, and troubleshooting labs' general technical problems.

The postdocs, spatially those in minority groups, are expected to be involved in DEI committees and groups, which is biased. A male postdoc is not often expected to be engaged (practically distracted) with the DEI services.

The postdocs are expected to help with peer-reviewing journal articles, interviewing students, and help with recruiting personnel.

Fundamental issues and challenges

Salary is a big issue. Some areas of the country are more expensive to live in but most of the postdoc salary is based on the NIH table. If the NIH salary range is below the min-wage, the postdoc work experience is not going to take into consideration for the salary!!

EU-postdocs in the US are in a privileged position which is discouraging of US postdocs and the postdocs of other countries. The EU fundings are with higher salary and tax-treaty.

A postdoc salary is less or equal to the yearly cost of childcare!! And PTO is limited.

The travel budget is another issue. Postdocs are expected to build a publication track record, but in practice, community engagement is an important factor in securing an academic job. For this reason, the areas of the country which do not have a dense scientific community (unlike the east coast for example) have higher travel costs and fewer exposers and access to the scientific community. They become isolated and unprivileged.

The postdoc timeline (for example 2 years) is very short for some research areas, making it hard for some postdocs to retain a healthy lifestyle.

Visa can be another issue, with an increased length of postdoctoral research, non-US postdocs are under the stress of extending their work visa in short increments, which is unsecured and distracting.

Mentors are the supervisors and there is a conflict of interest.

Often postdocs turn into research technicians. They may as well leave sooner for a higher salary, job security, and better benefits.

A postdoc is encouraged to define and run independent research and mentor students, but the PI wants ownership of the work. I see often that the postdocs postpone pursuing a timely research idea to when/if they start their lab to be the last author or the grant's PI.

Existing NIH policies, programs, or resources

- The salary range is not competitive.
- The low salary together with a limited PTO policy puts parents, especially mothers, at a disadvantage.
- Postdocs writing grants for the PIs without getting credit because they want to retain the new-investigator status for when(?) they become a PI. Maybe putting a mechanism that would be encouraging the postdocs to pursue their ideas as postdocs would help. K99 has been great but it is a very specific program.
- The postdoc length does not reflect the complexity and the pace of the research fields (primate research takes much more time longer than computational research).
- Most postdocs because of paying taxes are at a disadvantage in comparison to those (such as the EU) with tax-treaty.
- Postdocs with M.D. backgrounds earn more than non-M.D. even without clinical practice. An argument for the salary discrepancy is that they would earn higher than academics outside academia. This argument would also apply to postdocs with computer science backgrounds but they don't earn similarly for the same postdoctoral responsibility. Therefore, some scientists would be encouraged to leave academia for data science or similar positions in the industry.

Proven or promising external resources or approaches

Not sure, but thank you for your effort. NIH is great!

Response 2432

Perspectives on the postdoc roles and responsibilities

The postdoc position was an opportunity to get targeted learning critical for advancing a career in scientific research. I am grateful for mentors, advisors, and the network of folks I have built in the two short years I have been a postdoc. It also gave me an opportunity to focus on reading, honing my scholarly writing and learning from other postdoctoral scientists.

Fundamental issues and challenges

The fundamental challenge is the pay. The more prestigious positions are found at high-ranking institutions that are located in large metro areas where the cost of living is expensive. My biggest challenge, esp as a Black female scientist from a low-resource area, was struggling financially to live in the NY metro area. We were advised to not take on multiple jobs, but that was not a feasible option for me. I found myself either draining my already dismal savings or taking on multiple jobs to be able to live.

Existing NIH policies, programs, or resources

Perhaps pay folks based upon the cost of living for the area in which they have a postdoc. In NYC, one needs to earn $150k just to live. We are paid 1/3 of that, which is below the poverty line in this area of the country. If, however, I had a postdoc in Oregon, I'm living quite well. I think this needs to be taken into account. This was an unnecessary stressor that can be adjusted.

Proven or promising external resources or approaches

Perhaps have the institutions report out on the students and have some sort of forum for the postdocs that are funded by the NIH. There are a variety of experiences among T32s even within the same institution. I guess a way to standardize the experience would be key. Also, some PIs do a great job and publish with their fellows, bring them in on publications while others do not. Perhaps adding in a metric regarding publication would be fundamental to development.

Response 2433

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2434

Perspectives on the postdoc roles and responsibilities

The academic postdoc should be a training position, and include skills in grant writing, lab management etc. There should be more accessible Staff Scientist positions with competitive salaries for research positions.

Fundamental issues and challenges

Salary, salary, salary. Academic track needs to be competitive with non-academic positions.

Existing NIH policies, programs, or resources

The maximum for modular grants need to be $300,000, and there could be special categories on these grants for Postdocs in training.

Proven or promising external resources or approaches

Intramural NIH is competing substantially with the extramural community for postdocs, but not providing them with the skills to compete in the extramural environment.

Response 2435

Perspectives on the postdoc roles and responsibilities

The purpose of doing a postdoc is to get another job. I know the official purpose of a postdoc is to get more training but, in my opinion, many postdocs only need a couple of years of extra training before they have the skills needed to become faculty. However, the job market is such that more and more publications (and therefore longer and longer postdocs) are needed to become faculty. This means that postdocs now primarily exist as a cheap source of highly trained labor for more established labs.

This shift in the purpose of postdocs is also demonstrated by advice I have received from faculty who specifically told me to not seek out more training during my postdoc but instead continue working with populations and methods I'm already highly skilled in because that would let me produce publications at the rate needed to eventually successfully become faculty.

Fundamental issues and challenges

Low Pay: The pay postdocs receive is extremely low compared to

a) significant increases in the cost of living over the years,

b) the income needed to support a family,

c) the pay in industry.

Poor Opportunities for Advancement: Shifting expectations on the faculty job market have resulted in postdocs becoming longer and longer, with no clear end typically in sight for those who want to become faculty. Furthermore, additional stepping stones have started appearing on the way to Assistant Professor positions (e.g., Project Scientist, Instructor). These "super-postdoc" positions mean that the path to becoming an Assistant Professor and having your own lab is becoming even longer than it already is.

Lack of Geographic Stability: Postdoc positions and especially faculty positions allow people very little flexibility in terms of where they can live, which is worsened by academic culture assuming that everyone should only think of their work when choosing where to live and nothing else (e.g., family). This means that people who have preferences for where they live are often driven out of academia. This also negatively impacts diversity in academia because it means that people who want to live in a state that protects their rights (e.g., female-bodied people, LGBTQ+ people) have fewer places they can live and are more likely to leave academia.

Lack of Rights: Many postdocs, including ones on F32s, have no rights as employees because they count as 'students' instead of 'employees'. This means that postdocs have no right to medical disability if they become sick, and postdocs who want children have no federal—or state-protected right to take parental leave. Combined with postdocs' poor pay and the geographic inflexibility, this lack of rights disproportionately drives people away from academia who want a family.

Existing NIH policies, programs, or resources

I am only aware of three NIH policies/programs/resources that support postdocs:

1. T32s,
2. F32s,
3. small childcare supplements to T32s and F32s. From what I have heard from other postdocs, is marketed as though it is easily accessible; however, in reality even people who qualify for have their applications for childcare supplements frequently rejected for reasons that are not made clear.

Proven or promising external resources or approaches

Pay: NIH needs to enforce a minimum pay for postdocs; I know of at least one university which pays postdocs less than the NIH-recommended minimum for postdocs because there is no minimum pay that's enforced. NIH also needs to significantly increase the minimum postdoc pay.

Geographic Stability: NIH should create a funding mechanism that would let postdocs attain a faculty position at a specific university (similar to how F32s can be written to join a specific university). Specifically, the mechanism could be structured as follows:

a) the postdoc works with their university in mind, and

b) the university agrees that, if the postdoc receives funding through this mechanism, they will offer the postdoc a faculty position. This would help retain postdocs who would otherwise leave academia because they have geographical restrictions in where they want to live.

Rights: NIH should require postdocs to have the same rights as other university employees.

Response 2436

Perspectives on the postdoc roles and responsibilities

The postdoc is meant to be a means to intentionally build towards and enable an academic career. There should be fewer postdoc positions (this is your point of gate-keeping rather than graduating too many PhDs/postdocs who cannot be respectably channelized into an academic role. This is especially true of MD/PhD and other unique educational backgrounds.

Fundamental issues and challenges

Poor salaries, in many locations does not even keep up with local cost of living.

Unrealistic expectations from PI and lab heads about hours put into the job.

No 403 support/contribution.

90% postdocs who cannot transition into a faculty position are viewed as losers who essentially are not capable of better positions which is not factual.

PI or lab head has too much control on the fate of the postdoc, the recommendation letter is a farce—it just serves as a check mark for institutions that are not willing to take the responsibility of assessing a faculty applicant's calibre and potential to do good science. Do PIs even write the full drafts of the letter themselves?

Lack of equitable practices in labs—postdocs coming from different countries/nationalities have different opportunities for success (read applying for grants, fellowships, awards), it is also reflected in the stipends/fellowship amounts. It is not a level field especially for international trainees (why would NIH spend money on training these PhDs, then not support them through the postdoc pipeline to a faculty or equivalent position?)

Winner takes all system where only a few labs control the science, only a handful of people become successful and get every recognition while others slog anonymously for years.

Lack of PI-equivalent respectable positions in science at universities or similar institutions.

NIH does not care about harassment in labs. As long as you have the recommendation letter system in academia, PIs will continue to have undue advantage, and few people will dare to report problems.

Focus on impact factors and number of publications = metrics not measuring good science, little incentive for discovery.

PIs are hardly in lab, do little work themselves, it is a slavery system.

Existing NIH policies, programs, or resources

PAY the postdocs a respectable salary, else it is essentially saying that their NIH supported training as grad students is so bad that these people have neither the skills nor are they deserving of earning a living wage.

Institute a committee system for postdocs like the one for graduate students, to oversee and facilitate their progress.

Do away with this recommendation letter system, one person (PI) has too much power over the life of a vulnerable human being (postdoc) in a precarious role.

Each time a grant and progress report is submitted from a lab, get a 360 degree assessment of the PI. Ask lab members to submit a confidential review or assessment of the PI.

Make PIs and institutions more accountable for their actions.

Do an audit of the hours that a PI actually worked for the lab (for what they earn) and did not simply pass the work along to a lab member. This is a feudal system.

Proven or promising external resources or approaches

Make HR accountable in academic institutions supported by NIH to be on par with HR in Industry. Encourage reporting of issues and make this data mandatory reporting for grants and progress reports.

Improve benefits—PI and postdocs should have identical health benefits and follow same rules for retirement benefits within their salary caps.

Collect data—how many women versus men postdocs from a lab ended up in faculty positions? What is the financial gap between different genders and especially for marginalized groups?

If a postdoc had to take parental leave, hardship or a disability, how were they supported? Get data on career outcomes for postdocs with disabilities and first generation candidates.

Design a reportable mentoring rubric and make PIs accountable for systemic failures in labs to support postdocs.

Create more non-PI but PI-equivalent positions in academia.

Protection for whistleblowers, serious repercussions for retaliations.

Postdocs that generate data for grants should be made co-PIs on grants, not simply assigned as personnel.

Current NIH grant system serves the PI, not the science. Invite ideas to change this systemic problem.

Response 2437

Perspectives on the postdoc roles and responsibilities

It’s strictly a training position where people learn how to do research through doing research under supervision of a mentor. It should also provide training in management, mentorship and new skills such as bioinformatics.

Fundamental issues and challenges

There are multiple problems in recruiting and retaining postdocs.

The sources of foreign postdocs, who used to be a significant fraction of the postdoctoral workforce, have almost completely dried up. The reasons for this differ by region of origin. European postdocs do not want to come to the US because they are put off by domestic politics such in limitations on individual rights and fear of violence such as gun violence. Asian postdocs feel like they are targets of anti-asian sentiment and also countries like China are now offering better research resources than the US does and hence is out-competing the US for asian and even European postdocs.

US graduate students are skipping postdoctoral training to enter biotech immediately after receiving their PhDs because of higher salaries, better research resources and a much more uplifting research environment.

Existing NIH policies, programs, or resources

There is only one issue—ADEQUATE FUNDING

For more than 20 years, since the establishment of the modular budget, the NIH has pretended that there is no such thing as inflation. This has simply gutted research budgets, especially for grants that are

competitively renewed. Thus adjusted for inflation, what used to be a 25,000 module should now be a 41,000 module. Forcing lab heads to deal with the reduced funding due to lack of inflation adjustment has poisoned the NIH funded research environment. Simply put, it is hard to convince people they should go down the classic academic research track given the challenges this causes.

Postdoctoral salaries are not competitive. Salaries need to be appropriately increased and adjusted for local cost of living. I know that the NIH has adjusted postdoc salaries from time to time but additional funds are never provided to cover these increases, no matter how inadequate they may be. Forcing lab heads to deal with inappropriate postdoctoral salaries due to lack of inflation adjustment and failure to fund mandated increases has further poisoned the NIH funded research environment.

The lack of state of the art instrumentation also poisons the research environment.

The effect of these problems has simply made the biotech research track more attractive than the academic research tract. If the best opportunities to do state of the art research are in biotech, that is where our students will go. Or have gone.

Proven or promising external resources or approaches

The NIH simply needs to face up to the need to provide adequate funding at the key stages of a scientific career. These include adequate postdoc salaries and enough funding that postdocs have a reasonable chance to start and establish a competitive lab. But providing adequate funding for labs that succeed is also important because if being a successful investigator is unattractive, people will not want to enter the profession even if entry level opportunities are attractive.

Response 2438

Perspectives on the postdoc roles and responsibilities

To me it is a necessary step to get to a faculty position

Fundamental issues and challenges

Postdoctoral life is very unfriendly for people, especially women, with kids. The pay is not enough for childcare expenses, the maternity leave is too short, many places don’t have lactation rooms, childcare can be unreliable, all on top of the bias that women with kids are not serious scientists makes a postdoc life with a kid impossible.

Existing NIH policies, programs, or resources

The fact that extensions for having kids is not combinable with other extensions is unbelievable. With COVID it meant that someone who got stuck without childcare was the only one ineligible for a COVID extension.

Proven or promising external resources or approaches

No response

Response 2439

Perspectives on the postdoc roles and responsibilities

Postdocs are employees responsible to principal investigators. They need to address specific aims in grants. Their level of independence (or laxk thereof) is based on their PI’s attitudes and on their own skills and knowledge.

Fundamental issues and challenges

Postdocs need to be interested in the science and need to get along with their PIs. Postdocs often have a two body problem; their partners need jobs nearby. Postdocs with children need daycare. They should have matched retirement benefits and health insurance. They should be paid as professionals.

Existing NIH policies, programs, or resources

RO1s need to provide additional salary support. Granting agencies should require postdocs get benefits.

Proven or promising external resources or approaches

Also, what about moving costs?

Response 2440

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is ideally a short-term (~4-5 years) appointment in which a PhD grows additional skills, manages their own project(s) with support and advice from their advisor and other mentors and peers, trains others in the lab, takes on riskier projects than a PhD, and ultimately accumulates a body of research and expertise great enough to found their own lab.

Fundamental issues and challenges

Salary and other compensation (e.g. health insurance package, leave, retirement benefits) far lower than industry, consulting, government, and medical writing positions (a.k.a. literally any alternative).

Lack of institutional support and protections.

Little benefit to any future career other than PI, which is very difficult to get.

Existing NIH policies, programs, or resources

Fund research scientist positions for PhDs that are NOT meant as pipelines to the PI job. Many people love doing bench science and have no desire for a managerial role, but have very few options to remain in academia other than perpetual postdocs, which are not sustainable financially or stable.

Proven or promising external resources or approaches

Working environment: systematically require universities to provide HR with teeth and train all postdocs about their rights in the workplace, including sick leave, lack of sexual harassment, right to work without visa coercion (for international postdocs), and how to report any problems. This should also be the case in graduate school. Academia builds structures that refuse to hold prominent people accountable, and after graduate school many of us are already extremely jaded by corrupt systems and wouldn't consider a postdoc in academia even if it actually paid an appropriate amount.

Response 2441

Perspectives on the postdoc roles and responsibilities

Postdocs learn to drive a project forward with their own ideas. They get to learn fundraising through grants, and they need to get mentorship training and expertise. It is a training position hat provides incredibly important experiences for starting their own lab.

Fundamental issues and challenges

Major issue is salary—at times when industry scientists make ~150K right out of grad school and daycare costs are ~30K/yr per infant, a job with ~52K salary per year is not competitive. Limited positions in academia without a chance for midrange positions (like long-term academic scientists with a competitive salary) further decrease the likelihood that postdocs will join labs. In addition, the time it takes to produce a big paper as a starting point for an academic career means that salary shortcomings will be felt over a very long time.

Existing NIH policies, programs, or resources

NIH MUST change the RO1/R35 funding mechanism to allow for competitive postdoc salaries. That's the most important part. You can't fund an RO1 with ~250K/yr and expect progress on three aims (I could pay one postdoc and 50% of a graduate student/tuition plus supplies from this; so expect 1-2 aims to be covered). Salary range must increase with a starting salary at least at 70K/yr without benefits, better would be higher salaries (even a 100K salary means a good graduate student will forge 50-90K salary per year, as they could get 150-190K/yr in industry).

Proven or promising external resources or approaches

No response

Response 2442

Perspectives on the postdoc roles and responsibilities

In graduate school, students learn bench skills and to design and interpret a series of experiments to interrogate a biological process. The postdoctoral position allows the young scientist to add additional technical skillls that broaden their tool set to interrogate biological process. Even more importantly this position gives the young scientist training in how to take the next step as an independent research, the knowledge of how to choose an important biological problem and direct a research program.

Fundamental issues and challenges

A big issue these days are the salaries. Because graduate careers take so long, and postdoctoral positions also now involve a 4-year commitment, many recent Ph.D. students are choosing industry or science-related jobs. In addition, many students no longer choose a career path of a postdoctoral fellow because they see the struggles of faculty to fund their research.

Existing NIH policies, programs, or resources

Raise postdoctoral fellows' salaries. Raise the amount of grant funding for young invesigators. Neither the salaries of postdoctoral fellows or new investigator awards have kept pace with inflation. In many places a postdoctoral fellow makes little more than a graduate student (40K vs 55K). Grants for young investigators have been stuck at 250K for years. This funding barely supports a techniician, one graduate student, and supplies for their research.

Proven or promising external resources or approaches

No response

Response 2443

Perspectives on the postdoc roles and responsibilities

As a t32 director for decades with NIMH and NIDA and Fogarty I have found it increasingly important over the years to train postdocs. They are part of our mentoring mosaic because they have a need for training but also have a lot to give back to trainees themselves. It is an important position.

Fundamental issues and challenges

Stipend is too low. Benefits are too low. Travel offered is too low.

Existing NIH policies, programs, or resources

Make it more prestigious. Offer a competitive wage and more benefits. Allow for a one year and two year program. Not three year. That is too much. And maybe allow for a six month training. Several of our postdocs found a faculty position in their second year and it was detrimental to our program to lose them while also being detrimental to them.

Proven or promising external resources or approaches

No response

Response 2444

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is intended to be a period of continued training, professional development, and preparation for the subsequent career stage. This is a temporary position in which postdocs receive mentorship, training, and guidance to develop skills and knowledge to allow them to succeed as independent researchers.

Fundamental issues and challenges

Major issues inhibiting recruitment of postdoctoral trainees include limited job prospects in academia, limited financial supports, limited benefits, and poor work/life balance. The highly competitive nature of academic positions means that PhD graduates are considering alternative career paths, many of which do

not require postdoctoral training. These other prospects are also appealing to many for the higher earning potential and better work/life balance. Many are seeking other employment opportunities as the postdoctoral salary rates are not competitive compared to other industries, particularly in major cities such as New York. Additionally, the benefits available to postdocs are also limited and varied by institution, including access to employee assistance programs, medical insurance, life insurance, retirement contributions, and housing, among others. Finally, the work/life balance for those in a postdoctoral position have become increasingly skewed with many feeling the need to put personal life "on hold" while completing a postdoc.

Existing NIH policies, programs, or resources

The NIH OITE resilient scientist series has been a great resource that address the well-being component of postdoctoral training. This has been helpful to share with other institutions and continued offering of this resource would likely be beneficial. However, the larger systemic issues of financial and mentorship support would likely still need to be addressed as suggested below.

Proven or promising external resources or approaches

Increased funding that reflects the specific needs of geographical locations and increased accountability for current supervisors and PIs would likely help improve the postdoctoral ecosystem. Increased and appropriate funding rates would likely attract talented postdocs who otherwise feel the need to pursue alternative career opportunities to receive competitive earnings. Increased accountability for supervisors and/or PIs would also likely help improve the working culture for postdoctoral trainees. This could include required annual mentorship training, inclusion of mentorship skills in the tenure process, and/or confidential annual feedback from postdocs to the institution administrators regarding their PI/supervisor.

Response 2445

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Across the majority of academic institutions, obtaining external postdoc funding leads to a loss of benefits (medical, dental, retirement etc.), which are typically covered by the institution. Because of this, externally funded postdocs are penalized compared to non-funded ones, leaving little incentive to compete for funding or stay in academia at a time many of us are starting families and just cannot afford to lose benefits.

The K99/R00 mechanism is deeply flawed. One either "does not have enough preliminary data," but when including preliminary data upon resubmission one is "overqualified and does not need training." Addressing all the comments in a resubmission gets one nowhere because the NIH cannot ensure sufficient reviewer continuity. The R00 is designed to build upon the K99, yet reviewers will penalize the application based on perceived "interdependence."

This issue affects not just postdocs, but the review process seems entirely dysfunctional. So much of grant and manuscript reviewing is just luck of the draw. Reviewers don't get paid. Can't get the same reviewers again.

Existing NIH policies, programs, or resources

The Becoming a Resilient Scientist Program has been helpful to many individuals. However, one wonders whether these individual-targeted programs are the key to resolving what is instead a systematic problem.

Proven or promising external resources or approaches

No response

Response 2446

Perspectives on the postdoc roles and responsibilities

Originally, I had the impression that postdocs were an opportunity/place for new scientific exploration in a field completely different from one's doctoral focus. However, I have found that almost zero PIs want to

take a chance on a postdoc who is looking to pivot (or double pivot) to gain complementary skills/expertise. Instead, PIs look to hire someone with precisely the same background/skillset that they achieved during doctoral training. Thus, a postdoc feels almost like a relic of the past—a required "step" in order to obtain a tenure-track position, even if there are only marginal training/science gains from being in such a "transition" role. I know I am fully qualified to be a professor/PI and, yet, for reasons unknown to me, I "have" to take this pause on my scientific trajectory and growth to tick the postdoc box so I can be considered for faculty positions. Today, a postdoc feels like a way for PIs to get cheap skilled labor, rather than a beneficial training opportunity for me.

Fundamental issues and challenges

Largely financial hardship. Graduate school did not allow me to save any money, plus I am still paying off student loans. It was a really hard decision to not leave academia for a STEM industry role that paid 3-4x the standard NIH postdoc salary, but I have wanted to be a university professor since I was 8. I am really hoping that I don't have to abandon my dreams just to ensure that I have some financial stability after so many years as a student, but I have ~$500 in savings (total) even though I am 32. I cannot afford to stay in a postdoc for more than 1-2 years, maximum.

Existing NIH policies, programs, or resources

I was a predoctoral fellow funded by NIH (3 years; FIC/NIBIB/NCATS) and I am a current postdoctoral fellow funded by NIH (2 years; NIHLB)—I think the pipeline and overall structure for training and mentorship is adequate. Instead, the biggest barrier to the postdoctoral training experience is financial: the minimum postdoctoral salary needs to be increased to match cost-of-living and to reflect the amount of advanced training we have completed. Currently, our postdoc salary does not reflect our value or our educational status. I should not have to live in poverty-—even delaying starting a family--just because I elected to pursue a scientific/academic career. For comparison: my starting industry salary as a 22 year old with just a B.S. (10 years ago in 2013, so not adjusted for inflation!) was ~2x my current postdoc salary. That is ridiculous. I honestly do not know how I survived financially during graduate school and I am not sure I will fully breathe financially until I am a few years into my future tenure track faculty position.

Proven or promising external resources or approaches

While conducted without a thought to the downstream requirements within its academic pipeline, Germany's recent approach to limit the number of postdoc years to 3 is interesting. I am not convinced this is the best solution to deal with our (largely financial) crisis in the US, but I do believe that addressing the number of needless 3-5+ year postdocs is important. Recent efforts by many US universities to increase graduate and postdoctoral stipends—via internal funding or by no longer charging tuition—may also be instructive for how to identify additional funding sources that can bridge the critical salary gap. Still, NIH grant schemes need to be increased to account for this overall increase in salary costs. I also just want to note that postdocs should be eligible for continued loan deferment as long as postdoc status is maintained (aka maximum of 5 years). I think this could perhaps relieve some of the burden since the requirement to make loan payments while making such a low postdoc salary is especially burdensome, including for first generation and BIPOC.

Response 2447

Perspectives on the postdoc roles and responsibilities

While the postdoc is a training experience, I do not view the postdoc as being a trainee in the same way that a graduate student is a trainee. Like any other professional entering into a new job or experience, training is required. Also like every other professional in a job, there are also significant contributions being made by the postdoc, which deserve recognition, compensation, and status. Often postdocs are categorized as students when convenient (when classified for health insurance, for example), and yet also kept from student benefits when convenient (categorized as temporary full-time employees without access to student resources including fitness centers, student IDs, events, etc.). While one could argue that most postdocs are not interested in attending student-focused events, they also do not have the option to benefit either from student resources OR resources given to full time employees. While most understand the trade offs of staying in an academic postdoc compared to pursuing a career outside of academia (industry postdoc, industry job, among others), there is a high cost to staying in the academic arena, one

that is not equitable, just, or fair, and pushes out those who cannot financially or emotionally afford to stay.

Fundamental issues and challenges

To me, the challenges in recruitment, retention, and quality of life all come back to the cost and wages of a postdoctoral trainee. Even as a postdoc at a major R01 institution, I am paid below the "NIH minimum" salary. While peers with arguably similar training—perhaps even with fewer accolades (papers, awards, etc.), have moved into roles that pay twice the salary with retirement benefits, bonuses, and more protected free time. The benefits of pursuing a postdoc are often lost when academic jobs, grant funding, and opportunities are difficult to come by, hard to secure, and dwindling over time. It is difficult to feel like you are a respected professional, even one with an advanced degree, when you are often fighting to have what would be considered the bare minimum in all forms of compensation.

Existing NIH policies, programs, or resources

While the NIH minimum salary is useful in theory, institutions either choose not to follow, or have no motivation to follow these guidelines. Additional oversight is likely needed to ensure that the postdoctoral training position can be maintained. With the decline in individuals willing to spend important years in postdoc positions, it is perhaps unsurprising that this could have a greater effect on the academic system (future faculty, etc.) down the road.

Proven or promising external resources or approaches

No response

Response 2448

Perspectives on the postdoc roles and responsibilities

To me, being a postdoc means being a professional scientist, as I am responsible for designing and conducting research projects, analyzing data, obtaining grant funding, and disseminating research. While I am still learning and developing, I am much more focused on actual research than personal development and training. As such, the use of terms such as 'trainee' to describe my position is somewhat infantilizing and demeaning. Such terms are not used in equivalent industry positions.

The postdoc is a very exciting but challenging position. I am required to build a productive research profile while also preparing for a future independent research career and developing interest and skills in new research areas. This is daunting because although the potential rewards (an independent research position) are big, the odds of obtaining such positions can be small and there is a lot of uncertainty in terms of job security and long-term career prospects.

Fundamental issues and challenges

Two fundamental issues affect the quality of life of postdoctoral trainees (in my experience). Low pay and low job security. Postdocs have gone through many years of surviving on a PhD/graduate student stipend which means they enter their postdoctoral career at a financial disadvantage relative to industry peers. This is further compounded by low pay. I moved to the US in Oct 2021 to begin my postdoc, and since then, my wife and I have lived paycheck to paycheck despite living frugally and both having what would be considered 'good' jobs. This brings enormous stress and worry and I have not been able to fully devote myself to my postdoctoral work as I have been constantly worrying about paying rent, bills, etc. Although an independent academic research position is my dream job, I have given serious thought to moving to industry and I probably would have at this stage, but my visa means that I must keep working in my current position/field or I would have to leave the US. Given this financial insecurity, my wife and I have delayed starting a family. It often feels like the only people who are in a position to succeed in academia are those from wealthy backgrounds and academia effectively enables this by keeping wages low.

Job security, particularly for international postdocs, is a huge concern. While I have a good relationship with my PI, I still sometimes worry that I could be let go at any point and this would mean that my wife and I have to return to our home country immediately and give up our lives here. This is a worry even though I trust my PI. I am sure that there are other postdocs who do not have such supportive PIs who are really worried about this issue.

Existing NIH policies, programs, or resources

Given the large number of international postdocs in the US, the NIH should increase the number of opportunities (training + fellowships) that international postdocs are eligible for. For instance, we are not eligible for T32 grants, F32, K21 or even training programs such as the NIA Butler-Williams Scholars Program. In terms of NIH opportunities, we are limited to the K99/R00 fellowship which may not be suitable for a number of reasons. For instance, in some institutions (including my own) the K99/R00 requires postdocs to transition to a H1-B visa. This would mean that the postdoc's spouse would no longer be eligible to work in the US which essentially rules out this opportunity for many, except those who have enough wealth to survive on a single salary.

Given the many barriers faced by international postdocs, they can be at a disadvantage in terms of productivity in comparison to US citizens at the same career level. For many, this can reduce their competitiveness for the K99/R00 grant, which is often their only option. The ineligibility for many NIH opportunities is yet another barrier and effectively discriminates against international postdocs.

The NIH should make opportunities available for international postdocs specifically or increase the number of total opportunities to which they are eligible.

Proven or promising external resources or approaches

While many approaches may slightly improve the quality of lives and job satisfaction of postdocs, the single issue that would have the biggest effect is improving salaries. Happy and productive postdocs need good salaries. Without that, everything else is just window dressing.

Encourage institutions to allow international postdocs to progress/apply for specific grants while remaining on the J1 visa (as this enables spouses to work).

Increase opportunities for international postdocs.

Response 2449

Perspectives on the postdoc roles and responsibilities

Identifying a problem and designing the solutions in the form of several projects. Handling every different project with due diligence, while training students to work on those projects; Learning how to perform the different duties of a PI

Fundamental issues and challenges

Post docs are heavily overworked and massively underpaid having gone through 5-6 years of intense grad school training. Comparatively, other careers such as industry, consulting, etc. pay the Ph.D. graduates well and offer additional perks as well, which makes new grads choose these careers.

Existing NIH policies, programs, or resources

To significantly increase the pay.

To fix the work hours of post doc to 8-9h per day and pay extra for every hour of overtime work.

Proven or promising external resources or approaches

No response

Response 2450

Perspectives on the postdoc roles and responsibilities

I am a graduate student in the last few months of my PhD program and I am still on the fence between finding a job in industry and pursuing a postdoc. However, from my own perspective and those of my colleagues that have been shared with me, there are a number of anxieties around doing a postdoc that are pushing me away from it. For me, the main fear is that there is no guarantee that the projects you work on as a postdoc will produce high enough impact results to eventually land a job in academia. It's a risk to continue down the academic path because at the end of the day, there is a fair bit of luck involved in to science. Unfortunately, your luck as a postdoc can greatly influence your future career prospects and I think students are not willing to take that risk. Furthermore, even successful postdocs from top

institutions can struggle to find faculty positions, which seem to be a limiting factor at the moment. If you're not in the 10% that end up in faculty positions, more likely than not you will end up in industry anyway, so why not just start there after graduate school. Another anxiety is that around faculty jobs. People become scientists because they enjoy doing science. A postdoc is supposed to be an intermediate step between graduate school and faculty. However, the reputation at the moment is that many faculty are too busy with administrative tasks to do any of their own science, or, in some cases, mentor their students. If the main reason for someone to consider a postdoc is to go into academia, but academics don't have time to be scientists or mentors, what's the point in continuing down that path?

Fundamental issues and challenges

Lack of advising for future career opportunities coming out of a PhD. None of my advisors (either PI, PI of our partner lab, or thesis committee members) has ever really asked me what my career goals, why, or what the best way to pursue those goals is. At a recent committee meeting, one of my committee members asked me what I wanted to do after defending and I mentioned that I was interested in pursuing something in industry. My committee member, and later my PI, responded by saying that maybe I should consider doing a postdoc because at least it kept options open. However, aside from knowing a few postdocs personally, I have never really understood what separates a postdoc from a senior graduate student (apart from obvious program requirements) or how continued postdoc training in the same academic environment would help someone pursue their career goals. I think that having a stated goal for what a postdoc should entail and the kinds of trainees that might enjoy and benefit from it would greatly help with recruitment into academic postdoc roles.

The other obvious issue is compensation. I still want to believe that scientists can and should pursue their career goals out of a love for the science and not for purely financial reasons, but the reality is that the cost of living, particularly in cities with strong academic reputations like Boston and the Bay Area, are extremely expensive to live in. At the same time, companies are offering graduating PhD students double the pay with more of a focus on work-life balance than academia ever has. I don't think it's realistic to match the compensation offered by industry, but at least making it so that people can afford to live in the cities where they work would help.

Existing NIH policies, programs, or resources

I think the biggest thing, especially that the NIH could do, is increase funding. The cost of living in the US is rapidly rising and graduate students and postdocs are asking for more money to be able to live in the cities where they work. On top of that, inflation is increasing the cost of common lab reagents. The result is that academic labs, especially those operating on only one grant, are struggling to get by. Add to that the fact that grants are difficult to get and the impact of low funding on academic research is immediately apparent.

The other issue that I see as a graduate student, which is not necessarily something that the NIH can control, is that faculty are expected to spend a majority of their time on administrative tasks instead of doing research, which is supposedly why they were hired to begin with. I really think there needs to be a systemic change to address this problem and allow researchers to spend more time mentoring and doing research. From the perspective of a potential future postdoc, it's hard to see why pursuing this career path is worth it. Everything I've seen suggests that it will be difficult to land a faculty job (because there are not enough to go around) and even if I do, it will be difficult to get grant funding (which will also be something that I most likely will struggle with for my entire career), and even if I do, the constant anxieties around mundane administrative tasks, finding more funding, and trying to publish enough will probably prevent me from actually doing any science of my own. Faculty need better funding for longer durations and more time to do it or else academic research won't survive.

Proven or promising external resources or approaches

No response

Response 2451

Perspectives on the postdoc roles and responsibilities

For those wishing to become research faculty, postdocs now seem almost uniformly required.

In the best-case scenario, a postdoc provides protected time, mentorship, training and resources to publish papers, develop new collaborations, write grants, and conduct a job search. For clinician-scientists, a postdoc provides needed time develop research skills and practices and to test out a potential career in this area, which has a very different structure than clinical training. For PhD scientists, it provides time to recover from doctoral burnout, publish dissertation papers, and prepare for launching. The ability to develop one's own area of research and obtain additional training/mentoring is more common in fellowships supported by T32s (which have been more altruistic in my experience because they have more faculty and more oversight). Whereas in project postdocs supported by R01s, the experience of postdocs/fellows is much more varied, with little oversight, and subject to the ability of the PI to mentor or manage their own research. Postdocs are more commonly required to do the work promised in the grant rather than able to pursue their own independent projects or develop their own skills.

Fundamental issues and challenges

In the Bay Area, postdoc salaries are challenging to live on while also paying loans. Department/Divisions with limited resources (e.g. where clinical services are provided at a loss, like primary care and geriatrics) and PIs with NIH grants cannot easily supplement salaries and benefits to livable wages. This not only will lead to challenges recruiting candidates but also unduly disadvantages potential candidates from historically excluded or underrepresented backgrounds who may have family they need to financial support. Thus a postdoc is both a requirement for a research career and also a privilege and often illogical choice. Together, if salaries are not increased, it will substantially reduce our ability to diversify our population of investigators.

In addition, the lack of financial support for program directors or faculty in T32 postdocs means taking those roles is also illogical in soft money organizations. It seems like applications often claim there is support from other sources that is not there in reality. It's unreasonable to expect postdoctoral/fellowship programs to have any infrastructure or support trainees in this challenging transitional phase when there is no support/security for the faculty tasked with creating the infrastructure.

With ongoing efforts to increase the racial/ethnic diversity of the pipeline in academia, it will be particularly important to pay for the time of program directors with racial/ethnic minority, as they often are invited to more service opportunities (often unpaid). Paying adequately for program director time would allow faculty from historically excluded populations (whose mission and values aligns with mentorship) to serve in T32 leadership or faculty roles.

Existing NIH policies, programs, or resources

Adjust all NIH grants for area cost-of-living, e.g., both T32s and R01s

Increase salary scales for postdocs

Fund T32/postdoc leadership/faculty and administrators

Provide resources for postdoc training (e.g., coursework/training, funding for attending & presenting at 2 conferences/year, childcare for attending conferences)

For project postdocs (e.g. funded by R01s), require PIs to submit evidence of ability to mentor/train scientists, training plans that support the postdoc progressing towards independence, reporting evidence of postdoc success. Have mechanisms to not fund postdocs for PIs who cannot adequately support/mentor (e.g., change the funding to project staff, not postdocs).

Increase project (R01) caps so that (more) postdocs could be supported and at higher salaries.

Proven or promising external resources or approaches

No response

Response 2452

Perspectives on the postdoc roles and responsibilities

Academic post docs are meant to be roles for providing more expertise to a lab with the skill set you obtained from a PhD. This position can be used as a intermediate step to academic roles, industry roles, or having a more permanent position in the postdoc lab.

Fundamental issues and challenges

First of all, the pay is horrible. It is literally half the salary compared to industry and it is barely enough to save money for a Roth-IRA. That's the main issue at hand.

Other issues following the pay revolve around how the position is viewed as a whole. There seems to be an idea that postdocs are trained during their time in the lab. However, postdocs end up just trying to publish and leave to better jobs with no training from the PI as well. This job is not an apprenticeship, it is just an intermediate required employment. Postdocs provide so much expertise for the lab but are treated like they are first year graduate students. There is also no long term role in the lab that post docs can take. Lastly, the support for gaining skills for industry position as an academic postdoc is nonexistent. The postdoc position feels like a low paying dead end job that feeds into an unsupportive, low-paying, extremely competitive field.

Existing NIH policies, programs, or resources

Funding focused on schools outside of the Ivy leagues or main metropolitan areas (i.e. bay area, Boston, San Diego, New York) would really help broaden the scientific environment. The major schools have enough money to fund themselves, but state schools, MSIs, and HBCUs would seriously benefit from increased funding which would also help postdocs have more viable options for this position.

Proven or promising external resources or approaches

Improving the working environment is absolutely vital. NIH seems to just fund labs based on publications, but the lab environment needs to be seriously considered. Toxic lab environments lead to fabricated data. Just because a lab is highly productive does not mean they are doing good ethical science.

Response 2453

Perspectives on the postdoc roles and responsibilities

I consider my postdoctoral training to be an opportunity to develop my independent research capabilities and mentoring experience. It is highly desirable to increase my number of publications and citations and become more recommendable researcher.

Fundamental issues and challenges

Developing a good rapport with the supervisor is very important. Knowing each other's expectations towards work-life balance is not an easy handle where majority of the time I am stressed. I have a good relationship with my current supervisor but sometimes I feel he does not understand that there is only so much I could in a week. Foreign postdocs are often helpless at situations when they could not sustain the pressure yet trying to win over until they find another institution. Overall quality of life is average or below as the remuneration paid to a postdoc is also much lesser to run a family of four. Average hike every year increases only a couple of hundreds of dollars and makes not much of difference. Adding to work related stress in keeping up with experiments, reading and publishing, being worried about financial depression makes people want to jump to industries or anywhere other than Academia

In this critical moment in time, science communication is one of our nation's most important topics and yet NIH does not require training in science communication for its postdocs. There is a science of science communication that can improve how scientists communicate their own science to each other, to the public, and to our leaders. Mastering science communication skills such as understanding the audience, identifying a communication goal, framing a message, presenting complex data in evidence-based ways, storytelling, and delivery are directly related to their success as scientists, leaders, influencers, and teachers. This success, in turn, should leave to individual and societal benefits, including greater trust in science and use of that science. For the good of science and society, I recommend NIH require formal Instruction in Science Communication for all recipients of training, fellowship, career development, and R25 awards.

[redacted for anonymity]

Response 2455

Perspectives on the postdoc roles and responsibilities

As noted by the National Postdoctoral Association, the NPA and NIH jointly developed the definition of a postdoc to be a mentored research experience to develop skills to pursue a career of their choosing. Calling postdocs trainees during this stage of skill differentiation is diminutive and I think that "Scholars" are more appropriate and more in line with the K awardee nomenclature. Since the lines are often blurred between postdoc stage and K award stage, I would suggest that a reenvisioned postdoctoral training experience synergize those T, F, and K mechanisms to facilitate the development of these scholars in a structured way after receiving their PhDs. This would also allow postdocs to have consistent appointment types regardless of funding mechanism.

Postdocs also lead their research projects and often coordinate collaborations with internal and external stakeholders. NIH should find ways to reward this team science approach to encourage the formation of interdisciplinary research teams, and potentially having mentoring teams for postdocs composed of individuals across areas of expertise.

Fundamental issues and challenges

Echoing remarks from the Association of American Medical Colleges and the National Postdoctoral Association, research training environments need to be free of harassment of any form. I would recommend that NIH require all research funding opportunities that provide funds to potentially hire postdocs to require a section that commits to fostering inclusive and respectful work environments and a plan for conflict resolution.

The unchanged modular NIH R01 budget is very inhibitory to PIs to balance maintaining an adequate enough workforce to move their research along with providing suitable wages to postdocs above the NIH minimum. Furthermore, when postdocs are awarded an NRSA grant, PIs cannot supplement their salaries with federal funds which further exacerbates this issue.

When postdocs win prestigious T or F NRSA awards, their lives are essentially upended in most institutions due to being forced off of the institutions payroll and lose access to benefits.

Existing NIH policies, programs, or resources

Echoing remarks from the Association of American Medical Colleges and the National Postdoctoral Association, NRSA-funded postdocs absolutely need to be allowed to have the same access to benefit as employee-classified postdocs. NIH has put an incredibly unnecessary burden on institutions to normalize access to benefits across the different appointment types. I would suggest leveraging early career funding mechanisms that leverage mentored research experiences, like the K scholar mechanism to apply to Postdoc T32 training grants and individual F grants to allow those postdocs to be classified in a service role.

Proven or promising external resources or approaches

Cohort based programs strengthen community (ie, MOSAIC) and can be tailored toward career paths that reflect the contemporary workforce (ie IRACDA). Cohort based programs can be developed or expanded that allow for protected time to integrate interprofessional skill development into their training experience. For example, the IRACDA paradigm can be replicated for other differentiated career paths in academia to allow for protected time in industry, policy, research administration, technology commercialization or other specialties that would enrich academic environments.

Response 2456

Perspectives on the postdoc roles and responsibilities

Extremely important training to become an effective and well trained biomedical scientist, in academia or in industry

Fundamental issues and challenges

There has been very bad press via primarily social media in recent years suggesting that postdoctoral training is a miserable and unsustainably underpaid experience and should be avoided. This is accompanied and associated with the notion that academia is a similarly miserable experience that should be avoided. As a result the number of postdoctoral trainees has dropped precipitously in recent years. I believe that the poor remuneration of academic postdocs is a major reason for this dropoff, based on discussions with many trainees and what I see written about it online and elswhere.

Existing NIH policies, programs, or resources

I believe that extra NIH funding for remunerating postdocs is essential to stem what will otherwise be a major loss of future talent in discovery science in biomedical fields.

Proven or promising external resources or approaches

I believe that better remuneration is the most important area that NIH can remedy. It is essential!

Response 2457

Perspectives on the postdoc roles and responsibilities

I see a postdoctoral position as a chance to do cutting edge research, and gain new lab skills, project management, and ideally grant writing skills. If you are lucky enough to find and apply for an external grant, it is a chance to show PI skills.

Fundamental issues and challenges

Salary. This is not complicated. Please do not spend millions of dollars on consultants and listening groups and other b.s. trying to be convinced it is anything else. Salaries have barely budged for 20+ years. Many graduates come out of grad school having earned way under market rate for 5-7 years, with UG student loan debt and interest accruing as well. Many likely can’t even afford to take a Postdoc position even if they wanted to. There is a dignity component at play. Salaries are insultingly low, following grad salaries that are insulting low. How long would universities function if their low paid functionaries went on strike? Not long—e.g. [redacted for anonymity]. It is embarrassing that “low skill” workers (who actually are extremely important, skilled,and essential workers-as the pandemic has laid bare) make more than workers with 4 year college degrees or Masters/PhDs. Artificial time-limits (5 years of Post-docing at many institutions) and “suggested” salaries that get taken as immutable gospel by college admins work to depress wages and cycle through workers. Now that compensation is untenable, there is finally a realization there is a crisis, which has been a slow-motion train-wreck for years.

Existing NIH policies, programs, or resources

Crack-down on the ever widening and voracious administrative-industrial complex. Start fining or limiting grants to both for-profit private schools and public schools whose overhead bleeds away at grant dollars. Study the administrative bloat that has occurred over the past 30 + years. Nothing drives grad-students and post-docs more nuts than seeing insane ratios of Workers (Postdocs and grad students) to HR staff, Deans, assistant deans, assistant to the assistant dean and administrative staff ad naseum, who have sane working hours and adequate compensation.

If funding for compensation can't massively be increased, start a multi-year limit and ideally percentage decrease to overhead allowed to be charged per grant. Name and shame the worst actors. All this "excess" funding could go towards compensation for workers. There is also a near criminal lack of cohesive policy on vacation, family leave, paternity/maternity leave, which when left up to individual actors can be abused by either the PI or the Postdoc/grad student (though you can imagine which way this swings). Furthermore, many schools require grads/postdocs to sign contracts that do not allow them to work outside jobs, or be compensated in other ways. This is ridiculous micro-managment. I had friends who had to give up even small hobbies like etsy shops, music writing, ride-sharing etc because of these heavy-handed policies.

Finally, allow funding permanent scientific staff positions as part of grants. This is more just for scientific progress. I can't tell you how many times I've seen scientists try to repeat protocols from a predecessor, and have it takes months. Whereas, if institutional knowledge was valued, these same assays could have been completed in days to weeks with a permanent staff member to go to for help.

Proven or promising external resources or approaches

Open up grant calls to post-doc. There is an extreme lack of available funding mechanisms for post-docs to conduct truly new and groundbreaking research. The status quo is to try to uniquely expand on a PI's existing portfolio of research, while staying in the bounds of the grant. This limits the Postdocs efforts to diversify from the PI (and hopefully make themselves more marketable). It also limits, what could be a high risk high reward strategy for funding breakthrough research.

Response 2458

Perspectives on the postdoc roles and responsibilities

A postdoc should be a training position for PhDs to gain further skills needed for another occupation, not necessarily an academic research position. While research is a component of this, it does not have to be the only component; it can include teaching, legislation, partnerships with industry, or anything else needed to bolster a CV. A postdoc will have more skills than a PhD, but shouldn't be hired based on techniques alone, because then there is functionally no difference (except salary) between a postdoc and a lab technician. Responsibilities should include mentorship, particularly of graduate students; budgets or bureaucratic requirements; writing and editing; and again, any other duties that can benefit both the PI and the postdoctoral trainee. The responsibilities should not only benefit the PI and lessen their or others' workloads.

Fundamental issues and challenges

The major challenge for recruitment/retention is the salary and benefits. Both are better in other job positions, not just industry. My current position does not offer employer contributions to retirement specifically for postdocs; all other employees are included in these benefits, even part-time staff. Another is the workload and work/life balance, which is often ignored for postdocs. My boss expects me to work 60 hour weeks, which is not at all conducive to my mental health. In many places, the "training" is just continuing the mentor's research with little thought given to the postdoc's career development, making them a poorly paid lab technician. Quality of life is of course affected by this research-first mentality, as little time is spent outside of the lab developing community. There is also still a large stigma against mental illness in academia, particularly as it affects performance. At my particular institution, the Office of Postdoctoral Affairs is so small, it is run by one PI with one administrator, and I am in charge of planning the required RCR training for postdocs with no additional pay. As a postdoc myself, I do not have the time to balance my research responsibilities and maintaining the NIH requirements for continued RCR training. This is just indicative of an overall lack of support, that we postdocs are often providing training and support for ourselves, rather than it coming from the NIH or our institutions.

Existing NIH policies, programs, or resources

Policies regarding trainees and expectations of mentorship are not clearly spelled out by the NIH and therefore up to institutions and largely individual labs to decide what is and is not appropriate to ask of trainees, particularly postdocs as even graduate students belong to a larger group (ie graduate programs). While policy prohibits retaliation to reporters, it doesn't do enough to guarantee support to international trainees whose visas depend on their positions and by extension, their mentors. Much abuse goes unreported because of the unspoken threat of having to return to their home country. International

postdocs should be allowed on T32 training grants if they can be supported by their mentors' R grants. Postdoctoral offices should be able to apply for either T32 or a separate training grant classification to support postdoctoral training that is not directly related to their research, including RCR training.

Proven or promising external resources or approaches

Response 2459

Perspectives on the postdoc roles and responsibilities

postdoc is critical to success as an academic researcher. I love the independence and training opportunities it has afforded me. it is an incredible opportunity to build your research portfolio and build collaborations.

Fundamental issues and challenges

Delaying financial security/retirement—institutions should have to have retirement match programs and the same benefits that they would for faculty and staff members for postdocs. It is nearly impossible to meet financial savings goals when you have delayed getting a full-time, salaried job for many years because of graduate school and postdoc. moreover, the salaries for many research positions are significantly less than medical school or law school graduates' starting salaries, even though these individuals sometimes have similar or even fewer years of training (but significantly higher starting salaries).

Salary—these do not compare with peers in the job force who have significantly fewer years of education. Additionally, NIH salaries should increase at least at a rate commensurate with cost of living increases. This year's increase doesn't come close to accounting for the inflation seen this last year.

Existing NIH policies, programs, or resources

it would be great if NIH could distribute these materials at least to T32 postdocs for whom they have access to their emails. I was unaware of a lot of these resources. (also, I would recommend making sure that links in this form open in new pages. I had typed very long responses to the above two questions, but they disappeared after I clicked the links, so i apologize that they are not as detailed as before).

Proven or promising external resources or approaches

No response

Response 2460

Perspectives on the postdoc roles and responsibilities

A postdoctoral position in an academic institution help me transition from a predoctoral trainee to an independent investigator. With funding and fellowships available, I'm able to have protected time to conduct the research that I am interested in, improve my productivity by writing more manuscripts and grants, as well as obtain additional training to complement my skillset.

Fundamental issues and challenges

However, the fundamental issues for postdoc, especially after the COVID-19 pandemic, is salary and compensation. With NIH K00 fellowship, which has a higher postdoc salary compared to other fellowship and training grants, it is not feasible and practical to move across the country to a big city (e.g., New York, Boston, Seattle). Postdocs typically experienced at least 4 years of low income as predoctoral students. To continue pursuing an academic career, eliminating financial burdens for postdocs is essential. It would be helpful to modify postdoc salaries depending on the city of the postdoctoral institution, to allow postdocs to have training opportunities without financial constraints.

Existing NIH policies, programs, or resources

NIH recently promotes the K99/R00 awards to provide postdoctoral support to transition to independent investigators. Although the K99/R00 awards fit most of research field, for public health, population sciences, and behavioral sciences, the K99/R00 actually would delay the transition from postdoc to the

assistant professor for at least 6 months. The typical postdoc for these fields is about 2 years. For the early K99/R00 application, the due date is in February, which is about 6 months of starting a postdoc, but the earliest start date of the awards will be January of the following year, which is about 18 months into the postdoc. The K99/R00 requires at least 1 year of postdoc training, which would push the individual to a 30-month postdoc. With the low salary as a postdoc, and the risk to miss the regular recruiting circle, K99/R00 may not work for trainees in public health, population sciences, and behavioral sciences. It would be nice to modify the program and requirements to eliminate these challenges

Proven or promising external resources or approaches

No response

Response 2461

Perspectives on the postdoc roles and responsibilities

I was a prior Associate Dean for Postdoctoral Programs at a major research intensive university. The postdoctoral position is advanced training in preparation for professional advancement in biomedical science. The obligation of the mentor is to ensure that the training needs are met and to provide hands on professional skill development. The obligation of the postdoctoral trainee is the conscientious discharge of their research duties. Postdocs should not be treated as a PhD technician.

Fundamental issues and challenges

Over 50% of our postdocs are from abroad. The US has a strong dependency on foreign talent to advance its R&D. Yet the complex and often punitive visa process is a disincentive to come in the first place. We need a special visa category for these individuals which can be readily obtained once they provide evidence of a PhD degree. Many institutions have adopted postdoctoral policies to improve stipends and benefits for postdocs. However, postdocs have been traditionally under compensated. There should be a cap on the time in the postdoctoral training period. This is not a job but advanced training. The cap should be 5 years total at which time postdocs should be entering into the next step in their career. For some this may be a staff scientist position and not a faculty appointment. Careers outside academia are now in the majority and so we need to broaden our horizons on the training we provide.

Existing NIH policies, programs, or resources

NIH policies are built to provide inequities. Postdocs supported by research grants can be categorized as employees, be compensated at higher levels and be fully benefited while those on T32’s or F32’s have stipends capped and are not full benefited. This is a disincentive for postdocs to be appointed to a T32 or F32. All postdocs should be treated equally irrespective of source of funding. As many institutions are undergoing market adjustments in postdoctoral compensation NIH should allow grantees to adjust budgets on grants in their out years to cover these extra costs. Failure to do so may be loss of talent and set back research programs which jeopardizes investment. The restriction of T32 and F32 slots to US citizens and permanent residents is outdated and comes from another time. It does not recognize that the majority of postdocs are from abroad. The majority of these will stay in the US and enrich the biomedical workforce. This requires congressional action. NIH needs to increase the number of K99/R00 awards so that postdocs can transition to independence.

Proven or promising external resources or approaches

Institutions have a responsibility to provide the infrastructure for a postdoctoral training. This means polices on standardized compensation and benefits and childcare. I am not a fan of providing retirement benefits since a postdoctoral position is not one to retire from. Institutions should be held accountable to implement these policies and a the same time should provide professional skill development programs and career development/counseling programs. NIH could indicate that as a recipient of federal dollars institutions most provide evidence that these policies and programs exist.

Response 2462

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions should serve as an extension of graduate training. While graduate school teaches you the content and basics of writing, postdoctoral positions should provide training on the duties that will

come with an academic researcher/faculty position. Postdocs need to be trained on how to mentor graduate students and how to teach and mentor undergraduate students. The limited mentor training is feeding into the cycle of a system where everyone is only focused on writing papers and grant proposals and there is very little respect for the individual.

Fundamental issues and challenges

The primary issue facing postdocs is the psychological and emotional abuses from advisors. Many advisors think of and treat their postdocs like cheap labor. This means long work hours, very little time off, and very little support for growth. Postdocs need to not receive the training to advance because advisors want to keep them dependent on the advisor. While many institutions have limits on postdoc terms, however advisors will offer the postdoc a shell title, such as "researcher" or "scientist" but have them continue the same work. This leads to postdocs with low confidence and inadequate skills to be independent.

Existing NIH policies, programs, or resources

The existing NIH policies, programs or resources don't really matter and doesn't make a difference. Advisors are insulated by their organizations and tend to find ways around any NIH policies. Because of this, postdocs have no recourse or support. Advisors also have the power to tarnish their postdoc's reputation; thereby limiting the postdoc's ability to switch positions or apply for an independent position.

Proven or promising external resources or approaches

NIH should work with institutions to create mandatory enrichment programs for postdocs, and this should be tied to grants. If a PI list a postdoc on their grant then that postdoc should be required to attend before some funds will be issued. Advisors and institutions will only improve postdoc conditions if failure to do so is tied to funds.

Response 2463

Perspectives on the postdoc roles and responsibilities

I see the postdoc as continued training with more independence under the guidance of an established investigator. For me, it meant trying something new in a different place to build off what my graduate work had been on.

Fundamental issues and challenges

I know others that have different experiences based on their lab, mentor, and overall environment. My particular lab environment is very poor and I do not feel like a valued member of any team. It's a hard life and within 6 months of my fellowship, I am already looking at leaving for positions that will support me much more and finically compensate me far more fairly for having a PhD. There is very little support for post-docs and no existing community at my institution, even though it's big and established. It honestly feels like more cheap labor, primarily done by internationals, to support the work, grants, and travel of the PI. In terms of my career development, the post doc has only shown me what I don't want to do or become.

Existing NIH policies, programs, or resources

NIH websites are fairly clear but there is a lot of information to learn on your own, perhaps more workshops to educate students and fellows at all levels how it is set up would be beneficial to do before they are already in it.

Proven or promising external resources or approaches

No response

Response 2464

Perspectives on the postdoc roles and responsibilities

The postdoc is a difficult position because very often you are working on the work that is funded—likely from your PI—while simultaneously attempting to publish and secure your own funding.

Fundamental issues and challenges

Salary. If you are single and have student debt it is almost impossible to support yourself on a post doc salary in the US in most major cities.

Securing funding. The US seems to be better about getting early career fellowships to early career people but the NIH review process seems to be the luck of the draw. A resubmitted F32 is not always read by the same reviewers and potentially reviewers are not familiar with the topic area.

Existing NIH policies, programs, or resources

Is it possible to modify the fragrant submission process? The information requested in grants seems to be repetitive.

Is it possible to provide successful F32 applications from clinically based research?

Is it possible to provide a specific funding scheme for clinical research postdocs separate from basic scientists because the current stream seems to favor basic science?

Proven or promising external resources or approaches

Australia pays their postdocs around 100k/year. Plus 10% into retirement and their postdocs don't have the same student debt we do. Australia seems to have less money for research funding in general but they still pay their postdocs a proportionately higher salary.

Thank you for looking into this. It is hard not to think about leaving academia, even as someone who draws a significant amount of joy and meaning from their work. Academia seems to have a dark shadow over it and it is very hard to see a way forward. Mentors have even started telling me to look elsewhere because the grant game is only becoming more and more difficult to navigate successfully. Hopefully these responses are useful.

Response 2465

Perspectives on the postdoc roles and responsibilities

Postdoc should be a LEARNING experience—professional development for the postdoc. All too often, postdocs are viewed as cheap labor on existing projects in the advisor's funding portfolio.

Fundamental issues and challenges

1. Postdoc salaries are too low. These are people in their late 20's and early 30's who have had long (and often costly) educational pathways to their fellowship. They need to earn a fair and equitable wage. As noted above, the cheap labor for advisors is facilitated by low salary levels.
2. Postdocs need a pathway to permanent employment in the academic institutions where they complete their postdocs. This is more feasible in clinical environments that have multiple funding streams, in contrast to academic environments that have strong limits and gatekeeping on assistant professor positions. Acceptance of federal postdoctoral training funds should be contingent on development of such pathways. Postdocs should not be cogs in other people's research machines.
3. There are no standards for quality of mentoring. In my 35 years of postdoc training (30 within T32 programs), I have witnessed more bad mentoring than good mentoring. With current social networking technology, places with bad mentors (and individual bad mentors) quickly become known. There are no consequences for bad postdoc mentoring either at the individual or institutional level.
4. Many disciplines do not need formal postdoctoral training. Yet, this has become a standard (and functionally a barrier to gainful employment). This "standard" reflects both growing institutional bureaucracy as well as desire for a cheap labor pool.

Existing NIH policies, programs, or resources

1. *Meaningful* evaluation of advisor mentoring in institutions that accept federal postdoctoral funding.
2. Requirements for career pathways in institutions that accept federal postdoctoral funding.
3. Postdoctoral funding tied to programmatic training, rather than lab apprenticeships. This presupposes that such training is necessary for the career development of the postdocs (see comment 4 in prior question).
4. Emphasis on F32 over T32 funding—the individually developed goals and training programs provide postdocs with autonomy and agency, as opposed to fitting in with others' goals and needs.
5. Expanded use of the K99 mechanism (or some new analog), with expansion to a postdoc career development/transition approach. The integration of a mentored experience with an eventual R01-type experience within an established employment situation would be highly beneficial to integrating experience with career pathways.

Proven or promising external resources or approaches

1. Postdocs need strong advocates organized at multiple levels. At the national level, there should be an advocacy/ombuds system where postdocs can have help resolving problems frequently encountered in training environments (see also next comment). At a more local level, postdocs have organized into labor unions to advocate for their positions—this should be encouraged and supported (a national postdoc union?.
2. Mentoring in T32 and similar program should have a strong team mentoring model. In particular, postdocs should have *meaningful* mentoring input that provides educational and advocacy beyond the primary advisor.
3. T32 renewals should be contingent on direct feedback from recent postdocs on the quality of mentoring in the program, which should be anonymized in the same way that recommendations for postdocs in F32, K, etc. applications are done.
4. Postdocs are currently tied to a specific program or advisor. When things go poorly, there is little recourse for the postdoc. Some mechanism for a larger pool that allows movement among fellowship opportunities should exist. On recent analog in academia is the transfer portal for NCAA athletes. Postdocs do not fit into the usual model for training pre-doc students (in much the same way as athletes); postdocs have a much smaller space in which to thrive in an academic environment and thus a larger community of opportunities would be beneficial for all involved.
5. As a behavioral science researcher focusing on community interventions, I often emphasize that interventions need to be centered on patient/client needs rather than program needs. The same is true of postdoc training. Too often the focus on what is good for the program, rather than what is good for the trainee—this hierarchy of needs has to be reversed before any meaningful progress in postdoc training will be achieved.

Response 2466

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary and work hours, especially compared to industry salaries.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2467

Perspectives on the postdoc roles and responsibilities

I believe a postodc is the that it is a continuation of scientific training that should include experience with new techniques or analyses, as well as provide an opportunity to continue to publish and gain experience with grant writing. Beyond the specific scientific training, it is an opportunity to experience a different lab environment and its management style, as well as to start taking on more responsibility with supervision and lab management that provides a smooth transition into a faculty position where these skills will be essential.

Fundamental issues and challenges

As faculty positions in academia are becoming increasingly competitive, the need for extended periods of postdoctoral training to develop an equally competitive track record is becoming more apparent. As people start to move forward with their personal lives (growing a family, need for permanency of location etc.) its becoming harder to juggle everything with this extended period of postodcotral training, especially as it can be so demanding of time as responsibilities in the lab environment increase and personal development is prioritized too. I think coupled with relatively low pay for the level of academic qualification provides challenges, which may lead some people to step away from academia and choose a role in industry where this is less problematic.

Existing NIH policies, programs, or resources

Considering increasing the NIH guidelines for postdoc salary may prove beneficial for retaining postdoctoral talent, or at least consider a better weighting system that considers cost of living fro different areas in the US so that someone who is training in a major US city is able to take home the same amount after rent etc. as someone who perhaps lives in a smaller college town (see Tim Sainburg, 2022. "American postdoctoral salaries do not account for growing disparities in cost of living," Papers 2205.12892, arXiv.org, https://ideas.repec.org/p/arx/papers/2205.12892.html). There also seems to be some discord between universities and the NIH "guidelines" for pay. My current university refused a request from my supervisor to increase my salary as they said salaries are set by the NIH and they have no flexibility to change them on that basis.

Proven or promising external resources or approaches

No response

Response 2468

Perspectives on the postdoc roles and responsibilities

To me, the academic postdoctoral fellow position is a "transition state" position:

- It is useful for people who want or need additional technical training and protected time and funding to do so
- It is protected time to publish papers and write grants in anticipation of the next position (e.g., academia, industry, entrepreneurship)
- It is an opportunity to expand one's professional community/network
- For a lot of non-U.S. Citizen postdoctoral fellows, it seems to be a professional holding zone for longer-term visa support.

Fundamental issues and challenges

1. Salary—academic postdoc salaries vs. industry postdoc salaries are worlds apart.
2. Salary—academic postdoc salaries vs. industry postdoc salaries are worlds apart.
3. Salary—academic postdoc salaries vs. industry postdoc salaries are worlds apart.
4. Prospectives for "upward" mobility—scientific research is becoming more and more competitive and resource-intensive. If salaries stay the same, then hiring talent will be difficult. If salaries increase without commensurate resource funding increases, then "out-of-box" thinking will be limited.
5. Academic "toxicity" is not disincentivized.

Existing NIH policies, programs, or resources

1. Increased postdoc salary AND resource funding per grant (even if fewer grants are awarded)
2. More postdoc-initiated resource support—can there be "R01s" for postdocs without losing ESI status or F/K eligibility? E.g., an R03/R21 for postdocs only but postdocs don't lose F/K eligibility.
3. Incentivize career placement/job satisfaction of trainees in funding decision-making.

Proven or promising external resources or approaches

No response

Response 2469

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

There are a number of financial problems that affected my overall quality of life as a postdoc on a T32 training grant and ultimately led to my decision to leave my postdoc 7 months early for a career position. First, NIH stipends are set nationally even though cost of living varies greatly—living in Boston on the NIH stipend was not sufficient to support myself and my family. Second, the parental leave policy permits approximately 8 weeks of paid leave even though the current federal standard is 12 weeks. Third, while the childcare stipend was a much appreciated change, it was insufficient to alleviate the burden of childcare (which is approximately half my postdoctoral stipend annually).

Existing NIH policies, programs, or resources

Add a cost of living adjustment (similar to the GS pay scale) for NIH stipend levels.

Expand the parental leave policy to be equivalent with other federal policies (12 weeks).

Increase the child care stipend.

Require that universities pay trainees through a mechanism that allows for federal taxes and health insurance premiums to be withheld. I am unable to file for the child care tax credit because the "scholarship" mechanism through which I was compensated by my university is not considered qualifying income. We pay over $20,000 annually for child care, so that is a massive deduction that we do not qualify for despite having two full time working parents.

Fundamental issues and challenges

Kidney research requires significant resources and postdoctoral researchers often struggle to secure funding for their projects. NIH can consider providing more grants and funding opportunities tailored to the needs of kidney researchers and increasing salaries to be more competitive with industry standards. This could potentially help to retain talented researchers who may be considering leaving academia due to financial constraints.

One way to address the issue of limited funding for postdoctoral researchers is to consider funding them directly from the NIH. Currently, postdoctoral researchers are typically funded through grants awarded to principal investigators (PIs). By providing independent funding to postdoctoral researchers, the NIH can free up more resources for scientific research, which due to inflation is becoming increasingly expensive. Funding postdoctoral researchers directly could also provide more stability for early career researchers, enabling them to pursue their research interests and develop their skills without worrying about the fluctuations of grant funding. Additionally, this approach could help to diversify the pool of researchers and increase equity in the workforce, particularly for underrepresented groups who may not have access to the same level of funding as others.

Kidney research can be demanding, and postdoctoral researchers may struggle to balance research responsibilities with other personal and professional demands. Alleviating some of the financial burden associated with childcare costs will enable researchers to better balance their work and personal responsibilities. NIH should consider providing resources and support, such as funding to defray the costs of childcare, flexible work arrangements, and mental health services, to help support the work-life balance of postdoctoral kidney researchers.

In order to accomplish these recommendations, NIH to should explore alternative funding sources by partnering with industry, non-profits, or other sectors to strategically align academic research with real-world applications.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Kidney research is a highly specialized field, and early career researchers may benefit from targeted mentorship and networking opportunities with experienced researchers in the field. According to a 2016 survey of more than 7,600 postdoctoral researchers in academic and non-academic institutions, perceived mentor support and conferences attended were positively correlated with a choice to pursue a research-focused academic career and that providing a formal mentorship training for postdoctoral researchers may help prevent losses to industry. NIH can create programs to connect postdoctoral researchers with established scientists and provide training and resources to support mentor-mentee relationships.

Kidney diseases affect individuals from diverse backgrounds, and it is critical that the kidney research community reflects this diversity. According to the AAMC State of Women in Academic Medicine 2018-2019 report, women comprise 46% of postdoctoral students in biological and medical science, well below the 61% of women doctoral students in those fields. And only 6% of postdoctoral researchers are Black and only 9.2% are Hispanic or Latino. NIH must prioritize efforts to promote diversity, equity, and inclusion in kidney research by supporting postdoctoral researchers from underrepresented backgrounds and ensuring that funding opportunities and mentorship programs are accessible and inclusive.

The AAMC State of Women in Academic Medicine 2018-2019 report also notes that just more than half of postdoctoral researchers in the United States are not US citizens. Yet, non-US citizenship applicants face significant barriers to becoming independent investigators, which can limit their ability to advance in the field. NIH must consider addressing these barriers by providing additional funding opportunities or supporting policy changes that enable non-US citizens to become independent investigators.

Response 2473

Perspectives on the postdoc roles and responsibilities

As a physician-scientist, I am responding to this RFI based on over forty-years of experience in training post-doctoral researchers and other learners in basic laboratory research in bacterial pathogenesis. I consider, as does AAMC, "academic postdoctoral researchers (postdocs) as individuals who have received a doctoral degree (or equivalent) and are engaged in a temporary and defined period of mentored, advanced training in biomedical research." My laboratory has since 1983 trained and been the" home" for 24 PhD, MD, or MD PhDs post docs and I have been "key faculty" for T32 training grants. Postdocs are part of the intellectual "glue" creating an environment of inquiry critical for graduate students, other learners and for the PI in an academic laboratory research setting. They contribute to melting pot of diversity that is hallmark on many academic biomedical research laboratories. They need to acquire the knowledge and skills beyond a doctoral degree to pursue careers in the nation's biomedical research workforce. These careers can be in academia—both as independent and dependent faculty or staff-, industry, public health, research foundations or government positions.

Fundamental issues and challenges

A key issue is mentorship for future careers. Postdocs are advanced learners and should have a mentoring and career plan (a committee or group of mentors) as part of their experience. They also need support of an institutional office devoted to the issues of postdocs. I view a postdoc experience as equivalent to a medical residency or fellowship. Other Fundamental issues and challenges are limitations on visas for postdocs outside the US, educational debt especially on the part of MD, MD/PhD candidates, and inadequate postdoc stipends and benefits for postdocs and their families.

Existing NIH policies, programs, or resources

Overall NIH has multiple programs for postdoctoral training, but competition is fierce. More positions and greater communications about the programs are important. A key issue is enhancement of policies for equitable postdoctoral salaries and benefits paid. For a family of four the NIH stipend scale for this skilled workforce is inadequate. Enhancing institutional T-32s or equivalent and expansion of NIH repayment program are also recommended.

Proven or promising external resources or approaches

Enhanced or supplemental support through philanthropy, foundation grants, institutional commitments can reinforce NIH's efforts to enhance the postdoctoral training ecosystem. A strong NIH communications strategy to address the need of postdoctoral training will help garner these external resources. Trainees

are the future of biomedical research future. We should attract and train the brightest and best for postdoc positions.

Response 2474

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as an opportunity to gain further training in research skills and professional development. It provides a space for early career researchers with a PhD to strengthen existing or develop new skills and begin charting their own journey as an independent investigator. A postdoc is not a student position and should therefore be compensated with a salary and benefits competitive with other non-academic positions.

Fundamental issues and challenges

By definition, a postdoctoral fellow is an individual who has spent years of training and gained a doctoral degree. They should be fairly compensated in accordance with competing positions in industry or other non-academic spaces!! A major reason why there is a decline in the number of postdoctoral fellows is likely due to the lack of competitive pay. The current NIH level for someone with a newly minted PhD only makes $56,484. In many places in the United States, that is barely above the estimated salary for cost of living. How could someone be expected to save for their future with that kind of salary?

Existing NIH policies, programs, or resources

NIH needs to adapt their existing stipend levels to be competitive with entry-level PhD positions in non-academic spaces.

Proven or promising external resources or approaches

Improve pay for postdoctoral fellows. Create spaces for postdoctoral fellows within NIH institutes to present their work to each other, which may enhance interdisciplinary collaborations. Create mentoring resources for investigators and postdoctoral fellows.

Response 2475

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The salary scale should be adjusted to reflect the cost-of-living. The pay scale in states with very high costs of living isn’t realistic for a postdoc and affects their overall quality of life and influences their decision to leave for industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2476

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

As a postdoc in Boston, I am facing an incredibly challenging cost of living situation. Despite working long hours and being highly educated, I am struggling to make ends meet on the NIH minimum salary. Boston. for example, is notorious for its high cost of living, and it is simply not sustainable for me to continue living on such a low wage. I am forced to live in cramped and expensive housing, cut corners on essential expenses like food and healthcare, and constantly worry about making ends meet. This situation is not

only financially taxing but also emotionally and mentally draining. Therefore, I hope the NIH to address this issue and adjust their salary scale to account for the regional cost of living. It is time for them to acknowledge the dire situation that postdocs are facing and ensure that we are fairly compensated for our hard work, no matter where we live.

Existing NIH policies, programs, or resources

The NIH grant system is complex and difficult to navigate, with multiple portals and guidelines that can be overwhelming for researchers. Finding all the necessary information required for a grant application can be challenging, as it is scattered across various websites and documents. The frequent updates to the system only add to the complexity, making it challenging for researchers to stay up-to-date. It is essential for the NIH to simplify the grant application process and provide more accessible resources to help researchers navigate the system.

Proven or promising external resources or approaches

No response

Response 2477

Perspectives on the postdoc roles and responsibilities

I love working in academia and conducting meaningful and impactful research. I enjoy developing ideas to improve cancer care and survivorship. However, the current state of postdoc guidelines makes it extremely difficult to stay in academic research institutions.

Fundamental issues and challenges

One of the Fundamental issues and challenges inhibiting recruitment, retention, and overall quality of life of postdoctoral trainees in academic research is the current minimum salary for postdocs, which is unlivable and too low. Postdocs are highly qualified professionals who have invested several years in obtaining a PhD and specialized training to contribute to cutting-edge research in various scientific fields. However, the salary levels for postdocs are typically inadequate and not commensurate with their qualifications and contributions.

The low salary levels for postdocs are particularly frustrating given that individuals with only a bachelor's degree may earn twice as much in some professions. This not only affects the financial stability of postdocs, but also their motivation, well-being, and job satisfaction. Low salaries can also limit diversity in the academic research field by discouraging individuals from underrepresented groups who may face more financial pressures from pursuing postdoctoral training.

It is imperative for academic institutions and funding agencies to recognize the contributions of postdoctoral trainees and to prioritize fair and adequate compensation for their efforts. Raising the minimum salary for postdocs would improve the quality of life of postdocs and encourage more individuals to pursue postdoctoral training. It would also facilitate the recruitment and retention of highly skilled professionals who can advance scientific progress and contribute to the global knowledge base. Therefore, it is critical for institutions and funding agencies to address this issue and ensure that postdocs receive fair and equitable compensation for their contributions.

Existing NIH policies, programs, or resources

There are several existing NIH policies, programs, and resources that could be modified, expanded, or improved to enhance the postdoctoral training ecosystem and academic research career pathways. These include:

Salary Guidelines: As previously mentioned, the current NIH minimum salary guidelines for postdocs are inadequate. NIH can revise and update these guidelines to ensure that postdocs receive fair and adequate compensation for their contributions to scientific research.

Career Development Awards: NIH offers several career development awards (K awards) that provide support for postdoctoral researchers to transition into independent academic research careers. These awards can be modified and expanded to include additional career development opportunities, mentorship, and training in areas such as grant writing, teaching, and leadership.

Diversity and Inclusion: NIH has several programs aimed at promoting diversity and inclusion in the scientific workforce, including the Diversity Program Consortium and the Building Infrastructure Leading to Diversity (BUILD) program. These programs can be expanded and improved to provide more support for underrepresented groups in science, including mentoring, networking, and training opportunities.

By modifying, expanding, and improving these existing policies, programs, and resources, NIH can enhance the postdoctoral training ecosystem and academic research career pathways, thereby promoting scientific progress and contributing to the global knowledge base.

Proven or promising external resources or approaches

No response

Response 2478

Perspectives on the postdoc roles and responsibilities

I'm an MD/PhD student who is heading into residency and considering a post-doc after residency. While the stated role of the post-doc is to build your own research trajectory so that your can run your own lab in the future.

Fundamental issues and challenges

Pay and the difficult job market for PIs. This is probably the biggest factor for graduate students thinking about post-docs that I have talked to. Why would someone do a post-doc for low pay and low probability of actually getting a PI position when they can often make double this in an industry "post-doc"? The justification for the low pay is that it is only temporary until you get a job, but often there are no jobs available or the only ones available are not in geographic locations people want to be or are not tenure track.

Existing NIH policies, programs, or resources

Pay needs to be increased. This is across the board. If academia wants to attract and keep the talent they need to less the financial pain of saying no to industry jobs. Biopharma will only keep growing, which means more jobs, and increasing salaries. Universities are justifying low salaries with the prestige of their names, but now a post-doc at Genentech probably holds as much weight as one at Stanford. Also, let's be clear, universities benefit financially from having low-cost labor (taking a cut of any grant coming through the door, a cut of all IP filed, advertising for undergraduates by saying how much research they have, and by fund-raising). If you want highly-trained labor? Pay for it.

Proven or promising external resources or approaches

No amount of mentoring is going to overcome the pure financial pressure. Good universities with good post-doc opportunities are in expensive areas. A proven model for employee retention is to pay them more. This may be painful for payers, but it is by no means complicated. If you want highly-trained labor, you have to pay for it. These same people can also do equally satisfying and interesting work in industry for more money and more job flexibility.

Response 2479

Perspectives on the postdoc roles and responsibilities

I see my postdoctoral position as the opportunity (and need) to improve my curriculum to a faculty position. It also means building a solid and consistent publication record, network and training.

Fundamental issues and challenges

The main challenge in the Boston area is the cost of living! Without my partner's support, I could not pursue a postdoc. The salary IS NOT ENOUGH to afford the BASIC regional cost of living. The rent alone is 3k. As young professionals, building a family in the current position is also very challenging.

Existing NIH policies, programs, or resources

No response

No response

Response 2480

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Abolish unpaid positions (a scourge that sadly persists in this line of work).

Proven or promising external resources or approaches

No response

Response 2481

Perspectives on the postdoc roles and responsibilities

The postdoc is a training step in the academic career path to conduct additional mentored research in order to gather preliminary data to support a K/R grant for independence.

Fundamental issues and challenges

My salary has stayed flat while inflation has adjusted the cost of living such that my actual expenses outpace my income and I am losing money every month and cannot maintain the quality of life I budgeted for when I started this position 3 years ago. Further, my current salary is half of what I could make in the industry doing the same job.

Existing NIH policies, programs, or resources

Tie salary to cost of living and inflation. Improve salary rate to be more competitive with the industry.

Proven or promising external resources or approaches

No response

Response 2482

Perspectives on the postdoc roles and responsibilities

To me, a postdoctoral position at a high profile institution in the US is a critical step towards scientific independency in my home country. It is an extremely valuable experience which is intended to boost scientific accomplishment but also shape networks and context.

Fundamental issues and challenges

In a city like Boston, the postdoctoral salary is too low, given the life costs. This meant for me that a postdoctoral position comes at a high price of losing life quality and accepting decreased life standard in comparison to my position in my home country. This comes on top of the effort of securing a position and making a transatlantic move.

Existing NIH policies, programs, or resources

Increase the pay.

Proven or promising external resources or approaches

No response

Response 2483

Perspectives on the postdoc roles and responsibilities

A transition from trainee towards independent researcher, rather than a period of time where the postdoc's research skills could be utilized at extremely low pay to purely maximize the mentor/manager/PI's achievements. The roles **and responsibilities** of an academic postdoc should include i) further enhancing individual research capacity, e.g. knowledge and skills; ii) establishing research network and collecting research resources to foster collaboration; iii) developing independent line of research through e.g. grant writing; and iv) gaining experience of (co-)supervising master/PhD student for research work and/or teaching/tutoring.

Fundamental issues and challenges

1. Lack of scientific freedom: candidate postdoc may be offered extremely low flexibility over project implementation but required to be productive in a "follow the protocol" and "high-impact publication-driven"manner.
2. Insufficient respect for individual career/scientific goal: when enormous work hours are spent on the completion of the "required work content", few are left to ponder who we initially hoped to become and what are our original motivations, needless to mention the future plan.
3. Poor salary: mental stress, physical stress, etc.

Existing NIH policies, programs, or resources

No training about NIH policies, programs, or resources, unfortunately. What are they?

Proven or promising external resources or approaches

No response

Response 2484

Perspectives on the postdoc roles and responsibilities

The postdoc is an intermediary training period which will set me up for success in obtaining a tenure track faculty position at an R1 institution. In this role, I am focused on developing my independence as a scholar, identifying my "researcher identity" and my program of research, understanding how to integrate the various projects I have conducted into a cohesive story line, and branding and marketing myself such that institutions are interested in what I have to offer. I am also learning to apply for grants —essentially, a mini PI in-training.

Fundamental issues and challenges

The funding/salary for postdoctoral researchers is abysmal. My rent currently constitutes 40% of my monthly income PRE-TAXES, in other words of my take-home pay, my rent comprises 50% OF MY INCOME. This is severe rent burden. These living conditions are untenable for anyone trying to do good science and solve the myriad of life-threatening issues in our world. It's frankly insulting to be paid so little when the NIH and most NIH-funded projects would be nonfunctioning without the contributions of staff scientists like postdocs.

Existing NIH policies, programs, or resources

Fund Asian American researchers who study Asian American communities. Fund Black researchers who study Black communities. Fund Latinx researchers who study Latinx communities. Fund Native American/Indigenous researchers who study Native/Indigenous communities. Fund Pacific Islander researchers who study Pacific Islander communities. Stop funding White researchers to study Marginalized Populations, whose oppression they benefit from and contribute to.

Proven or promising external resources or approaches

Improving salary and diversity.

Response 2485

Perspectives on the postdoc roles and responsibilities

The golden gate to enter academia, by which without, it would be impossible/unsustainable to start independent research career. Opportunity to train and apply for grants, which however, is usually not accessible to non-US citizens.

Fundamental issues and challenges

The packaged pay and included benefits are not up to par with qualifications of postdocs. Postdocs are already beginning careers at much later stage in life, delaying accumulation of retirement funds and savings for home purchase among many important life milestones. Pay is not adjusted to increased cost of living, particularly for those living in more expensive cities e.g. Boston. From international viewpoint, pay is significantly lower relative to other countries (in Australia up to 6 figures). Paid time off is not part of institutional policy at times. It is a no brainer, esp for those with dependants, to opt for industry jobs when all of the above are better provided. It honestly just feels like academic slavery—expected to churn out research output, with minimal pay at maximum costs to personal finance, mental health, future opportunities.

Existing NIH policies, programs, or resources

Pay packages, paid time off, tax relief, future opportunity pathways. Immediate and MANDATORY compliance by PI to meet any increase in pay levels.

Proven or promising external resources or approaches

No response

Response 2486

Perspectives on the postdoc roles and responsibilities

It means to do what I love, to do research in a more mature stage. It also helps improve and learn from areas I didn't work during my PhD, as well as being part of a bigger and larger scientific community. To learn and apply my skills to build knowledge and translational medicine, also, to meet great scientist and researchers.

Fundamental issues and challenges

Salary.

I can't fully focus on my work because I also need to spend time on looking ways for saving money. Also, the amount of stress and anxiety that I have because I don't know if I'd have enough by the end of the month. If I have a dental issue that means my savings from 6 months are gone. I'm not even quality to rent an apartment with one bed and living room that doesn't have rats. I buy my food from leftovers or sales which spoil very quick. For months, McDonald's was my luxury meal of the week.

I migrate to Boston without knowing anyone, but for socializing, I require money to spend on going outs! So I ended up isolating myself.

Specially for hospitals, PhD should be appreciated more, and with a similar level as MD, PhDs.

Existing NIH policies, programs, or resources

Either higher salary or including housing as part as benefits that the university must provide to all postdocs

Proven or promising external resources or approaches

No response

Response 2487

Perspectives on the postdoc roles and responsibilities

Its a transition role I need for my next step as a principal investigator

Fundamental issues and challenges

The salary is very low, not match the life expenses.

Existing NIH policies, programs, or resources

Yes, we need salary raise.

Proven or promising external resources or approaches

No response

Response 2488

Perspectives on the postdoc roles and responsibilities

Second postdoctoral position for me, meaning it should lead to at least one publication in high impact factor journal and pave the way to be promoted as instructor, then ass. Professor.

Fundamental issues and challenges

Living a Boston MA, a major issue is the cost of living. Postdoc salary is completely incompatible with having a decent life here with own one bedroom apartment and healthy food. We are sincerely struggling to live on NIH minimums, and ask you to change the salary scale to account for regional cost of living.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2489

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism. "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate.

NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.

Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth.

Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings. Requiring postdoc and PI participation in formal performance reviews as part of an NIH award will better define, formalize, and evaluate factors of role, mentorship, and professional development, while differentiating postdocs from staff scientists.

The NPA's 2023 Postdoctoral Barriers to Success ("Barriers") reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

The Barriers report indicates salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle financially. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in defined areas. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual step increases. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, and tenure.

Academia contains remnants of structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups still today. Postdocs from historically-marginalized groups and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities.

NIH should hold institutions accountable for fostering inclusive and supportive training environments, including expanding the current requirement for institutional commitment to preventing discrimination and harassment (https://grants.nih.gov/grants/guide/notice-files/NOT-OD-19-056.html) to include mental health and wellbeing support.

NIH should require a percentage of indirects on all NIH grants supporting postdocs to provide postdoctoral offices (or offices with similar oversight) with increased resources to foster stronger postdoctoral communities.

International postdocs face unique challenges; the Barriers report shows 86% were negatively impacted by cultural transitions into the U.S. NIH should work with the State Department and USCIS to accelerate and simplify the visa and immigration process for postdocs and expand funding opportunities to internationals through K99/R00 and other programs.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. (Other implications, such as tax, do not stem from NIH.)

NIH should require that all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to offset costs. NIH could allow PIs to supplement fellowships from their NIH RPG funds.

NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its child care subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving can be cost-prohibitive for researchers from low socioeconomic backgrounds.

NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors.

Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs while differentiating between postdocs and staff scientists.

Collecting metrics on postdoc satisfaction on an annual basis will position NIH to adjust policy accordingly based on the needs of postdoctoral researchers. These data will not only provide key insights on policy effectiveness, but will allow postdocs to provide honest, anonymous feedback without retaliation.

Proven or promising external resources or approaches

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version to be released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 report to be released Q3 2023).

Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to the publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.

We encourage NIH to work closely with institutions that host postdocs and NPA on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change.

We applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps. We encourage additional funding for these efforts.

Response 2490

Perspectives on the postdoc roles and responsibilities

Learn how to become a independent PI, like how to write a grant.

Fundamental issues and challenges

As a postdoc living in Boston, I feel there are too much pressure for postdoc, which not only comes from our work but also from our life.

1. I'm in my early 30s and I have been a postdoc for more than 3 years. I have passion in research but I can not see clearly if I can get a faculty job after my postdoc. Even some of the positions require no more than 3 yeas of postdoc experience.
2. The living cost in Boston is high, I pay 2/3 of my salary for rent even the standard of a NIH postdoc is less than 60k a year.

Existing NIH policies, programs, or resources

More funding opportunities should be provided. At least let us have more chance to write a grant.

Proven or promising external resources or approaches

The salary level should be improved.

Don't treat postdoc as a graduate student, we should be more like a researcher.

Response 2491

Perspectives on the postdoc roles and responsibilities

A postdoctoral position represents to me an important step towards a successful academic career. I like working as a researcher at a university/research institution, where I can continue to build upon the research I conducted as a PhD student, gain new skills, and collaborate with other researchers in my field. This helps me build a strong research profile and develop the skills needed to succeed in my career path. Overall, a postdoctoral position can be an important step in an academic career path, providing valuable experience and opportunities for growth and development. However, some postdoctoral positions are paid fairly, while others offer more modest salaries, especially if living in most expensive cities (such as Boston, MA)

Fundamental issues and challenges

One of the biggest challenges faced by postdoctoral researchers and junior faculty is the high cost of living in cities such as Boston, Massachusetts. The minimum salary offered by the NIH is often not enough to cover the high cost of living in these areas, making it difficult for postdocs to make ends meet. Moreover, the competitive job market in the city means that salaries in the industry are often much higher than what postdocs earn, making it harder to attract and retain talented researchers in academia.

One major issue affecting researchers who apply for NIH K awards is the requirement to provide proof of permanent residency. Due to the COVID-19 pandemic and other factors, the United States Citizenship and Immigration Services (USCIS) is facing significant backlogs in processing green card applications, resulting in delays in the assignment of permanent residency. As a result, the US government is providing applicants with an Employment Authorization Document (EAD) card, which allows them to work in any industry without restrictions, but does not confer permanent residency status.

In my case, I have received a fundable score for my K25 award, but I am unable to start my program due to the fact that I have not yet received my green card. I submitted my application in February 2020, but the processing times have been much longer than expected. This delay is severely impacting my career prospects and may force me to move to the industry if I am unable to obtain permanent residency soon.

Existing NIH policies, programs, or resources

To address the salary issue, I suggest that the NIH consider adjusting the minimum salary for postdocs and junior faculty based on the cost of living in different cities and states. It is not reasonable to expect postdocs to live on the same salary in areas with vastly different costs of living. For example, earning $50,000 in Iowa may be sufficient, but it may not be enough to support a comfortable lifestyle in Massachusetts.

By adjusting the minimum salary based on the cost of living in different locations, the NIH can ensure that postdocs are fairly compensated for their work and can attract top talent to the field of research. This could ultimately benefit the entire scientific community by helping to retain talented researchers and promote continued progress in the field.

Moreover, I suggest that the NIH consider accepting the EAD card as proof of eligibility for K awards, in addition to the green card. This would help to ensure that talented researchers are not penalized due to delays in the processing of their green card applications, and would allow them to continue their research without interruption. Additionally, the NIH could work with USCIS to expedite the processing of green card applications for researchers who have received fundable scores for K awards, to help prevent delays in their careers.

Proven or promising external resources or approaches

There are several external resources and approaches that could inform NIH’s efforts to enhance the postdoctoral training ecosystem and improve postdoctoral recruitment, training, working environment, mentoring, and job satisfaction. I believe that by partnering with external organizations, promoting diversity and inclusion, supporting alternative career pathways, and leveraging innovative technologies, NIH can enhance the postdoctoral training ecosystem and support the career advancement and job satisfaction of postdocs.

Response 2493

Perspectives on the postdoc roles and responsibilities

I believe an academic postdoc offers me the opportunity to build on the technical skills I developed during graduate school. Not only does it offer an opportunity to continue to learn and grow, but it also allows for a unique chance to explore new areas of research and branch out from my prior academic focus. Perhaps most importantly, the postdoc experience provides a safe space to make mistakes and learn from them, free from the pressures and expectations of graduate school or from running my own independent lab as a principal investigator. Overall, I see pursuing an academic postdoc as an excellent way to deepen my knowledge and skills, explore new research directions, and continue to develop as a scientist.

Fundamental issues and challenges

I believe one of the most significant challenges facing postdoctoral trainees is the lack of clear career paths and opportunities for advancement. I think postdocs can find themselves in a holding pattern, uncertain about their future and without clear guidance or mentorship to help them navigate their career path. This can lead to feelings of frustration, demotivation, and ultimately attrition from the academic research career track.

Another significant challenge is the lack of compensation and benefits that are commensurate with the level of education and expertise required for postdoctoral research. Many postdocs struggle to make ends meet, with low salaries and limited access to health care and other benefits. For example I currently bring home a net income that is less then what I did in graduate school because of inflation, increased rent (even though I live in subsidized housing from my institution), increased cost of healthcare (this was something I did not have to pay for in graduate school), and increased cost of living This altogether creates financial stress, which can negatively impact overall quality of life and ultimately hinder ability to focus on research.

Other issues include a lack of work-life balance, limited access to training and professional development opportunities, and a lack of diversity and inclusion in the academic research community.

Existing NIH policies, programs, or resources

Increase funding for postdoctoral training: increase the amount of funding available for postdoctoral researchers. This can be done through increased funding for existing programs, such as the NIH Ruth L. Kirschstein National Research Service Award (NRSA) Institutional Research Training Grants, or through the creation of new funding programs specifically designed to support postdoctoral training. Additionally, it would be very helpful to extend some of the deadlines and strict timelines so that more postdocs have more opportunities to get funding awards.

Improve compensation and benefits: Another way to enhance the postdoctoral training ecosystem is to improve compensation and benefits for postdoctoral researchers. This could include increasing the minimum salary for postdocs, allowing compensation for relocation, providing better health care benefits, and offering more support for family care, such as parental leave.

Create clearer career pathways: Finally, NIH could work to create clearer career pathways for postdoctoral researchers. This could include providing more guidance and mentorship on career development, as well as creating more opportunities for postdocs to transition into independent research careers.

Fundamental issues and challenges

Its hard to live on a post doc salary! Increasing our salaries will allow talented people to stay in academia instead of going to industry. We cant have kids on these salaries! Or, you can provide an extra $10-20k per year to post docs who do have children so they can afford childcare. It costs me $30k per year for 1

child to be in daycare. With a second child due soon, I dont know how I will afford to continue my research!

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Help us with childcare, please! Any programs or money that can go toward this would be very helpful.

Response 2495

Perspectives on the postdoc roles and responsibilities

From a graduate student perspective, I viewed the postdoctoral position as a stepping stone on the path to becoming a tenure-track faculty member. When I realized that I did not want to be a faculty member, I then immediately decided not to pursue a postdoc because it would not make sense to keep going down a path when I'm not interested in the end point.

From an administrative perspective, I see that postdocs are realistically a workforce of skilled scientific researchers.

I think the NIH needs to decide which of these two things a postdoctoral position is:

1. a pre-requisite step to becoming a PI/tenure-track faculty, or
2. a scientific researcher position that is essential to maintain in academia.

The goals for these two descriptions are completely different.

1. If postdocs are meant to become faculty members, then it makes sense that fewer researchers are going down the postdoc path. There are simply not enough faculty jobs, and we all know it. Thus, it makes sense for anyone not looking to become a PI to not pursue this path. From the NIH standpoint, this means that the postdoc can remain a "training position" and thus, there should be clear skills that postdocs should be learning. Currently, this piece is also a problem: postdocs do not actually learn the skills that PIs need to run a lab (lab management, budgeting, etc.) and instead are just the skilled workers doing experiments.
2. If "postdoc" now means "skilled scientific researcher" instead of "pre-PI", and if we want to maintain this pool of highly skilled workers in academic research, then academia needs to offer jobs that are competitive with industry and tech (the other sectors that PhDs typically go to). This would mean higher salaries and many more benefits.

Fundamental issues and challenges

Low salaries: "Postdoc" is one of the lowest paying positions available to STEM PhD-holders. This makes it a very unattractive career path, especially for people from low-income backgrounds. As a person from a disadvantaged background myself, I was tired of having to be so vigilant about money (while spending money only on necessities). After getting the highest degree in existence, I decided that I don't have to live like that anymore. I looked for jobs that would finally allow me to be less concerned about finances. For people from more privileged backgrounds, the PhD and postdoc may be a finite period of time during which they have to "buckle down" and be watchful of their spending, but that's how the rest of us have lived all of our lives. By our late 20s (or later), we're looking for any way out of continuously feeling poor.

Limited benefits: childcare benefits are nowhere near the cost of childcare; typically no retirement contributions from the employer; healthcare in the US is very expensive even with health insurance

The bottom line is that the postdoc feels like it is only an enjoyable job if you have a partner who works in tech that can fund everything, AND a stay-home partner that can provide childcare and do all of the chores at home.

Proven or promising external resources or approaches

Since universities essentially train skilled workers (graduate students and postdocs) that then go into lucrative careers in the technology and pharmaceutical industry sectors, is it possible to get those industries to fund postdoctoral positions? Ideally, corporate taxes would shift money from those industries back into academia, but if we can't do it that way, could companies like Google and Meta directly fund some postdoc positions at universities?

A much smaller initiative that doesn't address the salary issue is for universities to have postdoc cohorts. Currently, the postdoc can be a pretty lonely position. It would be good for universities to create cohorts of postdocs and provide programming for them to socialize, get training in certain skills, and to get job application support for transitioning out of the postdoc.

Response 2496

Perspectives on the postdoc roles and responsibilities

My postdoc means a lot to me. I am motivated and engaged in understanding my projects. I feel responsible for organizing the projects and executing the experiments as best as possible. I appreciate the opportunity to move to the US and be in my current role. I started my postdoc because I wanted to become a PI in my field. Seeing many struggles with work/life balance, I believe I will seek an Industry job when I finish my position.

Fundamental issues and challenges

All postdocs from my field/area are financially worried. And I have seen this affect the overall life quality from others and myself. I've seen many fellows leaving in the middle of their postdocs for an Industry job due to the salary.

Existing NIH policies, programs, or resources

I believe my institution does a great job in terms of training and resources.

Proven or promising external resources or approaches

Surveys and RFI are great opportunities for postdocs to speak about their experiences.

Doing research in the US, and working on projects funded by the NIH is a great experience. I have learned so much as a postdoc, and I appreciate it. I just think that it is time to make a change to how postdocs are currently paid. Another issue I encounter myself is how to go into the job market after our postdocs. I don't feel supported if I still want to stay and do great work in the US. I would be very happy to see this change in the future for the next generation of fellows.

Thank you.

Response 2499

Perspectives on the postdoc roles and responsibilities

I view my postdoctoral fellowship at Brigham and Women as a crucial training step to gain necessary skills and experience, in order to ensure future success in my chosen field of interest which is clinical research. I believe academic postdoc positions provide a safe and nurturing environment for those who aspire to work in research-oriented fields, and acknowledge my privilege in being able to work and learn among highly accomplished mentors. However, the salary we receive as of now hardly covers basic cost of living expenses such as rent, food, and childcare costs for aspiring fellows who choose to complete their training in high cost of living areas such as Boston. My hope is that we will be able to receive more funding from the NIH to augment what we currently receive as base salaries, in order to offset the hardships of having to reside in high COL areas in order to complete academic training. Please consider readjusting the salary scale for postdoctoral positions so that our training programs are able to attract the brightest minds and maintain competitiveness in an ever-evolving climate of various other careers choose from.

Response 2500

Perspectives on the postdoc roles and responsibilities

Transition period between PhD and next career step (ideally faculty position in academia);

Opportunity to deepen knowledge gained during graduate studies while acquiring new skills, perhaps even exploring a new field to develop a unique skill set, allowing development of a research "niche" that would be attractive when applying for faculty positions;

Time to build/strengthen grant writing, project management and leadership skills;

Roles/responsibilities: leading projects from initiation to completion including data analysis and manuscript preparation, mentoring/supporting junior lab members, application for fellowships/grants

Fundamental issues and challenges

No issues from the university perspective (I have a very supportive mentor and [redacted for anonymity] university is providing great postdoctoral training opportunities)

Speaking from experience as an international postdoc: the main hesitation when applying for postdoctoral positions in the US were with regards to the political landscape in the US, lack of infrastructure and comparatively low benefits outside of academia (lack of public transit, limited maternity/paternity leave, limited vacation days)

Existing NIH policies, programs, or resources

More fellowship opportunities for international postdocs

Proven or promising external resources or approaches

I think one of the main keys to satisfaction is working with a PI who is supportive the postdoctoral scientist. In my case, I appreciate the following:

Mentor is available for feedback whenever needed (we have weekly meetings) while giving me space to explore my own research interests (I have started my "own" projects, mentor is very supportive of my grant/fellowship applications including allowing me to be the PI on internal University pilot grants (usually, only faculty members can be PIs), mentor is attentive to personal needs and career goals, mentor is invested in my success and offers paths to promotion

From the institutional perspective: The [redacted for anonymity] offers many fantastic workshops/seminars/lectures that are very helpful growing ones skill set.

Response 2501

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions in my field have been advertised as additional training time for research activities leading to independence as a researcher. However, within my field, most individuals have already worked for many years and then return to complete a doctoral degree. As a result, the majority of my former classmates have not gone on to complete a postdoc.

Fundamental issues and challenges

The main issue in my opinion is the lack of financial support. Most postdoctoral positions are located within universities where there is a lack of affordable housing. The cost of living is so expensive that most of my colleagues spend the majority of their stipend on housing. As a result, there is often little left over for transportation, food, and medical expenses. High performing individuals often have to relocate for postdoc positions. As a result, they lose their community and support while often being asked to be productive and constantly generate new findings. The high levels of stress and numerous working hours with isolation can often impact their physical and mental health.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2502

Perspectives on the postdoc roles and responsibilities

In my field, the postdoctoral position takes too long (min 5 years). After a 5-8 year PhD program, it is impossible to start a life while pursuing the academic career trajectory. Postdocs are not treated like employees in the best conditions and often miss out on important financial incentives by virtue of their temporary status.

Fundamental issues and challenges

For example, when my F32 funding ended, my mentor rehired me as a regular postdoctoral employee. My institute viewed me as "new hire" rather than a continuation of my job. At that point, I lost access to all benefits and had to wait a 42 day waiting period even for access to health insurance. My only option was to pay an exorbitant rate for COBRA at my own expense. NIH should provide bridge funding for situations such as these or disallow institutions from accepting such awards unless they can prove that their postdocs will not be treated like this. Stories like this are incredibly common; they severely detract from quality of life for postdocs and prevent people from pursuing postdoctoral training.

Existing NIH policies, programs, or resources

Provide bridge funding at the end of postdoctoral funding periods (such as F32) or force institutes to provide such funding so that postdocs don't get financial punishments for accepting awards (in addition to the example of losing health insurance at the end of my fellowship, I also lost access to normal benefits such as software provided by IT, gym access, retirement funds, etc when I became a fellow). NIH should provide unrestricted funds during and after the fellowship period to prevent such financial burdens endured by postdocs. The institutional allowance is simply not enough because it usually pays the COBRA rate for health insurance as fellows lose their employee status. After that cost, there is nothing left for software, retirement etc let alone conference travel, lab expenses, or a computer.

Give fellows more options for benefits.

Make the postdoctoral pay scale a RANGE instead of a single value to account for differences in cost of living e.g. a postdoc in a small town might be happy with the min of $56k but this is not sustainable for someone in a large city with high cost of living, yet PIs claim that they can't pay their postdocs above the NIH range from their R01s. So please make this a range.

Proven or promising external resources or approaches

No response

Response 2503

Perspectives on the postdoc roles and responsibilities

The roles and responsibilities of a postdoc covers both those from graduate students and faculty. Postdocs mentor students, teach classes, perform research, write grants and fellowships, and serve their community.

Fundamental issues and challenges

No clear guidelines or expectations for postdocs. Low pay. They don't always receive appropriate mentoring to help them decide on their future career. Also, there are no milestones to look forward to, which negatively impacts their experience.

Existing NIH policies, programs, or resources

Provide national online workshops to educate postdocs on career choices, mentoring, managing labs and people, and writing grants. If some of these are already done, please publicize them nationally to all schools.

Proven or promising external resources or approaches

Subsidized housing, childcare support, and financial stability correlate with scientific productivity and creativity.

Response 2504

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Existing NIH policies, programs, or resources

I recruited a postdoc for our T32 grant. She had been a non-traditional student who had close to 22 years vested in the University. While the T32 is prestigious its current set up is not ideal for someone like her. She had been a university employee and also owned a house, and is from a marginalized background where she supports her family. Even though she was an employee of the University as a postdoctoral fellow, she had to quit her role with the University and give up her benefits to become a T32 fellow. This was very stressful for her. It can also be hard for some to get their own affordable health insurance if they are older. I believe having this be the pay structure for T32 fellows is going to limit the diversity and inclusivity of who can participate in these prestigious training grant opportunities. There needs to be institutional change on the T32 program to enhance the ability of fellows from more diverse backgrounds and with greater responsibilities to still participate and get the training they need to develop their career.

See response regarding NIH’s policies that harm retention.

Fundamental issues and challenges

See response regarding NIH’s policies that harm retention.

Existing NIH policies, programs, or resources

NIH’s policies are out-of-step with modern career trajectories and harm the retention of postdoctoral researchers. I have one personal example. In 2021, I was awarded a 5-year K01 award. My field bridges AI and biology. In 2022, I began to see that there were opportunities in industry to learn about doing research in ways that are not possible to learn in academia. Having spent my whole career in academia, I decided it would be a disservice to my own career to not also learn from another environment.

My K award stood in the way because I was not permitted to take a brief unpaid leave. The PO directed me to GMP, which failed for months to respond to my emails, eventually providing a one-sentence response that such a leave is not permitted under Section 12.13.1 (I did not request an extension, and was fine relinquishing a year of funding). I was forced to terminate my award, giving up 3.5 years of funding.

From just one month in industry, I can unequivocally say that the experience would substantially benefit my own academic research program (indeed, I received three tenure-track offers to start my own lab).

After discovering how NIH permits zero flexibility, and not having funding in place for an academic return, I now believe it is unlikely that I will return from industry to academia.

Computer science has benefitted in the United States from back-and-forth between academia and industry, perhaps in part because NSF is less rigid than NIH in that respect. Academic biomedical research, on the other hand, confronts NIH’s backward-looking policies. Why would a postdoc want to remain in an environment where they are locked in—where even a brief leave, to learn science that would enhance their own academic research, necessitates terminating years of earned funding?

Proven or promising external resources or approaches

Response 2508

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

- Expected outcomes of a postdoc have grown to an unreasonable degree, due to the extreme competition for faculty jobs
- This has led to an increase in the average length of the postdoc tenure, where people spend more than 6-7 years in an attempt to produce work that is competitive enough for the faculty position search
- The postdoc salaries are insultingly low —which would be still okay if postdoc positions were still the short-term positions that they used to be. But with the trend of longer postdocs, spending so many critical years of one's life with such low income is incredibly difficult.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2509

Perspectives on the postdoc roles and responsibilities

A postdoc provides an intermediate career stage between graduate school and faculty positions and an opportunity for postdocs to broaden their expertise and connect with other researchers before settling down in a longer-term position. Most postdocs I know are the major contributors to the scientific, intellectual, and cultural development in their labs. They conceive of projects for themselves and their mentees, design the experimental framework, execute experiments, and write their own papers. Postdocs ghost write peer reviews of scientific manuscripts under their faculty advisers' names and often contribute a significant share of ideas and writing to R01s and other grant applications. These tasks collectively represent a huge fraction of the substance of academic research.

Such a wide range of responsibility provides a major opportunity for scientific and professional growth. The postdoc is thus often framed as a "training opportunity" . From my viewpoint, much of the training involved is provided by other postdocs rather than faculty and it is not unlike any other job in which one learns what they need to learn to be successful in the position, on the job. The idea that postdocs should be regarded as "trainees" and paid accordingly is growing increasingly offensive and absurd.

There may have been a time in which people graduated from PhD programs younger and moved into faculty positions more quickly than they do now. It may then have been appropriate to view the postdoc as a short follow-up training opportunity to grad school. This is no longer the situation. In most cases I have observed, academic-bound postdocs are functioning like junior faculty from their first year or two into a 5-6 year position rather than as glorified graduate students as their position as 'trainees' suggests. This needs to be acknowledged, and they need to be compensated accordingly.

Fundamental issues and challenges

From the POV of a postdoc in biological sciences, the major issue inhibiting retention of postdocs in the academic sector is grossly inadequate compensation. The postdoc salary scale does not account for the typical age of postdocs, duration of postdoc post-degree, hours/week required to successfully execute complex research projects (driven by high requirements for impactful publications), inflation and an increasing cost of life in the US. The issue is especially pronounced in expensive cities: while the NIH acknowledges that the cost of life is much higher is some places than others (as reflected in city-specific per diem compensation rates for travel), it does not account for these dramatic differences in salary—and as a result, postdocs working in cities that are also major scientific hubs are drastically below the salary required for a reasonable quality of life.

The NIH's hope that a postdoc position will be a brief (2-4 year) training period for young scientists is out of date and unrealistic for most people to become attractive candidates for academic faculty positions. Postdocs range from 4-6 years, during which time many postdocs are well into their 30s. For many postdocs, this corresponds with a closing window of opportunity to have children. But the postdoc salary is grossly insufficient support a new family.

Postdocs are known to work around the clock—after hours and weekends—and are often absurdly required by their universities to fill out monthly time sheets suggesting that they work 40 hours a week to avoid overtime payment requirements. I don't see a need or mechanism to regulate hours worked, but postdocs should receive a salary that better reflects the large time commitment being made to get the job done.

Existing NIH policies, programs, or resources

A few specific suggestions:

1. Regulations surrounding the K99 pathway to independence needs to be revamped to reflect the current realities of the postdoc timeline and so that postdocs within a general field (i.e. biology) have roughly equal access to this opportunity. The major issue is the eligibility timing—the deadline is too early into the postdoc. I do not agree that time spent finishing PhD work in prior labs after the date their PhD was awarded should count against the K99 timeline—there are many logistical issues that might cause a person recent graduate to spend extra months in their lab as "research specialists" until they are able to begin a postdoc in earnest. Another issue is the vast differences in the number of K99s awarded by different institutes. For example, NIAID is known to grant precious few K99 awards whereas NIA seems to have a reasonable number.
2. The K99 extension for childbirth is helpful but insufficient. While I applaud the extension to men and partners of individuals who give birth, they should not have the same duration as those giving birth. 9 months of pregnancy represents a massive obstacle to retention of child-bearing -—especially female -—postdocs in the life sciences. Many pregnant people are extremely sick for 2-3 months during early pregnancy and at substantially reduced ability in lab for the last 3 months. That represents a 6 month + time during which our soon-to-be-father peers are uninhibited in their careers. It would be appropriate for NIH timelines to account for pregnancy *in addition* to early child rearing.
3. I appreciate the F32 NRSA funding mechanism, but believe that the application package requirements should be re-examined and streamlined. Several of the required documents (other than the research strategy) are needlessly lengthy and repetitive with one another.

Proven or promising external resources or approaches

1. Additional financial resources for reproductive health (i.e. IVF) and childcare would be a massive help to postdocs and I believe this would attract a more talented a diverse pool of postdocs. At [redacted for anonymity] for example, a public university, postdocs are not given any discount to the [redacted for anonymity] daycare. For reference, as a 5th year postdoc, my monthly take-home salary is $4,500 before taxes; the daycare is $3,190 (which is typical for daycares in the area). So for postdocs at earlier stages the salary is roughly equal to the cost of daycare for their child. This is not sustainable.
2. UCSF offers an annual funding opportunity for postdocs to do research on something outside of their postdoc mentor's area of expertise. It essentially provides a small pool of money for a postdoc to obtain some preliminary data during their postdoc for their future research independent of their postdoc mentor. It would be extremely helpful if the NIH provided a small amount of money in a similar manner, with flexible eligibility requirements and less time-intensive application materials required than for a full fellowship. This would be an asset to postdocs seeking to gain independence from their postdoc mentors.

Response 2510

Perspectives on the postdoc roles and responsibilities

In my view, an academic postdoctoral fellow has two lines of responsibilities:

1. To fulfill the responsibilities to conduct the designated research projects, which usually are assigned by the mentor;
    a) This line of work can include conducting the research projects diligently and rigorously, updating and keeping regular and frequent updates with the research team and the mentor, and disseminating the results as soon as possible.
2. To prepare oneself professionally and academically for the next stage of one's career, which include the preparation in at least two dimensions
    a) Academic preparation includes plans on research directions and research projects, accumulating teaching and related activities experience (such as preparing a course syllabus, designing a short course, including assessments), volunteering in professional organizations, or as a peer-reviewer for journals and conferences on one's field.
    b) Professional preparation includes determining future career directions (academic, industry, non-profit, government, etc.), strategically pursuing the directions, networking accordingly, preparing for job interviews and CVs, and practicing negotiating skills. Additionally, grant writing, academic writing, communication, and management are all necessary skills to sharpen for an academic career.

Fundamental issues and challenges

1. The value of postdoctoral training was under-appreciated.
    a) The postdoctoral training experience can broaden the horizon of one's research and career experiences. Most Ph.D. students have worked closely with faculty members from a single department. The postdoctoral training could be with another mentor and in a different institution. The close work relationship through postdoctoral training is critical to provide a broader view of one's future research direction and research conduction.
    b) The postdoctoral training experience can prepare one better for a more sustainable future career. During postdoctoral training, one has a longer time, more experience, and more robust networks before determining one's future research directions and more time to refine future research projects, which is significantly different from a fresh Ph.D. This can be possible only if the postdoctoral training is well structured and the postdoctoral fellows are well informed.
2. The immediate status and salary that fresh PhDs could obtain were weighed more favorably than long-term potentials provided via postdoctoral training.
    a) I think starting a faculty position (perceived as a relatively permanent role) is very appealing to fresh PhDs versus doing a postdoctoral (needs to move to a more permanent role). This is understandable since most people focus more on the immediate benefits one can obtain.
    b) However, long-term benefits that postdoctoral training can bring to one's career in productivity, length and sustainability of the careers, and the actual impacts of one's work over the trajectory of an entire career are also critical, but often hard to measure, to track, and therefore are neglected often.
3. Another challenge happened far before Ph.D. Not all bright students value or prioritize science and research high when they are young. Perhaps more pipelines and early efforts to attract students or embed interests in science and research early in their minds.

Existing NIH policies, programs, or resources

I think the existing programs and resources are well structured. Perhaps more targeted marketing strategies will improve the ecosystem further. For example, to send the information, links, resources, available opportunities, workshops, or webinars about the opportunities and deadlines to Ph.D. program directors or program coordinators, who may distribute the information among the Ph.D. students and alumni, and they can be potential postdoctoral fellows; otherwise, lack of information awareness can be a significant bottleneck.

Proven or promising external resources or approaches

I think in addition to having publicly accessible websites and web pages, mailing lists, perhaps include Ph.D. program directors and program coordinators, who may circulate the opportunities, and information with their Ph.D. students and alumni. This is a more targeted way to disseminate information.

During the postdoctoral training stage, to have more structure and instructions (for example, goal setting at the beginning, quarterly updates in writing, targeted training plans—grant writing, teaching, peer-reviewing, and interview skills), even structure templates (similar to curriculum map, but with brief courses or workshops, e.g., one for an academic career, one for industry, one for a management role, etc.) will be very helpful for mentors and for postdoctoral training directors to manage their program more explicitly; such structure and instruction also have the potential to make the postdoctoral fellows use their time, resources, and effort more wisely and intentionally.

Response 2511

Perspectives on the postdoc roles and responsibilities

I view postdoctoral positions as a key step towards an independent career. Given the right mentorship, it gives researchers the right environment to learn something new and to combine it with their previous expertise as they develop their own independent research plans.

Of course, having obtained a PhD, a postdoc can deliver research results much faster than graduate students. I find this to be true even if the postdoc is changing fields.

Fundamental issues and challenges

Much has been done in terms of providing resources for mentoring and careeer advancement. However, ultimately a large number of graduate students decide not to pursue postdocs (or to cut them short) because of the low pay compared to PhD holders that move to industry.

Existing NIH policies, programs, or resources

Once again, higher salaries concomitant with cost of living is the key.

Proven or promising external resources or approaches

No response

Response 2512

Perspectives on the postdoc roles and responsibilities

Training for specific skill set that ultimately will transfer to leading labs/projects in industry, federal government, or in academics (which can include an academic path to becoming an independent investigator). A post-doc is a training environment and should have a clear goal, rather than being viewed as continuation of grad school or "cheap labor" or transition to another career. It should be paid like an employee, with salary and benefits commensurate to a highly skilled and trained person, at least at a senior technician role in academics.

Fundamental issues and challenges

1. Salary and benefits are not commensurate with the skilled required to be a post-doc. These are highly trained individuals, but they are often treated like graduate students without employee benefits and asked to delay their financial stability/security for further training and no benefits (retirement, better insurance, etc). Academia uses T32 grants as an excuse to treat them like trainees rather than employees and benefits are reduced when a post-doc is on a training grant. Pay is disparate if you are intramural vs extramural post-doc, the pay scale is a base, but grant funding is based on that pay scale and academic institutions use that scale to set salaries. Pay it also disparate with industry positions and most post-docs in academia are not paid a living wage, and they cannot support a family.
2. There are not clear goals and poor/limited career options in academics and no academic environment is helping post-docs find jobs outside of academics.
3. Very few institutions will support post-docs (PhD) to apply for career development awards/K awards. There is only one path to a K award for PHD post-docs.

Existing NIH policies, programs, or resources

Pay scale and grant funding to make the salaries possible. Require benefits commensurate with employees. Allow post-docs on training grants to be able to contribute to retirement funds/get matching funds. Expand career development grants, so that post-docs actually have funding when they are looking for faculty positions (few institution will hire a post-doc who does not have this funding), require mentors/post-docs to have a clear goals in mind for career development and state that industry/government/academia are all acceptable career options if that is the goal. If not, then work with institutions to actually create faculty options in academia—there are few job openings and few funding options and therefore, few people get hired. When post-docs are paid poorly, treated as extended trainees, receive no benefits/lack financial security, and see no job prospects in academia—> they will leave to go to other opportunities and/or leave science. Well trained people are the most valuable resource in science, and we loose many scientists because they are not supported and progressively hate the field as they continue in their career.

Proven or promising external resources or approaches

NIH could consider how industry has been successful recruiting and training post-docs that have left academia.

Response 2513

Perspectives on the postdoc roles and responsibilities

I believe that PhD training should prepare trainees for a wide range of careers—industry, academia, etc.—where as postdoctoral position should be a training period for those focused in academic career. In that regard, I think the number of postdocs should be decreased as there are only limited number of academic positions. I think academic labs should hire more technicians and staff scientists rather than relying on postdoctoral trainees for conducting research. It appears that this is naturally happening as PhD graduates see postdoc as less attractive option with the low pay and difficult academic job market.

Fundamental issues and challenges

Low salary compared to alternative options in industry and poor outlook in academic job market provides less incentive for postdoctoral trainees to stay in their position. I believe there should be fewer postdoc positions who are compensated at better rate.

Existing NIH policies, programs, or resources

Not allowing non US citizens to apply for training grant discourages both PIs to applicants for foreign born candidates to pursue a postdoctoral training in the US.

Proven or promising external resources or approaches

No response

Response 2514

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I was an NIH-funded investigator for over 30 years. I have observed how both the education and recruitment of post-docs has changed over time, mostly for the worse.

My family connection to the postdoc decision process gives me some insight. My son got his PhD about 5 years ago. About a year before he graduated, he told me that he and most of his fellow students were looking ahead to go for additional training as postdocs.

My son visited several possible postdoc offers. Those visits convinced him he would not seek a postdoc position, with the implicit career goal of eventual teaching an research. As he was newly-married, he said, the financial uncertainty of being expected to bring in grant funds in the current research-support environment was too great. He decided to work in industry.

After 5 years in his current position, he loves his job. As with anyone who devotes themselves to a life of the mind, it is not a job for him but a way of life. He benefits from good supervisors and colleagues, has the best technical support (unlike myself who has had to fight for computer and administrative support), and he gets financial bonuses for good work. He has over 18 patents, an excellent work environment and he does not have to write grants, thus not having to devote at least 50% of his time to raising money. He gets to do the research work he loves, work for which he is rewarded. He has the freedom to work on new things (thus the large number of patents he has secured for his company) and he gets support when he wants to try something new. He does not have to bootleg his resources to in order to expand into new areas.

Existing NIH policies, programs, or resources

As a seasoned investigator, I recall when getting a grant funded by NIH or NSF was not the chancy, onerous chore it has become. Having to write 5-10 grants to have a reasonable chance of getting one funded means that, first, getting grant funding is openly a matter of chance. Secondly, it means that much of the time, one is not actually doing useful research. It used to be if one had a reasonable idea, one could get a grant to pursue that idea; if not successful on the first submission then usually on a subsequent one. That is no longer the case. The lack of priority support for basic research has caused the granting system to be broken, if not outright corrupted. My observation is that, nowadays, reviewers approach their grant evaluation tasks with an agenda. Without good oversight of the "product" (the review), the frequency of outright errors in the review has grown. I do not mean disagreements about the science; I mean actual errors of content for which there is essentially no recourse.

In the past, when I use to participate in Study Sections, I found the reviewers to be honest and the interest in the science to be high, and the discussions enlightening. After my last two experiences, I would not participate again, so frustrating was the experience. The students in my departments have seen us senior faculty struggling with grant preparation and the ever-increasing rigidity and bureaucratic burden it imposes. (I particularly recall when the "innovation" section requirement was introduced. It seemed idiotic then and still does.) And the non-scientific requirements that must be satisfied before the ideas in the proposal can be evaluated—especially if institutional support for grant preparation is lacksadasical—can be daunting.

Proven or promising external resources or approaches

I am currently teaching a class attended by biomedical PhD students (last semester there were 13 students in the class). All of those students planned to seek jobs in biotech industries.

While what I write here draws on some of my experience, it unfortunately also directly reflects what students have told me when I ask if they are going to do a postdoc. They are not blind to what those of who have been doing NIH-supported research have been going through. This is especially true where, as in my institution, the faculty that are the most productive are those with non-government sources of funds.

When NIH funds were not exceeding difficult to get, students understood that, although there were reduced salary prospects (compared to industry) in an academic career, the compensation was that there was freedom to pursue one's scientific interests and to teach. The way the granting process has developed, and with the replacement of "publish or perish" with "bring in funds or perish" as the requirement for employment in a research university, it seems the logical step is to avoid a postdoc and an eventual academic career.

Response 2515

Perspectives on the postdoc roles and responsibilities

Postdocs are trainees but not post-PhD trainees, rather they are faculty-in-training (pre-fac). They should be given all the tools necessary to prepare for a successful academic search and position. In addition to learning the science and technical approaches in the lab that they are doing their research, there should be some professional training including the following topics: manuscript and grant writing, mentoring including culturally aware mentoring, lecturing and writing exam questions, communicating science, team work, statistics/rigor and reproducibility, exposure to how pharma operates and to non-bench roles outside of academia.

Fundamental issues and challenges

Finances—how little postdocs are paid

Benefits are not good for postdocs including parental leave, affordable housing and childcare options

Uncertainty for international postdocs to get sponsorship for visa

Length of postdocs is increasing so they are stuck in limbo

Limited prospects for landing an academic job plus frustration of academic jobs with regard to publishing and grants

Increased opportunity and acceptance of pharma and biotech as a viable option post PhD with better pay and work life balance

Academic bullying and pressure from PIs to produce data and overwork

Mental health resources are often for students. Postdocs do not have easy access to health care professionals.

Existing NIH policies, programs, or resources

Create International Scholar Supplement that are analogous to Diversity Supplements for R01s.

Open up some fellowship opportunities beside K99/R00 for international postdocs.

Proven or promising external resources or approaches

Taking in postdocs as cohorts through recruitment events and having them all go through professional development activities together to create community

Requiring mentoring plans/committees of faculty as mentors like thesis committee/IDPs

Make the positions more secure through longer-term contracts so they will be more productive rather than "at will"

Make the first 2-3 years of a postdoc position lower salary and then a big bump up for 3-5 years.

Allow for vesting and matching benefits after the first 2-3 years.

Create more staff scientist positions

Relocation fees and signing bonuses

Clear parental leave and vacation policies with the ability to accrue vacation for travel to home countries.

Unlink visa from PI/lab so that there is no fear of deportation

Punish academic bullying through the AToRT document and model

Create a grievance process with arbitration

RPPR for funded grants should include anonymous PI evaluation by postdocs and grad student mentees and R grant funding will be contingent on good mentoring reports

Response 2516

Perspectives on the postdoc roles and responsibilities

I am a first year postdoc at one of the hospitals in Boston. I am learning in a very good research environment and would like to continue for a couple more years.

Fundamental issues and challenges

However, the cost of living is very high in Boston. I have to live in a shared apartment which makes living not so comfortable. Being a married individual, I have to stay away from my spouse only because of cost of living here in Boston. This weakens my stability and has been challenging my decision to continue my work here.

Existing NIH policies, programs, or resources

Increase salary based on cost of living of the area.

Proven or promising external resources or approaches

No response

Response 2517

Perspectives on the postdoc roles and responsibilities

I think the goal for a post-doctoral position should be for a recent PhD graduate to receive additional training, transition to more independent research, and move toward their career goals. I'm not sure if they are considered scientists, fellows, trainees, students, etc.

Fundamental issues and challenges

Pay for academic postdocs is embarrassingly low. It's unreasonable that a person with a PhD would be unable to afford a 1 bedroom apartment in major cities (where, often, top-tier research institutions are located). Many PhD students already put their personal lives (family, savings) on hold, and still find their goals unattainable on a post-doctoral salary. Post-doctoral positions often require long hours without compensation, which is difficult for those with families. Other positions (e.g. industry) offer pay that is almost double the NIH salary, with reasonable hours, and so there is little motivation for an academic post-doc unless the scientist strongly wants to continue in academia.

Many students do not see academia as a reasonable career goal—the job market is limited. Academic research is almost by nature a bit of a pyramid scheme—PIs must recruit several graduate students and post docs, but there are not academic positions available for these trainees once they graduate. And again, a career in academia often means low compensation (compared to other positions for PhD holders) and a lack of stability (position is subject to funding/publishing/tenure decisions). Those who do not come from a place of financial privilege are not going to see this as an ideal option.

Finally, work as a post-doc is highly dependent on the individual lab environment. Some post-docs are treated as experiment factories, with long working hours (that are not fairly compensated) and very little mentorship from their PI. Although they have PhDs (and in other academic fields, this would be sufficient to become a faculty), they are treated as trainees. The role, expectation, and training can vary wildly between labs. After experiencing life as a graduate student in a less-than-ideal lab, many bright and motivated scientists want to move as far away from academic research as possible.

Existing NIH policies, programs, or resources

Better pay, or at least a salary that is scaled to cost of living in some areas. Most current PhD graduates have been experiencing a bad economy and have little to no retirement savings. Our peers with bachelors degrees are making more money at this stage in their life. It is financially not worth it to get a PhD in science without adequate pay as a graduate. I know science should be about more than just the money, but the salaries paid to people in their 30s with PhDs should be higher than it currently is.

More accountability for PIs to provide good mentorship in their labs. Many graduate students and post docs choose to leave academia due to toxic lab environments—poor mentorship, demands to work long hours, etc.

Make sure that there is an end to the pipeline! If the goal of post-doctoral training is to prepare trainees to become professors/PIs, then positions must be available for them.

Proven or promising external resources or approaches

As stated before, improve the pay/benefits, and hold PIs accountable to provide better mentorship, and create a system where there are positions for the postdocs that complete their training.

Is our current academic research framework sustainable?

Response 2518

Perspectives on the postdoc roles and responsibilities

Postdocs are more than trainees. Postdocs are early career investigators with Ph.D.-level expertise in defined areas of research. Postdocs are fundamental to the success of university labs and need to be valued as such. As early career investigators, the goal of the postdoc is two-fold:

1. Postdocs are hired to fulfill the final stages of their research training while also expanding on their own expertise and providing that expertise to the lab to strengthen that lab's research program; and
2. Postdocs are hired with the understanding that they are to receive training in grant writing, research program development, networking, teaching/mentoring, and lab management with the ultimate goal of developing an independent research plan and a more established research portfolio. Within a given day, postdocs are responsible for initiating and carrying out large-scale experiments, training lab members, developing experimental plans and protocols, data curation and analysis, data presentation, manuscript preparation, grant writing, project/lab management, and supply ordering.

Postdocs are also mature adults and no longer students. With the average age of postdocs being low-mid 30's it needs to be recognized that postdocs have families and that women are in their childbearing years.

Fundamental issues and challenges

[Redacted for anonymity] does not enforce the NIH salary minimum, instead, some postdocs earn $9,000 below the postdoc level 0 minimum, and on average senior-level postdocs still make ~$1,500 below the postdoc level 0 minimum.

Many postdocs never see an annual raise. This is a substantial issue because the cost of living is so extreme that postdocs struggle to afford housing, transportation, food, medical expenses, children/childcare, and student loans. [redacted for anonymity] puts postdocs on student health insurance which does not account for families. A postdoc pays $450/dependent added to their insurance plan that increases substantially every year, without meaningful raises in postdoc pay. This forces many postdocs to delay family planning, which is a biological problem for women nearing the end of their reproductive prime.

It is difficult for majority of postdocs to develop independent research projects that could lead to a subsequent faculty position due to lack of research funding. Often times PIs do not have extra R award funding to support independent postdoc hypotheses and F awards only support postdoc salary and not research costs. As a result, postdocs are unable to develop preliminary data in pursuit of their own independent research plans. There is also a lack of training and career development support by PIs. Many PIs do not support non-research efforts and/or postdocs do not have time outside of research to fulfill "extracurricular" training commitments. This is especially challenging for non-academic track postdocs.

Postdocs feel extremely isolated because we are not part of an official program with worker protection and community. Poor working conditions/environments heighten this sense of despair, leading to burnout and disinterest in continuing an academic career. Lack of protected vacation time, sick leave, and religious observance days sets the expectation that postdocs will work and be accessible 24hrs 7 days a week causing serious burnout.

Existing NIH policies, programs, or resources

NIH should create an award for postdocs that financially supports research ideas and training pursuits while also providing a stipend so that postdocs can pursue independent research ideas and develop cross-disciplinary preliminary research. The addition of research funds would allow postdocs to rotate through collaborator's/co-mentor's labs to learn multi-disciplinary approaches and increase training diversity. This new grant should also require the University to provide workshops on research program development, access to campus facilities and cores, PI panels for faculty-postdoc interaction, and career transition. NIH should also create an award for late-stage postdocs (year 3+) that need a final year's worth of funding in order to propel a smooth transition into an independent academic career. Additionally, another major restriction of the F awards is that internationals are ineligible to apply. The NIH currently offers almost no support regarding internationals except the K99/R00 awards. This creates two issues:

1. Low chance of retaining US-trained talent, which will mean that other countries benefit from highly skilled and well-trained young scientists, and
2. This makes the US less attractive for international postdocs. With the revamp in funding mechanisms the NIH also needs to encourage Universities to offer extended postdoc contracts. Instead of a yearly contract renewal system, a bi—or triennial renewal system with a required 6-month notice before contract termination would help internationals with the visa process and would protect postdocs from sudden loss of job or deportation. This would also provide postdocs with stable, protected time to accomplish research and training goals. Lastly, ERA Commons is not user-friendly and needs to be

revamped. The website is very confusing and hard to access and use. Users should receive training on how to use the site if it cannot be improved.

Proven or promising external resources or approaches

Postdoc salary disclosures and reasoning for paying below the NIH-recommended salary minimum need to be required of PIs. NIH also needs to ensure that postdocs receive the minimum recommended salary plus raises for each year of training as part of our annual contract renewal. To do this, NIH could supplement R awards to account for yearly postdoc salary increases. Or, the NIH could require that to receive indirect funds from the NIH, the University has to make sure that a portion of those funds are used to supplement postdoc salaries where the PI cannot afford to meet the NIH minimum pay. This increased oversight should also extend into postdoc training and career development. NIH needs to require progress reports not only on research progress but also on postdoc training and career development. Considering awards for international postdocs would also allow for the retention of international postdocs and encourage international postdocs to pursue US-based academic careers. Lastly, the NIH could consider a reporting system for formalized Individual Development Plans (IDP). Upon completion and annual review of a formalized IDP between the mentor and postdoc, the postdoc would then submit the signed document via an NIH portal. This system would serve as a yearly postdoc progress report where postdocs could honestly disclose their research and career progress, provide reasoning for lack of productivity, and confidentially disclose their mentor's performance.

Response 2519

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is a bridge between graduate school and the next stage of my career. It is meant to gain insights and training to progress in my career. But that is not what it has become. It is more of mule position!

Fundamental issues and challenges

Fundamentally the postdoc positions are indirectly promoting poverty. The wages do not allow for postdocs to have a family, transportation and afford housing near their place of employment. Especially since most universities are in or near large cities. While most postdocs go into their position wanting to make a difference in their field, it becomes abundantly clear that postdoc life is not sustainable long term.

In addition, PIs do not seem to be as supportive in career progression within academia. Cheap postdoc labor seems to be favored, thus postdocs are being beaten down juggling PIs grants to keep them afloat, while no time is allowed for personal growth. It is unknown where the problem lies. Whether it's grant funding not being large enough to hire the required personnel or PIs not wanting to spend money on labor, the weight falls on postdocs to solve.

These two issues in combination is a recipe for disaster. The result is toxic work environment, mental health and financial strain.

Existing NIH policies, programs, or resources

Build in career development time as part of all NIH grant requirements. If the PIs are not willing to provide the time, then it's up to the higher ups to mandate it.

The culture will not change if it is not mandated. Offer career trainings, career explorations remote and in person (away from the lab) in a way that has to be recorded so there is no out for the PIs.

Proven or promising external resources or approaches

At the moment even a laptop/PC, software subscriptions often times comes out of the pocket of a postdoc. There should be a way for NIH to garner some influence and or mandate purchase of a laptop/PC for a postdoc. With the age of bioinformatics and flowcytometry, it is impossible for us to progress sharing computers and or paying out of pocket for software subscriptions.

Response 2520

Perspectives on the postdoc roles and responsibilities

It creates the training pathway to becoming a principal investigator in academics.

Fundamental issues and challenges

1. The income is too low compared with a relevant position in the industry. We often stay in the lab on weekends, but scientists in the industry never go to the lab on weekends. Academia is less and less attractive than the industry.
2. Our salary is not going up with the inflation, which makes it even harder for us to survive with our family.
3. As I know, a postdoc in NCI makes around 90k dollars yearly, but a [redacted for anonymity] postdoc makes below 60k dollars a year. That's not fair!

Existing NIH policies, programs, or resources

Please speed up the process of reviewing the applications and increase the amount of funding to support PIs.

Proven or promising external resources or approaches

Booster the basic income to the NCI level can increase job satisfaction a lot.

Response 2521

Perspectives on the postdoc roles and responsibilities

While the postdoc period is in many ways defined by the training aspect in anticipation of an academic position, we are primarily highly skilled workers in extremely specialized fields. That postdocs are "in training" does not negate the need for much higher pay and stability than most postdocs are receiving—many highly skilled jobs in other fields and sectors provide extensive on-the-job training to prepare workers for the next stage in their careers while not restricting pay and position to a lesser "trainee, bordering on student" position within the workplace.

Fundamental issues and challenges

Higher pay is needed. Most postdocs have nearly a decade of experience in their fields and need higher compensation to comfortably conduct research without significant personal sacrifice, especially as academic jobs often come with extra costs for things like moving, conferences, etc. This is absolutely urgent for retention.

No policy aside from increased minimums/pay will have a universal, across the board, significant impact on retention and quality of life for postdocs.

Existing NIH policies, programs, or resources

Increase NIH minimums for postdocs pay. Consider cost of living and experience of postdocs in their respective fields, along with considerations of commensurate pay in other sectors for the same level of experience.

Proven or promising external resources or approaches

No response

Response 2522

Perspectives on the postdoc roles and responsibilities

They are expected to conduct their research with higher quality than PhD students do.

Fundamental issues and challenges

Family matters

Existing NIH policies, programs, or resources

I hope I would have a system to support postdocs who have partners in common-law marriage by sharing information about the way to manage their immigration status and live in the US together.

Proven or promising external resources or approaches

Lectures or public speeches open to ordinary people.

Response 2523

Perspectives on the postdoc roles and responsibilities

The postdoctoral role to me is an opportunity to apply the skills and topics learned in graduate school to a new project as well as learn new skills and interpretation of data to further develop as a scientist, regardless of staying in academics or going to industry or another position.

Fundamental issues and challenges

Challenges of recruitment are moving expenses and being able to afford to break a lease if a research opportunity arises. The uncertainty of a one year contract, whether it will be renewed or if the lab is a good fit, after moving many states is high risk. COVID made my postdoc interview virtual, I wish I could have met more colleagues (even virtually!) and observed the lab prior to my current position. I work just as hard at my current postdoc position as I did in my previous role that required a PhD, yet I am paid $30 k less a year. My quality of life is far greater than as a grad student since I can afford better housing, however I am on the cusp of entering the job market. I don't know if my current PI, who hasn't obtained tenure, can aid me as I go onto the job market as well as an established PI could. I am working for a new PI who is struggling to balance teaching, mentoring, and research. I am often talked over by my PI when we meet one on one to discuss my work, they often don't understand or forget my suggestions since my research specialty is outside of their area of expertise. I understand they're stressed out, however it's no excuse to be a jerk. I have thought about quitting to join another lab due to the current toxic environment, however I love the project I work on. I keep sticking up for myself. Most of my friends and family have advised me to quit, a few have suggested to stick it out since it's a temporary position and the project is good. I chose the latter, and it's been up and down.

Existing NIH policies, programs, or resources

The NIH pay increases every year to account for inflation help. My additional F32 funding all goes towards health insurance, so expansion for a dedicated allotment of funds for a conference that my PI isn't responsible for, would be nice. No surprise that an increase in pay would aid in attracting more postdocs when compared to starting industry salaries. The fact that the university no longer takes out taxes when I bring in a grant is very confusing to me. Paying quarterly taxes is extra work on my end, and it feels like I'm being penalized for bringing in extra money. I don't know if the taxes issue is a University discrepancy or NIH.

Proven or promising external resources or approaches

I rarely take all the yearly vacation days allotted by the university. A timecard where I can keep track of vacation days and get a buy-out at the end of my time as a postdoc would help a lot with moving expenses to another position or having to use COBRA for health insurance costs, as some institutions don't offer immediate health insurance coverage. The lack of any retirement plan that the university pays into is discouraging, especially since some universities offer this, and others don't. I doubt there will be any kind of exit interview when I leave my current role, but some type of accounting, like this survey, would be helpful to see how views change over time. A statement from the NIH on the F32 that may help for new PIs is that postdocs are to be seen as colleagues and not subordinates.

Response 2524

Perspectives on the postdoc roles and responsibilities

- The academic postdoc is a scientific and professional training. This includes doing science and advancing in our careers, while learning, and being mentored, but as well, during this crucial time we are training to be independent, and become a mentor ourselves.
- We need to write grants and fellowships, we need to teach techniques to others, and we need to network to prepare for the next stage.
- We, postdocs, are a heterogenous population, with different goals and priorities based on what we would like to do afterwards (e.g. academia or industry, in the US or abroad, etc)
- Our responsibilities are not to be lab managers of our labs, nor secretaries, nor technicians, nor just science production machines.

Fundamental issues and challenges

- The low salary and the higher cost of living in every city in the US,
- The lack of benefits including healthcare (in some cases), retirement, childcare funding, and vacation days amongst others.
- The structure itself of academia. There is no consistency between labs and institutions regarding salaries, policies, and benefits. Postdocs feel that there is a lack of clarity and transparency.
- The lack of stability or security to the independent step. It is a real worry, to all of us postdocs, that only a 17% of us will transition to faculty positions. Additionally, PI positions are often not attractive enough. The fact that to transition to a PI, we will leave the bench for office work, the pressure to always depend on grants, the time commitment the job demands are some examples to explain this lack of attractiveness.
- Another fundamental issue is that there is no alternative pathway for postdocs that would like to stay in academia but not in a PI position. It is scarce and rare to find a fix position as a scientist in academia.
- Foreign postdocs are dependent on visas, current policies and politics. In addition of being a very stressful and uncontrollable situation per se, visa issues can impact the scientific career of the postdoc by causing significant delays or even interrupting their research by denying reentry to the US.

Existing NIH policies, programs, or resources

- Increase the minimum postdoctoral salary
- Adjust postdoctoral salaries based on the location’s cost of living
- Consider removing the requirement to be a US citizen for more NIH fellowships and resources
- Significantly shorten the current long turnaround time in the feedback of fellowships. This would allow the possibility to reapply when first rejected, and overall, less delays in our research.
- Extend the current limited timing between receiving the PhD title and many deadlines to apply for different fellowships. Not only due to Covid, maternity or paternity leave, but also other life restrictions that are currently poorly considered.
- Offer funding and support for professional scientists that do not need training anymore, but want to do bench science after the postdoc, and would like to stay in academia.

Proven or promising external resources or approaches

- Offer more career advances grants.
- Offer smaller fellowships (e.g. for shorter duration) that give less funding, but higher success rate.

Response 2525

Perspectives on the postdoc roles and responsibilities

Being an international postdoc means opportunity and diversity but also a lot of challenges in order to get a status and funding for our ideas.

Fundamental issues and challenges

My particular case I have been trying to initiate my own research by the lack of resources for foreign investigators is disappointing, if you are not green card holder or citizen, you are not allowed to find resources. I have sent no less than 50 applications and I never qualify given I am visa holder.

Existing NIH policies, programs, or resources

From my personal experience, you should open a pathway for visa holders, it does not make sense to me that I need to give my ideas to an American researcher just because they can get funding and yes this is happening.

Proven or promising external resources or approaches

No response

Response 2526

Perspectives on the postdoc roles and responsibilities

I see postdoctoral positions as valuable training toward becoming an independent researcher and leading my own lab.

Fundamental issues and challenges

Postdoc positions can be demanding, leading to a poor work-life balance. PIs should recognize that postdocs are still in a training role and should be provide guidance on both experimental work and paper writing to help us develop a more comprehensive skill set.

Existing NIH policies, programs, or resources

I agree that there should be training programs available for PIs, which go beyond just mentoring postdocs and also include guidance on how to support their career development without any personal gain. This type of training would be valuable in promoting a healthy and productive lab environment and in ensuring that postdocs receive the support and guidance they need to achieve their career goals.

Proven or promising external resources or approaches

No response

Response 2527

Perspectives on the postdoc roles and responsibilities

I do what I love

Fundamental issues and challenges

Bethesda is an expensive place to live. If you are not american such as me, it is way too difficult to find a place to rent that is around groceries for an affordable price.

Existing NIH policies, programs, or resources

I think state taxes could be also deducted to our paycheck to avoid migraines. In caso of aliens like me.

Proven or promising external resources or approaches

In my case, I just can thank my PI so much because he is so professional and care about people in a sense of asking if we are happy doing our job, offering help and being so respectful to everybody.

I know that is not true for all laboratories. I would say some PIs are just a lot and can cause mental health problems or take it to higher levels.

I repeat: thats NOT my situation but, I know I am lucky.

I wish I could change it I mean the unnecessary pressure people face daily because our potential to be good scientists just decrease under too much pressure. We do not need people giving it up because of PIs bad mood.

Thank you.

Response 2528

Perspectives on the postdoc roles and responsibilities

Transitional position to next step, very important

Fundamental issues and challenges

I am working at Boston area and the salary we are having now which meets the standard of NIH is not sufficient for those living in Boson to have a decent life as the rent only can take almost half of the salary

Existing NIH policies, programs, or resources

Have more opportunities for international trainees

Proven or promising external resources or approaches

No response

Response 2529

Perspectives on the postdoc roles and responsibilities

I began this postdoctoral position after my psychiatry residency. With this step I aim to become more specialized in metabolism to bring the topic further into psychiatry research. Without a US license, I am limited to my roles as a postdoc, however I greatly enjoy the training in research.

Fundamental issues and challenges

Life in the US has become more expensive, and for us that come with family the postdoc salary is limited. Arriving to the US as a foreign scientist is complicated as we have no credit history and apartment places make special requirements that limit application from outside the country.

Existing NIH policies, programs, or resources

Providing options to study with Universities. Helping scientist spouses and their families.

Proven or promising external resources or approaches

No response

Response 2530

Perspectives on the postdoc roles and responsibilities

The main objectives of a postdoctoral position are to develop a competitive individual research program while acquiring the experience and credentials that make you competitive on the tenure track market through mentored work. Aside from acquiring new skills in developing and carrying out experiments and technical development this SHOULD include receiving training in grant writing and submission, honing of presentation skills both through regular lab meetings and at conferences, writing reviews, mentoring undergraduate students, and interview skills. The general parameters of the training/skill development should be tuned to the goals of the postdoc, i.e. shorter secure projects if the postdoc wants to transition out of academics and more ambitious projects for those that will go on the academic market.

Fundamental issues and challenges

Systemic issues are those dealing with quality of life and salaries, especially those that affect women with young children. The current expectations of PIs and the aid provided by the universities will often become self selecting for single people (easier to move around, no issue with TT recruitment if there are no

spousal hires) and those without children (able to work long hours and weekends). Postdocs also have limited access to teaching opportunities, which is a fundamental part of most R1 institutes.

If we conceptualize retention as the ability of postdocs to progress through the academic market with the goal of securing TT positions at R1 level institutes a major obstacle is showing a track record of funding. In my experience many postdocs remain unaware or unsupported in their pursuit of funding, leading to loss of experience in grant writing and artificially decreasing the competitiveness of otherwise excellent candidates, particularly those of underrepresented backgrounds and first generation scholars, who may not benefit from the generational knowledge of the US academic system.

Additional systemic issues are the current prevalence of the K99/R00 grants as one of the top selection tools for universities. While initially framed as a way to help exceptional scientists, the situation now is that the same K99 recipients are interviewed at multiple universities, taking up spots from otherwise competitive postdocs that did not secure a K99. This creates a selection bias, effectively removing non-K99 awardees from the pool of those interviewed. Additional issues exist at the level of nepotism within academia, where children of PhD holders are more likely to secure jobs at top institutes (Ref Morgan et al, 2022). The combined effect of these issues is loss of women, first gen, and minority researchers from academia.

Existing NIH policies, programs, or resources

Practices to narrow the knowledge gap for postdocs could include: mandatory training of PIs on mentoring and career advisement if they receive NIH grants. Stipulation of an outside career monitoring through committee formation or reporting to an internal office of the NIH for postdocs. Expanding eligibility years for K99 type grants or introduction of additional funding not restricted by time from PhD for those who's development might take a non-conventional or unlucky turn early on. More aggressive dissemination of opportunities, perhaps through University offices, it has been my experience that most postdocs are not aware that they are eligible for K01 grants.

Proven or promising external resources or approaches

No response

Response 2531

Perspectives on the postdoc roles and responsibilities

Being a post-doc means you must do everything without much say. You have the least say about your interests and need to perform better.

Fundamental issues and challenges

The quality of life is very poor for postdocs US. The major reason for it is inadequate salary/stipend. Due to this, we cannot afford good and secure housing. Because of a lack of funds, many of us live in unsafe housing or areas, risking our and our families lives.

Unequal opportunities to participate in career development programs and scientific conferences.

Existing NIH policies, programs, or resources

Our institute provides a minimum salary according to the NIH guidelines, whereas Boston City is so expensive that one cannot live a decent life with this salary. Maybe increasing the salary according to the city will help the postdocs research in an inhibition-free environment.

Proven or promising external resources or approaches

Postdocs should get more career development opportunities with a say over their interests and needs.

A decent salary so they can afford a good life in expensive cities like Boston.

Response 2532

Perspectives on the postdoc roles and responsibilities

A postdoc to me is an opportunity to receive more training in skills and independence needed to run your own lab. You have a responsibility to seek out opportunities to do so and focus on your growth as a researcher and scientist.

Fundamental issues and challenges

The number one issue inhibiting postdoc recruitment and retention is non-competitive pay and benefits. Alternative paths pay at least double if not quadruple more than the NIH minimum set for post-docs and offer better health insurance, retirement, and family leave. The postdoc salary after taxes does not even cover the cost of daycare in most cities. Without a partner with another income (non-postdoc) it is impossible to save any money or even consider starting a family. In addition, there are absolutely no benefits to take advantage of when you do have a family and it is in fact frowned upon by most mentors to take any family leave from the lab and it is expected that you will still maintain more than 50 hours a week in the lab when most daycares cannot accomodate late pickups. It is in fact recommended that as a woman in science, if you leave the lab early to pick up your child from daycare that you will return to the lab later for a few hours to finish up your work for the day. There is no protected family time or hours unlike most other industries.

Existing NIH policies, programs, or resources

The pay and benefits is the number one problem the NIH faces with postdoc recruitment, retention, and quality of life. The pay needs to be adjusted, particularly in major cities such as Boston and NYC where the NIH minimum does not even cover the cost of renting a one bedroom apartment, let alone utilities, food, and basic expenses. A standard life science post-doc of 4-5 years after a 5 year PhD means that if you are to do a post-doc, you cannot begin to even start contributing to your savings and retirement until your mid 30s, at least 10 years after your peers have been putting money away towards this. Competitive compensation is necessary to enhance the postdoc training ecosystem and academic career path.

Proven or promising external resources or approaches

You need to look at what start-ups and industry are offering people with PhD as starting compensation and how the compensation is adjusted with 1 or 2 years experience. Post docs are doing the same if not more work than their peers in these positions and are treated significantly worse for no reason. While a post-doc position is considered a training position and they are treated as such, their peers are respected as qualified scientists in their industry.

Response 2533

Perspectives on the postdoc roles and responsibilities

Postdocs are heavily involved in lab work with both PI and independent projects and are trained in more administrative tasks of running a lab and in grant-writing (if going to continue in academia). They are focused on continuing their career elsewhere after a short amount of time, ~3-7 years, with a PI. In my opinion, many current postdocs are actually research scientists, working for the PI without personal goals of moving into lab administrative roles. There is also often not enough guidance for postdocs and their role in a lab; it is highly variable by the lab.

Fundamental issues and challenges

Pay and cost of living. That alone is the largest and most important issue. Postdocs simply do not get paid enough for all the work that they do. Many work overtime and on weekends without pay. Additional work could be done on assisting postdocs with transitioning out of grad school, grant writing, and/or career advancement.

Existing NIH policies, programs, or resources

Cost of living adjustments should be included in the NIH funding program. Pay scale should reflect the cost of living in any area. Many postdocs in rural areas are very happy with their pay, while those in urban areas struggle to make ends meet.

Proven or promising external resources or approaches

Having a peer advisor system in place. Giving postdocs a more experienced postdoc contact that they can go to for information and advice.

Response 2534

Perspectives on the postdoc roles and responsibilities

I appreciate my current scientific role as a post-doc. I feel that my mentor has given me a great opportunity to mentor students, be independent in my experimental design and execution, and grant writing. I view this time as a trial period for what my life will be like a professor, while still having a fall-back of my mentor's funding and guidance.

Fundamental issues and challenges

Primarily, the pay scale is what I find drives many of my colleagues away from academia and into industry. Especially in a city like Boston where cost of living is high, the post-doc salary is not nearly enough for the level of expertise and education we have. This low pay also excludes people from financially under-privileged backgrounds (which is dominated by URM scientists) from succeeding in academia as easily as our privileged counterparts.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2535

Perspectives on the postdoc roles and responsibilities

Postdocs should have the ability to write papers and grants, to idealize projects and to train undergrad and grad students. In another words, they should be ready to become independent scientists.

Fundamental issues and challenges

Because postdocs usually have 30+ years old, the salary does not match with their cost of life (paying rent, afford school for kids, etc) specially in big cities.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2536

Perspectives on the postdoc roles and responsibilities

A postdoc should focus on training, not just labor for a PI in the short-term to wrap up an existing project or analyze some data to finish up someone else's work. Postdocs should not be expected to do the same work as a faculty member. They are in training, and training is more than doing. If they are supposed to be doing the work of faculty, they need to be hired and compensated as such. That said, even as "trainees" it should be recognized that postdocs are already professionals. They are not students. They need full benefits and pay like other professionals in other fields who have commensurate experience. Other industries have on the job training as well and the person is still paid for their existing professional skills. In other words, you can't slap a "training" tag on someone and pay them less when they already have a PH.D.

Postdocs should also help people build new skills and experience to help them move on, not just be more of what they did for their Ph.D. Otherwise, what was the Ph.D. for?

In sum, postdocs are not students or cheap temporary labor to fill in for permanent staff that PIs can't afford or don't want to mess with. They are professionals who are trying to upskill or pivot their research or teaching direction. Anything else is exploitation of highly trained professionals who in any other field would have job security and much higher pay.

Fundamental issues and challenges

Ph.D.'s are taking longer and longer to finish because definition of a complete Ph.D. continues to grow. Postdocs are at an age where they need to be able to start families. They expect and deserve job security. The number of expected years of postdoc experience or publication production required to take the next step continues to grow. People can't just keep moving around from temp job to temp job when they want to start a family.

The pay is insufficient, especially when people at similar life stages with similar experience make far more money. Passion for research and a willingness to make a little less money to pursue that can only be exploited so far.

Disinvestment in higher education institutions makes for fewer and fewer opportunities to advance beyond the postdoc in academia. At the same time, the positions that are available are more and more dependent on unreliable soft money. Tenure is melting away and providing less security. Good science, on relevant subjects, well-communicated, is no longer sufficient to get funding, and hasn't been for 30 years (arguably). A PI's work and their employees' livelihoods are left to a dice roll as much as they are left to the quality of grant submissions. Quality is necessary but not sufficient. If postdocs are overworked, underpaid positions, and faculty jobs look little better, why would anyone choose that path? Love of science and the appeal of academic freedom can only take you so far.

Existing NIH policies, programs, or resources

Policies on when postdoc positions are allowed on grants and how the PI expects to use the position need to be adjusted and tightened to make sure that postdocs are actually getting a mentored experience that will help them move on, not just filling in for positions that should be permanent staff or cheap labor.

Required pay needs to be increased to reflect local cost of living, full employee benefits (not student benefits), and reflect the level of experience and training PIs are getting when they hire a postdoc. No other field gets to pay people so poorly for so long for so much experience and education. It needs to end in the academy, even if that means funding fewer projects/positions. Academia can no longer do more with less. We've taken that as far as it can go.

Proven or promising external resources or approaches

I don't have anything to share here.

Response 2537

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is to prepare candidate to independent researcher. this is very crucial step of academic career.

Fundamental issues and challenges

over all training is good in good institution. however these good institution's are in expensive cities. therefore the money paid by NIH is not good enough to live good quality life. for example, cities like boston, new york the minimum salary should be around 84K.

Existing NIH policies, programs, or resources

Definitely, NIH has to modify and improve postdoctoral training.

Proven or promising external resources or approaches

No response

Response 2538

Perspectives on the postdoc roles and responsibilities

This is a training position and thus, should be developing new methods or avenues of investigation. Many postdocs get put on routine projects, where they are basically used as glorified technicians, running tens to hundreds of samples with no clear goal--see [redacted for anonymity]. I dont think that is a good postdoc. This kind of work is good for those that want to lead groups--gives them some managerial training that is painfully absent in most postdoc positions.

Fundamental issues and challenges

Postdocs are grossly underpaid for their stage of life. This is largely due to the fact that NIH grants are the same dollar amount as the 1990's. Not even pretending to keep up with economy.

PDs are not trained to manage people or funds. This is a challenge if their next step is a leadership position.

Existing NIH policies, programs, or resources

NIH grants need to be worth more money, especially for salaries. If an R351 is $250k a year, a postdoc in California is $90-100k a year (including benefits), then my salary (51% for an R35, plus benefits: $75K + 30% ~~$100k). That means I have $50k left for experiments. An ice bucket with a lid is $100.

A mechanism to fund foreign trainees IN AMERICAN LABS would also be helpful. Some kind of fellowships. I agree in supporting US-born PDs but a large part of the workforce are foreign trainees.

Proven or promising external resources or approaches

They need more money. They are trying to have kids and save for retirement. They are in their 30s. We have to pay them something competitive with industry salaries. They get freedom and other benefits but if they cant afford to live ($2500 for a 1 bedroom in Southern California) they wont postdoc.

Response 2539

Perspectives on the postdoc roles and responsibilities

For me, a postdoctoral position was a trainee position, where I could learn how to be a PI, learn a valuable skill such as coding to my list of abilities, and be associated to high impact work of my PI. But it's clearly not the case. I'm basically someone that does the projects that are below my PI according to her opinion, which often end up being dead ends. I only worked on my PhD data since I'm here, I'm not allowed to collect myself datas with patients so I need to hope that my PI will give me valuable things to work on, but I don't know of that's gonna happen.

Fundamental issues and challenges

First, the lack of definition of what you are, what your role is, what your environment will be. Then the salary: you are constantly struggling, you need help from your parents to survive, it's so humiliating to have to repeat to yourself "you are a postdoc, you are doing ok in life" just to convince yourself. The, the PIs treatment. Working 13h / day everyday is normal ? No. If PI provided a supporting environment, we could work 8h/day and be way more productive than an almost burned-out person workin 13h/ day. Finally, the publication pressure should be lowered: if you're in a smaller lab, you'll publish less, and it's ok, it doesn't mean that you are not doing your job right. 20 years ago, publication was easy, it's not the case anymore, so why are the expectations always go higher in terms of papers, even when you're just out of your PhD ?

Existing NIH policies, programs, or resources

To increase salary, NIH should monitor the amount of money the institution takes from PI grants, especially for labs that makes an insane amount of profits. If a lab is making lots of money, shouldn't [redacted for anonymity] (my university) take less money from this person grant ? In general, why are these rates so high ? If the institution takes less from the grant, a certain amount should be retained for

increased postdoc salaries. In addition, we HAVE to adapt the salaries to the location: I'm in New York and earning the same as someone in Texas: is this normal ? I'm barely surviving, some months I don't know how I'm gonna be able to do the groceries, I cannot afford any kind of breaks, holidays, or hobbies ! This is not normal in 2023. In addition, a lot of the postdocs are internationals, and therefore not eligible for NIH grants. We should be able to apply for grants, otherwise we are even more stuck and dependent of our PIs. In the same line of ideas : where are the grants for human sciences / psychology ? We NEED more recognition from NIH, more grants dedicated to human sciences (and no, not all human sciences are gender studies or ecological things . Come on, I'm working on PTSD / stress reaction from a psychological perspective and you have NOTHING I can apply to).

Proven or promising external resources or approaches

Monitoring the PIs !!! They need to answer to someone, we should have a platform to report abuses, outside our institution (because nothing happens, the story is killed or we threaten your job). And those reports NEED to have an impact on the PI! Working hours should also be monitored: why aren't we supposed to officially report our hours ? Why a week of rush on a project is not followed by a lower hours week? NIH should force institutions to officially record working hours to prevent abuses. It's not because years ago a postdoc = no life and only work that it has to stay the same, it is NOT a sign that you're good at your job if you work 13h / day. It shouldn't be a criteria anymore ! Suffering during your postdoc should not be a mandatory stage in your careers! And what about gender adaptations ? Why are we, as women, evaluated according to the same criteria than mens ? It means that I cannot start a family before at least one successful postdoc, to ensure my career. Otherwise, my record track will never be as good as others. I am doing a postdoc oversea in the fear that my relationship will not survive it and that I might never have a family. But it's that or have no career in academia, and as a researcher in psychology I cannot go in industry. I'm stuck in research after my PhD, and I feel like I don't have any other option now, so I HAVE to perform, according to sexist and horribly old criteria. You have to do something about this whole situation, it has to change and not a bit.

Response 2540

Perspectives on the postdoc roles and responsibilities

Cheap slaves that are exploited by PIs, who by the way have ZERO skills comparing to postdoc these days. A position that will damage your career in a permanent way.

Fundamental issues and challenges

This is a very stupid question. How dumb are you, NIH people? The most obvious issue is MONEY, SALARY, and [redacted] LONG WORKING HOURS!!!

Existing NIH policies, programs, or resources

Pay them more, morons!

Proven or promising external resources or approaches

None. You guys are useless anyway.

Response 2541

Perspectives on the postdoc roles and responsibilities

I view the postdoc as an extension of training from graduate school, either to learn new skills or crystalize understanding of the current field. The difference in perspective and responsibility compared to graduate students is an important means to gather more requisite knowledge about a career in academic science. Also, postdocs, unfettered by the requirements of studentship are often the most productive and invested researchers and leaders in the lab.

Fundamental issues and challenges

Increased demand for postdocs in biotech and biopharma has reduced the number available for recruitment to academic labs. If this continues, the academic output is likely to stagnate somewhat.

Postdocs have considerably better quality of life compared to graduate students, but this assumes a number of things. For example, it is exceedingly hard to start a family (and pay for childcare) as a graduate student or postdoc, especially in major US cities. Moreover, there is a large heterogeneity in terms of treatment for postdocs, where some are exposed to consistent and present mentorship, some are left alone for 5 years and expected to "just figure it out".

Existing NIH policies, programs, or resources

I believe there should be a simple to interpret and search, common framework for guidance from the NIH for postdoctoral fellows. As the preeminent investor in young scientists, having resources to help not just those funded but those seeking funding by way to training and tutorials that can be built and held asynchronously (to lower the burden on staff/teachers/mentors) would be powerful.

Simply creating something where when someone starts a new postdoc and asks "what do I need to no about a postdoc?" there's a single point reference to give them an idea of what to expect and trusted advice from those both in academy and industry would be invaluable. As a counterpoint, for example, to get a list of fellowships to apply to as a postdoc one needs to scour dozens of webpages to find eligibility and timelines. A community oriented/built, NIH administered, set of pages (think StackOverflow) could dramatically improve this.

Proven or promising external resources or approaches

The simplest thing is to pay postdocs more. Yes it's hard, yes it'll be challenging, but making ends meet or trying to build a family before the age of 40 results in an undue burden on postdocs who are often asked to work 60-90 hours a week.

Moreover, institutions (and states) such as mine will require higher minimum salaries for postdocs that will be greater than $90,000 by 2028. If there is not more money invested and reserved for postdoc salaries, we will continue to lose some of the best and brightest to more lucrative careers.

Finally, investment in ESIs will be essential, and a move away from the modular budget for early investigators. There is almost no way to afford modern and deserved postdoc salaries on budgets written to accommodate science 20 years ago.

Response 2542

Perspectives on the postdoc roles and responsibilities

The postdoc is an important training period where the trainee has the freedom to pursue their own project(s) that fall reasonably under the umbrella of the host lab in a largely independent way without the stressors of admin/fundraising/teaching/service/infrastructure building.

It is essential that tenure track faculty have a solid foundation in designing and executing research prior to becoming independent, as there are many hats to be worn once one is in a PI job.

Fundamental issues and challenges

$$$$, especially in Washington State due to the new legislation.

Existing NIH policies, programs, or resources

R01/R35 budgets need dramatic increases. The current modular levels are a joke.

Proven or promising external resources or approaches

Its really just $.

Response 2543

Perspectives on the postdoc roles and responsibilities

I view it as a means to an end. I view the post-doc as a temporary position that allows me to work in my field while I prepare to pursue other, more lucrative opportunities. I think the specific roles and responsibilities of a post-doc vary wildly from lab to lab, but in general I think post-docs are expected to be the drivers of research within their labs. They are tasked with training new students and other post-docs, generating data, and writing papers. For the most part it seems that principal investigators are

responsible for grant-writing and editing of papers, but the post-docs are responsible for ensuring the principal investigator has something to write about.

Fundamental issues and challenges

The low pay-scale for post-docs definitely has an impact on recruitment, retention, and overall quality of life. The highest salary for post-docs per the current NIH guidelines is under $70k per year, and even that salary requires 7 years of experience on top of the PhD. Given the high cost of medical care, housing, and transportation nowadays, this salary leaves a lot to be desired when compared to how hard post-docs have worked. Post-docs have gone through a PhD program wherein they were paid very little, and they have usually made significant sacrifices to make it through their program. After their years of hard work with little pay, I feel like post-docs expect to have the possibility of living a comfortable life. However, the high-paying jobs are limited to pharma industry jobs and tenured faculty positions at universities. Since tenured faculty positions are so competitive and post-doc positions pay very little, I feel like this forces many PhD graduates to look for industry jobs and nothing else.

Existing NIH policies, programs, or resources

The payscales for post-doctoral scholars could probably be increased. I would recommend increasing the payscales across the board, but ensure that the higher end of the payscale is significantly higher than it is now. The average pay for fresh PhD graduate joining the pharma industry is ~$90k per year. Under the current system, fresh PhDs can either find a comfortable industry position with good pay, or choose a post-doc and work harder for half the pay. I think the current payscales are driving skilled PhD graduates out of academia because the pay simply isn't good enough for how hard they work and have worked to get their PhD.

Proven or promising external resources or approaches

Unsure. I think increasing pay would make post-doc positions more desirable, and therefore would attract more of the most skilled and driven PhD graduates and thus improving the post-doc ecosystem.

Response 2544

Perspectives on the postdoc roles and responsibilities

[Redacted for anonymity], established the Long Range Planning Committee to build a shared collective vision of the future of postdocs. The Report, [redacted for anonymity] addresses the broader occupational context of postdocs in the US, the historical context of postdoc advocacy at [redacted for anonymity], the current mindset of postdocs ascertained through focus groups, and contemporary advocacy efforts of current postdocs. The Report concludes with an extensive list of recommendations broken down by specific issues postdocs face and action items for specific stakeholders, including the NIH. The bottom-up, community-oriented vision for the future is that postdocs should be enabled to perform the best research possible and be supported to achieve success in their subsequent careers inside or outside of academia. The Report was deliberatively focused on foregrounding the voices and efforts of postdocs themselves, asking "What do postdocs think about the postdoc role?". The Report received substantial input, including a dozen focus groups with 50 postdocs at [redacted for anonymity] and input from over 70 postdocs on the draft in the form of hundreds of comments. The full elected [redacted for anonymity] unanimously adopted the Report at our meeting on March 30, 2023 and directed the Committee to submit the Report to this NIH RFI. We request your deep and thoughtful engagement with the content we have created and for the NIH to adopt policies and procedures that can help postdocs reach the vision laid out in the Report by 2030. Postdocs play a major role in the academic and research enterprises by designing, executing, and performing experiments; assisting in writing grants; and teaching and supervising undergraduate and graduate students.

Fundamental issues and challenges

Difficulties facing postdocs are extensively covered in the Long Range Planning Report from [redacted for anonymity]. Difficulty meeting basic needs and extreme financial pressures are significant pressures and challenges facing postdocs. Postdocs in academia are underpaid, and postdocs at [redacted for anonymity] (and other high-cost-of-living areas) are additionally underpaid. Postdocs with dependents face extreme financial pressures, and most postdocs do not end up as tenure-track researchers. Postdocs exist in an occupational limbo, neither students nor staff. Postdocs are underappreciated and perform labor that tends to go unacknowledged or uncredited. Postdocs face specific issues related to Justice, Diversity, Equity,

Inclusion, and Belonging, but difficulties meeting basic needs overshadow those challenges. Postdocs face job instability in the short term due to being hired on a short term basis and also in the longer term due to the time limit on working as a postdoc or applying for funding opportunities. International postdocs, who represent a majority within both the [redacted for anonymity] and US postdoctoral populations, face additional job and life instability due to visa issues. In focus group discussions, major themes that emerged frequently were that postdoc salaries are insufficient for the high cost of living we face; that postdoc parents face very high costs and low access to childcare; that the instability inherent to the postdoc position prevents long term life planning; that effective formal structure is lacking for postdocs, the difficulty of navigating the US funding system (especially for international postdocs); the ambiguous status of postdoc leading to feelings of exclusion; the lack of effort on Justice, Diversity, Equity, Inclusion, and Belonging issues; postdocs not always being aware of existing resources; and that existing academic structures are poorly designed and unclear. Please see the Report for a deeper discussion of all these topics.

Existing NIH policies, programs, or resources

The NIH should work to achieve the policies that it has failed to reach over the past two decades. In 2001, the NIH set a target annual stipend of $45,000 for entry level postdocs and planned to increase then-current stipends by 10-12% over the following years to reach that target before subsequently maintaining the real value of those increased wages by annual cost-of-living adjustments. This decision came shortly after the 2000 report from the National Research Council, Addressing the Nation's Changing Needs for Biomedical and Behavioral Scientists, called for increased stipends for researchers. (For instance: "Recommendation 5-4. Stipends and other forms of compensation for those in training should be based on education and experience and should be regularly adjusted to reflect changes in the cost of living." in Chapter 5: Crosscutting Issues in Research Training). Starting from the NIH goal of $45,000 in September 2001 and adjusting for national average inflation, the target minimum annual postdoc salary in September 2022 would be equivalent to $74,403. However, the actual minimum annual postdoc salary is only $54,840, a gap of nearly $20,000. The NIH also does not have a policy to adapt funding levels to local cost of living, exacerbating issues for postdocs who live in high cost of living areas. The NIH should work to achieve its long-stated goals of increasing salaries for postdoctoral researchers. Additionally, the NIH should remove the time limit associated with the postdoctoral role. A majority of academic postdocs do not transition to tenure-track roles, but many remain employed as non-faculty doctorate holding researchers. NIH should recognize the empirical reality of the academic research workforce and create stable, long-term positions and funding opportunities for academic researchers with terminal degrees that are not employed on the tenure track. Please see the report at the link above for more.

Proven or promising external resources or approaches

The [redacted for anonymity] Long Range Planning Report, [redacted for anonymity], concludes the executive summary with a list of principles. Firstly, postdocs should be appreciated and not exploited, including receiving salary and benefits commensurate with their existing high level of training and expected contributions to the research enterprise. Secondly, postdocs basic needs should be met, including salary and benefits that take into account cost of living for the local area, not being required to spend more than 30% of income on housing, and access to childcare facilities that are affordable and cost no more than 30% of postdoc income. Thirdly, postdocs should have job security, which includes a removal of the five year time limit for postdocs and the distinction between postdocs and research staff; postdocs being employed as permanent staff with provisions to terminate employment if explicitly stated conditions are not met rather than yearly contracts; and work visas that reflect the permanent staff status which allow international researchers to work as postdocs as they do now. Fourth, postdocs should receive job structure and career support outside their immediate research groups in the form of:

1. structured guidance at multiple points during a postdoc, ideally within a cohort setting;
2. career tracking of past postdocs and communication of those results publicly; and
3. training for groups leaders to improve their mentorship skills.
4. Finally, postdocs should be actively included in university business by having (voting) seats on university committees and working groups, as well as recognition from funding bodies in fellowship and grant applications for university service and DEI work.

Response 2545

Perspectives on the postdoc roles and responsibilities

- Publish quality papers. Have been told by many mentors, "Publish or perish".
- Training to be an independent scientist and have the opportunity to train to be ready to be a PI
- Opportunities to write a grant for the postdoc to take with them to their next stage
- Opportunities to present at conference once a year to expand the network of the trainee. Not all PIs have the funds to allow all of their postdocs to go to conferences to expand their network. Furthermore, there are also PIs who do have funds, but choose to not have their trainees go to conferences due to desire to spend costs from grants on other expenses.
- Focus on training and meeting the trainee's research goal, not just the research goal of the PI. To ensure this, regular check-ups with the trainee and the trainer could be sent in to NIH for review if the postdoctoral trainee is meeting all goals. If there are signs that the postdoctoral trainee is not being provided with enough support to support the trainee, then new projects would need to be proposed by the trainee and progress need to be made for the trainee to be able to have the experience of leading an independent project.
- Mentor graduate/undergraduate students

Fundamental issues and challenges

- Unjust financial compensation. Private universities have their own postdoctoral minimum salary, therefore they are allowed to pay postdocs below the NIH stipend level. While the private institution minimum is higher than NIH's Year 0 level, they are not required to pay a 6th year postdoc the Year 6 level. Every institution, whether they are private or public should be required to meet the minimum NIH salary cap based on their corresponding year.
- Increase money given to labs in order for postdocs to be paid fairly. Many PIs are stating that they have to terminate postdoc opportunities due to increased postdoc salaries and lack of increase in grant funding from the NIH.
- Childcare/Maternity/Paternity Leave. Lack of childcare support discourages women and scientists who would like to start families from doing a postdoc and as a result is not creating an inclusive environment.
- Cannot save for retirement. Institutions should match Retirement 403b contributions. Full benefits from social security is projected to run out in 2037. Therefore, postdocs must be able to have 403b/401k to plan for their retirement. Also, postdocs on fellowships are not allowed to save for retirement! Only permitting salary-paying postdocs to have a 403b makes it unfair to postdocs who bring in a fellowship and who are helping the PI save money.
- Many postdocs do not take all paid-time-off/vacation days they are given due to external pressures. If quality of life is taken seriously for retention of postdocs in the biomedical research enterprise, make it so that for every paid-time-off the Postdoc does not take, they are compensated financially for the paid-time-off they do not take. Trainees should not be pressured to work every weekend and holiday. This should especially be the case because Postdocs do not get paid Overtime. Yet, majority of postdocs I've met work 60+ hour weeks!

Existing NIH policies, programs, or resources

- It should be modified such that if a PI who hires several postdocs has to set aside money to pay for the postdocs including estimates for covering raises each year to fit the NIH salary cap. It should be made that when a PI hires a postdoc, that if they are signed on for 2 or 5 years, they should have money set-aside that is used to pay for the postdoc. Then, any leftover amount, if they overestimated the costs, could be kept to be used for paying future trainees or could be used to supplement spending for trainees to go to conferences or can return to the PI. If there is true interest in fostering trainees and the next generation of scientists in the U.S. biomedical research enterprise, proper budgeting needs to be enforced for fair compensation and retention of postdoctoral trainees.
- If a PI saves money to spend for trainees, there could be a savings initiative put into place similarly to how there are savings benefits when people save money to go to college. The same could be applied to PIs and their grants, and therefore this would provide incentive for PIs to ensure that they have enough money to compensate the work the postdocs are putting in.
- NIH funding programs do not incorporate intersectionality very well.

Proven or promising external resources or approaches

No response

Response 2546

Perspectives on the postdoc roles and responsibilities

The primary goal of an academic postdoc is to supplement the graduate training with necessarily skills and knowledge for the next step, either for a PI position or a non-academic position. For a PI position, the postdoc period is for carving out a niche and crafting a research program for an independent lab; for non-academic jobs there is more focus on learning skills and methods. Responsibilities include mentoring technicians and students as well as carrying out an independent project.

Fundamental issues and challenges

Postdoc in biomedical research, especially for people intending on staying in academia is quite long. This is a prolonged period of relatively low income (compared to full earning potential of PhD-holders) and little certainty often overlapping with a period in life where family planning and settling down in a place happens. In other words, income and certainty of one's career prospects/ future are especially important during this period, but postdoc positions rarely offer even one of these: 5-6 years is a long time to be making ~60k at best especially with high childcare and housing costs, and academic jobs are extremely competitive and depend heavily on the mentors' reputations (for recruitment and for publication record). These issues disproportionately impact women as many women have to weigh whether and how to balance their careers and having a family in their early-mid 30s, which usually overlaps with their postdoc training. The low postdoc income especially deters recruitment of scientists from marginalized and underserved communities who may need to provide financial support to their families/communities.

The academic culture is also more challenging for women and minority scientists. The power dynamic in academia is such that there is very little protection for victims of bullying, harassment, and misconduct by PIs, especially by those that are established and well-known in the scientific community. There should be more definitive consequences to these kinds of actions.

The lack of consistent policies regarding salary and benefits also impacts the postdoc quality of life. Institutions have different policies on how an NIH fellowship would impact a postdoc's benefits and in many institutions a fellowship means losing retirement and subsidized healthcare benefits. This is counterintuitive as fellowships are critical for an academic career.

Existing NIH policies, programs, or resources

Higher salary and a greater year-to-year increase to account for inflation rates.

Allow for longer maternity and paternity leave in funding timelines.

Increase childcare reimbursement limits in NRSA awards: in many cities, $2500 barely covers one month of daycare.

Increase childcare funding for conference travel.

There should be less bias when reviewing extensions or funding based on life events (pregnancy, unexpected caretaking, etc.) and further justifications should not be necessary.

PIs who have been reported in the past of harassment or misconduct of any sort should not receive NIH funding again.

Proven or promising external resources or approaches

No response

Response 2547

Perspectives on the postdoc roles and responsibilities

A lot of work with minimal reward. I lead experiments. I supervise undergrads and grad students because the PI is absent, but will gain no credit for doing so. If I want to stay in academia this what I am required to do.

Fundamental issues and challenges

Overworked and underpaid. As a postdoc I am paid one third of the salary I could get from industry. In fact there are staff employees in my lab that get paid more than me despite them having a lesser degree and similar work experience. You want people to stay as postdocs, then pay us a fair wage for the responsibilities we have.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2548

Perspectives on the postdoc roles and responsibilities

Let's stop calling postdocs "trainees" and start focusing on their status as early career researchers. The term "trainee" is demeaning and too often used to justify paying low non-competitive salaries. Postdoctoral fellows should be focused on building their independent research program and obtaining their own grants rather than serving a prof's interests and research program. It should be a stepping stone and transition to faculty, not a lengthy 4-6 year commitment under the guise of "being in training".

Fundamental issues and challenges

Pay is horrendous. Quality of life is terrible. Postdocs are treated as glorified grad students and lumped into the same "trainee" category as them. There is little to no respect for them. It feels like doing a second PhD.

Existing NIH policies, programs, or resources

Increase salary support! And change where postdoc funding can come from. Our institution has a postdoc union that has negotiated a higher than NIH salary, but because of the NIH rules the difference between the union salaries and NIH pay scale have to be paid by non-federal funds. This makes it even more challenging for labs to recruit and retain postdocs. Allow postdoc grants to make up the difference or cover the difference on the mentor's R01. Add small amount of research funds to F32. F32 to K99 pathway could be reworked—by the time we get an F32 and complete it, no longer eligible for K99.

Proven or promising external resources or approaches

Competitive salaries.

Response 2549

Perspectives on the postdoc roles and responsibilities

To me, postdoc is a transient intermediate bridging PhD and independent career. In the context of biomedical research, independent career can be academic or for-profit organizations (a prime example being pharma or biotech companies). Postdoc is essentially meant to supplement skills and expertise that a PhD student feels are necessary, or important, or desirable on their resume for them to be competitive in the job market. As an extension, postdoctoral research should supplement PhD training and not repeat it in a polished, more sophisticated fashion. I feel as a postdoc interested in a tenure-track position, I want to learn how to set up and run a lab, how to identify funding opportunities and write compelling grant proposals, grow a sizeable network of peers as well as contribute to service through peer review, etc. Just getting better at certain techniques or solely focusing on learning novel techniques defeats the purpose of postdoc. In a research lab, a postdoc can be a great resource to train others, more approachable for daily experimental trouble shooting for both undergrads and grad students and a general oversight of the lab.

Fundamental issues and challenges

Postdocs are often treated as cheap labors to complete experiments that are needed for a paper or grant proposal a PI has envisioned, with little to no regard for their career development. To begin with, postdocs in biomedical sciences continue for ~5 or more years which is equivalent to the time spent earning a PhD

degree. The compensation is poor, not adjusted for inflation, there are no long-term career prospects. For postdocs on a visa, the struggle is a lot harder. It usually takes anywhere between 3-6 months for the university to process visa related paperwork during which they cannot realistically find any new job. Contracts are often abruptly terminated because the PI ran out of funds and the visa cannot be renewed. It is often very difficult to get a vacation for 4-5 weeks to visit one's home country at least once in a year. The contracts are often for one year only, which means we only get a visa for one year and every time we go back to our home country, we need to fill out lots of paperwork for stamping and it is expensive. With the COVID related disruption, slots for visa interviews are very limited.

Existing NIH policies, programs, or resources

a) Postdoc should be capped at 4 years, maybe extended to 5 under extraordinary circumstances. Just glorifying postdocs by titular changes is of little use. Lab associate/ postdoc associate should be abolished altogether and replaced by non-tenure track research positions with competitive benefits commensurate with skills and experience. Instead of capping salary for these positions, NIH should increase the number of these positions to increase research productivity.

b) ~50% postdocs are not US citizens nor permanent residents. They are not eligible to apply for any other NIH grant except K99 which is super competitive and open to US citizens. This translates to 50% of the postdoc work force left without any viable career development options if they want to continue their research in the US.

c) Health insurance offered to postdocs differs vastly across different states in the US and is not at par with other university staff. This really affects people with family given the prohibitive cost of healthcare in the US. Many of us just cannot make ends meet with the current pay and benefits and are forced to move into biotech (forced, not lured).

Response 2550

Perspectives on the postdoc roles and responsibilities

Transitional role for a faculty

Fundamental issues and challenges

Very low salaries. At this age and stage or our careers, a chunk of brilliant minds are underpaid leading them to explore other non academic opportunities (unwillingly) because everyone in their 30s need money to feed mouths at home, plan for their future, have a house! Basic things!

Existing NIH policies, programs, or resources

No one in my opinion would be substantially increasing the salaries to meet the industry standards for a related role.

Proven or promising external resources or approaches

Increasing salary

Response 2551

Perspectives on the postdoc roles and responsibilities

As an academic postdoc, my perspective on the roles **and responsibilities** of this position is that it is a critical stage in my academic career. The postdoctoral position offers an opportunity to develop research skills, gain expertise in a particular field, and enhance one's academic profile. It is also a time to collaborate with other researchers, build a professional network, and potentially open doors to future career opportunities.

However, there are genuine concerns about the expectations placed on postdocs, the lack of job security and opportunities for career advancement. On top of that for international postdocs, lack of a clear path to Green Card is another hurdle. With J-1 visa, international postdocs are practically held hostage to the

institution/P.I. they are working for and their ability to stay in the US depends on entirely the said institution/P.I.

Postdocs are expected to conduct research independently or as part of a team, publish their work in high-quality journals, and contribute to the academic community through conferences and seminars. At time, they are also expected to mentor and supervise students and participate in grant proposal writing. Though many time, they never get the chance to write actual grant and never get any recognition for their contribution.

Fundamental issues and challenges

One of the most significant challenges facing postdocs is the limited funding available to support their research. Postdocs are often funded through grants, and funding for research can be unpredictable, making it challenging to plan research projects or support themselves. This lack of financial security can be a significant barrier to recruitment and retention of postdocs, as many are forced to seek other employment opportunities to make ends meet.

Another issue that affects postdocs, particularly international postdocs, is the visa and immigration process. International postdocs face unique challenges, including language barriers, cultural differences, and the need to navigate complex visa and immigration processes. Obtaining/continuing a visa can be a time-consuming and stressful process that often requires significant financial resources. This is a significant barrier to recruitment and retention of international postdocs, as many might prefer to pursue opportunities in places with better visa processes.

Additionally, postdocs often experience limited job security, short-term contracts, and limited opportunities for career advancement. This lack of stability can make it difficult for postdocs to plan for their futures, leading to anxiety and uncertainty. This also make difficult to retain talented postdocs, as they may seek more stable career opportunities elsewhere.

Furthermore, postdocs often experience low pay and limited benefits, making it challenging to cover basic living expenses. Postdocs are generally paid way less than faculty and receive limited benefits, such as health insurance or retirement benefits. Many postdocs (especially international) feel isolated and unsupported in their research environments.

Postdocs also experience challenges related to work-life balance, including long work hours and high levels of stress. These challenges can lead to burnout, physical and mental health issues, and reduced productivity. Work-life balance can be particularly challenging for international postdocs who may be adjusting to a new culture or language and may not have a support system in place.

Existing NIH policies, programs, or resources

The National Institutes of Health (NIH) plays a vital role in supporting postdoctoral training, including international postdocs, and advancing academic research. While the NIH has policies, programs, and resources that support postdoctoral training and academic research, there is still room for improvement.

The NIH could improve the Ruth L. Kirschstein National Research Service Award (NRSA) by, for example, expanding the scope of the NRSA program to include more interdisciplinary and collaborative training opportunities. Additionally, the NIH could modify the NRSA program to provide more support for postdocs in underrepresented groups, including women and minorities.

Another existing resource that could be improved to support international postdocs is the Office of Intramural Training and Education (OITE). The OITE provides various resources and services for postdocs, including career development workshops, counseling services, and a speaker series. However, the OITE could do more to support international postdocs who face unique challenges, such as navigating the visa and immigration process and adjusting to a new cultural and linguistic environment. The OITE could develop tailored resources and services for international postdocs to ensure they receive the support they need to succeed in their academic research careers.

The NIH could work with academic institutions to create more welcoming environments for international postdocs, including providing resources for language and cultural training. Additionally, the NIH could establish policies that streamline the visa and immigration process for international postdocs, reducing the bureaucratic hurdles that often prevent international postdocs from pursuing academic research careers in the United States.

The NIH could establish policies that ensure that international postdocs are not disadvantaged when it comes to career development and advancement opportunities. The NIH could encourage academic institutions to provide international postdocs with mentorship and guidance, as well as opportunities to participate in collaborative and interdisciplinary research projects.

Proven or promising external resources or approaches

One promising approach is the creation of postdoctoral associations, which provide postdocs with a platform to advocate for their rights and interests, connect with fellow postdocs, and access professional development opportunities. Postdoctoral associations have been successful in enhancing the postdoctoral experience at many academic institutions and can serve as a model for NIH to support postdocs in their career development and advocacy efforts. Additionally, these associations can provide valuable resources and support for international postdocs, who often face unique challenges in their academic research careers.

Another promising approach is the use of mentorship programs to support postdocs in their career development and advancement. Mentorship programs have been shown to improve postdoc job satisfaction, research productivity, and career success. The NIH could work with academic institutions to establish mentorship programs that provide postdocs, including international postdocs, with guidance and support from experienced mentors.

Furthermore, the use of diversity, equity, and inclusion (DEI) training programs has shown promise in creating a more supportive and inclusive environment for postdocs. DEI training programs can help academic institutions and their faculty to recognize and address systemic barriers and biases that may be inhibiting postdoc recruitment, retention, and advancement. Such training programs can benefit international postdocs by creating more welcoming and supportive environments for them to pursue their academic research careers.

The use of career development workshops and training programs can also inform the NIH's efforts to enhance the postdoctoral training ecosystem. These programs provide postdocs with opportunities to develop the skills necessary for their academic research careers, including grant writing, project management, and leadership.

Finally, the use of technology can also inform the NIH's efforts to enhance the postdoctoral training ecosystem. For example, virtual mentoring platforms can provide international postdocs with access to mentors and support networks across different geographic locations.

Response 2552

Perspectives on the postdoc roles and responsibilities

Postdoc position is a trainee period where you apply your previous experience as a graduate student and have opportunity to develop your own research paradigm.

Fundamental issues and challenges

For international postdocs in US, the only career development award they can apply is K99/R00 and which also has 4 year eligibility rule. The 4 year eligibility window is very tight to get first acclimatized with US system, get a first author publication and develop a research proposal that shouldn't overlap with mentor's. Considering this fact, it is very challenging for an immigrant postdoc to foresee long-term stability in academic research.

Existing NIH policies, programs, or resources

NIH is no longer offering COVID extension. For example, the COVID pandemic year (03/2020—04/2021) falls in several postdocs timelines and the information on COVID-related eligibility extensions is not updated apart from the old notice NOT-OD-22-062.

Proven or promising external resources or approaches

The postdoc salary cap for the postdoc should be improved for better job satisfaction.

Response 2553

Perspectives on the postdoc roles and responsibilities

- From the perspective of the postdoc, the position is a transition from structured training to independent research. It provides a period to fill knowledge and skill gaps and allows the individual to develop a research portfolio that provides the basis for a future academic research career. The position also provides opportunities to expand professional networks and initiate new collaborations.
- From the perspective of the mentor, an academic postdoc has the potential to bring new knowledge, skills, and ideas to the research team, stimulate the research, yet be sufficiently independent to generate peer-reviewed publications. The academic postdoc also provides an intermediate level of mentoring to undergraduate and graduate students, particularly for day-to-day operations.
- From the perspective of the institution, a research-intensive organization thrives on a healthy and robust postdoc community. It reflects the strength of the research portfolio to attract the intellectual resources provided by this position, which in turn fosters more vibrant and expansive research. An active postdoc community also provides a pool of potential future colleagues for the institution.

Fundamental issues and challenges

- The major challenge with both recruitment and retention of postdocs is fundamentally financial. Recently, entire graduate student bodies have gone on strike for higher wages. Even the most senior, highly paid postdocs typically earn significantly less than other PhD graduates who go straight to work in other career options outside of academia. Moreover, recent graduates with a lesser degree than postdocs are capable of earning more than most postdocs in careers outside of academia. Foreign nationals may come to the US as postdocs because this is their only route forward, but many American students generally have more attractive options. A 2017 review of longitudinal survey data found that ex-postdocs continued to earn less on average than non-postdocs ten or more years post-PhD. [Kahn, S., Ginther, D. The impact of postdoctoral training on early careers in biomedicine. Nat Biotechnol 35, 90-94 (2017). https://doi.org/10.1038/nbt.3766]
- The same 2017 article points out that there appears to be a lack of new tenure track permanent academic positions while the number of graduating PhDs has grown over time, as the likelihood that a postdoc led to a tenured/TT position was only 21-27.4% for the ex-postdocs they sampled. The article also notes that "official bodies have raised concerns about the working conditions, long hours, lack of benefits, and forced geographic mobility faced by postdocs, as well as the effects of postdoc jobs on families," which could also be considered potential challenges.

Existing NIH policies, programs, or resources

- NIH postdoc salaries should be increased at all levels, particularly for starting postdocs. There also needs to be a regional cost-of-living adjustment. Some cities are disproportionately more expensive and more competitive than other cities or rural areas. A starting NIH postdoc annual salary is currently $56,484, but likely needs to be at least $10k more to remain competitive. As more students graduate with crippling student loan debt from both undergraduate and graduate studies, salaries need to facilitate payment of student loans while being able to meet a minimum standard of living. Student loan repayment is one of the primary concerns of current postdocs and needs to be addressed before they are able to secure mortgages, etc.
- NIH should continue to implement and support policies and programs that diversify the postdoctoral population by increasing the number of postdocs currently underrepresented in biomedical sciences research, in order to stimulate new and innovative research that advances public health.

Proven or promising external resources or approaches

- More could be done to coordinate and train existing postdocs on funding opportunities to transition out of postdoc positions and to maximize their time as a postdoc. An excellent example of an NIH initiative that is making a difference is the Institutional Research and Academic Career Development Awards (IRACDA) (K12) program. This program provides funding for salary, outstanding mentoring, and prepares graduates of the program for a variety of career opportunities. The IRACDA program and other similar programs should be expanded in scope and reach.

- NIH should expand the inclusion criteria and/or reach for the student loan repayment program. This is an amazing resource to reduce student loan repayment burden, but it varies across institutions and is not widely promoted. Reducing student loan repayment burden shifts the needs for salary increases for eligible postdocs. Participation in these programs also requires a commitment of the recipient to a minimum of 5 years in non-profit clinical research. This allows a period of time to allow the postdocs to secure a position in academic research, consistent with NIH's priorities.
- Institutions like St. Jude Children's Research Hospital or Princeton University have recently increased postdoc salaries beyond the NIH standards. Some universities have implemented postdoc "term limits." Academic departments may also consider tenure-track hires for top new graduates. (Kahn et al.)

Response 2554

Perspectives on the postdoc roles and responsibilities

Recruitment of junior faculty / physician scientist must be as faculty and not as research fellows , especially for those with prior clinical or research experience so that they are ready to be scientists and take on challenges.

Fundamental issues and challenges

1. Intramural program needs to focus of health issues of public health relevance.
2. Efforts must be on to recruit talented physician—scientists.
3. Salary of physician scientist especially young investigators must be realistic and in tune with the pay around the country.
4. There should be ease of transition from intramural to extramural environment and vice—versa for the benefit of science.

Existing NIH policies, programs, or resources

1. Intramural program needs to focus of health issues of public health relevance.
2. Efforts must be on to recruit talented physician—scientists.
3. Salary of physician scientist especially young investigators must be realistic and in tune with the pay around the country.
4. There should be ease of transition from intramural to extramural environment and vice—versa for the benefit of science.
5. Efforts must be on for a K award like mechanism for clinicians / fellows in training to transition if needed from intramural to extramural environment.

Proven or promising external resources or approaches

K awards / CTSA awards / k99/R00 awards etc

Response 2555

Perspectives on the postdoc roles and responsibilities

The post-doctoral trainee period of a young scientist's career is critical. It is where one starts to learn how to focus their research and efforts without the dictates or support from a PhD. committee. It should be where they learn new skills and application of these skills to studies. It is also the time when they learn the details of how research is funded and how this funding is a contractual arrangement with the funding agency—not simply to do whatever idea you have but one that has undergone review. It is that awakening to the framework of how one has to work within academia. It should be a time when they learn how to manage a lab and/or group and to make a decision on their future career.

Fundamental issues and challenges

Pay, opportunities for job offers, at NIH limited support for visas, time to recruit foreign candidates, not enough good candidates, uncertainty of funding for full period.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Within NIH—require all intramural divisions to follow the NIH guidelines for pay and term limits rather than to have different divisions set their own limits. When a division arbitrarily states that post-docs will only be for 3 years that confuses candidates as they look at the NIH website and it states different time limits. A 3 year post-doc for someone at the wet bench is not sufficient for training—thus, one would choose to go to a different place for more stability and opportunity. There are divisions within IR that set their own time limits, ignoring NIH guidelines,—this is usually not DIR but rather the other divisions within IR.

Response 2556

Perspectives on the postdoc roles and responsibilities

A stepping stone toward a more permanent position. Time to develop independent research niche.

Fundamental issues and challenges

The uncertainty of timeframe is very challenging. A post-doc is not a set program like a PhD or a fellowship, but can go on for many years. This could allow flexibility in developing projects or in waiting for the best next step to become available, but more often than not, it makes it seem like these goals are not imminently achievable. Because you don't HAVE to move on to the next step at a certain time, mentors are less motivated to help with this.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2557

Perspectives on the postdoc roles and responsibilities

Post doctoral fellows have a wide range of responsibilities and career development opportunities available to them across the biomedical sciences. It would be good to have some standard guidance from the NIH attached to funding for post-doctoral training (i.e. for the mentor/supervisor to provide for career development advice, a set number of developmental opportunities to better prepare post docs for the next step, freedom to network/meet other non-supervisory mentors and participate in social and academic engagement with other disciplines periodically)

Fundamental issues and challenges

Sorry to be so blunt, but in some institutions, post-docs are abused/have work dumped on them for very little compensation with very long hours. At other institutions they are more like "absentee" slots for PIs to use up funding to justify their grant/apply for the next cycle while the post-doc interviews for junior faculty positions—I think both are abuses of the system (but who would track and report as such as fraud/waste/abuse?)

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Mentoring and clearer pathways for advancement as junior faculty might help with improving post doctoral recruitment/training. There need to more scrutiny for "large academic institutions" [which are almost automatically considered 'conducive training environments'] for utilization of resources (including trainees) for scholastic productivity vs. hours worked based on outcomes beyond placement of fellows. Blue sky

science is very important and ought to be protected, however, there needs to be some ongoing/iterative process of discussion with other disciplines to see about implementation—so that tax dollars aren't funding projects that sound glamorous but do not, ultimately, benefit the average American.

Also consider greater urban/rural collaboration for more equitable distribution of resources rather than constitution at a few large institutions. Maybe encourage a certain amount of funds to go towards biomedical outreach to less population dense centers (not just to build impressive buildings but also provide a pipeline for collaboration and education?)

Response 2558

Perspectives on the postdoc roles and responsibilities

It is a senior training position.

Fundamental issues and challenges

There need to be a fewer number of graduate students trained and postdoctoral positions need to be reserved only for those graduate students who have shown exceptional talent and accomplishment. They should come with a competitive salary and benefits.

Existing NIH policies, programs, or resources

Eliminate training grants. We are training too many graduate students. Replace them with Masters programs of 2-3 years that will create a workforce that is trained and competent to work in pharma or biotech. Allow penalty free discontinuation of a Ph.D. Program towards only a Masters and vice versa allow masters program students to opt to pursue a Ph.D. If they can obtain an independent fellowship.

Limit the number of trainees that a lab is allowed to have. It is unfathomable that the NIH thinks that a lab with 20-30 trainees can provide good training. In that kind of environment the PI does not even talk to the trainee on a weekly basis. The trainee is just a cog in a large machine. Even the most competent and talented PI will struggle to offer good mentorship and scientific guidance to more than 10 trainees, regardless of the organization and infrastructure of a lab. The main reason trainees go to such labs is not because of the science training but because of the political connections that such large labs offer. Time for the NIH to value mentorship and quality of science over the political power of such labs. Research also shows that smaller labs also produce more original science, so it is a win win both for the science and training.

Proven or promising external resources or approaches

Gradually phase out grants to institutions that do not provide salary support of at least 50% to its faculty and eliminate grants to research faculty who do not have secure appointments at their institutions. The number of tenured faculty positions with some institutional support has steadily decreased in the last 30 years thanks to the reliance on the indirect support from the NIH. This will force universities/research institutions to increase the number of tenured and tenure track positions at institutions which will create a larger number of positions for well qualified postdocs and will also improve the quality of teaching and mentoring at US institutions.

Response 2559

Perspectives on the postdoc roles and responsibilities

The postdoctoral position in theory is to be the opportunity for the postdoc to receive more training / build additional skills in preparation to transition to a role as an independent scientist leading their own lab. In reality, to me the postdoctoral position is a way to take advantage of young scientists by underpaying them to essentially lead a research lab and generate the majority of scientific contributions for the lab (e.g., papers, experiments). The postdoctoral position has moved from being a transitory phase to a black hole that seems to swallow trainees up and not spit them out for another 5-7 years. The delays in migrating to permanent positions observed for postdocs, in my experience, seem to be motivated in part by PIs not allowing postdocs to apply for grants until the end of their second year or later, not providing pathways to publications, and actively working to retain the postdoc for longer periods of time, for both financial and scientific reasons. I view the postdoctoral position as a frustrating obligation that stymies

growth but cannot be avoided for folks who want a career in academia. I think the postdoctoral phase is the single greatest contributor to the mass exodus out of academia.

Fundamental issues and challenges

In my position as a postdoctoral trainee at NIH, I do not receive any retirement contributions / matching, I am not eligible for government pension programs (so my time here is gaining me nothing for my financial / health security in the future), and I am not considered an employee--meaning that I only get paid once per month. My taxes are not taken out in my paycheck, which causes severe stress and anxiety--if taxes are misestimated, this can create a crippling financial disaster. The postdoc prolongs the training process, and because trainees are encouraged to move institutions for graduate school, postdoc, and their first faculty position, it makes it impossible for postdocs to settle down and make roots. We cannot afford to buy houses, as our salaries are too low and the financial risk of buying a home and then having to sell in uncertain markets in 2-5 years is too great. We may face difficult decisions in starting families. Because I have chosen this path, I feel that I have chosen to forgo the personal life and happiness that I crave. I am behind my peers who have only gotten a Bachelor's degree but went into other fields--with less training and lower degrees, they are making double the money I make, they have had the opportunity to grow in their jobs and communities by staying in one place, they have houses, equity, and retirement funds, and they have been able to start families. Postdocs do not have these opportunities because of the inherit structure of the postdoc. It is a major reason why postdocs are leaving their positions, and why graduate students are choosing to go into industry instead. We are sick of being enslaved to the lab and indentured servants to academia.

Existing NIH policies, programs, or resources

1. Increase the NIH stipend level.
2. Increase the budget caps for postdocs on NIH grant applications
3. Call for a change in the tax code so that taxes can be taken out of the fellowships that pay postdocs (F grants, K grants, NIH intramural funding)
4. Change the hiring practices at NIH so that postdocs are considered regular employees and can benefit from things like retirement contribution matching and pension plans

Proven or promising external resources or approaches

No response

Response 2560

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism. "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate.

Fundamental issues and challenges

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. (Other implications, such as tax, do not stem

from NIH.) Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible.

Proven or promising external resources or approaches

Compensation improves retention broadly across other industries.

Response 2561

Perspectives on the postdoc roles and responsibilities

Fundamentally, postdoctoral training is meant for the individual to gain additional skills to facilitate their transition to an independent scientist. While traditionally this may be defined as a tenure-tracked researcher in an academic institution, today, what this means may differ across individuals. Because of the expertise the postdoctoral fellow may bring into the lab/institution, the individual may may have additional responsibilities that is separate from their training program.

Fundamental issues and challenges

Financial compensation is a key issue as a postdoctoral fellow. Given their skills and expertise, in addition to their responsibilities, the current financial compensation does not match their expected roles in the laboratory. Additionally, differences in the postdoctoral training experiences across laboratories is not reflected by the pay schedule. For example, there is no financial incentive for myself, a postdoctoral fellow, to supervise additional postbaccalaureate trainees, in addition to my research projects. And yet, there is an unsaid expectation for me to supervise them. This experience differ from my peers in other labs, where no such responsibility is expected. Yet, we are compensated at similar amounts. Even within my own lab, my colleague who began working at around the same time as me is compensated at higher levels just because their source of funding is external of the NIH. This, in addition to the uncertainty of our career stability, creates grounds for a challenging experience.

We are overworked and underpaid. Overlooked and undervalued.

Existing NIH policies, programs, or resources

Increase funding for postdoctoral fellows. Have standardized, measurable standards of achievements. Improved benefits and flexibility comparable to external opportunities.

Proven or promising external resources or approaches

No response

Response 2562

Perspectives on the postdoc roles and responsibilities

An opportunity to work with a new mentor or continue working with an existing mentor. An opportunity to further explore and refine my area of interest. An opportunity to learn new methods and contribute to the body of knowledge. Get constructive feedback on areas of improvement. Teach courses in my field of expertise. Be supported while seeking funding for research.

Fundamental issues and challenges

Supply/Demand imbalance due to lack of relevant mentors and/or location restrictions. You need to pay us a fair and competitive salary and offer tuition reimbursement.

Existing NIH policies, programs, or resources

Examine your ageism policy. It should not just be about old people. Young people can be discriminated against, too.

Proven or promising external resources or approaches

No response

Response 2563

Perspectives on the postdoc roles and responsibilities

Final training to become an independent Scientist. Postdocs apart from their projects need to be trained on how to manage labs, write budget and mentor students.

Fundamental issues and challenges

Postdocs salaries and carreer progression are undervalue at NIH and all academic centers. NIH payment table serves as the reference for the average of postdocs' salaries in the intra and extramural. that maybe helps to explain why the postdocs' salaries are so undervalue and depreciated, which impact directly in the number of recruits, Quality of Life, Quality of postdocs (the best ones are being recruited to Industry) and in a long-term lead to depreciation of Science.

Existing NIH policies, programs, or resources

expand the number of career paths' grants. There is only one grant option for postdocs' immigrants to apply to help on the transition to Independence (K99).

Proven or promising external resources or approaches

No response

Response 2564

Perspectives on the postdoc roles and responsibilities

Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth.

Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings.

Requiring postdoc and PI participation in formal performance reviews as part of an NIH award will better define, formalize, and evaluate factors of role, mentorship, and professional development, while differentiating postdocs from staff scientists.

The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

International postdocs face unique challenges; the NPA's 2023 Postdoctoral Barriers to Success report shows 86% were negatively impacted by cultural

transitions into the U.S. NIH should work with the State Department and USCIS to accelerate and simplify the visa and immigration process for these world-class early-career researchers. NIH should also expand funding opportunities to visa holders through K99/R00 and new programs.

Short contracts create immigration headaches. NIH should encourage contracts with lengths commensurate with the intended postdoc periods, longer termination notices, and ties to institutions not PIs. NIH should also support adoption of policies such as vacation accrual rollover to support international travel, subsidized visa costs, and insurance with dependent coverage, while prohibiting use of part-time postdoc positions to avoid provision of benefits.

Existing NIH policies, programs, or resources

Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing

additional career options for postdocs, while providing clear differentiation between these positions and postdocs.

PIs should be evaluated based on how they meet mentoring expectations and sustained postdoc development.

More programs should be open to the international postdocs, or new programs should be opened specifically for them.

Proven or promising external resources or approaches

We encourage NIH to work closely with institutions that host postdocs and NPA on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change.

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

Response 2565

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are NOT trainees. They have earned the right to be treated as adult professionals who have earned a highly advanced degree. In my view, the infantilization of postdocs into perma-trainees disempowers them to take charge of their own projects, their lives and their careers at the age where most of their peers in the normal world are treated as full adults in their workplaces. This, in my view, is also hurting transition to independence. Postdoctoral training used to be almost entirely about doing a crazy hard curiosity driven project that would make a real breakthrough, learning to write a grant, mentoring a few students and then moving on to a real job. Just a decade ago, I did a 3.5 year postdoc, before applying for faculty positions, and that was the norm across the biomedical field.

Now postdoc scholars are overwhelmed with entirely diffuse well-meaning but useless trainings and developments that 90% of grad students already do in their graduate careers. Scientific progress by these brilliant talented fellows, first and foremost, is the reason taxpayers fund research. With a few careful exceptions, the majority of other initiatives have been dreamed up by over-paid and under-evaluated administrators, many of whom have never lifted a pipet in their lives. Many of these folks, while truly passionate about postdoctoral scholars wellbeing, don’t appear to recognize it takes hard work, real discipline, intensity and the true burning curiosity to fuel the phenotype that is a scientist.

Fundamental issues and challenges

Due to an over-commitment to universities, that result in a glut of PhD scholars who do a postdoctoral position just to figure out what they want to do next (rarely continuing in academia), there are few jobs available as PIs. This is coupled with the ludicrously lopsided grant system which favors scientists in their 70s and 80s, and even 90s. The lack of an enforced retirement age (unlike the EU) results in a pyramid scheme which benefits university administrators and PIs, but not the true face of creativity—fellows who earn these advanced degrees and actually do the science.

We are seriously lagging behind other countries, where by the age of 32, most students will have moved on to jobs, and only a small fraction will take the academic route, which they are truly passionate about. Thus, our postdocs hang on for years and years—10 year postdocs were unheard of until recent times, because there is nowhere for them to evolve. This is the biggest challenge facing the United States, where an 75+ year old PI can have 2,000,000+ funding, while a new PI gets only a tiny fraction of that amount, if they are lucky. Most are not, and just quit from exhaustion and depression. We see this routinely in our mentoring. It is devastating.

Existing NIH policies, programs, or resources

1. Strict cut off policy for senior PIs who have already had one or two RO1s plus external funding.
2. No double funding beyond age 75 except in truly rare cases where the person is actually at the bench doing amazing work (highly unlikely)
3. Fund young and mid-tenure PIs and postdoc scholars with an independent program (K99, expand that!).
4. Cut off overhead to the highly paid and totally corrupt university system (110% overhead at Salk?! How is that even justified?!).
5. Institute strict oversight of how funds are spent—how many conferences does the PI go to? How many does their student go to?

Proven or promising external resources or approaches

Look to Cancer Research UK and welcomm trust. They do a good job.

Response 2566

Perspectives on the postdoc roles and responsibilities

My postdoc is a research training position to prepare me for independence. I personally am aiming to become an independent investigator in academia (tenure-track) but I also want to be prepared to transition to industry. However, I want to clarify that I consider myself an early-career professional. I think it is important to acknowledge that as a postdoc I am in the early stages of my career because the word "training" suggests I am untrained, which is wrong.

Fundamental issues and challenges

Funding and a lack of exit strategies.

Existing NIH policies, programs, or resources

Funding is not adequate for mid-career professionals. I know all the arguments for why funding is difficult but it comes down to being a poor choice for me to choose to earn so little at this stage of my life. I have a partner who is subsidizing my career right now. I could not afford to be a postdoc otherwise.

Exit strategies: the resources I am familiar with are mostly panels of industry professionals explaining how they transitioned. It would be more helpful if the NIH somehow encouraged companies (and more than just biotech, many of us are trained to program for instance but cannot sell this on a resume) to come RECRUIT us.

Proven or promising external resources or approaches

Speaking as an [redacted for anonymity] one of the easiest ways I see for a quick quality of life improvement (besides more $) is to get us on actually salaried pay and off of these horrible grant stipends. It makes taxes a true nightmare and we cannot even legally save for retirement on them. Which is a horrible position to be in as an early-career professional.

Response 2567

Perspectives on the postdoc roles and responsibilities

The postdoc experience is a great opportunity for new investigators to learn and be mentored by other scientist

Fundamental issues and challenges

For those graduates like myself that has to work full-time it is hard to have to quit a job in order to get the post-doc experience, some of us can't afford the low pay postdoc trainees receive so that is why retention and recruitment can be a challenge

Existing NIH policies, programs, or resources

There should be a policy that full-time NIH employees like myself that is also in graduate school should be able to do postdoctoral training without having to quit their full-time job and just become a trainee, some type of collaboration program between your current position and postdoc training on the side, example if you work 40hrs a week maybe some of these hours can be given for research time 10-20hrs etc, whatever your supervisor agree on.

Proven or promising external resources or approaches

More collaborations for post-docs and working NIH employees that want to pursue graduate opportunities but want to remain a NIH FTE

Response 2568

Perspectives on the postdoc roles and responsibilities

Training for my professional development, and a chance to get some good publications under my name.

Fundamental issues and challenges

The system has resources for career development but often the fellow has no suitable time and opportunities to pursue those. This is mainly because of the 40 lab hours/per week. PIs often prefer to have their fellows busy with lab work and not engaged in individual career development. The training at the lab is really great. Simultaneously, it limits the options for the development of individual career pathways.

Existing NIH policies, programs, or resources

Already mentioned!

Proven or promising external resources or approaches

The quality of mentoring and expectations to and from a fellow may be modified/improved.

Response 2569

Perspectives on the postdoc roles and responsibilities

What the postdoctoral position should be is an opportunity for gaining experience at a higher level with more responsibilities than a graduate student, in preparation for a job in academia, industry, or government. Postdoctoral fellows should be expected to carry out their own research and design their own experiments, while having plentiful opportunities to gain management experience by mentoring undergraduates, post-baccs, and graduate students. Postdocs should also have the opportunity to gain experience with grant writing or other skills that may serve them in industry.

Fundamental issues and challenges

The biggest issue facing postdoctoral fellows, or potential fellows, is the lack of job opportunities following their postdoctoral fellowship. This puts a tremendous amount of stress on postdoctoral fellows to publish high impact research in high impact factor journals, until they ultimately find out that the position they are looking for is not available and none of it mattered. It can be a soul-crushing experience. Additionally, while senior scientists are continually encouraged from above and from grant issuing institutes to prioritize the training of their fellows, there is no real accountability on senior scientists. I have personally seen many senior investigators, funded directly by NIH grants, pay lip service to the importance of postdoctoral training while privately discouraging and preventing their fellows from traveling to conferences, using “lab time” to write grant applications, or attend training sessions that may interfere with their bench work.

Existing NIH policies, programs, or resources

The existing structure of the R-01 and Z-01 funding is a huge impediment to training of both graduate students and post-doctoral fellows. By allowing the research done on these grants to be carried out by trainees and fellows, it puts a massive incentive on senior scientists to push bench work over all other types of “training”. In order to really improve the graduate student and postdoctoral experience, graduate

students and postdoctoral fellows need to be entirely funded by training grants that strictly prioritize their training. I'm sure the pushback to this suggestion would be that this would leave a void in researchers able to perform work R-01 and Z-01 projects, but this work should be carried out by full time staff scientists and biologists, thus creating more openings in a job market currently saturated with PhD's looking for work.

In addition to my above comments, I would take issue with the phrasing of the background statement "Data published by the National Science Foundation suggest that the number of postdoctoral researchers may be declining, presenting an uncertain future for the overall U.S. biomedical research enterprise". This should not be cause for concern, as (to my knowledge) there are no shortage of applications for positions requiring a PhD and postdoctoral training. Indeed, K99 awards are currently funded at a ~20% rate, and every industry position that I am aware of requiring a PhD receives hundreds of applications per opening. A shrinking number of postdoctoral researchers may be a healthy indication that more PhDs are realizing the futility of the job market post fellowship, and are acting accordingly. Additionally, I am unaware of any research indicating that a post-fellowship PhD is more prepared for a non-academic job than a pre-fellowship PhD.

Proven or promising external resources or approaches

The postdoctoral training programs that I have seen (both at the NIH and in academia) have generally been moving in a positive direction by offering additional training on grant writing, networking, and coordinating exposure to alternative career paths. However, the benefits of these programs will always be limited by the financial incentives of a senior scientists demanding bench results from their trainees/fellows. Until their funding and training is separated from the lifeblood funding of the senior scientists assigned to mentor them, real change simply won't be possible.

Response 2570

Perspectives on the postdoc roles and responsibilities

I went through postdoctoral training as part of my training to be an early career investigator. I also pursued medical training as well. I strongly appreciate the importance of needing to build independence and the ability to develop / interrogate research ideas both on micro and macro scales, and do think the postdoc allows for this opportunity.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

There is ABSOLUTELY not enough accountability of senior investigators, particularly abusive senior mentors. Accountability comes in the form of investigations where trainees' complaints do not jeopardize their jobs (NOT true of current NIH complaint systems—your name is required for AOR and anonymity cannot be guaranteed through the process—https://public.era.nih.gov/shape/public/notificationForm.era), in the form of rescinded grants, and in the form of setting the standard that academic abuse is *never* justified.

The current requirements from Congress of reporting bullying to the NIH for potential action involving grants as of 2022 depend on academic institutions already *removing* or *disciplining* faculty, where there have been numerous accounts of accountability taken only when complaints have been made to state bodies or to the NIH directly. (Example here: https://cancerletter.com/the-cancer-letter/20210528_1/)

The academic institution is not a neutral player in this problem, but has incentive to minimize the harm done to the postdoctoral fellow in exchange for maintaining funds.

Proven or promising external resources or approaches

Persistent anonymity of trainees filing complaints with the NIH through the process -> with a threshold of complaints, for example to launch an investigation into an NIH grantee (R01 or higher)

https://grants.nih.gov/grants/policy/harassment/notify.htm

Response 2571

Perspectives on the postdoc roles and responsibilities

Postdoctoral Positions seem like ways to get cheap labor out of highly qualified individuals under the guise of providing "additional training".

I worked in a few non-postdoctoral scientific positions in industry, before accepting a postdoctoral position at NIH and have to say that the amount of new skills learned are not meaningfully different. (In my opinion this is due to the fact that all scientific positions require problem solving, which is something that just happens during the course of work.)

Fundamental issues and challenges

I would argue Postdoctoral positions are fundamentally unappealing. They are not very well compensated with respect to what most people could earn in industry. On top of that we constantly have to listen to and participate in meaningless mandatory trainings to keep the illusion alive that there is some sort of meaningful benefit in working as a postdoc as opposed to working in an industry research job. Another factor is the time-limited nature of the position, which a lot of postdocs just don't want to deal with any more when they reach a certain age.

A more short-term issue. The focus on getting fellows back into the office is just a total dealbreaker for me. I work mostly on a computer but are still supposed to commute in to work three days a week to sit in a sad cubicle. Which I realize was the norm before the pandemic, but at this point it just seems like the goal is wasting my time. I guess the larger issue here is that the desires of fellows/postdocs are not taken into account very much when policies are made.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Pay better. Maybe provide retirement benefits instead of offering "financial literacy courses". its a financially dumb decision to take a postdoc position. So don't lecture me about it. Be more flexible in accommodating different work arrangements.

If you don't want to pay more don't pretend that it is because you are providing some sort of additional teaching benefit.

Response 2572

Perspectives on the postdoc roles and responsibilities

As a postdoc, we hope to acquire new skills and experiences to advance our careers. With the expertise to the experience researcher, we can contribute to research community and this mentorship will help us advance our career.

Fundamental issues and challenges

The first and foremost is the unattractive salary which is low paid and also not equal. The benefits for a postdocs should be more comfortable. For example, childcare in New York is so expensive that one has to spend $30000 annually which is almost more than half of what is earning. It should be adjusted according ti the the salary a person is getting. The one who earned more, can pay more. It should be subsidized based on salary. To survive with a family and kid is so difficult, that a researcher struggles for every bit of day to day life and then is expected to give 48 hours a day work in lab. There is no personal life of a postdoc and most of the people are depressed at a certain levels. No time limitation for work, but constant struggle with expenditure and savings, leads to unhealthy mindset of the postdoc. We are thought be creative and give innovative ideas. But the constant struggle impedes the process. If one is paid accordingly, every person will do more work when they have money to spare on other necessities. Housing is said to be subsidized but for example in New York, it is so expensive that 40% of salary goes in housing and remaining into the taxes. The commute itself takes 2000$ annually. The list goes on and on.

Existing NIH policies, programs, or resources

Removing discrepancies in postdoc salary is the prime concern. A comfortable starting salary with regular increments would grease the wheels of the life a postdoc researchers.

Cheaper childcare facilities so that one can survive with kids. If both the parents are postdocs, childcare facility becomes a necessity. It is well known fact that it is impossible for a family to survive on one postdoc salary. So, both the parent has to work. Thus a reasonable childcare prices would make their life much simpler.

Good medical benefits. We postdocs, go through sever mental states and thus faces several medical concerns. thus we need good medical benefits.

More workshops on imparting knowledge on Visa information and educating postdocs with their options.

Review of the mentor along with the postdoc for regular upgrade in the work. Making committees to reveiw the progress of both the mentor and the mentee should be made mandatory.

Proven or promising external resources or approaches

Training programs to include recent advancement research can be implemented. If one want to explore industry careers or leave the bench and venture into science policy or consulting, there should be some ways to explore those as well.

A time limited work pattern for postdocs so that one can have a personal life. Every lab should have a manager or technician to do basics jobs so that postdoc can focus on the experiment and research

Response 2573

Perspectives on the postdoc roles and responsibilities

A postdoctoral position provides a time to actively perform independent research, while receiving training from mentors as well as continuing to develop new skills. It provides a time to learn more management skills to run a lab or work in collaborative teams that may not have been skills you learn during graduate school. The postdoc should not be a "technician-like" position, solely investigating the mentor's research questions. A postdoc is not a means of cheap labor for a lab; guidance and support for pursuing independent research questions is necessary.

A postdoc position is a time to further develop skills for communication, applied research, and navigating the larger research community past the experiences of graduate school which is focused more on individual experiments and techniques.

Fundamental issues and challenges

Low pay in many academic postdoctoral positions that is not equal to the experience level. Understanding that it is still a training position, so salary does not need to be equal to higher positions, but current salaries are barely an increase from graduate stipends, despite having greater experience and cost of living increasing (loan payments beginning). It makes postdocs feel undervalued and taken advantage of as cheap labor. Many of my colleagues were able to get full-time jobs immediately after graduate school, making a postdoc less-desirable if it is not necessary.

It is hard to find available positions. A central job listing would make it easier to find open positions. Currently, it requires looking at each individual university, government institute or lab page to find openings. Many applicable positions may be missed simply because it is not easily found. Compounding this are often short open period for application further limiting the chance that someone may see and apply for a position.

Highlighting the skills and career development to be gained by the postdoc during the position, rather than just what the lab can gain from the postdoc. This shows the mutual benefit and will help in recruitment and retention of postdocs. If there is no benefit to the postdoc, then they will not stay on as a low-paid postdoc when they could be paid higher doing a job that also provides more growth in experience in the workforce. It is often not made clear the goals of the postdoctoral training experience.

The academic research environment can be very toxic, abusive and unhealthy. This leads to poor retention and low recruitment. Efforts need to be made to change this unacceptable environment and show that inclusiveness, support and collaboration are necessary for effective scientific research.

Existing NIH policies, programs, or resources

Making it either possible, or better known, that salary/stipend adjustments are feasible. Currently, academic postdocs are paid substantially less than government postdoc positions.

Creating a centralized repository for open postdoc positions, and marketing that so it is known where to find open positions.

Proven or promising external resources or approaches

Include required mentor training and resources for the mentors of the postdocs, particularly if funded by NIH grants. Lack of mentorship skills by PIs makes the working environment inhospitable, leading to poor satisfaction and poor retention.

Response 2574

Perspectives on the postdoc roles and responsibilities

Postdocs are a critical part of the research environment. They are trainees and they are still learning, but they are independent, contributing members of any research group and serve as mentors to younger trainees. Postdocs are necessary for the continuation of academic research—if we don't train and keep strong researchers, then we won't be able to keep going. Especially if we don't appreciate their value and contribution and show that appreciation in meaningful ways.

Fundamental issues and challenges

Money and benefits are a huge issue for postdocs. The amount we pay postdocs isn't enough but that is in large part because very few people make "enough" to live comfortably and save. That being said, the absence of benefits, especially retirement benefits, is a deterrent to doing a postdoc—postdoc experience is proving to have less of a benefit than going to work in industry, etc. where you can begin to save for retirement earlier in the career. There is also still a sense of the toxicity in academia and the power imbalance between PIs and the others in lab and that is pushing people away. The "publish or perish" mentality as well as the sense that the work of one brilliant person matters more than the health and well being of others in the lab is still pervasive. More senior individuals working longer also makes it seem less likely that a young researcher WILL gain independence in academia in any reasonable length of time which drives them to look for opportunities elsewhere.

At the NIH especially, there are also challenges with the Visiting Fellows Program—these fellows are brought here to train, but do not feel that they are supported to the same level as their IRTA peers. We don't do as much to support them in transitioning to next steps and the language communicated to them when they are recruited may be misleading in that regard.

Existing NIH policies, programs, or resources

More opportunities or better communication regarding transition and next steps for Visiting Fellows; higher pay and perhaps some resources related to financial literacy to help them plan while they aren't getting a 401K or other retirement plan but still have options; better training for PIs and other lab staff re: mentoring to help promote a more equitable and balanced research training environment—remind PIs that they are ALSO trainees (not employees) and preparing for next steps is a critical element of the postdoc experience.

NIH grant policies and oversight is also critical in ensuring positive environments across the industry. NIH can't just exist in a bubble and as a policy establishing institution and role model there is an obligation to ensure that standards are being met and expectations enforced. Anyone receiving NIH funding should adhere to a certain ethical standard, and that's not just scientific ethics. I know of at least one highly funded institution that is rife with corruption and toxic work environments, but because they do good science, people look the other way. This teaches bad habits (that they can get away with anything if they do good science) and good people get pushed out altogether.

Proven or promising external resources or approaches

Mentor training. The better the experience overall for trainees that ARE here, the easier it will be to recruit. If fellows are satisfied and successful when leaving, word spreads; they will encourage others to

consider opportunities at the NIH and so-on. The more positive the experience, the more continued collaborations and mentoring relationships, the wider our network gets. Wider networks attract and bring in more fellows in general.

More collaborative environments vs. competitive encourage free exchange of ideas and less toxicity.

Response 2575

Perspectives on the postdoc roles and responsibilities

In my opinion, the academic postdoctoral position was designed to provide further training to recent STEM graduates before they pursue a tenure-track position in a university or organization that has a heavy research component. I also view it as a transition phase between graduate school and a position in industry or government during which one may acquire new skills necessary to succeed in their next position. I find the postdoctoral position an important component in the development of an individual's skills and acumen as a scientist. As Peter J. Feibelman's book "A Ph.D. is not enough" argues that the technical mastery required for getting a PhD is not sufficient for career success, or even necessarily for finding a job in the sciences, a postdoc position coming out of a Ph.D. provides the perfect opportunity to hone one's skills and better prepare for a career in the sciences. Overall, to me, a postdoc is generally a short-term research position that provides further training in a particular field, and for individuals planning research careers in academia, government, or industry, the postdoc years can be an opportunity to develop independence, hone technical skills, and focus research interests. For many, however, the value of a postdoc is not so clear. The rewards of postdoctoral work are usually not financial, and a postdoc might not provide an experiential gain for some career pathways.

Fundamental issues and challenges

Today's postdocs face an array of challenges, some newly visible and some stemming back decades. Ways to address them are becoming more complex. They can include lack of financial resources, variable positions within their institutions, toxic work environments, lack of mentorship, family stresses, a clear pathway to a permanent position, and other pandemic-related problems. Moreover, in most places I have seen, including my own situation, postdocs are underpaid, overworked, and variable grant funding meant they had very little job security. It's not a secret that postdocs are undervalued. Yet, few academics talk about how awful the situation actually is.

In her book How Economics Shapes Science, the economist Paula Stephan breaks down the loss of potential earnings of Ph.D.s in the biological sciences versus those who earn a master's degree in business administration. She estimates a loss of $1,219,257 in lifetime earnings for those who spent seven years completing their Ph.D. in biological sciences compared to the holders of M.B.A.s. For those who complete their Ph.D. in seven years but also complete a three-year postdoc, the loss in lifetime earnings is even greater: $1,272,680. She notes that the difference in earnings between the M.B.A.s and the Ph.D.s makes "it quite clear that reasons other than money enter into the decision to pursue a career in science and engineering. If it were only money, virtually no one would choose such a career."

So is the suffering for the greater good or for the honor of academic advancement worth it? With more industry positions arising, it is no surprise that Ph.D. graduates are moving away from postdoctoral positions.

Existing NIH policies, programs, or resources

Credit where it's due, the NIH have taken steps to raise the profile of postdoctoral researchers and to explore ways to make postdoctoral training more effective. The NIH Office of Postdoctoral Services, which is part of the NIH OITE, serves as a clearinghouse for information and policies affecting intramural postdoctoral researchers at the NIH and its affiliated institutes and centers. However, here are some directions that the NIH can take to enhace or modify postdoctoral experience.

1. Establish a Postdoctoral Association (PDA)
2. Setup and maintain a postdoctoral listserv and social media outlets
3. Establish a Postdoctoral Advisory Committee
4. Ensure postdoctoral scholar representation on relevant institutional committees
5. Identify and establish policies to deal with issues concerning postdocs
6. Utilize a centralized appointment process
7. Establish time frame for postdoctoral transition to independence
8. Provide career counseling and development services
9. Establish a minimum baseline salary/stipend, plus a salary/stipend scale
10. Provide a comprehensive, fair, and equitable benefits package to postdocs, comparable to that which is received by standard employees whether national or international at the same institution.
11. Extend family-friendly benefits to all postdocs
12. Allow matched contributions to a retirement program

Proven or promising external resources or approaches

The NIH has a lot of resources that do help enhance the postdoctoral training experience. I think that having more financial support for postdocs and atleast pushing to bring the postdoc experience to attain parity with industry positions would make once again attract postdocs to academia. Then, if NIH can make policies and provide resources to support the postdocs such that they have an enjoyable experience, that would help retain postdocs in academia.

Response 2576

Perspectives on the postdoc roles and responsibilities

A step in the direction of building research career and approach academic positions.

Fundamental issues and challenges

Some institutions consider Postdocs trainees while other find them employees. This is a fundamental flaw in how these positions are defined. Most institutions keep Postdoc performing well for more than 5-10 years while changing the name of position. Appointment terms are not at all defined well and most Postdocs have no say in terms of job, responsibilities, progress. This is duty of NIH and any institution that hires Postdoc and should never be left on Investigator/ Professor.

Labs should hire more Staff Scientists/Biologists/Technicians and no more than 50% personnel can be Postdocs. This will allow better mentoring.

Existing NIH policies, programs, or resources

Institutions should be held accountable for welfare of Postdocs. One way to build quality in research is hire all Postdocs through NIH centric fellowships which is based on evaluation done by independent committe and hiring manager can be only a stakeholder. This will ensure the quality candidates will be chosen by the institution and diversity can be maintained.

Proven or promising external resources or approaches

No response

Response 2577

Perspectives on the postdoc roles and responsibilities

The postdoctoral research is a period to progressively gain scientific independence from your mentor. It is about defining the research questions you want to address in your future lab. It is also a period to acquire new technical skills and new perspectives. It should be a time to expand your network.

Fundamental issues and challenges

Low pay. Overworking. Lack of grants accessible to postdocs that have more than 4/5 years of postdoctoral research. Lack of grants open to non-citizens and green card holders. Use of postdoctoral fellows to advance the lab research, but not necessarily good mentorship and realistic career advice.

Existing NIH policies, programs, or resources

Available grants, especially for non-citizens or green card holders.

Increase stipends.

Serious effort to follow up of what happens to postdocs, for better visibility of what they become.

Proven or promising external resources or approaches

No response

Response 2578

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are a period of protected training where junior scientist receive the training required to be successful in their field, including writing/submitting manuscripts, grant writing, management/mentorship, and technical expertise. Postdocs should receive directed guidance from a direct mentor that has expertise in the areas required for their success or support in seeking outside training/mentorship for roles outside their direct mentors supervision.

Fundamental issues and challenges

Major issues regarding long term financial stability of junior scientist, such as social security and retirement. Quality of life—when I was a postdoc (2014-2019) most of my peers were expected to work 50-70 hours per week which isn't compatible with family commitments such as child or elderly care.

Existing NIH policies, programs, or resources

Maximum number of hours, minimum number of conferences, postdoctoral committees to support a comprehensive training plan, training plans/financial commitment for training in essential scientific areas such as grant writing, manuscripts, and lab management

Proven or promising external resources or approaches

Look to european systems for better work life balances. Junior scientists in many other countries do not need to choose between career and having a family.

Response 2579

Perspectives on the postdoc roles and responsibilities

Lower entry training position (Low wage, Long hours). It is the academic equivalent of hazing where a post doc student must "pay their dues" before being considered for an academic position (assistant professor). Better alternatives include gaining industry experience and then transitioning to a Sr Scientist/Principal Investigator.

Fundamental issues and challenges

Fundamental issue is the low wage and poor work life balance.

Existing NIH policies, programs, or resources

Strategic reform is needed to move away from traditional views of the career pathway to independent research: postdoc -> academic PI. There are other career pathways that are viable.

Proven or promising external resources or approaches

Industry pays significantly more and offers the same level if not better training for future academic/industry positions.

Response 2580

Perspectives on the postdoc roles and responsibilities

- A transition period to apply scientific knowledges bases acquire during phD (10-20%) and an intense/extraordinary training period (80-90%)
- Learning how to use scientific knowledge, building a mythology, developing and leading a project, mentoring trainee (postbox, summer student,phD)
- Responsibility to maintain good workplace atmosphere and working ethics (postdoc are the one the most physically present in the lab so their attitude among the lab and with the other member can determine the general atmosphere)
- Responsibility to communicate with the PI and consider that this communication is essential and will help his/her scientific growth and the atmosphere and trust in the lab (highly competent but still at the beginning of their career postdoc should be able to receive feedback in a positive way, acknowledging their mistake, and share their concerns/questions/scientific and personal opinions and feeling to make sure to get the best of their postdoc experience)
- Postdoc are the workforce of the lab and lead/coordinate projects in the lab, but should also considering to learn from their mentor about mentoring, developing their own idea, being creative and the way to make work a lab and a team between the half-term to end of their contract
- Because of their workforce role, they are the one in direct contact of the data that will hopefully help the field and patient at longer term, so trust, honestly and ethic are very important quality/role/responsibilities of a postdoc

Fundamental issues and challenges

- Stress of publication (a new system of evaluation should be installed, people should be evaluated not only based on publication but also based on their skill of mentoring others, developing a project, their aptitude to help the members of the team and interaction with other people in the lab/with other labs. I am seeing/heard too much postdoc becoming frustrated and willing to do anything to get a publication (= stealing data from others, transforming data, being rude and competitive with their lab coworker.ect). For me this is killing the science. I will always choose my values before the publication, even if I might not reach or slower reach the level than other reach in few year by acting badly. We are scientist, I choose this work by love of the science and to improve life or solution for patients, it does not make any sense to “break” healthy people by competition or publishing unreliable data. The system need to change, the publication number does not mean anything and induce bad science/personal practice.
- As a postdoc we are very busy to do science and less time is available to develop our skill for the after postdoc = finding a job and knowing what are our options and the timeline for that.
- I am lucky to be in a lab with an extraordinary PI, who is human and care about the development of her trainees. She gives me the space to do mistake, to think and supports my creativity. She takes the time to communicate, listen, teach me the science but also the mechanism of thinking science, the scientific system system. But I know this is extremely rare, and most of my friends postdoc have a more frustrated experience, most of others are treated like a “machine of data”.

Existing NIH policies, programs, or resources

- We are very busy to do science but less available to develop our after-postdoc (finding a job/knowing what are our options/timelines). Having more information/more exposure to know our options will be very helpful. A group of discussion with people who were NIH postdoc few years ago and now has another position would be great too. Organizing once a month a forum with people presenting their pathway and option after the postdoc. OITE has some really good ressources but I think they will benefit of this. Maybe some "carreer development trainings" should be "mandatory", like the annual trainings about ethics, use of biological material.ect. To give a space/time for that.
- As said below, some postdoc are treated as "machine to generate data". I am wondering if some evaluation at least at the beginning of the postdoc or a closer follow up could help to prevent this. Having anonymous audit from the trainee or something like this. NIH, has place to speak but it ask to the trainee to take time off of the lab to go. Also, some trainee do not know either if the issue is worth to talk about, some just accept their condition thinking there is no solution. An organized time to talk for each trainee included in their training, at least at the beginning could help. The eIDP that we filled is helpful but only for the lucky one, like me who have a great PI that communicate with them. Having a meeting on one and one with the person who review the eIDP for instance will be really helpful. It can prevent any harassment too.
- In the same idea, module to learn how to develop idea/creativity and how to develop his own lab could be also a good adding to the OITE program

Proven or promising external resources or approaches

I am speaking from experience of my engineering school. The first year and last year we had modules that I found extremely helpful. Some people from outside came to help us for interaction with people and teach us communication skills and recruitment skills:

- Theater classes (from actors or theater teacher) with situation of communication with people in a team or in conflict
- Professional coach were teaching us communication/resilience skill, by putting us in small group and acting in different situation: resolving a conflict, asking for needs, mediation.ect
- Professional coach were teaching us communication/skill for interview. and knowing our weakness and strength. And how to choose the best options fitting our personality.personality test.ect
- Psychologists teach us to know ourself and help for communication (instance: non-violent communication). Teach us how to try to understand the people we are interacting with an being patient and change perspective, to decrease tension and help others.
- I think it will be a real good adding to the OITE program, to propose some after-work or day program with this kind of external person.
- Having former students (here former students) presenting their pathway and being in contact with them (could be during lunch time or after-work)

Response 2581

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are stepping stones from graduate research under the mentorship of an advisor to independent research.

Fundamental issues and challenges

One of the biggest inhibitors for recruitment, retention, and quality of life of postdoctoral trainees is the starting salary of postdocs. It is one of the main reasons listed for people not pursuing postdocs, because starting salaries are so much higher going straight to industry positions. Otherwise, those that are interested in academic research typically will work for very little material incentive to the detriment of their quality of life in the present and future (put off starting a family or neglect their own mental health).

Existing NIH policies, programs, or resources

Since the bar for success as a post-doctoral researcher transitioning to independence is high (i.e. necessity to publish large multi-disciplinary research in high impact journals, display competency in multi-omics approaches), the restricted time frame of 5 years of post-doctoral research experience time allowed to secure career transition funding is not practical and exclude a group of productive post-doctoral trainees from pursuing academic research careers.

Proven or promising external resources or approaches

No response

Response 2582

Perspectives on the postdoc roles and responsibilities

An academic postdoc is aimed towards performing independent research.

Fundamental issues and challenges

Independent research can take place at a number positions-academia, industry, government, and non-profits. Supporting what research looks like in these institutions would make a smoother transition. Mentoring around a specific case (ie industry through a I-Corps or AIM model) should be encouraged across the spectrum.

Existing NIH policies, programs, or resources

Expand the AIMs program and include entrepreneurship at FAES for government scientists.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Unlike the other ICDs in the NIH Intramural Research Program, the NIH Clinical Center does not offer K99 grants. This makes it very hard (if not impossible) for Clinical Center postdocs to get U.S. university faculty positions. When candidates interview, they want to know what former postdocs do after completing their fellowships in the Clinical Center. By not having a track record of success at getting academic positions, this makes CC postdoc fellowships less desirable than postdocs in the other ICDs. Thank you.

Fundamental issues and challenges

PSLF for CRTA postdocs working at NIH, little to no assistance with student loan repayments

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2585

Perspectives on the postdoc roles and responsibilities

I see my role as a scientific trainee who learns these key skills:

- How to independently think about solving important questions in the field
- How to conduct research with appropriate experiments to answer these questions
- How to establish fruitful collaborations
- How to share my scientific findings with the community
- How to envision a long-term scientific program

I enjoy the privilege to learn something new every day, be it new findings or new methods. I am grateful for the freedom I have in choosing the questions I want to work on. However, I find it challenging to balance the expectation of productivity with the requirement for deliberation and creativity in developing a good experimental strategy.

Fundamental issues and challenges

There is little appreciation for the work I am doing, neither financially nor through other means. There is constant pressure to produce new data and lots of scrutiny. This scrutiny does not only come from within the scientific field but also from dealing with visa or other bureaucratic issues. The (visa) renewal process is in large parts untransparent and requires the involved parties not to make any mistakes. In my case, during three of my renewal, issues occurred that caused a temporary loss of my health insurance or being paid late.

It is also very challenging to reconcile job and family. In my case, I have a child with special needs who requires substantial medical attention. These additional private matters are left out of any consideration the NIH has regarding my productivity.

Existing NIH policies, programs, or resources

The Visiting Fellow program would strongly benefit from changes to the annual fellowship and visa renewal requirements. Giving the fellow five years from the start will be beneficial for dependability. This will not only allow the fellow to plan riskier or more long-term-oriented projects, but it will also reduce the time spent on dealing with visa issues. Permission to spend the whole five years at the NIH can still depend on factors such as preceptor satisfaction and long-term career plan preparations. Furthermore, the NIH should consider private hardship as factors that can negatively affect a fellow’s short-term performance.

Proven or promising external resources or approaches

No response

Response 2586

Perspectives on the postdoc roles and responsibilities

Two types of postdoc roles:

1. Get targeted training in new or peripheral area
2. Continue with existing work to increase experience/expertise needed to land faculty position (or some kind of equivalent)

Fundamental issues and challenges

- Compensation is pathetic (sometimes unlivable) compared to alternative career paths
- Postdocs feel like a "holding pattern" or indentured servitude necessitated by lack of adequate funding to do work in grants and lack of sufficient faculty positions
- Many/most good postdoc candidates have no interest working with junior faculty, as plenty of availability with well-established labs
- Universities offer extremely little in terms of job perks (commuting benefits, good insurance, family benefits, retirement plans) to postdocs
- Industry postdoc positions are much more lucrative than academic postdocs, particularly in computational fields (e.g., biomedical AI)
- The fundamental purpose of a postdoc role needs to be clarified, and used to redefine policies (e.g., those mentioned below) that influence recruitment and retention

Existing NIH policies, programs, or resources

- Minimum stipend levels should be increased
- Funding levels for research grants need to be adjusted upward to allow for better pay/benefits for postdocs (we can't hire competitively due to lack of room in grant budgets)
- Ways to encourage joint postdoc positions between academia and industry, could unload financial burden from NIH grants
- Fund platforms, etc. to help disseminate available postdoc positions to the best-qualified trainees who can fill those rolls.
- Training guidelines or other programs for faculty that help them to provide a more fulfilling experience to postdocs
- Increased allowance for grant funding (T/F/K grants, etc.) to postdocs who are not US citizens (but maybe would like to reside in US long-term)

Proven or promising external resources or approaches

No response

Response 2587

Perspectives on the postdoc roles and responsibilities

Postdoctoral programs are in my opinion are job training programs that generate the future scientific workforce. The role of a postdoc is to learn the "tricks of the trade"by contributing to a major project. The responsibility is to complete the project and deliver the outcome via publications and /or other means. Postdoctoral training must not be regarded as an end in itself. Life work balance is also equally important during postdoctoral period.

Fundamental issues and challenges

The most important issue is the disparities that exist between the the pool of postdoctoral talent and the traditional job opportunities. Academic research may not be the appropriate choice for every Ph. D. This realization must set in at an early stage, and necessary changes introduced to steer towards different career trajectories. Another factor inhibiting recruitment is the lure of publications in so called "high impact' journals, which are often attributed to the Ivy.

Existing NIH policies, programs, or resources

Maximum postdoctoral training must be 3-5 years.

Trainees must be encouraged to follow alternate career paths.

Trainees must be convinced that the postdoctoral training is NOT necessarily meant to transition to a permanent position at the NIH.

Proven or promising external resources or approaches

University/ Academic Institutes models are often better suited for postdoctoral experience. The NIH based research is more apt for overarching goals that require more experienced scientists.

Response 2588

Perspectives on the postdoc roles and responsibilities

Independent research, expertise on new techniques, mentoring of students, grant writing—some of these areas will need continued training and development during the postdoc, but that is generally driven by the postdoc's own motivation—not departmental or mentor efforts as is more common in graduate training.

Fundamental issues and challenges

Low pay, one year contracts to prevent classifying postdocs as employees, high cost of health care for family, minimal support for postdoc career development, no savings for retirement

Existing NIH policies, programs, or resources

Stop penalizing postdocs on 'training' metrics who are in labs where no other postdocs have gone on to faculty positions. Require higher base salary requirements. Provide grant supplements to PIs so they can give raises to their postdocs every year that keep up with inflation. Provide supplements to postdocs in NIH funded labs to offset cost of health care/child care. Set expectations for multi-year contracts for postdocs—don't allow 1 year contracts for NIH funded grants.

Proven or promising external resources or approaches

No response

Response 2589

Perspectives on the postdoc roles and responsibilities

A postdoctoral position means the transition to becoming a PI. In that regard, after we finish our training we should be able to independently lead research, write grants, and guide people.

Fundamental issues and challenges

Very low salary, which is not competitive with postdoctoral researchers in the industry.

Also, there is considerable variability between the postdoc salary among different institutions.

Ten days of yearly vacation for someone that works more than 9 hours/day and is from abroad is not good, considering that we need to travel to our countries to renew our visas, and sometimes the embassy takes more than ten days to process the paperwork.

No coverage for children

Very low benefits compared with other workers of the same institution

Very low opportunities to grow

Most of the time, we are requested to do more than our postdoctoral job requires, and we ended becoming a Postdoc/lab manager/technician.

The salaries for post-doc proposed by NIH should be the standard for all the universities that receive NIH funding, not just a recommendation. Because even when the laboratories are funded with more than one NIH grant, the postdocs are still being paid below the minimum because the postdoc salary is just a recommendation by NIH and not a must.

NIH should require that all the Universities/PIs receiving funding from NIH must meet the NIH standards.

Existing NIH policies, programs, or resources

Given there is a considerable population of postdocs from abroad, NIH should expand the grants offered to postdoctoral researchers with no permanent residency

Proven or promising external resources or approaches

To improve the working environments and mentoring, PIs and institutions receiving funding from NIH should receive an annual in-person course to work in these aspects

Also, the postdoctoral association from every university with NIH funding should be required to prepare bi-annual reports to NIH to inform the status of their postdoctoral researchers regarding the training, the working environment, and job satisfaction.

Response 2590

Perspectives on the postdoc roles and responsibilities

NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.

Fundamental issues and challenges

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to at least $62,898, with higher amounts in areas with defined cost-of-living levels and annual increases.

Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.

Academia contains remnants of structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups still today.

Postdocs from historically-marginalized groups and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. Examining and acting on these power imbalances is key to creating a more inclusive and safe environment. Cohorts are a proven way to improve recruitment and retention of postdocs and other staff from diverse backgrounds.

Existing NIH policies, programs, or resources

NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be especially cost-prohibitive for researchers from low socioeconomic backgrounds, those with increased familial commitments and internationals.

NIH should require all postdocs receive employee-level benefits (including affordable healthcare for dependents) as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.

Proven or promising external resources or approaches

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library Cohorts (e.g. for postdocs of color) are effective for recruitment and retention.

Response 2591

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellowships are an opportunity to gain new or additional research training in pursuit of an academic or industry career after receiving an advanced degree (PhD, MD or equivalent). In my field, postdoctoral fellowships are required to obtain a tenure-track job at a major research institution with 2-years unofficially viewed as a 'minimum' required time for a 'successful postdoc'. For me, my postdoctoral fellowship has provided me the opportunity to gain new clinical research skills while also developing basic and preclinical research skills for the first time while also receiving career and professional development. In my view, postdoctoral fellowships should provide structured opportunities to gain experience establishing independence, running a lab and experience mentoring with adequate resources, support and protected time to write grants, manuscripts which are required for promotion in addition to research tasks. Postdoctoral fellows are NOT research assistants, technicians or a graduate student and should not be treated as such with respect to responsibilities, treatment, or compensation. Training should be specific, obtainable and efficient relative to the individual's career goals without excessive unnecessary training because postdoctoral fellowships should only be viewed as a 'stepping stone' to independence and an individual's career goal rather than synonymous with a second PhD (in terms of duration, expectations).

Fundamental issues and challenges

- COMPENSATION and inflexible rules around compensation! Low pay not consummate with an advanced degree/ experience, does not take into consideration regional cost-of-living, annual cost-of-living increases, family expenses (cost of daycare, etc), whether institutions provide retirement or not. I currently receive less than 1% raise each year despite inflation being >8% in my region. Prior to NIH minimums being increased, my raise last year was about $200 for the entire year which essentially goes to taxes. The NIH won't allow postdocs to be supplemented from federal sources, which is the majority of our funding. ~50% of research assistants without advanced degrees and less research experience than myself make more money than I do, receive more time-off and are eligible for university retirement matching which is incredibly frustrating after getting a PhD. I live in [redacted for anonymity] a region that was expensive before the pandemic but has risen dramatically. I am lucky because my family is well-off and they were willing to let me finance my mortgage through them and pro-rate my mortgage in 2019 when I bought my house to have my mortgage + utilities be 45% of my take-home pay. I am a single-income household with no dependents. Despite my mortgage staying the same since 2019, my mortgage + utilities is now ~60% of my take-home pay because of inflation that has risen exponentially compared with NIH compensation. I have had to dip into savings (which I thankfully have) to make ends meet when I've had unexpected medical bills or high energy bills.
- Increasing length/duration of postdoctoral fellowships but limited (3-years) of support
- No forgiveness/leeway for delays in training and progress due to the pandemic. Because of regional differences in COVID shut-down/delays, the NIH would rather ignore the pandemic happened than provide bridge funding/extensions of fellowships.

Existing NIH policies, programs, or resources

- Increase NRSA salaries
- Develop an additional NRSA (F) or K mechanism to provide bridge funding after the pandemic for people who have had delays due to the pandemic. For example, I was just starting my fellowship at the start of the pandemic. My NRSA clock started because I receive a T32 however, I wasn't allowed to do research for 13 months because my university suspended research due to the pandemic. I do interventional clinical trials in humans that range between 3-6 months in duration that are complemented by preclinical studies. While there was forgiveness initially for current F32 and K-awardees, there is no grace, support or acknowledgement of these delays now. My F32 runs out in June 2023, even though a portion of my NRSA time was spent with research being suspended. I have had a successful postdoc but even with a lot of hard work, it's impossible to make up for 13 months of research suspension in a 3-year postdoc. I have a K01 under review but I had to get creative because my studies were ongoing but I had to submit something because my funding ends soon.
- Decrease time-to-award. The time from submission to review, review to council, council to funding is almost a year now. This is a problem for 1-2 year awards.
- Increase $$ for daycare assistance
- Require institutions contribute to retirement

Proven or promising external resources or approaches

No response

Response 2592

Perspectives on the postdoc roles and responsibilities

A postdoc works a dual role in a give and take relationship. Postdocs receive training and an environment to conducive to their development as independent researchers from their mentors. In return, postdocs have a duty to their mentor to support ongoing research of their mentor in addition to pursuing their own professional goals.

Fundamental issues and challenges

I believe that the lazy response is to say that postdocs are worked too hard and do not receive adequate compensation for their work. I'm conflicted. As someone who would benefit financially from that changing, it is tempting to give that answer; however, I think that improving postdoc compensation would be like putting a bandage on necrotic tissue. The academic research enterprise is saturated. Entering into a postdoc comes with a promise of training to support an eventual faculty position. It is a career stage with a lot of responsibility and low compensation, but the promise of a long and rewarding career as an academic scientist (in the form of a PI) makes it worth it. Many PIs only keep labs afloat by keeping several trainees (grads and postdocs). If a PI trains more than one academia-aspiring postdoc in their career, they have contributed to saturation of the employee market for independent faculty. For most PIs, their career number is much higher than 2 trained postdocs hoping for a faculty position. One solution is to expand independent faculty positions, but this will only create further competition for already highly competitive funding. With this option off the table, you now have postdocs being asked to work low paying, high demand jobs with no real promise of a faculty position once they finish. No one should be surprised when they go ahead and take the high paying industry job right out of grad school rather than working 5 tough years just to end up there anyways. The only solution I see is to invest in higher paying, career staff scientist opportunities at universities. It will make non-faculty academic research careers more attractive, make PIs less dependent on postdocs, and make academic research more productive in the long term.

Existing NIH policies, programs, or resources

Create funding programs to support staff scientists in established, PI-led labs. This will support an academic alternative to faculty positions for postdoctoral trainees that is a balance of stable employment and a respectable wage. Whatever ends up being done, postdocs need to know that there is a stable career path waiting for them when they finish training.

Proven or promising external resources or approaches

No response

Response 2593

Perspectives on the postdoc roles and responsibilities

In my lab postdoc researchers are given a unique training opportunity to work with top scientists in the field to learn how to execute rigorous experiments, interpret results with integrity, ask unique questions and be part of team science. During their time in the lab they have one on one conversations with lab colleagues and participate as lead authors or collaborators on manuscripts, a subset of which are high impact. In my lab they travel to meetings to present their work. They learn about job opportunities in the field and it is my job to help them achieve their long term career goals. They are paid well compare to people coming out of college with a bachelors degree in science who struggle to find a job. They have the chance to meet with scientists throughout NIH in a variety of ways, develop out of institute collaborations, and meet with other trainees.

Fundamental issues and challenges

The most problematic issue NIH is the work ethic associated with the culture. PhD postdocs here don't feel a sense of urgency to be the best, learn the most, present the most compelling ideas, etc. They often don't want to travel to meetings, are reluctant to participate in lab meetings, and they talk more about

vacations than science. They often want to "work from home" and don't value the community atmosphere of team science and sharing ideas. Reasons for not attending journal clubs include things like "getting my tires rotated," or "getting my lawn finally mowed." Many postdocs are just as happy to have someone else "be first" to address some fascinating aspect of their project if it means they don't have to work a weekend or stay beyond 5:01 pm. The culture does not push them. Finally, they are hierarchical and credit obsessed. They don't want to help another person in the lab unless, as multiple postdocs have told me, "I get full credit." Indeed, I've had them tell me they have been told by NIH leadership that they should not have to participate in anything where they won't be a first author. They are told they should do the work for their fist author papers and nothing else matters. Finally, having a family as a postdoc represents extra challenges. But I find that group of postdocs is the hardest working and most focused. They have the greatest sense of urgency and best time management skills. We should value those trainees more and offer them the support they need.

Existing NIH policies, programs, or resources

To help get postdocs interested in academic research career pathways you could stop telling them over and over (and over) that it does not matter what they do and academic research careers are not that important, they are always hard, and not for most people. You could send them information on academic career opportunities. You send information everything else but that. You never have successful academicians from outside NIH come and talk to them about how great it is to be in charge of your scientific destiny. You have the clinical people meet with Lasker Award winners, but not the average run of the mill Ph.D. You also undermine the Principal Investigators by constantly asking Postdocs to provide information on things they don't like about their PI. Talk to me as well. I can tell you why they are unhappy about lab meeting--it is because it is at 10 am and they don't want to be here that early. But you don't hear that part.

You also create an atmosphere where it is increasingly hard to offer constructive criticism of their work. I was told not to be critical of post doc experiments at lab meeting, lest it make them feel bad. Science is a critical field. It is what we do to achieve excellence and rigor. I have to tell them when an experiment proves nothing.

Finally, I'd say if you want to improve one thing for postdocs--have classes where you teach basic writing skills. At least half of US born postdocs can't express themselves scientifically. I spend a huge amount of my time rewriting their papers before submission.

Proven or promising external resources or approaches

Go talk to Universities where being a postdoc depends on funding (most universities) and you will find trainees with a far greater sense of urgency and curiosity. See what makes those trainees tick, and succeed. You will find their rewards are attached to their achievements. We give postdocs 5 years of funding and make it nearly impossible to get them out early if they are not producing. They get raises every year no matter what they achieve. We send them on travel (if they want it), regardless of whether they have a paper published. Why would one work hard? Seriously, why would you?

Response 2594

Perspectives on the postdoc roles and responsibilities

One's experience as a postdoc should be, ideally, something combined with training from graduate school that, together, no one else has done. This should also be a time where writing (grants, manuscripts) and presentation style is developed.

Fundamental issues and challenges

Limited number of tenure track positions available. Why spend five or more years chasing something that, at the best of times, is highly unlikely for success. Postdoc fellows must navigate complicated taxes law unaided (by design from Universities) and may be paid less. Many institutions, if not all, lack a backstop for postdocs that work for someone who is racist, unfair, or unfit to be managing people.

Existing NIH policies, programs, or resources

Higher pay and funding across the board. Shift money back from indirect costs, if need be. Some Universities, such as Yale, are corporations (their words); treat them as such.

Proven or promising external resources or approaches

No response

Response 2595

Perspectives on the postdoc roles and responsibilities

The postdoc position is a temporary position with largely undefined goals that widely varies across labs and institutions. Ideally, I would view the postdoc as an opportunity to gain additional technical and non-technical skills that benefit my professional progression in academia, industry, and government. I believe it is an important time to gain experience in developing an independent research plan, establish grant writing practices, and gain mentoring skills. Altruistically, I envision the postdoc position akin to an apprenticeship where the focus is on 'shadowing' mentors to best develop yourself as an individual researcher. Unfortunately, I currently feel the position is more so seen as a second graduate degree with a stronger emphasis on scientific production.

Fundamental issues and challenges

Career outcomes and tangible benefits of pursuing a postdoc are often misunderstood. There is a lack of actionable information and transparent data to make informed career choices before and during their postdoc periods, including increased awareness of career options (e.g., academia, industry, government). The NPA's 2023 Postdoctoral Barriers to Success report shows postdocs are paying a significant opportunity cost for limited faculty positions and 86.6% are impacted by job security concerns. Moreover, there is unsatisfactory access to exploring additional career opportunities that vary between institutions due to inequitable resource allocation.

Compensation is a continual source of consternation and anxiety for myself and these sentiments are almost universally shared across other postdocs I have spoken with. While I commend the NIH for setting minimum salaries, this amount is often set as the default postdoc salary even in regions with higher cost of living or can be entirely disregarded by universities and departments. At the [redacted for anonymity], there has been a move from administrators to change the status of postdocs so that we are paid hourly in order to avoid state-mandated raises in minimum salaries starting in 2024. I believe these administrative maneuvers undermine the value of postdocs that reduce retention and quality of life for postdocs.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such

postdoc as an employee. (Other implications, such as tax, do not stem from NIH.) Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.

Many PIs lack formal training in mentoring and personnel management. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute substantial, reportable grant requirements for

mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors.

Postdocs need to develop essential skills for their career transition, whether teaching and grant writing for an academic career or program management and public engagement for careers outside of academia. NIH should mandate that all

NIH-funded postdocs develop an IDP and that PIs support and aid in submission of documentation.

Proven or promising external resources or approaches

Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.

I am appreciative of the NIH's efforts to advance and improve postdoc training and the desire to collect our experiences and visions for future postdoctoral training in the biomedical sciences.

Response 2596

Perspectives on the postdoc roles and responsibilities

As postdoctoral fellows, our responsibilities extend far beyond conducting research, analyzing data, and maintaining collaborations for our PIs. We play a vital role in ensuring the success of our labs and university by taking on multiple additional responsibilities. In addition to writing research papers and postdoctoral fellowships, we work alongside our PIs to secure funding through grant writing, contributing to the significant financial and reputational success of our institution. We also serve as peer reviewers for our colleagues and collaborate with journals to ensure the quality of published research.

We serve as mentors to a wide range of individuals, including undergraduate and graduate students, as well as research technicians. We take pride in teaching essential research techniques, analysis methods, and current literature, all of which are critical to the success of future scientists. Our work as postdoctoral researchers is multifaceted and integral to the success of our academic communities.

In addition to the indispensable roles highlighted above, we often find ourselves responsible for managing the lab and fulfilling various administrative duties. These tasks include organizing, stocking, ordering, and maintaining equipment—all of which are crucial for the success of our research. However, these additional responsibilities cannot be accommodated within a typical 9-5 work schedule. As a result, we frequently have to extend our already-packed schedules to ensure that our research is not compromised. In fact, 100% of our colleagues report working on weekends. Furthermore, a staggering 80% of us work up to 60 hours per week, and more than 10% work up to 80 hours per week. It is important to note that these hours far exceed the average workweek, which can lead to burnout and jeopardize the quality of our research.

Fundamental issues and challenges

While we view our work as a calling, this should not come at the cost of our standard of living or our well-being. There is no common policy for postdoc contracts, which allows some PIs to pay their postdocs below NIH salaries. It is distressing that firing a postdoc does not require a justification as in the case of a laboratory technician.

Our career should enable us to achieve personal goals (owning a car, buying a home, and starting a family). However, more than 75% of our colleagues cannot save money, almost 90% cannot afford to start a family, and 50% report that their financial situation impedes their access to medical consultations/interventions. Less than 8% of us own a home, and almost half of the postdoctoral fellows surveyed rely on a significant other or family to maintain their current standard of living. In short, we are undervalued, underpaid, and feeling the strain. While 75% of [redacted for anonymity] postdoctoral fellows initially sought a career in academia before starting their postdoctoral fellowship, this number has dropped to less than 40% due to the current financial situation.

Despite the significant contributions that postdoctoral fellows make, [redacted for anonymity] payscale is inadequate, starting at only $56,484, which is supposedly in line with the FY 2023 NIH minimum. However, [redacted for anonymity] not only pays below this base salary for some postdoctoral fellows, but it also fails to provide experience-based yearly raises and/or fails to implement the NIH-mandated yearly increase for more than 90% of its postdoctoral fellows.

Regardless, this number does not account for the high cost of living in [redacted for anonymity], which is approximately 20% higher than the national average. Furthermore, the median household income for [redacted for anonymity] is $65,781 and $67,521 for the US as a whole, which is on average ~20% higher than that of [redacted for anonymity] starting salary.

Existing NIH policies, programs, or resources

At [redacted for anonymity], roughly 60% of our postdocs are international postdocs who in addition to dealing with the issues mentioned above have to deal with costs associated with retaining their immigration status averaging $3,131. In addition, international postdocs often struggle to be as efficient as native speakers in publication writing and grant writing. Very often, postdocs do not have support from their PIs to start their own independent research, which will allow them to be competitive for transitional funding such as K99/R00 or career development awards in such a short period after graduation. Furthermore, since the data generated by the postdocs are often included in their PI's grants, the postdocs are not seen as independent candidates who will establish a novel research program from their PIs. Significantly, many of the transitional funding opportunities are not available to international postdocs due to their immigration status.

In addition, postdocs are often discouraged from applying for R01 grants because postdocs do not have physical lab space where they can carry out their independent research. Commonly, the postdocs are encouraged to apply for the R21 mechanism which is not well suitable for young investigators, or the R35 mechanism which is restricted to several institutes but not all NIH institutes have R35 MIRA funds.

To summarize, the current funding mechanisms (K99R00) are highly competitive and postdocs with mediocre support of their PI will never be awarded a K99R00 grant, postdocs struggle to start independent research when their tasks are associated with their employment. There is a need for adjustment in the eligibility of certain mechanisms for international postdocs that are not currently eligible for NIH postdoctoral fellowships.

Proven or promising external resources or approaches

Until recently, there was no postdoc association at [redacted for anonymity]. Thanks to the size of the university, only about 30 postdocs are employed at our institution. Most of the postdocs do not know that resources are available to them. The new postdoctoral association we have established is aiming to change that including helping other postdocs to navigate the available funding opportunities. While starting the association at [redacted for anonymity], we highly appreciate efforts from National Postdoc Association.

Response 2597

Perspectives on the postdoc roles and responsibilities

It is a training position meant to make us ready for the next stage of career. In simple terms that it the main purpose.

Fundamental issues and challenges

Quality of life is fairly low overall. Over worked, stressed because of this. Less money than peers of similar education that didn't do a postdoc. Or that did a postdoc in a more affordable location. Bethesda area is very expensive to live. We do not make enough money to successfully save up for things like a house, or retirement. We are not counted as real employees for some reason—compare this to MD fellows who are for some reason (and make more money). Starting salary for PhD in Pharma entry level is over 100K + benefits + bonuses. It is criminal NIH pays starting fellows so little money. We have no voice or say. Very little vacation days (and combined with sick). No performance bonuses is very disappointing. The general attitude of PI culture is toxic.

Existing NIH policies, programs, or resources

Give us unions. We want to be treated as real employees rather than temporary underpaid people. The entire academia structure of labs publishing at the NIH depends on postdocs. So then if we are the key to NIH success pay us like we are key. Give us performance bonuses then. Give us better working conditions. The FDA has more strict work environment rules such as hours worked. Give us the same. The FDA pays higher, give us the same. Post docs in different institutes shouldn't be given higher salary than those in less funded ones.

Train us for industry better. Allow us to more easily travel and visit companies. Travel to conference that is industry based is frowned upon. I was denied going to industry conference because it would be too expensive coming out of our budget and it is "inappropriate" to send me somewhere just to learn about potential jobs and the field. Then how am I to ever learn about industry if I cannot travel to participate in the industry conferences and workplaces? PIs not understanding of industry. The NIH being proactive in helping us get a career outside academia is a sham. I would never come here again if I had the choice. I would never do a postdoc if I could go back. Because it is all fake. There is no real support here.

Proven or promising external resources or approaches

How about not having us work in crumbling buildings with no heat all winter and no AC all summer? Stop being such a terrible place to work. Holes in the ceiling. Holes in the flooring. Last updated before I was born. It is absolutely terrible working conditions compared to university setting. Some buildings are nice. But some post docs work in absolutely terrible working conditions.

More resources for us to be able to job shadow and learn about careers. Why does it have to come from my PIs budget for me to learn about a type of job? NIH should cover all these expenses for us to learn not the PI.

Better more fair pay. I have a PhD and I'm making the same money someone with a BS makes teaching high school biology class. Ridiculous. Pay us what MDs are making as fellows at least. Pay us equally across all institues. Give us bonuses for performance.

More vacation days and don't combine it with sick days. Better working culture as far as hours and expectations go. Train the PIs better in workplace civility and make them learn they are King of their lab. It doesn't feel like a nice culture to work in. I would absolutely leave any workplace that had this type of culture.

Give us real employment status. Real benefits. This is crazy how we are temporary workers. Paid on a 1099G which makes taxes also terrible.

Build a modern research facility the US is supposed to have as the premiere research facility.

Response 2598

Perspectives on the postdoc roles and responsibilities

As a transition period

Fundamental issues and challenges

We are not paid enough.

Existing NIH policies, programs, or resources

Increase pay. yes you have increased it this year but it is not enough to support a family and we have our phds

Proven or promising external resources or approaches

Increase pay, we have our doctorates

Response 2599

Perspectives on the postdoc roles and responsibilities

Postdocs are critical to the mission of NIH and academic institutions. Postdocs conduct much of the research at NIH and at universities. They sometimes mentor and train postbacs, summer students, undergrads, and graduate students. These are amongst the most highly trained professionals in the country, are passionate about their work, and are proud of their contributions to the advancement of science in the united states.

Fundamental issues and challenges

Despite being some of the most highly trained individuals in the country (Ph.D. or MD being a minimum qualification requirement), and their contributions to the advancement of research in the country, Postdocs

are amongst the most inadequately compensated group of professionals. The starting salary of a postdoc based on the NIH standard is $56,484 (2023-2024). This is well below the living wage of the cities in which postdocs live and work. Compounding with the post-pandemic inflation has put most postdocs in untenable financial situations. Rising costs of living in the DMV area (a standard 1bd apartment costs 2000USD on average to rent) and other university towns, as well as other expenses, make it difficult for postdocs to maintain basic standards of living. The problem gets worse for those with children, as they struggle to afford childcare, and many defer having children for financial reasons. These are individuals in their early to mid-thirties having to defer having children at a period in their life where their fertility window is fast closing. Additionally, postdocs are not paid wages at the NIH and this presents a financial opportunity cost that deprives all of them of critical savings and pension contributions. Historically, none of these factors have been so severe as this post-pandemic period. Combined, they produce high burdens, leading to talent loss to the industry.

Existing NIH policies, programs, or resources

Postdocs need to be paid living wages (not stipends) for their contributions. Also, the NIH should provide childcare support for postdocs.

Proven or promising external resources or approaches

All of the problems I have listed above are well-known. They have recently been recognized with pay raises by some universities across the country, and also in articles published in Nature (https://www.nature.com/articles/d41586-023-00332-6), (https://www.nature.com/articles/s41587-023-01656-4) and Science (https://www.science.org/content/article/postdocs-need-raises-who-will-foot-bill). Princeton and MIT have committed to raising starting postdoc salaries to $65k annually (which is a good start). The NIH can follow their lead and raise postdoc starting wages (not stipends) to $75k annually with full pension contributions.

Response 2600

Perspectives on the postdoc roles and responsibilities

A postdoc position is intended to be a specialized training period, while working towards independence.

- Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings.
- The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.
- NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.
- Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth.
- Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

Fundamental issues and challenges

- The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.
- Per the NPA's 2023 Postdoctoral Barriers to Success report, more than 90% of postdocs are negatively affected by the lack of clarity in transitioning to next positions. More than ever, postdocs are paying a significant opportunity cost for limited faculty positions and 86.6% are impacted by job security concerns. Additionally, 'disenchantment with academia' is trickling down from overburdened faculty, making these positions less desirable to early career researchers. Career outcomes and tangible benefits of pursuing a postdoc are often misunderstood. NIH should provide early career scientists with actionable information and transparent data to make informed career choices before and during their postdoc periods, including increased awareness of career options (e.g., academia, industry, government.
- Postdocs also often cite high instances of isolation and poor mental health. NIH should hold institutions accountable for fostering inclusive and supportive training environments (to decrease discrimination and harassment and enhance mental health and wellbeing support.

Existing NIH policies, programs, or resources

- Increase staff scientist opportunities.Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs, while providing clear differentiation between these positions and postdocs.
- Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. (Other implications, such as tax, do not stem from NIH.) Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible.
- Many PIs lack formal training in mentoring and personnel management. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors.
- NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

Proven or promising external resources or approaches

- Resources provided by the National Postdoctoral Association (NPA) and Graduate Career Consortium (GCC), and AAMC/GREAT Group
- Center for Improvement of Mentored Experience (CIMER) Mentor Training
- NASEM report from 2017: The Next Generation of Biomedical and Behavioral Science Researchers
- Career/professional development resources provided by NIH OITE
- Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.
- NIH should work closely with institutions that host postdocs and NPA on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change. The NPA could utilize its convening power in this role.

Response 2601

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as an opportunity to receive further training and develop my independence as a scientist, in preparation for the next stage of my career. I feel that the average time of a postdoc position should be shorter than it currently is, but at the same time the current demands of the field require it to be a long position. Postdoc should be a time to build whatever skills and professional network is needed for your next job. Ideally you would have opportunities to expand your technical skills, learn management skills, and have opportunities to attend and present work at professional conferences or meetings.

Fundamental issues and challenges

We are not paid enough. There is no way around this; the NIH needs to increase the limit for modular budgets in R01 funding, and correspondingly postdoc salary must increase. Academia will never be able to compete with industry-grade salaries, but when I look at friends who have left academia for work in industry or nonprofits, I often wonder if I am just stupid for staying in a position where I am so underpaid and overworked. To add to this, the faculty job market feels very bleak, with few opportunities to secure a position and even more pressure and demands on your time waiting for you even if you are successful. It does not feel sustainable. These are also the primary factors driving women and URMs as a group to leave academia.

Existing NIH policies, programs, or resources

It would be valuable for the NIH to provide more opportunities for funding for staff scientist positions at departments or within labs. This is a career option for many scientists that want to continue working at the bench, in an academic setting, but do not want the pressure of running their own lab. However, currently few institutions have funding for these positions outside of the NIH itself. As science continues to become more interdisciplinary and moves towards a team-based approach rather than an individual PI model, this type of position can serve as a valuable resource for a department or team of PIs.

Proven or promising external resources or approaches

I have been impressed by the Society for Neuroscience's Neuroscience Scholar Program—this provides some funding for travel and professional development, but it's most important feature may be the structured mentorship aspect that places URM students in contact with faculty members at other institutions. It can be difficult for trainees to identify mentors outside of their own PI, but having other perspectives on professional development, research practices, etc, as well as building out one's professional network, is really valuable. https://www.sfn.org/initiatives/diversity-initiatives/neuroscience-scholars-program

I don’t know if this falls under the NIH’s purview, but it would also be very valuable to have some legal protections for international postdocs that are relying on a visa to remain in the U.S. Many international postdocs may choose to stay in labs where the PI is demanding, hostile, or even sexually inappropriate, for fear of losing their visa and uprooting their entire life. More protection to stay and search for another postdoc position would decrease the penalty for leaving a difficult work environment.

Response 2602

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

A key issue for success in biomedical postdoctoral fellowships is a lack of computer science and biostatistical skills. Far too fellows are equipped to analyze complex data and navigate multi-level data structures. Fellows working with omics data or data from administrative systems (e.g. U.S. health care databases, UK Biobank) need these skills to succeed in today’s working environment. This largely reflects a lack of support for developing these skills on the job through coursework, collaborations with quantitative scientists, and access to well-curated banks of previously-developed code.

The biomedical research environment often feels surprisingly low-tech, with only a weak conceptual grasp about the underlying quantitative nature of research. This has resulted in “technical debt” in the field. See news stories about Southwest if you need to know why this is important!

Technological and computational skills in biomedical sciences need to be improved generally, but it is especially important for our junior scientists.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2603

Perspectives on the postdoc roles and responsibilities

Academic postdoctoral fellowships are positions where individuals who have completed their doctorate can round out their experience, wrap up projects from graduate school, work on and complete new projects (particularly using new methods, populations, etc.), and complete requirements for licensure or other accreditations.

Fundamental issues and challenges

Quite frankly, postdoctoral positions do not compensate individuals adequately who have 22+ years of school and completed a doctoral degree. These positions require individuals to work nearly 24/7, and pay less per hour (even when only considering it a 40-hour-per-week commitment) than bus drivers in some cities, which they absolutely deserve (https://chicagotransit.taleo.net/careersection/ex/jobdetail.ftl?job=22000029&tz=GMT-05%3A00&tzname=America%2FChicago, $29/hr starting hourly rate). The postdoc pay is not a living wage by today’s standards, and it must be at least 1.5 times the rate it currently is to recruit and retain talented doctors in academia. PhDs typically have more years of training than medical students, who have residency pays that are ~1.5+ times what we make. There is no reason for postdoctoral scholars should continue going into debt and not be able to grow savings.

Further, the average time for postdoctoral positions is increasing substantially to be competitive for the very few tenure-track academic appointments that open up.

Existing NIH policies, programs, or resources

Programs and resources that allow under-represented individuals to join academic societies for free or cheap in order to be aware of the same resources and opportunities that those who are more privileged have.

Proven or promising external resources or approaches

N/A. Focus on increasing salaries to a wage that is comparable to the extensive training and hours postdoctoral fellows have achieved.

Response 2604

Perspectives on the postdoc roles and responsibilities

A highly trained scholar that needs to learn a couple of things more before becoming a faculty member

Therefore between the roles and responsibilities comes mentor students (undergrad and grad), direct an independent project, learn to write grants, perform budgets, etc. While at the same time getting technical skills required to pursue her/his own research

Fundamental issues and challenges

The lack of long term security of the job. There is not way to be sure that one will be able to land a faculty position after a postdoc. After a postdoctoral training the need to move across the country (with family, without support group)to find a job in academia.

The low pay (specifically for postdocs with family)

Existing NIH policies, programs, or resources

Better monetary compensation, some type of financial support for daycare expenses

More train and retain positions (right now there is a little tabu about staying in the same institution in which one was postdoc)

Better benefits

Proven or promising external resources or approaches

No response

Response 2605

Perspectives on the postdoc roles and responsibilities

Independent and thoughtful Researcher, who should give valuable inputs and ideas too instead of following the project goal and orders from PI ONLY.

Fundamental issues and challenges

1) Complexity of processing DS2019 or table works for immigrant Scientists
2) Complex salary structures like different ununified salary structure by different institutions and project funding sources
3) Hike is too low
4) Main issue is very low salary compared to industry so people choose to join in industry rather than in postdoc research.

Existing NIH policies, programs, or resources

1) Increase the salary at least 20% to meet the gravity of post doctoral research with industry and to prevent brain drain to industry.
2) Should offer a minimum Relocation charges on joining new labs or changing them.
3) Salary should be unified and the range should not be absurd like from $47000/year—$55000/year to stop human resource exploitation in some cases.

Proven or promising external resources or approaches

No response

Response 2606

Perspectives on the postdoc roles and responsibilities

Opportunity to more independently explore biological questions while taking on a greater leadership role.

Fundamental issues and challenges

Lack of pay makes it extremely difficult to work in expensive cities.

Existing NIH policies, programs, or resources

Increase salaries for training grants and fellowships.

Proven or promising external resources or approaches

Improving pay would improve job satisfaction.

Response 2607

Perspectives on the postdoc roles and responsibilities

- I perceive a postdoctoral position as a trainee, rather than an employee. I see it as a mentored position where an early-stage researcher is gaining additional skills that will help them land a faculty position. I also don't think anyone does a postdoc unless their goal is to eventually become faculty (or they are at least considering it).
- The postdoc appears as the scientific equivalent of a medical residency, i.e., relatively low pay training position for individuals with doctorate degrees.
- It is not always clear whether a postdoc position is perceived as career advancement or more as treading water until a more permanent position is made available

Fundamental issues and challenges

- Low salary
  a) Pay does not align with level of training, experience, and expectation of work
  b) Postdocs are a stage in their lives with many financial responsibilities, with a strong desire to "settle down" , purchase home, and start a family
  c) After 4+ years of school it would be preferable to jump into a position that starts off with a bit better pay
  d) Underpaid positions all the way up to higher faculty levels versus a much more lucrative career path outside of academia
  e) People who come from economically disadvantaged backgrounds may find it hard to commit to a postdoc position when you would likely be compensated less than your peers without advanced degrees
- Relationships with mentors:
  a) Fear that a post doc is at the mercy of their advisor and that the experience can be very hit or miss depending on that relationship
- Reduced desire to pursue a tenure-track faculty position
  a) Perception that advancement in academia is increasingly competitive with far less tenure-track faculty positions available than candidates
  b) Less interest in driving own research/aims; more interest in coming up with research aims as a team.
  c) More interest in applied research versus academic research
- Postdoc is not necessary to be competitive in desired career space
  a) Increased awareness of job options outside academia
  b) Increased visibility of biotech and pharma positions available for recent graduates

Existing NIH policies, programs, or resources

- Increase pay/salary support for all NIH supported postdoctoral fellow
- Enhance benefits for NIH supported postdocs (i.e. child-care, flexible work schedules)
- Increase support for professional develop of NIH supported postdocs to help them as they apply/interview for faculty positions and for postdocs who want to pursue a career outside academic.

Proven or promising external resources or approaches

Response 2608

Perspectives on the postdoc roles and responsibilities

Historically, a postdoctoral position has been framed as a training position. However, in my experience, a postdoc position has become much more of a staff/employee position in its roles and responsibilities. Most postdocs do not enjoy full creative and intellectual freedom, and these positions are often used as the main labor source, along with graduate students, in executing the research goals of a PI. The lack of staff scientist positions in academia has shifted those responsibilities and roles onto postdocs and students. However, compensation and benefits have not evolved along with this and still reflect that of a trainee (low salary, no access to institutional retirement benefits, limited or unclear access vacation/sick/parental leave, etc.).

Fundamental issues and challenges

Low compensation and benefits, and the high prevalence of bullying and harassment by PIs, are the main factors limiting quality of life for postdocs in the current academic climate. Most institutions match their compensation scales to the NIH pay scales for postdocs, even if they are not directly funded by fellowships and thus, few PIs are able to increase these compensation levels even if extra funds are available. Postdocs are also beholden to PIs for letters or recommendation, visas, research funds, etc. which increases opportunities for experiencing bullying and harassment in the workplace as there are few institutional checkpoints or accessibility points for administrators to be involved in postdocs' experience/career training/trajectory.

Existing NIH policies, programs, or resources

NIH pay scales must be increased and must allow for more flexibility in increasing salaries on an institutional level. NIH training fellowships should be allowed to be combined with other types of government and non-governmental fellowships and grants to facilitate this. NIH should also provide more training and mentoring guidance for PIs to learn about team management, communication, navigating difficult conversations and situations, and professional norms. These should be mandated courses to receive federal funding. Further, allegations of bullying and harassment need to be taken seriously by the NIH and there need to be real consequences on funding for PIs that display these types of behaviors. Without real consequences, PIs will continue to exploit postdocs for their professional benefit.

Proven or promising external resources or approaches

Increasing efforts for postdoctoral recruitment without improving workplace quality of life, compensation and benefits would be unethical and an inefficient use of resources. We cannot in good faith bring more postdocs into an environment that does not support them, and in some cases, exploits them. NIH must decide whether it intends for postdocs to be a short-term training position (and if so, invest in better mentoring training for its PIs and more transition grants to facilitate postdocs moving on to permanent careers more quickly) or for it to a be a staff/employee position that is more long-term and that matches the current pivotal role postdocs serve in the scientific enterprise (and if so, invest in increased compensation and benefits and long-term job security). Postdocs can serve both roles at once.

Response 2609

Perspectives on the postdoc roles and responsibilities

Postdoc training is an essential step for me to transition my role from a student to a researcher in the future, no matter in academia or industry. From this training, I can learn how to mentor and how to apply for high-level grants, and how to lead my projects.

Fundamental issues and challenges

The salary is tooooo low for postdocs, especially when the postdocs are living in Boston or New York. We cannot live a dignified life, but share everything with one or several roommates and mice. When someone ask us to hang out to a restaurant, it's not easy to say "yes", because we have to check if we have enough money to go through this month. Please Please raise the salary for postdocs.

Existing NIH policies, programs, or resources

Raise the salary, please!! Many institutes still obey your salary rules even in Boston, a high-living city.

Proven or promising external resources or approaches

Please enhance the inspection of postdoc living quality including the salary and mental health. It's not easy living on only $3000 (after tax and insurance, etc.) per month in Boston.

Response 2610

Perspectives on the postdoc roles and responsibilities

An academic postdoc position is taken by individuals that have obtained a Ph.D. but want to gain more technical, intellectual, and administrative experience in the field of their interest. In current times, most postdocs positions are undertaken with an assumption that they will be a transitionary position. With the training and experience during their postdoc, individuals will be able to transition to more stable, better paying, more meaningful roles. The post doc training is therefore a preparatory phase where individuals get trained not just on techniques and science but should also be prepared for the current job environment.

Fundamental issues and challenges

Rather than being a transitionary and training position, postdoc positions have come to mean cheap labor for the institutions and PIs. Postdocs are some of the brightest, highly educated, and most hard-working individuals of the society. Low pay, unregulated hours, minimal training, and no career progression paths make this a very unattractive career move for such people. Most PIs are only focused on their own grants and sustainability without providing postdocs with the tools, training, experience, and career progression paths. Since many American students are already aware of these shortcomings, they do not join the postdoctoral programs in as many numbers. To overcome this limitation, overseas Ph.Ds. are often hired. While these overseas candidates are attracted by the science, they still must face the same fundamental problems described previously. The fact that they are bound by visa limitations makes the situation very exploitative for these people. While the lure of science and better pay was initially quite attractive for this group of people, but in course of time they have become aware of the shortcomings. It is therefore going to be increasingly difficult to attract overseas talent.

Existing NIH policies, programs, or resources

Extramural program should be modified with penalties and rewards for post doc support. Examples are:

1. Restrict post doc to 4 years. Individuals wanting to continue must be promoted.
2. Grant applications must evaluate PIs for their mentorship record. If a postdoc joins another postdoc after 3 to 4 years and does not progress to other career paths points should be deducted. Every postdoc that progresses to better positions in industry or academics should get extra points. This puts the onus of development on the PI.
3. Similar to the above point, institutions should also be evaluated.
4. Explicit requirements for postdocs to work for 8 hours a day. Employers must track and provide these details in progress reports. Consistent overwork should trigger penalties on grant applications.
5. If one individual cannot finish the tasks, then more people should be hired.
6. Institutions must adopt policies that ensure career development for postdocs. Institutions with poor record should not get NIH money.
7. Fundamental issue is commercialization of academic research. Tenureless faculty have little time or concern for the careers and development of postdocs as they are caught in a fight for survival. Reforms that give more stability to faculty positions are needed. Safe and stable faculty support the development of their postdocs.
8. Grants must have well defined allocation for salary and raises. Expense reports must be scrutinized. Grants for institutions and PIs that fail to provide benefits to postdocs should be frozen.
9. Funding pipeline to fund more stable positions.
10. Separate grants could support higher level positions.
11. Eligibility for bridge grants should be expanded to include foreign nationals. The timeline of eligibility to apply should be increased.
12. Overseas candidates must be hired on immigrant visas instead of non-immigrant visas like J1. This will enable faster stability and fair treatment.

Response 2611

Perspectives on the postdoc roles and responsibilities

An academic postdoc is an early career researcher who plays important roles in both the research and teaching missions of a university: designing and performing experiments as well educating of graduate students. When I was a graduate student, I would turn to the postdocs in my lab with questions before anyone else, and they were invaluable in helping me analyze data and design experiments. Postdocs already possess advanced training and subject matter expertise. They can also provide feedback on training and career progression for earlier stage researchers like graduate students and undergraduates. A postdoctoral position is also a time to learn new techniques and enter new fields. Switching from the physical sciences to the life sciences, I viewed the postdoc as an opportunity to pursue research of my own design in a field other than where I received my training. I have had wonderful opportunities but also faced challenges. Though a postdoc should be a position where one can change fields and researchers are nominally encouraged to move away from their graduate work, I faced great difficulty obtaining funding: reviewers consistently said they did not believe I could perform the research because it was too far from my training. There seems to be a twofold responsibility: stated and unstated. The stated responsibility of a postdoc is to develop skills as a trainee to transition to an independent career. The unstated responsibility is to enter the laboratory ready to be productive from day one. There is a misalignment between the way we talk about a postdoc position and the empirical reality. Postdocs mostly seem to be used as a source of cheap and highly skilled labor.

Fundamental issues and challenges

Postdocs perform highly skilled labor for long hours with little compensation or career stability. By definition, a postdoc recently finished a PhD, and graduate training is widely known to be low paying. Some people have difficulty meeting basic needs in graduate school and are promised that the short term suffering will be paid off with long term gains. When a postdoc offers continued low wages, instability due to short term contracts, and no ability to plan for the future (e.g. matched contributions to retirement accounts), that career path is relatively unattractive. This is especially true since postdocs are at a time in life where they may be seeking stability such as planning for retirement, paying off student loans, beginning a family, or caring for aging parents. Furthermore, the experience of postdocs can widely vary depending on the specific institution and lab one joins and potential for toxic work environments is high. A majority of postdocs for every year (except one) since 1991 have been international—the draw for postdoctoral employment is simply not as strong for US citizens and permanent residents. This has been the case for nearly my entire life. Even if someone does pursue a postdoc, there is high difficulty with retention. Funding rates have not kept pace with inflation, so compensation is severely lacking. Funding has gotten more competitive, pushing out potential postdocs who would be willing to continue on the academic career path even with the above listed challenges. Postdocs receive little institutional support. As an example, someone who began a postdoc a few months before the pandemic like I did received no extension on timeline for a K99 grant, even though lab work was disrupted for well over a year. Postdocs simply are not respected, so people choose to work where they are respected.

Existing NIH policies, programs, or resources

Pay more. Expand funding opportunities to be available to international researchers. Create long term staff scientist positions for researchers who want to stay at the bench performing experiments. Student loan forgiveness up to a certain dollar amount for every year of work as a postdoc. Matched contributions to retirement accounts for postdocs as a mandatory benefit for employers to provide as a condition for receiving funding. Dependent health care costs covered for postdoctoral researchers. Access to affordable childcare, both near one's place of work and at conferences. Pay more. Pay more. Pay more. Mentorship training for PIs (and postdocs too!).

Academic career paths are lengthening. It is increasingly common for researchers to complete a postbac fellowship or work as an academic research technician for a year or more before applying to graduate school. This provides an opportunity for pairing early career researchers with postdocs to give them an opportunity to hone their mentorship skills and work to develop the expertise needed to be lab leaders one day. But this must be coupled with a recognition of the reality of the lengthening career pathways. If a common academic career pathway becomes working as a research technician for two years followed by graduate school for 5(+) years, followed by a postdoc of 5(+) years (e.g. 1st year apply for an receive an F32 then apply for and receive a K99/R00), researchers will by design be in their mid-30s at the earliest when they transition to an independent career. In any other industry, workers would be recognized and respected as working professionals by that time. We need to alter the perception that a postdoc is simply 'transitional', which incentivizes institutions to not care for the researchers in the long term. Incentives need to be aligned to support the humans doing the work.

Proven or promising external resources or approaches

Mentorship training for PIs can help improve the experience for postdocs.

Opportunities for postdocs to mentor early career researchers in a formal way that enables their receiving recognition for that work. As a graduate student, I received a great deal of mentorship from postdocs in informal settings but not in any way that they would receive credit for. As a postdoc, I have been fortunate enough to work with a postbac fellow for two years through a formal mentorship program. I have been able to help mentor her with career progression and guide her in experimental design and execution. Scaling opportunities for postdocs to provide mentorship would be a great opportunity (see ChEM-H/IMA Postbac Fellowship in Target Discovery at Stanford).

Required tracking and public reporting of postdoc career progression and outcomes for universities receiving NIH funding.

Increase pay for postdocs, and normalize salary to cost of living in local area where postdocs work.

Streamlining visa process for international researchers.

Affordable dependent health care options and affordable and accessible childcare options for postdocs.

Reach out yearly to trainees in the labs of funded PIs to get feedback on mentorship experience and utilization of that information in further funding decisions.

Removing the idea of a postdoc as a 'transitional' role and recognition of the value provided by non-tenure track PhD holding academic researchers.

Recognition of work beyond the laboratory in funding decisions for postdocs (e.g. DEI work, science communication, outreach, university service, teaching).

Provide funding opportunities for postdocs to build community at their institutions and within their disciplines.

Provide relocation funds for postdocs to enable them to transition to their new roles without going into debt (e.g. as a line item on a PI grant for when they hire a postdoc).

Provide funding opportunities for non-tenure track PhD holding academic researchers as a stable career option.

Response 2612

Perspectives on the postdoc roles and responsibilities

During the postdoc I am observing and learning from my mentor about scientific research planning and project management, as well as understanding clinical studies, funding opportunities and developing important skills in appropriate scientific validation and grant writing. The postdoctoral training has enabled me to network and collaborate with researches from our group but also from other institutions that work in my field. It is a critical step into becoming an independent researcher and learn how to develop my own research projects.

Fundamental issues and challenges

The postdoctoral training is been extremely challenging for me and my family, specially considering the financial burden. I have two small children, one of them still in daycare, and the cost of childcare alone corresponds to more than 60% of my net salary. We also pay US$3700/mo rent to live in a fairly small two bedroom apartment, so we are barely making it every month. My husband is very supportive of my choice of pursuing an academic career, but it certainly imposes extra pressure on him to provide for us since my salary is not even close to the cost of living in Massachussets. We could certainly have a more comfortable and financially stable life, but this would require that I change paths to industry and give up an academic career in medical robotics.

Existing NIH policies, programs, or resources

I'm not considered to be an Early Stage Investigator, since I have finished my PhD in 2022. However, during this 11 year-period after my degree, I followed a lecturer-oriented academic path in Brazil (my home country) before deciding to switch back to research. Just when I started, I had to deal with 2 maternity leaves followed by the restrictions of the covid pandemic while taking care of two toddlers, which puts me in a position of a somewhat unexperienced researcher (hence, my current postdoc position). I understand that I haven't followed the standard career path, but I also know that I'm not alone. I also understand that my unconventional career path gives me different perspective and a different skill set that can add to the research enterprise, but it also makes it more challenging to become an independent researcher when I have to compete against already established researchers. It would be great if NIH programs could include more opportunities to those with unconventional career paths.

Proven or promising external resources or approaches

No response

Response 2613

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions should be the last step to a career position. Professional development is crucial. I had 2 one-year long postdocs. The first, at a USDA funded facility I obtained through ORISE/ORAU. I provided me the opportunity to plan and run an entire animal study on my own under the management of my PI, which gave me a lot of confidence and was a valuable experience.

The 2nd position was the exact opposite and turned out to be nothing more than a lab tech position in a poorly managed lab. My only accomplishment was genotyping (in a lab that had been unable to successfully genotype several of their animal colonies for almost a year). No professional development of any kind. The PI's bad management prevented him from retaining qualified staff. 3 people quit within my first 60 days. Conditions were poor and there was no access to HR because I worked at [redacted for anonymity] considered separate from the University. No handbook for employees, no access to HR. Department staff stood in for HR even with confidential medical forms and other normally protected employee information, providing no confidentiality. It was like working in a developing country. There was also coercion to falsify data (I was asked on multiple occasions to create a "fake" western blots). I did not comply, but that made the work environment openly hostile. So not only was there no training, I felt that continuing to work for this PI would endanger my reputation for scientific integrity and I elected to quit after one year. Until postdocs have a direct voice, abuses of this kind will continue. NIH needs to check up on funding recipients because the universities won't do it.

Fundamental issues and challenges

For my 2nd postdoctoral experience, I'd say lack of best practices in HR resources at the university, lack of scientific integrity of some scientists (without any way to report the behavior or submit feedback) and total lack of management skills of the PI were key factors in limiting retention and quality of life. There is no quality of life when you work in a hostile work environment and the boss is literally "above the law". My PI actually told me if I wanted to speak to other professors outside his lab, I had to ask him first and have him screen my questions to these professors. I am an adult US citizen and do not need to submit to such requests, yet I have him on tape telling me I was not allowed to speak to other professors. He often appeared unhinged and made threats as well, picking out names from my CV to threaten me. Freedom from coercion and abuse should be fundamental to any job. I don't think any of the science that is produced from such work environments can be counted on, as most of the staff who generate the data are abused and scared and just want to survive. Luckily, the mismanagement was such that I never even got to start a real study. The few "fake" western blots I made were very poorly executed and have watermarks, so if I ever see them published I can call the journal to report the fraud.

Existing NIH policies, programs, or resources

ORISE is a step in the right direction. If it weren't for COVID and my PI needing to retire unexpectedly, my first ORISE postdoc would have been all I needed. For less ideal positions: NIH funding for PI's that includes salary for postdoctoral staff should be contingent on a plan for professional development for those positions. If there will be no first author publications, there has to be something else to make this "training position" worth it. First author publications were an impossibility for my last position. A plan B for professional development for all postdoctoral staff could include training in core facilities used by the PI, training in other labs, writing and teaching opportunities, and networking. A minimum of hours/week could be devoted to such opportunities. Postdocs could then submit feedback on the topic of professional development as a way to review the PI's compliance. If the PI could not provide professional development opportunities, then the NIH could provide external resources for the postdoc, like ORISE provided to me during my postdoc at USDA (automatic membership in the NPA and other remote resources). This would help retention staff even in difficult situations (albeit not in the case of abuse). Apart from the abuse, I may have stayed at my last postdoc even as a lab tech if there had been on-site or remote programs available to me. My situation was unique in that I chose not to work for such a loser, but there are many labs that might benefit from retaining their staff by providing a Plan B during tough times. If it's really supposed to be a training position, ENSURE THERE IS SOME TRAINING AND ALLOW THE POSTDOC TO GIVE FEEDBACK TO MAKE SURE THE TRAINING IS BEING OFFERED.

Proven or promising external resources or approaches

ALLOW POSTDOCS WHO WORK IN POSITIONS FUNDED WITH NIH MONEY TO GIVE DIRECT FEEDBACK. I wonder why this is not already a policy. The only people who really know what is going on in NIH funded labs are the staff members and they don't have any voice. There is no boss. The universities are not resources—with no actual HR department? And it is not in the best interest of the academic institutions to oversee labor relations in these labs, as the universities themselves benefit from the funding (so their incentive is not to discipline abusive PI's) NIH HAS TO START LISTENING TO THE STAFF. I had no one except [redacted for anonymity] Title 9 office. However, they could not help me with any HR problems and even admitted to me that HR was not doing their job in my case. If this PI is getting paid by NIH, NIH should be checking up on him as the university is not doing it. Also, the policy that only university-

disciplined researchers are reported to NIH for civil rights violations is not going to work. The university protects bad actors because of the money they bring in. Protected classes pay the taxes that fund the NIH and it is appalling that individuals in those very groups are being discriminated against openly. Check out the resources for staff of [redacted for anonymity] and you will see. They are investing zero $ in supporting postdocs and the NIH doesn't even know.

Response 2614

Perspectives on the postdoc roles and responsibilities

Postdocs are supposed to be prepared for leading research projects given from the PI at the bench. Specific Aims, budget, and instructions about the framework of data acquisition strategy come from the PI, and postdocs will generate primary data with other lab support members. Postdocs are responsible for providing timely reports and feedbacks to the PI, including troubles and negative data.

Fundamental issues and challenges

Postdocs are not currently paid well, and their financial future has no assurance. Their diligent efforts may not be appreciated by reviewers of their papers or grants —quite often unfairly. Whether they can secure good faculty job or industrial positions depends on not only their good training but heavily on simple luck. Whenever this issue is raised, we hear arguments AGAINST helping postdocs based on a historical view that science and scientific positions are always competitive. However, aspiring scientists do not have any obligation to gamble their living on this uncertain game. As young people exchange information far more efficiently today than just a decade ago, they are making choice in favor of avoiding such risky games even at the time of selecting graduate school education.

Existing NIH policies, programs, or resources

We are currently hearing a lot about increase in postdocs' basal salary. However, NIH funding never increases to sufficiently cover such raise. As a straightforward consequence, we must fire postdocs when the laboratory faces financial difficulties. Even when two full-modular budget R01 are active, the amount of these funds do not fully support even one postdoc's salary + benefit + reasonable research expenses. The only responsible way to manage the lab is to support only a small number of affordable postdocs whereas other, well-talented PhD's will be out of job security.

Proven or promising external resources or approaches

Postdoc applicants want to know whether their job will be secured in the next ~5 years. Unless NIH makes a very significant change in supporting postdocs' salary and benefit, their number in the US ecosystem will decrease. Because we have spent a lot of effort to increase and maintain the PhD level of the US graduate education, recruiting postdocs from foreign countries may not work well. Besides, if current PhD students in the US see a move that Government encourages employment of foreign-educated PhDs as postdocs, the US-educated PhD candidates will lose their motivation and go away from the system.

Creating a set-aside budget request for postdocs might be a solution. Namely, in a 10-module R01 application, up to 2 modules ($50k) are permitted as ADDITIONAL budget request set-aside if the application includes recruitment/employment for postdocs, and these additional modules MUST NOT be used for any other purposes than payment for postdoc salary/benefit. Similar budgetary rules should be created for non-modular grant applications. It is important to establish rigorous rules to separate these postdoc-supporting budget elements from supervisors or institutions, who might create any local rules to take money out of these set-aside funds.

Response 2615

Perspectives on the postdoc roles and responsibilities

postdocs are very stressed and unsupported and have no future at all that is visible. At hospitals like mine, [redacted for anonymity], where its a 100% soft money position, we need the hospital to non-discriminatively provide support for F & A costs that our IDCs bring. Unfortunately at [redacted for anonymity] it is not done and women faculty in particular are ruthlessly retaliated against if they complain. If we are people of color also, we are freely called aggressive for complaining. We are told our careers will not go further and indeed those retaliations relentlessly follow. They do not forgive dissenting opinions even if brought up nicely, in a group, or in desperation when things are falling apart for our

postdocs. Our postdocs see that and they have no hope. There is no respect from the administration for postdocs who have PhDs but their salaries are lower than admin at hospitals who dont. They are also kept lower by such strategies; our repeated attempts to raise salaries from grants WE get are killed by HR and in return we are haunted by retaliation with the way you asked for it was aggressive, misconduct etc. There is no policing. We had a discussion during covid where they wanted to stop salary raises for trainees, as they had for hospital administration and also us PIs, but all of us PIs stood firm against it, they fought back against us rather threateningly but had to back down because NIH had released a note to not affect postdoc salaries and because we PIs were united and ready to revolt.

Fundamental issues and challenges

There is no incentive to being a postdoc. There is no respect from administration. There is no future; too few academic jobs all of which want a K99 that is not possible for the institute to get IDCs. Industry and other options are very serious about quality of life, academia does not care about postdocs.

Existing NIH policies, programs, or resources

If NIH would survey both trainees and minority and female faculty annually, which hospitals would know of, then that would help as a deterrent to correct these actions. It will also prevent horrific harm to minority female faculty who raise complaints on behalf of their postdocs.

Proven or promising external resources or approaches

A path forward is necessary. A curriculum is needed. Some things that they can check off such as grant writing, alternative jobs, a time plan, and surveys so that they are heard annually.

We also pushed back against them trying to monitor postdocs at home for the amount of work put in, which is not needed at all. HRs do not seem to understand that they cannot override NIH policies. They also retaliate against minority female faculty like myself as we are marked after complaining in desperation when salary raises were not done for years or other trainee services delayed. If NIH would survey both trainees and minority and female faculty annually, which hospitals would know of, then that would help as a deterrent to correct these actions. It will also prevent horrific harm to minority female faculty who raise complaints on behalf of their postdocs.

Response 2616

Perspectives on the postdoc roles and responsibilities

Being able to apply knowledge earned in grad school. Transition to an independent scientist.

Fundamental issues and challenges

No financial stability. Almost all postdocs are 30+/—3 years old and breadwinners for the family. Not making ends meet despite having a doctorate with no guarantee of future is highly demoralizing. Also there’s subtle male dominance when it comes to decision making.

Existing NIH policies, programs, or resources

Offer salaries competing to industry (probably not possible in reality). Encourage collaborative projects. Adjust salaries based on city instead of making it the same nationwide.

Proven or promising external resources or approaches

Advertise non academic positions available for postdocs. Yearly Evaluation of PIs as a mentor would help in avoiding hostile environment. Evaluation of trainees to track progress.

Response 2617

Perspectives on the postdoc roles and responsibilities

Academic postdocs seed the next round of discoveries and set the trajectory for the future of biomedical research in the US and beyond. It is vital that we thoughtfully engage the next generation of researchers and shape them to think critically and to see the promise of a fulfilling academic research career.

Fundamental issues and challenges

The 'on-ramp' for a biomedical research career can be steep and tortuous. We need to create more opportunities for early career investigators and to make sure their mentors are adequately incentivized and supported to help them navigate the next stages of their careers.

Existing NIH policies, programs, or resources

Increasingly, we have seen a large group of biomedical trainees, particularly MD-post-docs, who want to engage in global health work. They are deeply committed to ideals of social justice and equity, and they are well-positioned engage diverse partnerships around the globe to tackle pressing global problems. There is substantial benefit to be gained domestically through these interactions, which, because they are in different contexts, often lead to innovative solutions that can shake up our status quo approaches to problem solving.

Proven or promising external resources or approaches

Providing child care, increasing salary cap, incentivizing mentors, and opening up training slots to non-US citizens for T32s —perhaps through 'twinning' with US citizen T32 trainees.

Response 2618

Perspectives on the postdoc roles and responsibilities

The postdoctoral positon feels like a way to continue paying highly educated scientists a fraction of their worth for as long as possible. Roles **and responsibilities** can vary greatly from institution to institution (and lab to lab within institutions). There appears to be little regulation/oversight. My institution treats post-docs as an offshoot of the graduate school—and have trouble maintaining even a single employee in a role meant to provide professional development and support. I think it can be useful to scientists who are looking to change their field of research; however, it has absolutely gone far beyond that original goal. I don't understand why a PhD isn't qualification enough to secure a position after graduation. Postdoctoral positions should not be an expectation after graduation.

Fundamental issues and challenges

My institution currently offers no paid parental leave to postdoctoral scholars. Paid parental leave is offered to full time employees and graduate students. As most postdoctoral fellows are in their prime child-bearing years (mid-twenties to mid-thirties), this feels like a huge oversight and a major disincentive for scholars who want to start families, particularly female scholars. Pay is also substantially lower than what many of us might expect to earn with a bachelor's degree + 5 years' experience. PhD-level scientists are eligible to begin working in industry without postdoctoral training,so why is it required (often for a period as much as 7 years) to attain a position in academia? Are we not getting appropriate training during our PhD? If so, why not implement some of that training rather than requiring a post-doc at a substantially lower rate of pay. There is little work-life balance and the overall "vibe" seems to be that we must work as hard as possible for as long as possible to get a position in academia—where we continue working ourselves well beyond a typical 40-hour work week. As a pregnant woman, I don't see a way for me to continue working in academia with a young family, certainly not anywhere on a tenure track. I don't know a single faculty member who has a top priority other than their job, and that makes me feel like I don't belong in academia.

Existing NIH policies, programs, or resources

I am not familiar enough with these resources to comment.

Proven or promising external resources or approaches

Improve pay. Guarantee parental leave (and other forms of leave). Promote work-life balance. Limit postdoc positions to 2 years, with a maximum of 2 post-docs per person (no more than 4 years of training post-PhD). Reduce the expectation that a post-doc is required after earning a PhD. Improve training during graduate work so that post-docs are not a de-facto requirement. Improve training of faculty mentors. Start mentorship programs where post-docs can interact with people who are not at their institution/are not in academia. Share resources with post-docs seeking to leave academia—we tend to get mentored towards the positions our advisors have and that is not always the best fit for each person.

Response 2619

Perspectives on the postdoc roles and responsibilities

The postdoctoral position allows the researcher to expand or gain new knowledge in an unknown field. Therefore, traditionally the postdoc position has been viewed as a training position. This is partly true today. The postdoctoral period takes on average 4-6 years of which only the first 2 years can be considered training, since two years are enough to get "trained" on the main concepts and technologies in a new laboratory. The rest of the time the researcher tries to be as productive as possible to compete in an already highly competitive academic environment or fulfill all requirements to become eligible for a green card and make his exit to the industry.

Fundamental issues and challenges

As mentioned above, the postdoctoral position is for most of its time not a training position. However, the benefits and the salary and the perspectives have the character of a training position. Most postdoctoral researchers are in their late 30s. Low payment and "being stuck" in a position make starting a family impossible. Especially women suffer under this a lot, since they are facing the dilemma between career or starting a family.

Existing NIH policies, programs, or resources

Salary of postdocs should be adjusted to the regional cost of living (e.g. Boston, NY and SF are more expensive then S. Carolina). After 2 max 3 years the postdoc training should end and the researcher should move to a more sustainable position.

Proven or promising external resources or approaches

Please urge the labs to recruit a smaller amount of postdocs but pay them better and treat them better. Also, the J1 visa for postdocs is a catastrophe and should be replaced by H1B which allows the researcher to visit their home country more often and foster collaborations world wide.

Response 2620

Perspectives on the postdoc roles and responsibilities

This is an opportunity to build collaborative skill sets in a mentored academic environment with access to resources for scientific investigation.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Great as is.

Proven or promising external resources or approaches

Provide a platform for funded postdocs to communicate directly with each other across extramural institutions. It will promote a sense of community—which is valuable to Millenials and Generation Z.

Response 2621

Perspectives on the postdoc roles and responsibilities

A postdoc position is intended to provide further training to a researcher with a PhD degree and prepare him/her for an independent academic career path. So a postdoc researcher is usually working under a PI to conduct research. During this process, he/she is expected to develop his/her own ideas and projects, which eventually lead to independence.

Fundamental issues and challenges

Postdocs usually work long hours, have little personal life, and get a very low stipend. More importantly, the chance of getting an independent academic position is very low, and most eventually go to industry or

other non-academic fields. But the postdoc experience is often worthless in non-academic fields. I wish I had known this earlier and never gone down this path.

Existing NIH policies, programs, or resources

The design of the postdoc position is problematic. It would be better if postdocs were treated as scientists as those in the industry but not trainees. As trainees, we should have clearer pathways leading to independent academic positions. In this way, all the hardship we are enduring would be defensible. However, the reality is not the case at all.

Proven or promising external resources or approaches

There might not be an easy way to solve this issue, considering the limited academic job openings. The situation may be improved if postdocs are treated as scientists, get good salaries, a better working environment, and more professional development support.

Response 2622

Perspectives on the postdoc roles and responsibilities

Higher training, professional position

Fundamental issues and challenges

Low pay, long work hours, poor work/life balance, lack of full independence, little respect.

Existing NIH policies, programs, or resources

Shorten the number of years for postdoc training to 3 after which a more professional/permanent position is offered.

Salary.

Proven or promising external resources or approaches

Salaries of biomedical PhDs in any job position other than postdoctoral fellow.

Response 2624

Perspectives on the postdoc roles and responsibilities

I view it as a transitionary role following PhD and before gaining a full-time career position in academia or industry. As an international scholar who received a PhD in the US, it is also a more stable visa environment compared to the uncertainties of industry roles.

Fundamental issues and challenges

While postdoc fellowships by design were meant to be a transitionary role, it is no longer the real case. It is not uncommon to see 3 to 6 year postdocs, working to get enough publications and citations to be competitive in the academic market. As such, it is unfair to continue treating this role as a ‘stipendee’ role as if it is temporary, when postdocs are in practice a full time position.

Academic postdoc fellowships offer extremely low stipend salaries compared to salaries Bachelor's degree holders with 2-4 years research experience can obtain in an industry setting. The NIH-minimum suggested stipend is unfortunately the de facto stipend offered by most universities. This stipend is only livable wage in places with low cost of living. Postdoc trainees live on the edge of poverty in many prestigious universities, which inhibits recruitment of people with diverse socioeconomic background, affects retention of talented postdocs who are unable to sustain a comfortable living on low salaries, and overall reduces quality of life of these highly-trained scientists by making them require monetary support from other sources (personal funds, spouse, etc.) to maintain their position as an academic researcher. Especially with industry salaries on average being 2X or even 3X what is offered to NIH stipend-receiving postdocs, many academic career aspirants are forced to move to industry to have a better quality of life.

Existing NIH policies, programs, or resources

The NIH stipend scale needs to be revamped to a sliding percentage system that factors in cost of living of various locations and also the federal employee pay grade for people with equivalent education and experience in those locations. It needs to change the suggested minimum for postdocs in high cost of living places. This is a key policy to ensure low-income background researchers and diverse communities aren't excluded.

Proven or promising external resources or approaches

Competitive salaries, benefits, and 401k match with full-time industry scientists.

Response 2625

Perspectives on the postdoc roles and responsibilities

As Postdoc we are not only learning from the existing cutting-edge science, but also contributing to the development of new avenues of these.

Fundamental issues and challenges

Most fundamental challenges after pandemic became the financial issues where the less salary for a postdoc is concerning as the prices for daily life survival had gone upwards. And this is really challenging for the academic life in the cities like Boston.

Fundamental issues and challenges

A number of opportunities for funding, position, career path are not open to non-U.S. citizen, even conducting research using certain facilities are not allowed to be opened to us. These challenges make non-U.S. citizens postdoc lost these opportunities to advance their research and spend relative more time and efforts to achieve similar career goals.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2627

Perspectives on the postdoc roles and responsibilities

Postdocs are a major workforce of the research enterprise because they are trained scientists who drive research projects forward, mentor and train junior scientists, and at our Institute, they are the first authors of most peer-reviewed publications. After successfully received a doctoral degree (Ph.D., M.D., or equivalent), a postdoctoral position is a temporary and time-limited period of mentored training to gain the experience to transition into an independent career of the postdoc's choice.

Fundamental issues and challenges

Salaries & Benefits: There are fewer Ph.Ds. applying for (recruitment) and staying in (retention) academic postdoctoral positions because they are going into employment positions with better salaries and benefits in other sectors, primarily industry.

- Academic institutions cannot compete with industry companies that offer higher salaries and better benefits.
- Postdoc salaries at academic institutions do not routinely consider inflation or the cost of living, especially in big cities (New York City, Boston, San Francisco, San Diego, and similar).
- Academic postdoc positions are lasting longer with low pay and poor benefits.
- Some postdocs do not have access to childcare services or support to care for family members which can negatively impact their research productivity, work-life balance, and mental health.

NIH Funding Mechanisms: Postdocs have limited opportunities to apply for funding based on the current eligibility criteria.

- Faculty have difficulty financially supporting postdocs because NIH postdoc salaries have increased over time, but R01 grant funding has remained relatively flat.
- There are limited opportunities for international postdocs to apply for funding, because many fellowship (F32 & T32) opportunities require citizenship.
- Eligibility for early career awards such as the K99/R00 are limited because postdocs must apply within 4 years, but time to a publication has increased making these candidates less competitive.

International Postdocs: International postdocs are in a vulnerable position because their visa status is directly linked to their faculty mentor. This can lead to unhealthy expectations where the international postdoc is in fear of being sent back to their home country if they do not meet all expectations of their faculty mentor.

Career Progression: Other than a faculty position, there is a lack of career development tracks within academia for Ph.Ds. who want to pursue independent research.

Existing NIH policies, programs, or resources

Salary & Benefits: Increase funding amounts to all mechanisms in support of academic institutions becoming more competitive with other employment sectors in postdoctoral salaries and benefits.

- Increase postdoc salaries in consideration of inflation and cost of living.
- Provide additional funds for fellowships and institutional training grants in support of childcare and family services so that academic institutions can be more competitive with industry companies.

NIH Funding Mechanisms:

1. Create new funding mechanisms and
2. expand eligibility criteria for existing funding mechanisms to allow for a larger percentage of postdocs to pursue independent funding of their research projects.

- Expand time limits (e.g. 4 years of postdoc research experience) on early career awards.
- Create separate funding mechanisms beyond K99/R00 for postdocs to transition into more independent positions between postdoc and faculty, such as a Staff Scientist or Research Assistant Professor.
- Emphasize importance of career development for postdocs within all funding mechanisms (e.g., institutional training grants and research grants).
- Provide more travel awards to ensure postdocs can attend conferences.
- Remove citizenship requirement for fellowships (e.g., F32) and institutional training grants (e.g., T32) funding mechanisms so that international postdocs are eligible to apply.

Career Progression: Emphasize the importance of career development for postdocs through existing and new NIH programs.

- Track faculty/institutional use of Individual Development Plans (IDPs) to emphasize importance of reaching research milestones and of career development/advancement for postdocs.
- Create new funding mechanisms for institutions to develop career tracks for PhDs beyond postdoc towards research independence, i.e. between postdoc and faculty, such as a Staff Scientist or Research Assistant Professor.

Proven or promising external resources or approaches

Two strategies at our Institute that have proven success are:

1. Establishing a Postdoc Training Advisory Group for postdocs to directly provide their ideas, feedback, and input into shaping the postdoctoral training experience and advocating for their needs. Outcomes have included:
   a) Establishing a postdoc pay scale based on years of postdoc training experience,
   b) creating an-Institute wide Trainee Seminar Series, and
   c) rewarding faculty who demonstrate high-quality mentoring of their postdocs through a Mentor of the Year Award.
2. Recruiting talented postdocs through a Rising Stars Symposium mechanism which has:
   a) brought together the research and training communities at the Institute,
   b) supported diversity, equity, and inclusion efforts and raised awareness of the postdoctoral training experience at our Institute, and
   c) led to talented postdocs joining our Institute.

Response 2628

Perspectives on the postdoc roles and responsibilities

Postdocs are highly qualified professionals and usually an undervalued driving force behind the high quality research being produced and delivered in the US. However, they are often undervalued and face unique challenges due to their academic career stage and limited opportunities for continued academic positions. Postdocs are at a transition stage of becoming independent researchers, but still require mentorship and guidance. The quality of mentorship can vary greatly, with some postdocs being treated as "cheap labor." In addition, the temporary nature of the postdoc position, which is often dependent on external funding, adds to their stress as they constantly worry about their own financial stability. Postdocs are also burdened with financial and family-related stressors. The average age of obtaining an R01, a grant for independent research, continues to increase, making postdocs financially vulnerable.

International postdocs, who represent a significant portion of the postdoctoral workforce (47%), face unique challenges such as visa issues, cultural challenges, etc. A "bad mentor" can have disastrous consequences for an international postdoc, as their visa status may be jeopardized, affecting their career trajectory. To address these challenges, postdocs should have access to a support network that includes academic, HR, financial, and legal experts who can provide support specific to their needs. However, many institutions do not have this support. It is important to survey postdocs funded by organizations such as the NIH to assess the support they receive.

Postdocs have diverse roles and responsibilities, including conducting their own research, mentoring junior lab members, and assisting their mentor's projects. These challenges also present opportunities for professional growth. As postdocs have varied career goals, there is no one-size-fits-all solution to address their challenges. Therefore, it is crucial for funding agencies like the NIH to seek feedback from postdocs themselves on their challenges and how best to address them.

Fundamental issues and challenges

1. Salaries do not keep up with the rising cost of living, leading to financial difficulties for postdocs (arXiv (https://arxiv.org/pdf/2205.12892.pdf). Salaries should reflect the cost of living in the area where the research is being conducted.
2. Postdocs are the driving force behind research in academic labs and often work long hours, with little work-life balance. Institutions should implement policies to protect postdocs from exploitation due to overwork. Postdocs are often heavily dependent on their PIs for their future career prospects, including reference letters and opportunities for research, which can create a power imbalance.
3. Postdocs play a critical role in securing grant funding for universities, yet some institutions do not consider them as employees, resulting in limited access to benefits. The NIH should conduct surveys to understand the financial challenges faced by postdocs in terms of benefits and employee status in various universities.
4. Bullying in academia is also a pervasive issue (https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3850784), and institutions and funding agencies should provide support for addressing toxic workplaces. Adequate mechanisms should be in place to support postdoc victims of abuse and harassment in continuing their research while investigations are ongoing, including providing them with a safe environment.
5. Postdoc are often not equipped with the necessary skills to transition into independent career (administrative work, etc) and institutions should provide training opportunities in these areas to prepare postdocs for leadership roles.
6. There is a lack of non-tenure track academic positions (research scientists). The NIH should collaborate with entities like NASEM to research the feasibility and benefits of such career tracks to accommodate diverse career aspirations in academia.
7. International postdocs face unnecessary daily life challenges when only signed into short 1-year contracts. International postdocs that are currently funded should have a secured contract and visa status for the duration of their funding.

Existing NIH policies, programs, or resources

1. Expand the timeline for fund opportunities like the K99, which is a unique funding mechanism for which international postdocs are eligible.
2. Gradually transition postdocs into more independent roles, such as "senior scientists," before obtaining an academic appointment. This would allow postdocs to gain more experience and autonomy in their research, preparing them for future career steps.
3. Academic incentives and tenure rewards for PIs who provide good training, positive learning environments, and foster non-toxic workplaces and education are also important. This would promote healthy work environments and support the professional growth of postdocs.
4. Institutional support for health insurance, paid leave, and retirement plans is crucial for the well-being and financial security of postdocs. Expanding the R50 mechanism to support non-tenure track positions would also provide more stability and opportunities for career advancement.
5. Offering more funding opportunities that are accessible to international postdocs would promote diversity and inclusion in the postdoc community. Institutions should also allow certain expenses, such as childcare during conferences or funded fellowships, as allowable costs in postdoctoral fellowships to support postdocs with caregiving responsibilities.
6. Longer maternity leave with additional support from the laboratory to continue research during leave would also benefit postdocs who are starting families. It is important to consider postdocs as employees of the institution, providing them and their families with health and other benefits.
7. Creating more permanent staff scientist positions with competitive salaries would provide additional career options for postdocs and ECR.
8. Addressing tax issues related to child and dependent care credits for postdocs who do not have earned income would provide financial relief for those utilizing caregiving services while working. Universities should commit to developing and expanding offices for postdocs and early career investigators, providing specific support for professional development, mentoring, and mental health to address issues like burnout and depression.

Proven or promising external resources or approaches

These efforts should be a continuous process and in constant contribution with the institutions where these postdoctoral researchers are employed. To better inform the parts involved, the NIH could provide and collect templates for job satisfaction surveys, performance evaluations, newsletters informing about the recruitment process, etc.

The NIH should be in contact with successful postdoctoral offices who have found a way to support their postdoctoral community with career training programs, employee benefits and advocacy resources that address visa and employment issues, like misconduct and harassment. One example can be found at the University of Pennsylvania: https://research.upenn.edu/postdocs-and-students/welcome-postdocs/

Extra hands support, such as that provided by Harvard's Claflin Distinguished Scholar Award or the Doris Duke Fund to Retain Clinical Scientist, for postdoctoral scientists who are also caregivers can be pivotal in retaining scientists from underrepresented groups by maintaining research momentum during times of significant caregiver responsibilities.

Response 2629

Perspectives on the postdoc roles and responsibilities

I am transitioning fields from physical inorganic chemistry to biomaterials, and this postdoc position allows me to gain critical training and experience. I particularly value the support of the NRSA postdoctoral fellowship I currently have. I view my role as a mentor to the junior scientists in my lab, and a mentee to my current PI, where my focus is to learn, help people around me learn, and grow as a potential future leader in academia. However, I do find it challenging that the academic market is so difficult to find positions in, and that industry is more accessible and better paying. A huge percentage of my cohort and many labmates younger than me have left postdoc positions for industry, or didn't bother to find a postdoc. Partly because of that, I think a lot about how I could more easily obtain financial security with an industry position, i.e. supporting a family, having a retirement fund, and not worrying about applying

for grants all the time--and contrast that to the fact that I have less than $10,000 in retirement savings, would struggle to raise a child on my postdoc salary or deal with a major illness, and have no guarantee of securing an academic position. I believe that there isn't value in doing a postdoc unless you want to change fields in your job after, or if you want to be a professor. In those specific ways, I think postdocs can be a great opportunity and stepping stone to a more fulfilling career. For me, I think both apply, and I do really value the opportunity and freedom my postdoc has given me to grow intellectually and creatively, and I wouldn't change the fact that I went after one.

Fundamental issues and challenges

Because the postdoc position is a short-term one, when people are considering becoming and staying as a postdoc, they're primarily thinking about the next stage. Do they want do pursue academia or industry? I think in this time, more people are rethinking postdoc positions because of the difficulty of obtaining academic positions in desirable locations and the challenges associated with academia. And thus, if they are not as interested or able to get an academic position, they would either choose not to obtain a postdoc or choose to leave their postdoc early. I think it's a common viewpoint that the value of a postdoc intrinsically is rather low unless there's something specific about the research, the location of the postdoc, or the chance for employment afterward. Especially because many industry positions pay at least twice the typical postdoc salary, you're really taking a financial hit doing one, and it's hard to save for key life events like a having a wedding, buying a home, or having a child that would typically occur at the same time. Being a postdoc also means being uniquely vulnerable to your PI, as you need their recommendation and support to pursue a career in academia. I generally have a good relationship with mine, but there have been several instances that I have felt uncomfortable, and found it difficult to speak up to defend myself knowing that he welds such control over my career. More broadly, the pyramid-scheme-like nature of academia makes it dispiriting to think about future prospects. All of these factors are challenging and make it hard to continue as a postdoc.

Existing NIH policies, programs, or resources

When I became an NRSA NIH postdoctoral fellow, I forfeited my status as an employee of my university. As a result, I lost all the retirement benefits I had previously as a postdoc. In actuality, the value of those benefits came out to exactly the same amount as the increase in my NIH salary, meaning that the only difference was the title of my position. Additionally, it means that if I ever have an accident in the workplace, I will have difficulties navigating the process because I am not an official employee; I don't have documented vacation time as I did previously; and I have no specific people supporting me in the HR department who are familiar with all of the features of my fellowship. These factors all contribute to a poorer experience than I was anticipating, given the prestige of the fellowship. It would be really beneficial if the NIH could help support fellows in these gaps and in particular, pressure universities to maintain postdocs as employees. Cost of living adjustments to salaries would make a huge difference to fellows, as well as more support for non-traditional pathways.

Response 2630

Perspectives on the postdoc roles and responsibilities

It means I have the ability to conduct research more independently with opportunities to apply for more grants. I used to view it as the best post PhD graduation option because I study a very niche area of biomedical research which isn't heavily represented in [redacted for anonymity], but at the end of my PhD and especially with the UC strike, the amount of abuse increased across campus and I'm not sure if it's worth it to endure PI abuse for a "chance" at getting a ladder rank position at a university, for HALF the pay of anyone else in industry

Fundamental issues and challenges

Getting paid half the salary of any equivalent PhD level position

There's no regulations preventing academic abuse, unlike in industry

There's no guarantee that taking a $50k salary in the most expensive state will lead to a research position

The level of grant awarding is so low how can any post docs really expect to be able to fund their research and supposed future lab?

We rely on the NIH as the major funder and guideline of biomedical research to actually protect people who want to improve humanity through research, please help us end the cycle of academic abuse that forces foreign nationals to be afraid of losing visa status, women to have lab meetings WHILE IN LABOR (which happened at [redacted for anonymity]) so that they can keep the students doing research to not lose grant status, and to force publish data (potentially mistaken data) because the labs weren't "productive enough" by publishing enough papers within a short amount of time

Existing NIH policies, programs, or resources

A lot of PIs are funded off federal grants, so PIs should have to treat students with the level of respect that is afforded federal employees or at least decent human respect, so if PIs are reported and found to be non adherent, they should be fined or dinged on current or future grant applications

Increased funding for either post docs or transition roles—only the F32 and K series grants are well known for those positions but why is it only those?

Published statistics on the number of postdocs who successfully transition to ladder rank academic positions, or any other academic level positions

Proven or promising external resources or approaches

Response 2631

Perspectives on the postdoc roles and responsibilities

During doctoral studies, most students work on supervisor-provided research topics. While working on such topics they start developing their own research ideas and topics. After graduation, if the supervisor is not interested by such ideas or topics, the graduate may live with their ideas. Working on those ideas is one way of becoming an independent scientist. To do so, one need to find a postdoctoral position where their ideas are valued and they are given a chance of exploring their own path towards independence. Also, during doctoral program, most skills learned are match related to the topic on which one is working. To be an accomplished independent scientist, there is a set of soft and hard skills that one need to acquire. Postdoctoral position is a time to acquire such needed and desired skills. So, postdoctoral position for me means a time of transition between graduate student and independent scientist. It should not be considered as a trainee position as it is now, rather as an employment in early career stage. It should not be unstable, but give a way to a tenure position as scientist.

Fundamental issues and challenges

Postdoctoral candidates are not considered as employees, therefore they have limited benefits compared to employees. They are the lungs of the academic world, yet they are given limited paid leave time and less support for their families, which they often sacrifice for the sake of building an elusive career in academia. Most postdoctoral trainees are recruited to do the work of their PIs who, if the trainee fail to produce the results they expected, decide to let him/her go. The overall quality of life of postdoctoral trainees in academic research is below the average.

Perspectives on the postdoc roles and responsibilities

Post-doctorate is the initial stage of scientific research work, and it is an important stage. A perfect scientific research platform is essential.

Fundamental issues and challenges

Compared with the expensive rental price in Boston, the postdoctoral salary may not be able to support their lives well.

Existing NIH policies, programs, or resources

Is it possible to provide postdoctoral fellows with relatively cheap rental housing resources?

Proven or promising external resources or approaches

Reduce unnecessary meetings that take up a significant amount of research time.

Response 2633

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Several current problems with postdoctoral positions come from lack of reward from the work as perceived by current trainees.

In my view this arises from several converging factors:

1. Postdoctoral training times have lengthened as PI biomedical research positions have been harder to obtain, and assistant professorships harder to obtain funding for.
2. In many fields, industry jobs have grown up, often with greater compensation than postdoc positions.
3. The generation of postdocs today faces serious societal stressors: soaring costs of housing, job insecurity, a warming planet, a nation sinking towards fascism, gun violence, and stripping of fundamental rights. All of this makes junior researchers want to obtain stable employment, not take on increasingly risky research positions. They are also less willing to sacrifice personal and family time for work.
4. Generational change that makes it harder to raise children as a postdoc. This is getting easier but still a problem.

Together, in my experience, these factors discourage students from taking postdoc positions. I have had a half-dozen conversations of this type with postdocs and junior faculty over the past few weeks alone.

Existing NIH policies, programs, or resources

- NIH should act to make grant funding for young PIs easier.
- Require applicant /institutions/ to commit to funding salaries of grant applicants and investigators. It is too easy for soft money positions to be created, which has dramatically increased the number of grant applicants. The stress on junior PIs is scaring postdocs away.
- ARPA-H has pulled money from NIH R01s to risky translational work that makes it harder for young PIs to obtain funding. This discourages postdoctoral training.
- Better child care and family support especially in two-career households—a standard situation for young PIs and one that is hard to manage as a postdoc.
- Better writing and presentation training. Top institutions have substantial resources for this, but many institutions do not. This sharpens the funnel of postdoctoral positions and career advancement.

Proven or promising external resources or approaches

Key approaches:

- Fund R01s at a greater level so junior PIs can again (as 20 years ago) fund small but stable laboratories with one or two R01s, and mentor postdocs without submitting 10 grants per year.
- Reduce the number of soft-money positions, asking institutions to fund their own faculty (for the same reason as above).
- Raise postdoc support systems: childcare, other household support, etc —see many tech companies which do (or used to) provide food and other services, to make postdoc positions more desirable and also let postdocs concentrate on science.
- Support RAs or postbacs for postdocs. This is common in pharma/industry postdocs and helps postdocs develop mentoring skills, trains young RAs/postbacs, and can also accelerate their own work.
- Support science infrastructure for postdocs. In the tech industry, production teams take experimental code written by researchers and make it robust. Animal support is better. Automated systems run assays. The absence of these resources in science makes science postdocs less attractive.

Response 2635

Perspectives on the postdoc roles and responsibilities

I view the academic postdoc as a time for learning how to apply the skills and scientific method gained during graduate school to new problems while building a independent research program. In other words, I see the postdoc as a transition from an independent researcher (able to conduct and collaborate on the experiments for a project without day-to-day guidance) to a PI who manages multiple research projects and lab members, while blanacing the administrative and research activities of the lab. It’s also a time to continue to build writing skills in terms of articles and grants, and expand on the tool kit of techniques or protocols of expertise.

Fundamental issues and challenges

The salary is the biggest challenge. Choosing a postdoc requires weighing the lab environment, the research area, the resources of the institution, the recognition of the lab, along with salaries, and the living environment. Some of the labs that are most likely to set a postdoc on the path of success are in cities with high cost-of-living. Until recently, I was paid based on the NIH minimum and while I was able to make it work, looking ahead I was unsure if I would be able to afford to continue living where I do with rent increases. Even with my recent increase in pay, I am still paying a substantial portion of my paycheck towards rent. I made a conscious effort when I started my postdoc to try to reduce expenses where I can to make it work, but I have friends who didn’t want to or couldn’t make those choices.

The other big challenge is that the support for postdocs and social experiences are not really as prominent at my institution as they were in graduate school. It can be hard to make time for meetings at the institutional level which seem heavily weighted towards postdocs with families or at a different campus. In part this is due to COVID, since I started during the pandemic, but since restrictions have lifted I’ve still

had a hard time to fit some of the in-person activities into my schedule and around experiments as I've also recognized I have to produce data to publish and set myself up for an academic career.

Existing NIH policies, programs, or resources

The timelines for some of the postdoctoral grants are difficult to meet if experiments take a long time, or the science requires multiple additional follow-ups to fully explain a phenomenon. I feel like postdocs are continuing to be asked to produce more and more high quality data in shorter time frames that are not always realistic with the experiments. It might also be nice to have more how-to resources for people to help understand all of the language and minutiae of the grant applications so they seem less intimidating to start. I think the NIH minimum salaries should be updated to reflect the years of experience in research that postdocs have gained through graduate school, or at least include guidelines for institutions in high cost-of-living areas.

Proven or promising external resources or approaches

No response

Response 2636

Perspectives on the postdoc roles and responsibilities

Academic postdocs are highly skilled, trained scientists seeking to build upon their graduate training to advance in their careers. While postdocs are responsible for day-to-day conduct of research, the position should be primarily viewed as a temporary and transitional career stage focused on mentored training and development. The expected timeframe of postdoctoral training is typically from 2 to 5 years but is highly dependent on the field and type of research, and career and training goals of the postdoctoral fellow, among other factors.

While it is often assumed that postdoctoral training is intended to prepare scientists for tenure-track faculty positions, only 1 in 4 postdocs will be in a tenure-track academic position after 5-6 years post-graduation (Denton et al., 2022). Postdoctoral training can provide an array of professional skills, such as grant writing, navigating academic publishing, experimental design, subject matter expertise, communication, and expansion of existing research skills, which find application in a range of professions in the academic, private, and government sectors. If given adequate mentorship and opportunities to develop their skills and independence, a postdoc should be well positioned to transition to a variety of careers.

Postdoctoral training is considerably less structured than Ph.D. education. The training a postdoc receives is almost exclusively through their mentor, and consequently the quality of training varies significantly. It is critical that postdoc programs offer ample opportunities for professional skill development. The assumption that postdocs are preparing to enter tenure-track faculty positions may discourage training opportunities that would benefit other career tracks. Moreover, even skills that are essential for faculty positions, such as mentoring, managing a budget, and teaching classes, may be overlooked. NIH should take steps to improve the breadth and consistency of skill training opportunities that postdocs receive.

Fundamental issues and challenges

Relative to comparable high-skill jobs in other sectors, the salary for academic postdocs is low. For many students finishing a Ph.D., this can make a postdoc impractical. A postdoc salary may not even cover basic living costs in more expensive cities, and leaves little to no room for retirement savings or student debt payments. Those from disadvantaged backgrounds are especially likely to struggle on a postdoc's salary, further exacerbating existing inequities at some of the most well-regarded academic institutions.

Many postdocs are in the early stages of starting families, which can further strain their limited financial resources. Furthermore, benefits available to postdocs vary significantly by state and institution, including parental leave and access to childcare, which are a critical concern for many postdocs. When added to other financial pressures such as student debt and moving costs, many who earn a Ph.D. may decide to seek a more stable career path.

A postdoctoral fellowship comes with an inherent degree of instability. The incentive for postdocs to accept the lower salary that comes with staying in academia is assumed to be an assurance of a stable and rewarding job afterward. However, the lack of structured training, minimal opportunities for career exploration, and the short duration of training grants and fellowships leave many with insufficient support.

Furthermore, postdocs are often employed on a one-year contract, so if their salary is not covered through a training grant, they may find their mentor is unable to support their position through the necessary duration. Postdoc attrition could be significantly reduced if there were a stronger assurance that after 2-3 years they will have acquired a breadth of transferrable skills that will prepare them for the career path of their choice.

Existing NIH policies, programs, or resources

NIH programs and policies should be refocused to improve professional skill training for postdocs, support a broad range of career trajectories, and improve access to essential resources to support the needs of a diverse and inclusive postdoc workforce.

Postdocs often have few opportunities to diversify their skillset. Outside of direct mentorship from an advisor, training is generally limited to the programs available at the postdoc's institution, if there are any. NIH should prioritize expanding career development and training opportunities available to postdocs. Skill development can be supported through creation of instructional materials, mentoring rubrics, workshops, or other similar mechanisms, and can be developed in partnership with third parties such as scientific societies.

NIH should develop clear standards and guidelines for postdoctoral training that reflect the range of careers for doctoral degree holders in the biomedical sciences. Postdocs often feel that they are expected to train for a tenure-track faculty position at a research-focused academic institution, even though there are far fewer such positions available than postdocs. Some may feel uncomfortable being open with their advisor about their career plans if their goals lie outside of academia or feel pressured to hide their career plans when writing a training plan for fellowship applications. An academic postdoc is a valid career step for a variety of jobs outside the tenure track, and NIH policies and programs should reflect that.

Several current NIH programs effectively address the requirements of postdoctoral training but could be expanded or adapted to broadly improve the postdoc experience. K99, K01, and K08 awards offer support for researchers and clinicians, respectively, a guided pathway with clear timelines and outcomes to achieve a career transition. Additionally, NIH loan repayment awards address a specific need of postdocs, improving quality of life and making training more accessible for those who are less financially secure.

Proven or promising external resources or approaches

The resources that academic postdocs rely on typically come from the institutions where they work—mostly universities and academic medical centers. These institutions are also responsible for providing benefits and salaries for postdocs. NIH should partner with universities to identify strategies to improve consistent benefits such as family care for postdocs, as well as to manage costs of living for more expensive geographic areas.

University postdoctoral associations often provide career training opportunities, facilitate networking, and sponsor mentorship programs. While these resources are valuable for postdocs, the associations are often run by postdocs and therefore subject to high leadership turnover. Some associations are able to provide high quality programs, but there is large variation among institutions.

Postdoctoral associations can benefit greatly when supported through institutional leadership and organizational structures. For example, the [redacted for anonymity] Postdoc Association ([redacted for anonymity]) is supported by the medical center's Postdoctoral Division (PDD), which was created to facilitate career training for postdocs within a more cohesive environment. The postdoc-run MGPA seeks to provide opportunities for career development, networking, and training through workshops and other events. The PDD assists in the organization of these activities, and provides further support through mentorship opportunities, career advising, and resources for personal health and family care. Because of the robust range of support provided, postdocs are given the resources they need to transition into the career of their choice.

The National Postdoctoral Association (NPA) also offers resources to support postdocs, in addition to their advocacy activities. NPA offers resources to support the development of institutional postdoctoral associations. NIH should seek to partner with NPA and institutional postdoctoral associations to broaden the impact of existing training and mentorship resources.

Response 2637

Perspectives on the postdoc roles and responsibilities

The postdoctoral experience is an opportunity to be mentored by a world-renowned scientist, prepare for one's future career in STEM, learn about the process of discovery, publication, and critical thinking, obtain leadership training and experience, and develop one's personal and career goals.

Fundamental issues and challenges

Postdoctoral stipends are typically low, benefits are minimal, and hours are long. The average age of a postdoctoral fellow is early to mid 30's, past the age when many people have already secured their first job, bought their first home, and had their first child. Many people in scientific careers delay these milestones for financial reasons, setting them behind their peers and putting them in the category of high risk for pregnancies. Because most postdocs do not have retirement benefits, many delay the initiation of their retirement savings until after their mid-30's, resulting in the loss of hundreds of thousands and even millions of dollars compared to those who initiated their retirement savings in their early 20's. Furthermore, some individuals who secure a tenure-track position after a successful postdoc will further delay having children and/or contributing to their retirement savings as they catch up on deferred student loan payments, saving to buy a home, and/or paying off debts that accumulated while they were in graduate school or in their postdoc.

In addition to the issues described above, the traditional path to becoming an academic scientist is not reasonable for individuals from lower socio-economic backgrounds who do not have family members who can contribute to the cost of their education and/or to their living expenses while they pursue full-time education and postdoctoral research. This disadvantage is especially true for young women with limited access to healthcare who become single mothers, the numbers of which will grow with abortion bans in many states. For these reasons, careers in academic research select for a population of people who come from high socio-economic backgrounds (often including parents who have higher education), have good access to healthcare, and have financial support from family. This population is the minority in the U.S. and are mostly white.

Existing NIH policies, programs, or resources

The NIH should set the example of an alternate path to obtaining a Ph.D. education and to becoming a Principal Investigator that eliminates full-time education and excludes post-doctoral training. This alternate path will open careers in academic research to individuals from lower socioeconomic backgrounds, first-generation college graduates, young single mothers, young men who pay child support, and individuals without financial support from family. It will also prevent individuals from having to defer student loan payments and from having to delay initiating retirement savings, having children, buying their first home, etc., and from accumulating more debt while pursing education and training. I accomplished all the above by pursuing my Ph.D. education part-time while working as a laboratory technician in the NIH. I was able to head my own lab in the NIH after completion of my Ph.D. which put me on track towards becoming a tenured Principal Investigator. This alternate path allowed me to have children, purchase my first home, pay my students loans, and initiate my retirement savings in my 20's, setting me far ahead of my peers on the traditional track. This alternate path should be encouraged in the NIH and used as an example for academia to do the same.

Proven or promising external resources or approaches

The NIH should offer funding (through a new grant mechanism) for very talented technicians with B.S. or M.S. degrees who have already published several research papers, presented at international conferences, and are seen as experts in the field to pay for their part-time Ph.D. education (classes and research). These individuals can take the alternate path to becoming a Principal Investigator described above.

Response 2638

Perspectives on the postdoc roles and responsibilities

Postdoctoral researchers have more independence than graduate students, leading more projects and progressing more quickly, with the prospect of eventually running their own labs.

Fundamental issues and challenges

Postdoctoral trainees are paid horribly; I will not consider working as a postdoc because of the salary, I feel like the only reasonable option is industry. To pay someone with a PhD ~60-70k is absolutely insane (also considering the hours >40 hrs a week/working on weekends), I would expect starting salary to be 90-100k minimum, which you can find in industry. To become a postdoc, you will be a student until you are 30 to obtain the PhD, already living on very low income. The job I take after this will have to allow me to afford basic life necessities and the ability to support a family, especially after surviving on barely livable PhD student wages for 5-7 years.

Existing NIH policies, programs, or resources

Pay livable wages

Proven or promising external resources or approaches

No response

Response 2639

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is a transitional role predominantly towards an academic tenure track position that is underpaid relative to staff scientist position in order to drive turnover.

Fundamental issues and challenges

Low pay relative to industry positions draws talent away. Administrative dual role of trainee and staff can further cut worker benefits. Some institutions have poor data collection efforts on incoming and outgoing postdocs that can be useful to detect or predict challenges facing their postdoc population.

Existing NIH policies, programs, or resources

Fellowship funding mechanism emphasizes that sponsor have extensive previous experience with training postdocs, which can disproportionately favor well-established sponsors, who are often composed of a less diverse population and who are uninformed on current career prospects facing postdocs. Program lack lower value grants that have a higher probability of award.

Proven or promising external resources or approaches

No response

Response 2640

Perspectives on the postdoc roles and responsibilities

My job as a postdoc should be to learn, grow, and pursue a line of scientific inquiry. A major goal should be to establish independence. I currently feel like an inconvenience/burden to my mentor. NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills. Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth. It is hard to not think that I am exactly replicating my mentor, since I am offered almost no room for doing things outside their interests. It is common for me to propose an idea and be told no because someone else (early faculty) has been promised that slice of data. This has led me to pursue things that are not my interests, but are available, so I don't have to compete for access to data. Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings. Requiring postdoc and PI participation in formal performance reviews will better define, formalize, and evaluate factors of role, mentorship, and professional development, while differentiating postdocs from staff scientists. NIH should establish a minimum percentage of postdoc time to be devoted to service,

mentoring and professional development activities. The NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

The biggest factor affecting my overall quality of life and my thoughts of leaving science is compensation. The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. And if you want to think about diversity, equity and inclusion. How are women supposed to have children, pay for child care, and be successful early career investigators on such a low salary? Postdocs from historically-marginalized groups face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. Examining and acting on these power imbalances is key to creating a more inclusive and safe environment, particularly for women and mothers. My postdoc environment is unhealthy due to the focus on others' growth (PI, staff scientists, other early career faculty). The majority of my conversations with my PI center on how to handle data or make decisions about analyses, while conversations surrounding my development, career trajectory, and future are put off. I have not felt that I have room to grow and mistakes are handled in such a way as to make me feel long-term embarrassment, which makes me contemplate hiding future mistakes. I don't feel that I am treated as a person who has a PhD but rather as an accolade for my PI (they get to report that they mentor a postdoc). My opportunities are limited by the interests of staff scientists and early faculty and I am left to do what is "left-over" rather than was promised and what I want to do.

Existing NIH policies, programs, or resources

Postdocs need more money and better benefits. It can't be said strongly enough. The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high-cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels. The NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit. NIH should require a percentage of indirects on all grants supporting postdocs provide postdoctoral offices with increased resources. Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, and provide funding to institutions to assist with these costs. NIH should expand its family-friendly policies, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income. NIH should provide NIH-funded postdocs with moving allowances. NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding.

Proven or promising external resources or approaches

he NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library. Consolidate professional development resources. Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by

increasing not only the availability and access of federally-funded research but also its community resources. Engage with key stakeholders. We encourage NIH to work closely with institutions that host postdocs and NPA on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change. We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

Response 2642

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a transitioning job for a scientist who seeks to pursue a career in either academia or a higher-level industry sector. Individuals interested in a governmental sector would normally pursue their careers post-PhD. Hence, postdoctoral positions should be highly structured and project-orientated—to equally allow both advancements of science (in a lab), and the progress of an individual scientific career. Instead, postdocs are commonly considered cheap labor force, and their presence is subjected to the needs of a lab solely, without a clear plan for their own advancement.

Fundamental issues and challenges

Unreasonably low salaries for the individuals with the highest competences and academic credentials.

Existing NIH policies, programs, or resources

As an international postdoc who was trained outside of the US, I encounter multiple admin obstacles—such as non-US citizens being ineligible for the majority of grant applications.

Proven or promising external resources or approaches

1. Providing training for supervisors who recruit postdocs in their labs, in terms of dynamics and requirements of a postdoc position—i.e. defining and improving mentorship schemes
2. International postdocs who wish to stay in the US academia are encountering additional obstacles due to visa issues. The scheme of career-tracked positions enabling a smooth transition from being a postdoc to becoming a faculty should be empowered. Those positions are systematically lacking.

Response 2643

Perspectives on the postdoc roles and responsibilities

This is being submitted by [redacted for anonymity] comprising US postdocs, International postdocs, faculty advocates and the Director of the Office of Postdoctoral Education. At our institution, postdocs are

hired by individual faculty members and supported from their PI's current funding source(s). They are hired as Staff under category called "Research Fellow" if they are receiving salary paidby the individual PI. They are hired as "Fellow" or "Research Scholar" if they are supported by a stipend from a T32 or other training grant. Both categories are provided the same benefits as all other Staff, which includes health care insurance from the group plan, access to all other services offered to Staff hires. They are not invited to participate in junior faculty activities with the exception that they are eligible to compete for the "R and K grant writing" training program. In this sense, Postdocs are hired via the Human Resources office and are treated as staff members.

At the same time, the Graduate School supports the "Office of Postdoctoral Education", which is the source of professional development activities for Postdocs, provides faculty advocates for postdoc groups (20-30 people each), and guides and funds the Postdoc Association social activities. In this sense, the postdocs are provided training and career development support geared toward career advancement.

Fundamental issues and challenges

1. At our institution, the percentage of international postdocs is >= 50%. These postdocs fear that should their PI's abiilty to fund their position falter, or if they have a problem with their PI, that they will be forced to leave the country within a very short period of time. Our institution does not have any "bridge" funding for postdocs, and there is no organizational provision for re-assigning a postdoc into another lab (international or US) if the PI who hired them "does not work out".
2. Quality of Life: Our institution has fallen behind on many family-friendly policies for postdocs who are in the 30-something age group and may still be repaying their college loan debts. The "Family Leave Policy" allows both mother and father to receive leave, during which accumulated "BTO" (vacation and sick leave) cover their salary or else they can request FMLA (with no pay). The institution has a private day care on site, but the waiting list is very long and the cost is very great. These policies may reasonably apply to full time faculty workers who have been at the institution for enough time to accumulate carry-over BTO and sign up for the daycare center. However, this policy is not good for a postdoc who needs to find daycare immediately upon being hired into the position, or has no accumulated BTO to plan for a pregnancy. The postdoc job is a limited-time position, and so more flexible support needs to be provided.

Existing NIH policies, programs, or resources

1. Expand training grant numbers and capacity from all NIH institutes, and develop international training grants: The Training Grant umbrella provides a secure salary support because it is not limited to the PI's ability to pay. The Training Grant faculty is comprised of a close network of research advisors and faculty mentors rather than one single PI thereby allowing the trainee to move to a different lab under compelling circumstances. Finally, the Training Grant offers a program developed to enhance the training and education within the chosen disciplines and missions of the NIH institutes, and can direct the trainees into the next level grants (e.g. Ks and Rs).
2. Use the IRACDA model of the NIGMS to develop training grants that encourage professional development as part of the Postdoc's training. For IRACDA, it is 75% research and 25% teaching at a partner MSI-teaching mission institution. This model could be extended for those interested in industry to include 75% research and 25% internship with an industry partner (to be paid by the industry partner). A third would be 75% research and 25% policy/advocacy/public outreach/education internship.

Proven or promising external resources or approaches

The DHHS, NIH and Dept. Education could provide competitive "Facilities Improvement Fund grants" for educational institutions to renovate space for private on-site Day Care facilities to use rent-free so that the per capita cost of child-care is reduced to less than 10% of the postdoc wages/stipend. The plan for the facilities award would require a guaranteed set-aside for a number of postdocs based upon the total number of postdocs at the institution. The competition could consider:

The ability of the institution to reduce costs but maintain quality;

The institution's educational mission to train early-childhood education professionals;

collaboration with private or public organizations with a social impact (an example is the Association for Retarded Citizens) with missions to improve the care of and perhaps mainstream special needs children via a shared facility;

the enhancement of services such as incorporation of a "walk-in" day care plan for those who need childcare for limited planned or unplanned times, or a sick-child ad hoc day care for children recovering from an illness that is no longer contagious but not quite ready to return to general population (e.g. late stage chicken pox) or trauma with limited mobility (broken legs,arms).

Response 2644

Perspectives on the postdoc roles and responsibilities

Institutes do not respect postdocs and do not provide benefits or support when us faculty plead for them. Yet, when there is a covid shutdown, they are also asked to redeploy as in our hospital at [redacted for anonymity] and serve the covid cause. While faculty have to fight severely with threats from administration to ensure their salary raises are not removed since we bring it via nih grants and they dont have benefits, which during covid was beyond the pale. This attitude of adminstration will change only if such surveys are run annually. And are included with PI feedback in our annual reports. We cannot submit them without admin approval so its a section that should be allowed to justify IDC.

Fundamental issues and challenges

No future. Not enough grants to start and institutes want postdocs coming in as faculty to have grants. No work-life balance. No benefits. No respect, they are treated badly based on the fact that their salary despite their high education level, is lower than administration. HR proactively disables raises from PIs who have industry or other monies. They often use NIH or poorer faculty as an excuse to stop raises although the NIH salary levels are not meant to be an upper limit, just a lower limit. We faculty cannot speak without immediate and decimating retribution from the administration, especially hospital leaders and HR who earn administrative salaries from IDCs. These activities will stop only if there is oversight annually via such surveys.

Existing NIH policies, programs, or resources

Annual surveys.

Mandatory reports from lab postdocs of grantholders and from the PI regarding justification of IDC and fringe taken from grants as well as random surcharges made on our direct costs, severely depleting funds. All of us in soft money positions have to prepare not so much for nih cuts but rather institute raising rates, charges, etc at random, to offset their budget mismanagement. We PIs cannot complain, there has to be oversight from funding agencies.

Proven or promising external resources or approaches

Postdoc should be equivalent to staff position in benefits, mandate that at institutes.

Surveys.

More grants for postdocs, more time also given the short frame for k99.

If more grants are hard, more industry collaboration enabled to allow for such funds to enable postdocs.

Response 2645

Perspectives on the postdoc roles and responsibilities

For me, postdoctoral training is one step getting closer in establishing one's own lab. I view postdoc as a training that enables me in acquiring skills and tools including funding procurement, and resource management to understand and help me to pursue and at times answer research questions.

Fundamental issues and challenges

As an international, the constant need to worry about visa is an important factor. This is because postdoctoral researchers come under J1 visa which is a trainee visa that can be renewed every year. As postdoctoral researchers, I would argue the training aspect has a different meaning. For instance, to draw

parallels with industry, I would say postdocs are team leads who are trying to become managers which essentially means that there is more contribution coming from them. If there is one thing that would make the life of international postdocs easier is having a separate type of visa for them or making them go under H1B category.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2646

Perspectives on the postdoc roles and responsibilities

In the three institutions I have been at; as an undergraduate student, as a technician, and as a graduate student, postdocs are essentially mini-PIs operating under the real PI.

Fundamental issues and challenges

Money, money, money, money, and money. My dream is to be a PI in an academic setting—I love the environment and would love to mentor students. But I cannot ask my partner to carry me as financial dead-weight for another 1, 2, 3 years after 5 years of graduate school. Postdocs cannot support themselves at many institutions. That's what it comes down to—money.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2647

Perspectives on the postdoc roles and responsibilities

As it is currently organized and supported, I believe a postdoc position should almost exclusively be for people who want to pursue a career as a faculty member with a significant research component to their faculty work. A postdoc (hopefully) receives a few years to explore a research direction that can propel them into an independent research career and potentially some mentorship experiences, but in my view postdocs receive almost no training in anything else that would meaningfully support them in pursuing other career directions (there is even a lack of training in key aspects of a research career like management and communication).

Fundamental issues and challenges

The three main issues I see are low pay and benefits, the length of time the average postdoc spends in a postdoctoral position, and for international postdocs the anxiety associated with an overly complicated immigration system. Low pay and benefits (especially relative to the highly specialized training that postdocs have) causes an incredible emotional strain on postdocs, especially those that have to support family members (most postdocs are in their 30s and 40s, so many are supporting family members). The long duration of "postdoctoral training" reinforces a sense that the postdoc must go on in this career direction because they have already "sunk" so much time and energy into it, even when they no longer feel truly attracted an academic path or that path has been closed to them. Finally, a high proportion of postdocs at my institution are international, and they all feel an incredible pressure created by the immigration system, which seems unnecessarily complex and involves separating them from their families for long stretches of time. I know that all three of these dimensions have prevented some of my colleagues from pursuing postdoc positions.

Existing NIH policies, programs, or resources

Increasing the minimum salary and benefits for postdoctoral researchers would be hugely beneficial to the entire academic career pathway. Hand-in-hand with that is increasing the sizes of grants. If there's any

way for NIH to work with USCIS to streamline the visa system for postdocs, that would also be incredibly helpful. For a more long-term solution, having a stronger funding stream for long-term bench scientist roles that aren't postdocs would hugely impact the overall "academic ecosystem"—so many people pursue a postdoc because they love doing bench science but don't actually want to become professors, and they end up eventually being pushed out and dissatisfied, and their knowledge gets lost from the overall academic system. Another longer-term solution would be to have the effectiveness of PIs' mentorship be evaluated as part of grant review—what I mean is not just a narrative of their own mentorship style, but in some way actually evaluating how effective their mentorship is (concretely, how many of their postdocs have published (first author, middle author, last author) papers? How many postdocs have left the lab before publishing? How often do postdocs get to participate in training opportunities like attending conferences and courses?)

Proven or promising external resources or approaches

I strongly support programs that pair postdocs with mentors outside of just their PI. In my view, the "exclusivity" of the PI-postdoc relationship is ripe for potential abuse (in contrast to the PI-graduate student relationship, where there is usually a thesis committee and department leadership that can theoretically intervene if problematic behaviors emerge).

Response 2648

Perspectives on the postdoc roles and responsibilities

Gain training in new and/or complimentary area of science from my doctoral training; conduct research at a more independent level than doctoral work; participate in career development courses/workshops; prepare for a career as a faculty member or in industry; and gain autonomy in order to develop an independent program of research.

Fundamental issues and challenges

The major and central issue is pay. First, it is really challenging to make ends meet with $50,000 a year (before taxes). The only people who can afford this "pay cut" are those with money and resources, further nurturing the socioeconomic divide that is present in higher education and science. Secondly, it makes absolutely no sense that the traditional NIH funded T32 training program has a set pay regardless of zip code. Cost of living differs dramatically in Gainesville, Florida, compared to New York or San Francisco. Most universities require you to be in person with good reason. But living in New York or San Francisco on $50,000 a year is poverty.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2649

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

There are three main issues that contribute to poor quality of life as a postdoc:

1. Uncertain career path—the major issue that contributes to poor quality of life for postdocs that wish to remain in academic research is the uncertainty of their career path. Currently, the only academic path that provides stability and good pay is to become faculty at an academic institution. There are very few opportunities for alternative options such as staff scientists. Creating a stable and well-paying career path for staff scientists would allow those who do not attain, or do not wish to attain, desirable faculty jobs a way to stay in academic research long-term. Furthermore, such a career path would greatly benefit academic science by providing a long term source of technical and intellectual expertise with time directly spent conducting research for labs that employ staff scientists.
2. Extreme competition—due to the relatively small number of faculty positions available there is ever increasing pressure to be as productive as possible in a short time. This environment engenders overwork and anxiety. This point is related to point 1. Establishment of viable, stable, and well-paying career paths in academia other than faculty/PI would help immensely.
3. Low salary—this point is fairly self-explanatory. The large majority of academics use the NIH postdoc salary scale as their own scale. The salaries in these scales are embarrassingly low for postdoctoral researchers.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2650

Perspectives on the postdoc roles and responsibilities

Postdocs should learn new knowledge, techniques, and other skills in this position, and adapt these skills to develop a career in academia, industry, government, or other fields. I think NIH should avoid using "trainee" to call a postdoc and use "fellow" or "scholar" instead. Postdoc positions should facilitate research independence. The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish more programs and opportunities for postdocs to develop a career.

Fundamental issues and challenges

Per the NPA's 2023 Postdoctoral Barriers to Success report, more than 90% of postdocs are negatively affected by the lack of clarity in transitioning to the next positions. More than ever, postdocs are paying a significant opportunity cost for limited faculty positions, and 86.6% are impacted by job security concerns. NIH should provide early career scientists with actionable information and transparent data to make informed career choices before and during their postdoc periods, including increased awareness of career options (e.g., academia, industry, government).

It is even more difficult for international postdocs. International postdocs have extremely limited opportunities to apply for NIH funding. K99/R00 is the only program that we have access to and the time window is only for the first 4 years. With such limited opportunities, the majority of international postdocs will not succeed in developing independent careers, which inhibits further recruitment and retention. Meanwhile, a large number of them struggle in their current position and have a poor quality of life. NIH should also expand funding opportunities to visa holders through K99/R00 and new programs.

Existing NIH policies, programs, or resources

NIH should require all postdocs to receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies.

Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining the continuity of lab knowledge, and providing additional career options for postdocs while providing clear differentiation between these positions and postdocs.

Proven or promising external resources or approaches

We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

Response 2651

Perspectives on the postdoc roles and responsibilities

Postdocs are trainees, often MDs or PhDs, sometimes MD/PhDs. Their role in our institution is to learn how to be independent researchers or academic clinicians under the supervision and support of experienced and successful independent researchers. This role can support existing research, but the overarching goal should be for trainees to progress toward their own research goals.

Postdocs are early career scientists, often also in the early stages of adult life, with newer primary relationships, often new or very young families, and all of the attendant "real world" responsibilities.

Despite our best efforts, most successful postdocs tend to be those who come from elite or established families who can afford to support them well into adulthood and do so.

Fundamental issues and challenges

Recruitment is harmed by insufficient pay. Young adults or those who find success or good pay in private industry are often discouraged from pursuing an academic career because the pay is well below most comparable industry positions, the expectations are increasingly regarded as abusive (long hours, unreasonable demands), and universities and other academic institutions in areas with a high cost of living often pay well under the amount needed to survive and thrive as a young academic.

Existing NIH policies, programs, or resources

NIH could move to the GS system of compensation, based on geographic location, for NRSA stipends and when considering funding in other programs which support postdocs financially. NIH SHOULD require detailed verification that all institutions are paying their postdocs at the level required, as there are reports of postdocs being paid well under NRSA stipend amounts across the country. NRSA stipend amounts either

1. need to take into consideration actual COL or
2. need to require that PIs/mentors cover a certain percentage of pay to ensure the stipend amount truly "supports" postdocs.

Total pay needs to be more competitive with related industries to encourage more postdocs to choose academic research pathways.

Proven or promising external resources or approaches

Training Grants should be more closely tied to the grantee institution's academic year cycles to encourage competition and more equitable recruitment. Basic expectations for IDPs should be required and verified. All programs should have external monitors/advisory boards who are not beholden to a mentor or institution to allow postdocs a safe route for reporting any abuse or problems, without fear of undermining their careers. Reporting cannot stay within a powerful mentor's institution. Mentors must be certified and meet national standards of training and must be evaluated externally as well.

Response 2652

Perspectives on the postdoc roles and responsibilities

The academic postdoc is part of the backbone of a research lab —ultimately projects are developed in-depth, new avenues are explored all as part of his/her training toward independence. It is also the first opportunity to develop mentorship skills, by supervision of graduate students and undergrad independent study projects.

Fundamental issues and challenges

Even though I have a Chemistry Nobel Prize which should be an incentive, I get no US applicants, and just a few from China and India as response to a job posting. This has been true for a number of years now. I think there is a general perception that training for an academic career is a waste of time. Students appear to be very much focused on short-term goals, getting rich quickly in some way. They probably have found out by word of mouth and social media that it might take a couple of decades to get public funding. Because of the general uncertainty about the distant future, focus on short term goals makes a certain sense.

The career choices of postdocs who trained with me fit into this pictures as well. Of six people who finished in recent years, only a single one stayed in academia, five (brilliant people) went for jobs in industry or they became EM facility managers.

Existing NIH policies, programs, or resources

The salary differential between NIH postdoc salary and industry is too great. The bleak grant situation is a disincentive for everybody to even consider going the academic route.

Proven or promising external resources or approaches

I don’t know

Response 2653

Perspectives on the postdoc roles and responsibilities

As a postdoc, I am expected to conduct original research in my field of study, often under the guidance of my advisor. This involves designing experiments, collecting data, analyzing results, and writing up findings for publication.

Publishing my research in academic journals is a crucial aspect of my role as a postdoc. It helps to establish my research reputation and is essential for advancing my career.

I am also responsible for mentoring and training graduate students or undergraduate researchers who assist with my research projects. This involves providing guidance on experimental techniques, data analysis, and professional development.

Presenting my research at conferences, seminars, and other professional events is an important part of my job as a postdoc. It allows me to share my findings with the wider academic community and can lead to new collaborations and opportunities.

Securing funding for my research is another critical responsibility. As a postdoc, I may need to develop strong grant proposals and build relationships with funding agencies.

Overall, I see the postdoctoral position as a crucial period of professional development for myself. I am expected to take on significant responsibilities and make important contributions to the research community, while also building my own skills and expertise.

Fundamental issues and challenges

Lack of job security: Postdoctoral positions are often short-term and lack job security, which can make it difficult for trainees to plan their careers and personal lives.

Low pay: Postdoctoral salaries are often low, especially when compared to the level of education and experience required for these positions. Limited career opportunities: Many postdoctoral trainees aspire to academic or industry research positions, but the competition for these jobs is fierce. This can create a bottleneck, with many talented trainees unable to advance to the next level. Lack of mentoring:

Postdoctoral trainees often lack adequate mentoring and support from their advisors. Workload and work-life balance: Postdoctoral trainees may face heavy workloads and long hours, which can lead to burnout and negatively impact their quality of life.

Existing NIH policies, programs, or resources

J-1 Visa Limitations: Many postdoctoral trainees are international scholars who hold J-1 visas, which are temporary visas that are subject to strict regulations and limitations. These limitations can include restrictions on the length of the visa, the ability to transfer to a new institution, and the ability to bring dependents to the United States. These limitations can create additional stress and uncertainty for postdoctoral trainees and may contribute to their decision to leave academia or the United States altogether.

Advisor Misconduct: Unfortunately, there have been cases of postdoc advisors taking advantage of their power dynamic to mistreat, bully, or even harass their postdoc trainees. This can take many forms, such as setting unreasonable expectations, withholding resources or authorship credit, or even engaging in discriminatory or abusive behavior. This type of misconduct can have a significant negative impact on the postdoc's mental health and professional development, and may contribute to high rates of attrition among postdoctoral trainees.

To address these issues, the NIH and institutions could consider implementing stronger policies and procedures to protect the rights and well-being of postdoctoral trainees. For example:

J-1 Visa Limitations: The NIH and institutions could work to streamline and simplify the visa application process for postdoctoral trainees and advocate for more flexible regulations and visa options that better reflect the needs of international scholars.

Advisor Misconduct: The NIH and institutions could establish clear guidelines for expected advisor behavior and provide training for postdoc advisors on appropriate mentorship practices. Institutions could also establish clear channels for reporting misconduct and provide support for postdocs who experience mistreatment. Additionally, institutions could provide mechanisms for postdocs to share their experiences and offer feedback on advisor behavior in order to hold advisors accountable and improve the overall postdoctoral training experience.

Proven or promising external resources or approaches

To improve the quality of life and sustainability of postdoctoral positions in academic research, the NIH and institutions could take several measures. They could increase the minimum salary for postdoctoral trainees to reflect the cost of living and the value of their work, expand benefits such as access to affordable healthcare and retirement plans, and promote work-life balance through policies like flexible scheduling and mental health support services.

To better support postdoctoral trainees who are parents or caregivers, the NIH could provide additional resources, such as on-site childcare or subsidies for child care. In addition, the NIH and institutions could expand existing career development programs and resources, such as mentorship programs and networking opportunities, to help postdoctoral trainees develop the necessary skills and experience for advancement.

International scholars who hold J-1 visas face limitations and regulations that may cause additional stress and uncertainty, leading to high rates of attrition. The NIH and institutions could streamline the visa application process, advocate for more flexible visa options, and simplify regulations to better meet the needs of international scholars.

Unfortunately, some postdoc advisors may engage in misconduct, such as bullying, harassment, and discriminatory behavior. To address this issue, institutions could establish clear guidelines for advisor behavior, provide training on appropriate mentorship practices, and establish channels for reporting misconduct. They could also provide mechanisms for postdocs to share their experiences and offer feedback on advisor behavior to hold advisors accountable and improve the postdoctoral training experience.

Response 2654

Perspectives on the postdoc roles and responsibilities

The postdoc is responsible for learning skills that will benefit the next step in their career. Mentorship, leadership, finance training, management, and science communication in the form of grant and manuscript writing and the ethical performance of science are critical components of that training.

Fundamental issues and challenges

Salary is particularly challenging and inhibits retention and reduces quality of life for postdoctoral trainees, particularly in locations where the cost of living is high and the NIH salary is below what is needed for housing and food.

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

All postdoctoral fellows (and all graduate and early career scientists) should receive practical, skills-based training in science communication. These skills are beneficial both within and outside the academy and will only improve outcomes and career success for these scientists.

Response 2655

Perspectives on the postdoc roles and responsibilities

Postdocs are involved in independent research, working on new projects and applying for grants and developing skills.

Fundamental issues and challenges

Salary and benefits are too low for postdocs' scholarly degrees.

Existing NIH policies, programs, or resources

Better salary and benefits. The opportunity to obtain better salary increases with experience.

Proven or promising external resources or approaches

No response

Response 2656

Perspectives on the postdoc roles and responsibilities

Postdoc is a temporary position following the completion of a PhD to acquire further skills in preparation for the most demanding professional research careers in academia and industry.

Fundamental issues and challenges

1. Financial feasibility of living as a postdoc in states such as California with extreme living costs is a significant issue. In particular postdocs with small children are typically left with an extra 2000+ dollars monthly expense from childcare alone (in San Francisco 5-days a week childcare monthly tuitions currently range between 2000-3000 dollars). For a single-parent postdoc the cost of childcare can easily amount to half or more of their monthly take-home pay which, combined with typical rents in these areas leaves hardly any money for other living expenses. This creates a vicious cycle where postdocs in such situations have to opt for less than full-time childcare, significantly hampering their ability to conduct research, thereby not only lowering the return-on-investment of NIH's funding, but also causing significant stress and diminishing the career prospects of those postdocs due to reduced research output. These issues seem to be almost exclusively a US-specific problem, within the so-called western countries at least. I think the US, while at the moment still a leader in science in many fields, endangers its position as a world-leader if these issues are left unaddressed.
2. Postdocs are in many instances used akin to cheap labor for conducting the bulk of research activity in universities, while the later career prospects in research or other highly specialized positions where the postdoctoral training would be needed are often slim due to significant surplus of postdocs trained. Many end up working in fields where their training has little use, raising the question of whether engaging in postdoctoral training made sense for those individuals in the first place, given the cumulate loss of life-time income during the training period at the current salary levels, combined with the (often) high-stress working environment resulting in sacrifices in other life areas.

Existing NIH policies, programs, or resources

For cost-of-living challenges mentioned in the previous box, the obvious solution would either be cost-of-living adjusted salaries, or directed subsidies to specific items such childcare.

For the issue of training surplus of postdocs relative to the needs of academia and industry, NIH should encourage and support funding permanent staff scientist positions that would come with both higher salary and no time limits like the usual 5 years that exists for postdocs.

Proven or promising external resources or approaches

No response

Response 2657

Perspectives on the postdoc roles and responsibilities

The role of a postdoc seemed like a necessary evil to qualify for faculty positions at an academic institution. However, it claimed to facilitate protected time to publish dissertation and grad school work but these have certainly had to occur after working hours. One main benefit for my postdoc was to gain some additional expertise in a field of interest beyond what I had done for my dissertation. I have learned skills and built a network in a field of interest. I felt like my path was clearer before my postdoc and, like many of my peers, I feel swayed towards a path that may be less struggle, less competition, and better compensation.

Fundamental issues and challenges

For me, the pay structure of a postdoc is criminal. As a 33-year-old, I had have little opportunity to save for retirement, build equity, or pay off student loans. Housing is essential but qualifying for home loans is virtually impossible based on how my "income" is allocated. My institution also doesn't take out taxes which makes tax season complicated and difficult for a family. The health insurance is nice. While I am proud of my PhD, I am ashamed of playing into a system that does not value my years of education. I am more worried that there is not a place for queer researchers as it has been near impossible to find queer senior scientists in my division at NCI.

Existing NIH policies, programs, or resources

What is the deal with the narrow qualifications for Loan Repayment programs? Can there be more ways for intramurally funded postdocs can gain more grant writing experience/qualifications by collaborating externally?

Proven or promising external resources or approaches

No response

Response 2658

Perspectives on the postdoc roles and responsibilities

A postdoc seems to be given more responsibilities to work on multiple projects, mentor students, and to work more independently. Postdocs are expected to be able to learn new techniques quickly and without much hands-on training. Postdocs are expected to be more efficient (trouble shooting faster, reading literature faster, and come up with new hypothesis faster).

Fundamental issues and challenges

The most pressing issue in recruitment and retention of post-docs is that post-doc salaries are not much higher than PhD salaries (particularly because post-docs are older and are more likely to start or have families). Furthermore, only about 1/4 of post-docs become PIs within 5 years, which means that the hard work and low paying salary sacrifice is not very likely to be worth it if the end goal is to be an independent researcher/PI. And, a post-doc who goes to industry/pharma/biotech enters at a similar position as someone who just graduated from a PhD program, which means that the time spent doing a post-doc does not advance a person's career much unless they become a PI. Lastly, the intrinsic nature of testing the unknown means that there is a lot of failed hypotheses and troubleshooting, which can be demoralizing. Although one could publish negative results, positive results are the ones that get into higher impact journals which is the currency to promotions in academia.

Existing NIH policies, programs, or resources

NIH minimum salary/stipend should take into account the cost a living in a particular region. Cost of living in different states are different, and even within the same states, different cities have different cost of living. For example, the cost of living in New York City is much higher Rochester, NY even though they are in the same state. More programs/workshops that could indicate how a post-doc training program can be beneficial to jobs outside of being a PI would be good.

Proven or promising external resources or approaches

No response

Response 2659

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are focused time for trained researchers to develop a substantial, independent scientific project. Academic postdocs have principal responsibility over a well-defined project and carry out substantial research with few expectations for teaching, service, or formal coursework. Postdoctoral positions can provide a range of training opportunities—to learn a different field of biology, to learn new techniques, and to work with a mentor with different approaches to a thesis advisor. However, undistracted time and attention on carrying out research is essential, and postdocs should have the maturity to learn in the course of working, without structured training.

Fundamental issues and challenges

Low pay is clearly the fundamental challenge for postdoctoral trainees. Salaries are quite low relative to those in biotechnology and to other fields with highly skilled and trained workforces. The NIH directly controls fellowship pay scales and strongly influences postdoc pay from research project grants and drives decisions by other fellowship sponsors.

Existing NIH policies, programs, or resources

Postdoctoral fellowships should last longer as well as pay more. The timing of review and resubmission for F32 fellowships does not align well with the timing of postdoctoral positions.

The administrative burden of these fellowships should be lower. Elaborate training and mentorship plans do not improve postdoctoral positions, and drive an escalation of burdensome requirements that detract

from research. Greater emphasis on research plans in fellowship review will ensure that postdocs are carrying out well-defined and independent projects.

Furthermore, the strict timing requirements for K99 fellowships distorts postdoctoral training and discourages ambitious, impactful projects. In practice, successful K99 applications require an accepted manuscript in a particular point in post-doctoral training, along with an artificial training plan that in effect interferes with post-docs taking advantage of existing research successes and strengths.

Proven or promising external resources or approaches

When postdoctoral scholars unionize, they typically ask for more money, along with employment benefits that typically accompany highly skilled professional jobs. A substantial fraction of salaries and benefits for postdoctoral scholars come directly or indirectly from the NIH, and other funding sources often track NIH policies as well, so the NIH has a great deal of influence here. Changes should be based on a pragmatic assessment of how post-docs are actually paid—usually through a shifting mix of research grant funding and fellowships at different times.

Postdoc training plans should focus on fostering scientific interactions with other PIs, and engagement with the scientific community through local and informal seminars.

Response 2660

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

First, salaries are too low, particularly in high cost-of-living cities. The State of Washington recently passed a law guaranteeing a living wage to all employees in the state. It is embarrassing how far below this minimum most postdocs fall. We need to ensure that all postdocs make a fair wage for their work. It may be necessary to reduce the total number of funded postdoc positions in order to make this happen.

Second, although postdoc positions are nominally training positions, in practice few postdocs receive training in anything other than research. In particular, postdocs are typically aiming for academic positions, where teaching is likely to be a component of their position, yet they receive no teacher training and rarely are given a chance to practice their teaching skills. Also, regardless of their career trajectory, they will need the skills required to run a lab, most notably with respect to effectively managing a team of people. I think the NIH should fund formal postdoctoral training programs that focus on effective pedagogy, as well as leadership and management skills.

Third, postdoc recruiting is a huge source of inequity. Unlike admissions to undergraduate or graduate schools, where recruiting is done publicly and all applicants are evaluated in a batch using established criteria, postdocs are almost always recruited by word of mouth. This reinforces the "old boy network" and makes it harder for people from disadvantaged backgrounds to find good postdoc positions. Solving this is hard but, I believe, super important. One could imagige, for example, a centralized NIH database of people looking for postdoctoral positions, with a standardized CV format. NIH-funded postdocs could be hired via such a system, with PIs reporting how many applicants they reviewed and what criteria they employed.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2661

Perspectives on the postdoc roles and responsibilities

I view my current role as an academic postdoc as a highly-specialized spearhead of the research in my PI's lab. My PI (early career) has so many responsibilities that she rarely has direct contact with the data, so my role has been everything from data generation (including logistics), processing, systems

prototyping, to analysis. And my responsibilities over the past three years the lab has existed have been manifold, but primarily focused on the details of lab and research setup while my PI focuses on overarching design of the research and all of the administrative duties and logistics of setting up the lab. So this has felt far less like a "trainee" position and more like a focused researcher position. I've simultaneously been able to apply many of the skills learned during my PhD as well as learn many new skills, although much of this has been independent learning/trial by fire. However, I have observed other friends of mine in postdoc positions who have had responsibilities more akin to being junior academic faculty, managing both research and the administrative/logistical aspects of running a lab. My role is also, to a certain extent, to help train graduate students and other trainees in the lab (even more junior postdocs). The responsibilities of a postdoc are most certainly not uniform across individuals or labs, and also depend on the individual's career interests/intentions. I intend (if possible) to pursue a non-ladder research faculty position (e.g. staff/research scientist) within academia, so my perceived role and responsibilities have also been shaped by the intent to learn skills necessary for such a position.

Fundamental issues and challenges

Amongst the myriad issues with the current state of postdoc recruitment, retention, and quality of life, perhaps the keystone is this concept of postdocs as "trainees". The default assumption is that a postdoc is training to become an academic PI, but especially in recent years such a path has become disincentivized —very few positions are available, competition is high, pay is limited, and postdocs and postdoc funding opportunities are frequently limited in lifespan, forcing recent doctoral graduates and current postdocs to pursue avenues outside of the traditional ladder academic track. Pay differences between industry and academia have had a dramatic effect on recruitment and retention. Furthermore, there is a negative feedback loop maintaining low postdoc pay which leads to low retention and quality of life: Universities will always try to minimize postdoc (and graduate student) pay, matching the NIH or NSF minimums even if they could afford more and placing all sorts of obstacles to raises, while the NIH and NSF use arguments of pay disparity/equity to maintain current minimums despite the obvious and increasing economic strains of the past several decades (e.g. absurd levels of inflation). This problem is further exacerbated at smaller institutions, so I (a postdoc at an Ivy League university) can only imagine how much more extreme these problems are for graduate students and postdocs there, let alone how systemic racism and sexism can augment these problems and even synergize with institutional differences (e.g. smaller institutions with less average federal funding having demographics skewed toward underrepresented populations leading to exacerbation of existing inequalities in pay, quality of life, recruitment, and retention).

Existing NIH policies, programs, or resources

NIH postdoc salary minimums could of course be increased with a concomitant commitment to increased salary lines in grant budgets. The push for change has to start somewhere, and universities are eager to grasp at the excuse that the NIH won't change funding levels, so don't let them use it as an excuse! I also think the R35 is a great concept, although more could be done to increase diversity and inclusion in R35 cohorts, given how R1 institutions are grossly overrepresented in awardees. It is very likely that an R35 will be used to fund a postdoc in a newly-started lab, so R35s may be a tangible avenue to stimulate a healthier postdoctoral training ecosystem. These sorts of systemic inequalities may present themselves in both evaluation criteria for these grants (e.g. what a reviewer would consider a sufficient "environment" for the researcher to succeed, or how the quality of their prior research record is evaluated) as well as simple issues of access (e.g. faculty at smaller institutions may not even be aware of such early career awards, nor have the administrative support structures available to help with applications, leading to systemic inequality). It's difficult to say what changes to the K99 system might help in a similar way. However, broader access to resources about postdoc funding (both direct funding like K99 and indirect like R35) and even active promotion of such resources to smaller institutions should help quite a bit. I knew next to nothing about postdoc funding coming into my postdoc as a first-gen academic, yet it is such an important factor for recruitment, retention, and quality of life. Frankly, any resources even just about *being* a postdoc and the academic career path would have been helpful as first-gen.

Proven or promising external resources or approaches

The Yale Postdoctoral Association has a peer mentorship program for postdocs that seems to help new postdocs acclimatize quite well (though I have not had a chance to participate).

Response 2662

Perspectives on the postdoc roles and responsibilities

I decided to pursue a postdoc to enhance my clinical skills, academic/scientific writing, and learn new lab and research skills/techniques. My perspective was that I would be mentored by a senior scientist and that they would help improve my clinical skills, provide constructive feedback, and make time for my mentorship and career development. My goal was to obtain a larger NIH grant near the end of my 2nd year as a postdoc.

Fundamental issues and challenges

The salary would be impossible to live on if I wasn't married and had a partner with a better paying job. It often feels as though I am filling a spot in a lab that doesn't need to be filled by a PhD and that I am not being trained/ mentored/ or taught by someone with enough time to do this effectively nor am I being paid an adequate fair rate for the level of education, experience, and skills I have. Quality of life could be better, the main factors that decrease quality of life for me as a post doc are the financial restrictions, lack of mentoring from my team/ leadership of the lab, and having no other individual in the lab with a similar background as me to help guide career development. There are postdoc associations, but they more for socializing and do provide support about mentors or how to make your position/training better.

Existing NIH policies, programs, or resources

The payback clause within a T32 grant should be modified. As a young professional in a 12 month contract in a position that I am not feeling supported/ mentored/ trained adequately in is difficult. It should not only be the postdocs responsibility to fulfill their obligations but the institute and the mentoring team as well. If the full team is not being providing adequate training, mentoring, help accessing educational opportunities, or providing advice on career development, then it should be up to the postdoc if they want to continue in this lab or not. They should not be locked into a contract that holds them in a stagnant position that is not helping to advance their career.

Proven or promising external resources or approaches

There should be continuous follow up with labs on how they are training their postdocs, how much time is dedicated to mentoring the postdoc, and this should be very transparent when a post doc is hired into a new lab. The mentoring team should have a release from other obligations to make time for training and mentoring the postdocs. In my experience every mentoring team / individual mentors are too busy with their own obligations for their role to be bothered to adequately train and mentor a postdoc. 60% of the time my mentoring team doesn't even answer my emails or they respond at least a week after. I am their direct report and they make me feel as though my position and individual training is not important and that I am here to help progress projects along.

Response 2663

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The NIH has some grant funding mechanisms that are meant to encourage early stage investigators, i.e., K99/00 pathway to independence. Another example is RFA-HG-22-001, the eligibility of which is limited to "Early Stage Investigators," which is defined as someone "who has completed their terminal research degree or end of post-graduate clinical training, whichever is later, within the past 10 years and who has not previously competed successfully as a PD/PI for a substantial NIH independent research award". These policies have served as barriers to my own career, which has followed a non-traditional path. I completed my PhD in Genetics in 1999, and then had a few jobs on the business side of science, before working as a stay at home mother and a community volunteer for a number of years. When my children got older, I went back to school to reenter my career, earning a MS in Bioethics in 2016. I completed a two-year postdoctoral fellowship in medical ethics in 2019. However, as I was finishing up my postdoctoral fellowship, I realized that I was not eligible to apply for the K99/00 and did not meet the definition of an "Early Stage Investigator." I finished my terminal degree in 1999 and although I completed my post-doctoral training in 2019, it was not clinical in nature. Nevertheless, I was and still am an early stage

investigator in reality. These policies--which likely disproportionately negatively impact women--have proved to be a significant barrier for me, and quite frankly, may jeopardize my ability to stay in academics. I feel it is important to provide a specific case in which these policies are having unintended affects. My situation is unique. However, my guess is that many others are also negatively impacted by the exclusion criteria for the Early Stage investigator grant funding mechanisms.

Existing NIH policies, programs, or resources

Need to change definition of early stage investigator to include all those who have not had prior NIH grant funding as a principal investigator.

Proven or promising external resources or approaches

No response

Response 2664

Perspectives on the postdoc roles and responsibilities

I think the postdoc role should be specifically focused on advanced research training with the career goal of leading a research group. This differs slightly from the PhD, which is focused on training how to pose and research scientific questions. Postdocs should be more independent, pushing their own research project, speaking with their mentors as equals (more or less), and actively working on skills related to starting a lab. This includes grant writing, managing finances, selecting and training students, and learning how to build out a research program.

Fundamental issues and challenges

Postdoc positions are seen as temporary, which means many people (trainees and supervisors included) see them as opportunities to underpay and overwork. Salaries in major cities are not competitive for the level of education or work expected. There are few (if any) benefits, and universities further dilute these benefits by making arbitrary distinctions between postdocs who have fellowships (not employees, no benefits) and those that do (employees with benefits). Many postdocs are in their 30s and beginning to think about families, and postdoc salaries and expectations do not match that. Particularly now, it’s really difficult to spend 3 years in a badly paying job with no job stability afterwards, even if you love what you do.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increasing the minimum salaries. Making a postdoctoral position a real job and requiring universities to see it as such.

Response 2665

Perspectives on the postdoc roles and responsibilities

The postdoc is a transitory position in which, in addition to performing research, you take on new responsibilities that were not acquired during the Ph.D. and will be helpful for the next stage of your career. These responsibilities include but are not limited to supervision, teaching, and fundraising.

Fundamental issues and challenges

Viewing this question from the engineering lens, a major challenge to recruitment and retention of postdoctoral trainees in academic research is the appeal of a career in industry. In engineering, industry careers are more stable, more abundant, and offer significantly more money than what is available to a postdoc in academia. Academic positions for postdocs are often limited, both in the number of available positions and in the funds to sustain the position. The need to fundraise in order to maintain job security can hamper stability and overall quality of life for future and current postdocs, a group with little to no experience in the fundraising process who now need to fundraise in order to support themselves and their family. Retention is also a difficult question as the postdoc is not a long-term career option, so moving on

is inherent to the job; retention in the sense of staying in academic research is subject to the above issues and challenges.

Existing NIH policies, programs, or resources

I am less familiar with what is available from the NIH, so more access to information on what is available starting at an earlier stage of the process would be helpful. More funds is always helpful, but is obviously difficult to implement. Finally, more options to facilitate international partnerships.

Proven or promising external resources or approaches

The postdoc experience is often greatly shaped by the mentor and facilities associated with the institution/position. I have found that some supervisors are very invested in their postdocs' career, and others treat their postdocs as Ph.D.s that require less supervision. If the NIH can target mentoring opportunities toward the supervisors (or offer postdocs solutions to enhance their position), then that will already make a big impact.

Response 2666

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a stepping stone to a career as an independent Principal Investigator (in academia or elsewhere). Postdocs take on leadership and project management responsibilities under the lose supervision of a PI. Success in the role is measured by getting that PI position.

Fundamental issues and challenges

1. Salary and benefits are not commensurate with industry; not even close. This makes it difficult to stay and be productive as scientists with a PhD. We make big quality-of-life sacrifices to be postdocs.
2. Precocity of appointment. Everything depends on the whims of a PI even though many postdocs are employees of their university. This arrangement makes postdocs dependent on a PI even when they are striving towards independence.
3. Lack of faculty positions means we are in the postdoc queue longer and many leave. Maybe we should have more, stable, higher paid staff research scientist positions and fewer postdocs.

Existing NIH policies, programs, or resources

We need more research about the experience of postdocs and effective mentoring.

Proven or promising external resources or approaches

No response

Response 2667

Perspectives on the postdoc roles and responsibilities

Most postdocs at the [redacted for anonymity] see postdoctoral training as a necessary step towards a tenure-track faculty position, and therefore typically choose a faculty member for their research. The position allows more time to publish and apply for grants. A significant perceived benefit is the ability to pursue interest-driven research, compared to profit-driven research in industry or other sectors. Some postdocs stated that mentorship of undergraduate and graduate students was a part of their role, but few received formal training on how to mentor/supervise students.

There can be a disconnect between how postdocs view themselves and how faculty view postdocs, which leads to high variability in postdocs' roles and responsibilities. The spectrum ranges from faculty who treat postdocs as research technicians to faculty who treat postdocs as early career collaborators. In the former group, postdocs only conduct research and are offered little to no career and professional development guidance while in the latter group, postdocs can pursue their own research interests and are encouraged to take professional development opportunities. To alleviate these discrepancies, NIH should adhere to a consistent universal definition of a "postdoc" as being in a training role regardless of funding mechanism. PIs should be required to submit and report on mentoring plans as a part of the NIH pre—and post-award process.

NIH-funded postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have protected time for and access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant writing, new experimental techniques, career exploration, and other transferable skills. Postdocs should have time and funds to attend professional development opportunities of their choosing on an annual basis (e.g., conference, internship, or shadowing program) to explore new concepts, share knowledge and perspectives, and network.

Fundamental issues and challenges

Per a survey of [redacted for anonymity] postdocs, top sources of stress include finding employment opportunities, finances, workload, obtaining funding, work/life balance, mental health, and family responsibilities. Higher salaries, paid parental leave, and subsidized childcare would help postdocs support themselves and their families. Postdocs need to earn a living wage that is adjusted annually for inflation, location, experience, and merit. NIH should require NRSA stipend levels be paid to ALL NIH-supported postdocs, and increase grant funding limits to allow for it. NIH might also expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

At [redacted for anonymity], 75% of postdocs feel that they could use more information about career options to make a good decision regarding which one(s) to pursue. Postdocs pay significant professional and personal opportunity costs to pursue limited faculty positions. Career outcomes and tangible benefits of pursuing a postdoc are often misunderstood. NIH should provide postdocs with actionable information and transparent data to make informed career choices before and during their postdoc, including increased awareness and training opportunities for careers in a variety of sectors.

NIH should establish a minimum percentage of protected time to be devoted to service, mentoring, and professional development activities. This would assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Postdocs from historically marginalized groups and international postdocs face increased structural and implicit barriers. The NIH should continue expanding its DEIA initiatives and instate rigorous, impactful annual mandatory DEIA training for all those impacting postdocs (mentors/peers/faculty/PDOs), similar to research ethics. NIH should ensure training materials are current and evidence-based, while developing accountability and outcome measurements.

Existing NIH policies, programs, or resources

There is a significant career and personal financial trade-off associated with accepting an NIH NRSA fellowship. While the fellowship is beneficial career-wise, [redacted for anonymity] postdocs lose eligibility for state employee benefits as a result. NIH should issue guidance that receiving an NIH fellowship does not prevent the host institution from categorizing and paying such fellows as employees. NIH should require that all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to NASA's new postdoc fellowship requirement.

To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be especially cost-prohibitive for researchers from low socioeconomic backgrounds, those with increased familial commitments, and international scholars. NIH policies could also be expanded to support postdocs with disabilities. For example, additional funding to hire technicians would allow postdocs with certain disabilities to conduct necessary experiments while providing an opportunity to train and mentor early career scientists.

International postdocs face unique challenges; the NPA reports that 86% were negatively impacted by cultural transitions into the U.S. NIH should work with the State Department and USCIS to accelerate and simplify the visa and immigration process for these world-class early-career researchers. NIH should also expand funding opportunities to visa holders through K99/R00 and new programs.

Many PIs lack formal training in mentoring and personnel management. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded faculty, mentoring/managing up training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those

provided under NIH mentored training programs. Such training should be offered to all supervisors of postdocs.

Proven or promising external resources or approaches

Postdoc training could be enhanced by the Entering Mentoring and Mentoring Up curriculum from the Center for the Improvement of Mentored Experiences in Research (CIMER). These courses would train postdocs to mentor down and up more effectively, and give them the necessary tools for increasing self-advocacy and building a mentoring network for career success.

At [redacted for anonymity], the Center for Teaching and Learning provides pedagogical teaching training through the Tech-to-Teaching Program and Fundamentals in Teaching and Learning for Postdocs course. Postdocs who take these courses are better prepared for teaching-focused positions.

[redacted for anonymity] is also a part of the NSF-funded "Alliances for Graduate Education and the Professoriate (AGEP) Research Universities Alliance Model" , which aims to increase rates of doctoral candidates transitioning into postdoc positions and postdocs transitioning into early-career faculty employment. Grad students and postdocs in AGEP have dedicated mentors, are supported by a community of peers, and participate in professional development activities that prepare them for faculty positions at R1 institutions.

Within the [redacted for anonymity] Office of Postdoctoral Services, we offer "Faculty Career Advancement Groups" that teach postdocs about the faculty application process and facilitate peer review of their application materials. We also piloted the Leadership and Management in Action Program this spring with great success. Our experience is that postdocs are gravitating toward cohort-based programs that allow them to discuss career and professional development challenges and opportunities with their peers. As such, we will be piloting a Professional Development Hub series next fall, which focuses on peer-facilitated career explorations groups. NIH should provide funding to PDO leaders to further explore what cohort-based programming would look like for postdocs.

Response 2668

Perspectives on the postdoc roles and responsibilities

Research intensive position to develop new skills, perspectives, and expertise.

Fundamental issues and challenges

Very few postdocs are able to successfully obtain faculty positions. To publish well and have a chance at a job, one must remain a postdoc for a financially unsustainable amount of time. Postdoc salaries are insufficient to afford to live in major health research hubs (Boston, Bay Area, etc.). Childcare is not remotely affordable on a postdoc salary in many places (e.g. > $60,000 per year for two children in Boston metro area). Entry level jobs for PhD scientists in Pharma and Biotech pay up to twice as much as postdoc positions.

Existing NIH policies, programs, or resources

Raise the minimum postdoc salaries to account for the cost of living (see https://www.nature.com/articles/s41587-023-01656-4). Create more academic research scientist positions "between" postdoc and assistant professor. Create more assistant professor positions (smaller labs). Make more fellowships available (including for non-US citizens).

Proven or promising external resources or approaches

Response 2669

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

My postdoc is in Boston, and I entered from a MD/PhD program. Boston is quite expensive particularly with a wife and child. My health insurance premiums are 9,000 per year alone. Many of my MD colleagues were also going to Boston after graduation for postgraduate, US-gov't funded training in the form of residency. I didn't understand how they seemed to be much less concerned with making the city financially work. I was quite surprised to find that [redacted for anonymity] residency training programs start with salaries of 79,000 + 10,000 stipend for childcare/rent. Their yearly increase is 4k, compared to 1k for postdoctoral scientists. This is almost a 40% higher salary than I make as a postdoc at the same institution, often working the same number of days per week and similar hours. I do not believe that residency and postdoctoral scientific training compensation used to be so radically different.

Because the hospital must maintain staffing, their compensation was chosen as the one necessary to quickly get to work 6-7 days a week in an expensive city, and pay for >40 hours of childcare. *[redacted for anonymity] knows this and consequently has set the resident salaries accordingly.* This involves them "topping up" the medicare-funded resident slot compensation, which is too low. It is so strange then, that the same institution has *different* compensation for other postgraduate training run out of the medical school. This discrepancy is common across institutions, but I hear it discussed little, and often postdoctoral compensation is (erroneously) compared to industry compensation levels, which of course should be higher than academic institutions.

Every institution funded by the NIH knows the salary necessary to support rigorous postdoctoral training and often sets this in their residency training programs. The same should be done for other postgraduate trainees like scientists.

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

No response

Response 2670

Perspectives on the postdoc roles and responsibilities

A short period to become more independent however it becomes a long period due to limited positions and tight competitions over limited grant resources.

I do not even want to be a professor, I wanted a research scientist role in academia.

Fundamental issues and challenges

Low salary

Vague future

Limited grants and funds opportunities

Having most responsibilities of a PI but getting paid less than half

Existing NIH policies, programs, or resources

Raise the salary standard or adjust based on location (using a logical formula considering cost of living, inflation, etc.). 55K is not enough for a postdoc in expensive cities

Proven or promising external resources or approaches

No response

Response 2671

Perspectives on the postdoc roles and responsibilities

A Postdoc position means the stage of your career where you are stuck doing more research before getting any faculty position which gives you chance to publish more papers and gain more skills.

Fundamental issues and challenges

The main problem is the visa issued is the duration of DS-2019, so if DS-2019 is issued for a year, the visa validation will be a year only. This makes postdocs difficult to travel abroad and to their own home country. So, DS2019 should be issued for the entire 5 years. Another thing is the salary of postdocs is very low in many universities just little bit above the marginal poor family which makes postdoc with family difficult to cover their living expenses as most of the postdocs will have family.

Existing NIH policies, programs, or resources

Visa extension for Postdocs and salary increment, more grants for non-resident

Proven or promising external resources or approaches

training about writing grants, better working environments as some PI threaten to fire them if they don't work hard. There should be a system where postdoc can complain about such PI. Efforts to maintain work-life balance.

Response 2672

Perspectives on the postdoc roles and responsibilities

[redacted for anonymity]

What is the Roles and responsibilities of a Academic Postdoc

A postdoctoral appointment offers a bridge between mentored scientific research experiences and the scientific profession. Unlike other apprenticeship models in the professional world the traditional postdoctoral appointment provides the fundamental skills for operating as an independent, fully functional principle investigator. There are typically are no cohort models like in medicine, no pairings like in teaching, no need to be familiar with the business of science e.g. funding sources, direct/indirect costs models, travel budgets, publishing and presenting. It's possibly the most unique onboarding pathway to faculty research appointment yet has very little standardized or objective components for successful completion.

Fundamental issues and challenges

A few fundamental issues:

- University processes for managing and monitoring postdoctoral appointments vary from institution to institution and within a single institution from department to department.
- There is very little intentional oversight over these assignment which opens to door for potential abuse by a highly empowered Advisor.
- Minority Serving Institutions are typically not aware of opportunities prior to broad public circulation due to their absence and access to powerful networks within the research enterprise.
    - Postdoctoral candidates are rarely identified organically. Majority of candidates are made aware and subsequently emerge as a result of PI to PI networking. This creates a huge disadvantage to schools with smaller research footprints like HBCUs and MSIs.
- Postdoctoral training typically ignore work culture issues like belonging and inclusion.
    - Many appointments by-pass the rigor of a traditional HR training and support. The process has gotten better over time but candidates still find themselves segregated from the general workforce.
- Significant pay differential despite similar work locations.
    - Among the federally funded postdoc programs the funding is determined by the project budgets rather than an objective qualitative process.
- Ad hoc teaching assignments.
    - In many cases postdocs are often used as back-fill to support instruction in absence of their advisor.
    - These assignments are loosely monitored and rarely documented.
- Project "creep"
    - Many times postdoctoral candidates are reassigned to new projects not described in the original job listing.

Existing NIH policies, programs, or resources

I would suggest the use of the National Postdoctoral Association (NPA) recommendations here.

In addition, things to consider could be:

Creating a HBCU/MSI Postdoctoral program where the research is conducted on a HBCU/MSI campus. This will address some of the barriers discussed in the response above. It can also be source of increasing biomedical research and recruiting new faculty to the campus.

Establishing a new code of ethics for institutions hosting NIH candidates. The code should reflect a commitment to guarding against activities and assignments that are not highly correlated to professional development objectives.

NIH should form a community of practice with other agencies to constantly evaluate best practices for managing postdoctoral experiences.

NIH should consult with industry leaders like ORAU to gain insight on challenges and best practices.

NIH should always seek to have industry standard competitive compensation (salary and benefits (health care, etc).

NIH should provide support (workshops/mentoring) outside the host site for candidates, particular women and minorities, that struggle with adapting to the environment.

NIH should try to implement site visits for formative evaluation of postdocs and their Advisor/facility.

Proven or promising external resources or approaches

Probably the best resource available is the National Postdoctoral Association (NPA)

I would also suggest the National Science Foundation Mentoring Network resources

ORAU/ORISE Resources

A Beginner's Guide to Professional Training

https://orise.orau.gov/internships-fellowships/stem-professional-training-modules.html

Postdoctoral Program Management

https://orise.orau.gov/internships-fellowships/postdocs.html

Response 2673

Perspectives on the postdoc roles and responsibilities

The (first) postdoc position for me is indeed a training position which allows to change/expand fields of research, shape an individual research profile and develop a network.

It is a postdoc's individual responsibility to "make things work" as in searching opportunities and possibilities to solve a problem or develop a method. Of course the PI is supposed to support this (with network, insights, resources, etc.), but I think its a postdoc's business to carry the project.

Also, to some degree the postdoc position is the first time where you are mainly responsible for supervising students and techs, whereas when supervising as grad student yourself, you can often refer questions and decision to more senior colleagues.

Fundamental issues and challenges

While a postdoctoral position provides a lot of freedom, limited only by the pressure applied by the respective PI, it also brings the intense challenge of strategically forming a career to happen within a time frame of only the next 10-15 years.

There is a lot of professional pressure on the postdoc to do experiments, publish, report, supervise and all a salary that is far from being competitive with industry positions together with a lack of job security/perspective.

The current system almost forces you to hold back on any personal life, dumps intense stress and responsibility on the researcher. While I can accept that research (and mainly the struggle for appropriate

positions in academia) is competitive, the very limited salary leaves an intense gap in personal funds, be it for family or retirement investments.

It needs better salaries for postdocs! If as a graduate I have to choose between an academic position and an industry job that easily pay three times as much, it depends so much more on the socioeconomic background of a graduate whether or not they can afford to choose academia. This is cementing gender inequality and the lack of diversity in research.

Existing NIH policies, programs, or resources

I think currently there are many valuable resources available on how to navigate the current system and also to raise awareness on career paths outside of academia, but what it takes would be to change the system to make it more attractive, or say less obviously disadvantageous, to subject oneself into it.

Proven or promising external resources or approaches

It needs much better salaries! And more time. In biomedical research things just take so much longer than in other fields. Working up e.g. a mouse model can take 1-2 years before you even can start doing your actual experiments to answer your questions. One year time frames are ridiculous.

Further it needs true incentives for faculty to cultivate a healthy and not toxic atmosphere. Those group leaders who try to change things for the better do definitely exist, but it's their personal struggle to develop/maintain healthy work environments. I feel there is little actual support of these people (mentoring awards are a start, but hardly anything more). Somehow it needs to be put as a requirement to all (especially current senior) faculty, to undergo training for empathy and compassionate leadership (or leadership in general might be a good start).

The current system, that is very hierarchical, is built to foster unhealthy power dynamics and abuse. If there is misconduct that is reported it's usually damaging only the inferiors career—there must be protection for the victim and actual consequences for the PI/faculty/institute.

But again: It needs much(!) better salaries for postdocs!

Response 2674

Perspectives on the postdoc roles and responsibilities

I personally view it as a great training period where you will be introduced to new areas of research and also get help to become an independent researcher.

Fundamental issues and challenges

1. SALARY, SALARY, and SALARY only
2. It is difficult when you have a family including kid(s)

Existing NIH policies, programs, or resources

1. Better salary and extra benefits (e.g. housing, parking, daycare/school benefits, etc.) if someone lives with a family with kids.
2. Mandatory grant writing. Every post-doc should work towards at least one grant during their training
3. Some more help and mentorship about job search (academic or industry)

Proven or promising external resources or approaches

No response

Response 2675

Perspectives on the postdoc roles and responsibilities

I see the postdoc as a highly specialized worker who performs research in a lab and mentoring trainees while setting up a personal line of research. It should be moment when a scientist learns something new and combines this new methods with previous knowledge to create a new and unique line of research who will allow the postdoc to pursue an independent position.

Fundamental issues and challenges

The institute where I am working (in Boston), until last year, used the NIH postdoc minimum salary table as RECOMMENDED salaries, with almost zero possibility of negotiation. This created a lot of problems since the cost of life in Boston is dramatically higher than in the NIH area. I suggest that together with the minimum salaries, NIH also publishes MEDIAN salaries for EACH INSTITUTE at EACH YEAR to maximise transparency and give the more realistic idea that at NIH, the MINIMUM salaries are used as a MINIMUM starting point and not as a religious reference.

Existing NIH policies, programs, or resources

Non americans pay american taxes, therefore it is very obsolete that F32 fellowships are accessible only to people with citizenship.

Also, NIH grants and fellowship salaries should be adjustable with the cost of living of each USA region.

Proven or promising external resources or approaches

publish median salaries divided by years of experience to create a better competition in the job market and to improve the job offers.

Response 2676

Perspectives on the postdoc roles and responsibilities

Taking an academic postdoctoral position should be an opportunity to grow as a researcher and establish your career. Yet unfortunately for many, it means sacrificing your personal life and enduring financial hardships.

Fundamental issues and challenges

Fundamental quality of life issues are mostly related to compensation. Low compensation at the height of the current cost of living manifests into unaffordable childcare, expensive health insurance (specially for dependents), and general safety concerns for only being able to afford housing in certain/cheaper areas. The age of a typical postdoc position is at a prime time for wanting to establish a family, and the disincentives for taking up postdoc position, and particularly fellowships with increased tax and health care burden, are becoming larger. This disparity is even larger for female postdocs that often have to choose between having children or focusing on their careers. Retention also becomes increasingly difficult when postdocs are lured into private industry positions for the higher compensation and better working hours.

Existing NIH policies, programs, or resources

As a current Ruth L. Kirschtein T32 NIH fellow, I see that the Stipend Supplementation and Compensation policy (11.2.10) should be updated to:

1. Clarify that while the definition that "individual fellowships are not considered to be in an employee-employer relationship with NIH or the sponsoring institution" there is nothing preventing the institution from establishing an employee-employer relationship with the fellows to supplement their income and provide employee benefits they would otherwise be ineligible for (e.g. retirement accounts).
2. Allow the supplementation of salary be from other federal and/or NIH grants by the PI. Many PIs only have federal funding, and even if they wanted to supplement the salaries of their fellows to a decent living wage, they are unable to due to the policy.

This could alleviate the constant burden of asking NIH to increase the minimum salary requirements by giving more leeway to the institutions/PIs to decide supplementing fellows without any additional obligations, particularly as we see institutions implement a much higher minimum than that set by NIH which leaves fellows excluded from the institutional policy.

Proven or promising external resources or approaches

NPA Institutional Policy Surveys provides a great resource. The research by Tim Sainburg (arXiv:2205.12892v1) on postdoctoral salary compared to cost of living is also a great resource that can guide efforts to enhance pay scale. I sincerely thank NIH for the platform to share our experiences as postdoctoral trainees, and I applaud NIH's efforts to progress postdoc training.

Response 2677

Perspectives on the postdoc roles and responsibilities

I took an academic postdoctoral position because I eventually wanted a tenure-track faculty position at a research institution, running my own laboratory. I know it's not useful if you want to go into industry, but an academic postdoc is basically required in biomedical research to obtain a TT faculty position.

Fundamental issues and challenges

Postdocs are expected to fund their own moves, are often paid ~half of what an industry job right out of PhD pays, and are not offered retirement benefits, making it a significant financial hurdle to undertake a postdoc. Since there are so few tenure track faculty positions relative to the number of people who obtained PhDs, no one is interested in doing a postdoc unless they want a TT faculty position, so it is hard for PIs to recruit and retain postdocs. This is creating an issue for those PIs who rely on postdocs to produce data to fund their grants, but really those people should be using staff technicians or staff scientists. The postdoc should be working on their own project they can take with them to start their own lab. It is a failure in university policies and NIH grant funding in general that the staff techs/scientists are not able to be paid enough to get good quality productive techs/scientists.

Existing NIH policies, programs, or resources

Postdocs should really be only undertaken by people who want tenure track faculty positions, and the number of postdocs overall should be reduced. PIs should instead pay staff technicians/scientists much better wages than they currently receive, and get most of their data that way, as postdocs should be focused on generating their own data to start their new lab, while learning from the lab in the meantime.

Proven or promising external resources or approaches

No response

Response 2678

Perspectives on the postdoc roles and responsibilities

A role where an individual continues their development and training from the work they did to attain their doctorate, through the contribution to completion of a research project which contains components relevant to their training to date but includes methods and/or techniques that have a mutual benefit to the training/development of the postdoc personally and completion of the project they are working on. An ideal postdoc position would allow sufficient time to allocate to career development alongside the research project the candidate is working on; including grant writing, mentorship, peer review, conference presentation—but also developments more relevant to a career outside academia.

Fundamental issues and challenges

Appeal of academic career: from discussions with peers at graduate level and outside academia, the main appeals of an academic career are largely based on ideas of freedom of thought and flexibility; in reality academic careers are perceived to be constrained by difficulty in receiving funding, small chance of success (few achieve tenured positions), lower reimbursement than similar skilled jobs outside academia, lack of time to dedicate to research (demands of administration, teaching, etc.)—result is that people who choose academic career more likely to be doing it out of intrinsic motivation at the expense of other aspects of life (this reduces the recruitment pool, many not willing to do this and many cannot afford to).

Pace of academic work: postdocs are inherently ambitious and hard workers due to the nature of their training to this point in their career, but the pace of decisions and progress in academia is far slower than similar roles in industry. Speaking from experience, it feels like I am fighting administrators for my right to do research, which is exhausting and is the main factor making me doubt a career in academia beyond postdoc at the moment. It is unfair if postdocs commit to relocating to work on a project that does not start for a year after they have started.

Financial constraints: linked to appeal of academic career, but independent in the way that for many people a postdoc salary and benefits (or lack of) simply do not support the cost of living—whether that be family life, caring for relatives, etc.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2679

Perspectives on the postdoc roles and responsibilities

This position should be a training role with progressive development towards independence (in many forms). Our roles involve conducting research, communicating outcomes and training the next generation of scientist. In theory the responsibilities should be multi-faceted and benefit both the postdoc and the environment they work in. I fear that these positions have largely morphed into skilled and cheap labour, based on listening to the experiences of those around me for 5 years, and these roles have become even more unstable after the COV-19 pandemic.

Fundamental issues and challenges

Issues:

- Visas: these processes are impossibly opaque and stressful for foreign postdocs, and this population makes up the majority of the workforce
- Childcare: of particular importance for female postdocs, who bear the brunt of the lack of benefits and structure
- Pay: has not changed with inflation and does not compensate for skillset; low pay occurs at a time when many significant life changes are also happening (i.e. kids, marriage, house etc.)
- Startup costs: difficult to scrounge for many who were also paid minimally during their PhDs; definitely a barrier to some for changing location; debt incurred lasts years
- Cost/location of living adjustments: NIH salaries should not be identical for postdocs living in relatively low vs. high cost of living cities

Existing NIH policies, programs, or resources

- Faculty are trained in understanding NIH grants and systems almost solely, in my experience, and this doesn't relate to foreign postdocs. Perhaps it is a lofty goal to hope for more resources for foreign-trained PhDs, but in the meantime, education faculty on how to support postdocs not trained in the US would be important.

i.e. it is often suggested to try and get on an F32 or apply for K awards. not possible if not American

- More bridge to independence type awards

Proven or promising external resources or approaches

No response

Response 2680

Perspectives on the postdoc roles and responsibilities

A postdoc is a period when I receive further training into independence to start my own career. During this time, I expect to learn new knowledge/techniques and receive career advice.

Fundamental issues and challenges

In my institution, postdocs are not well respected by the university ; because it's a prestigious institution, there are always sufficient applicants and postdocs are replaceable. So issues that postdocs can be easily dismissed by the administrators.

Existing NIH policies, programs, or resources

The salary baseline should be adjusted based on geography and inflation. The past two years, the inflation has been close to ~10% , so the salary should have been raised by ~10%, but it's not.

Proven or promising external resources or approaches

Postdocs should be given opportunities to review the PIs , instead of just PI reviewing the postdocs.

Response 2681

Response 2683

Perspectives on the postdoc roles and responsibilities

it is actually a good way to interact and be in the research world. It is also a good training phase to be responsible for tasks useful in the real world and feels like you are making a difference.

Fundamental issues and challenges

I have a good quality of life and see no inhibition in my recruitment. The only slight problem in my case might be for the admin employees out of the international affairs department not being familiar with the visa process and hassles.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

ways to be in touch with them like there being a contact person or something like that

Response 2684

Perspectives on the postdoc roles and responsibilities

I have had two postdoc positions (in the science/biomedical field) at two very different academic institutions. At the first I felt like a "sr." graduate student, nothing could be done without getting my mentors approval. It felt stagnant, and that I was not learning skills that would make me an independent researcher. It was also my main job to finish up research projects that previous students never finished, either because they quit the lab or because they moved on without finishing. At my second (current) postdoc appointment, I have a bit more autonomy. I have learned a lot of valuable lab skills. In this position I feel more independent but there are people who I can go to if I need help. This position is very fast paced and a lot of projects are rolling in and out quickly.

Fundamental issues and challenges

Fair pay. My number one complaint about being a postdoc is the low pay. I have been in school for over a decade and have multiple degrees and I am making the same(my first two years was making less) as someone with a bachelors in hospitality management who is a manager at an Olive Garden. That is so demoralizing. All of my mentors in academia continually tell me to just hold on it gets better, when you get a faculty position or this grant or that grant funded. But the harsh truth is that there are not as many faculty positions available, the grant opportunities are limited. I had to have a very frank discussion with my mentor and tell them that my salary was not keeping up with the economic demand, and it took eight months to change it. I have gone into more debt by being a postdoc, and it is a hole that I don't know if I will be able to climb out of in the next decade.

In addition to the low pay. there are also not many positions after your postdoc is completed. I know it varies but field and discipline but so many faculty researchers are staying and not retiring which means my peers and myself are just waiting in this postdoc purgatory until there are positions available or jumping ship into industry to save ourselves from accruing even more debt. I know multiple faculty members who are well into their 70s (or older) and not retiring, I know of another who stayed in their position until they passed away. I would not encourage anyone to get a PhD or enter a postdoc until there is some kind of job security or better pay because otherwise you will never get out of debt.

Existing NIH policies, programs, or resources

I think the NIH has great programs and resources. The job fairs that you host and the talks and career path option symposia that you have are all very valuable and helpful to new postdocs.

I like the idea of the LRP that NIH offers, but it requires a lot of time and information and for myself I can barely get my mentors attention to read through a manuscript we are trying to get submitted. I think it would take a lot to get all the necessary documents from my mentor to do the LRP. Maybe adopting a plan that is closer to the Public Service Loan Forgiveness (PSLF) plan that is run by the FSA would be better. For example, if you are a postdoc for X number of years, e.g. 3 years, and are a productive scientist based on a letter from a mentor, or a grant applied to, or a manuscript accepted for publication, then you get X number of dollars of loans forgiven. Offering help, but making it overly complicated to get the help is not helping.

It might also be helpful for any person funded on NIH funds if they have mentees to go through a mentorship course. Even something as small as one hour a year. There are many brilliant scientists who fall short at mentoring their trainees.

Proven or promising external resources or approaches

I think a lot of current problems can be alleviated by paying a fair competitive wage to postdocs. We all know academia can't beat the pay scale that is in private industry but they need to at least be competitive. No one, but especially a highly educated individual, should be paid below a living wage and that is what is continually happening with postdocs. Especially since the NIH has one standard stipend based on year and the cost of living is variable throughout the country.

I think the shift has already happened, whether you want to blame the pandemic, or millennials, or a butterfly beating its wings too hard on the other side of the world; no one wants to go into a job where they feel undervalued and unappreciated, and work for 60+ hours to maybe move a boulder an inch. Having a work-life balance is the new demand, and many of my mentors do not understand that. Their favorite tactic to resort to is "Well back in my day, when I was a postdoc" which can't even relate to modern times and the debt burden most students have entering a PhD program and then leaving that program to get paid a questionable livable wage, it's unreal.

I guess in short a list of things that will only improve your chances of getting people to come into a postdoc would be:

Fair and equal pay

Better loan forgiveness options

4 day work weeks (or 9-80s)

Response 2685

Perspectives on the postdoc roles and responsibilities

My definition of what a postdoc is has changed since becoming one. In my eyes, postdocs are the driving force behind scientific innovation, we are the individuals that have forgone convenience and practicality to pursue a scientific journey with the hope of helping humans. We are organizing collaborations, running experiments, presenting, writing grants, and reviewing journals and the reality is we are spending 60-80 hours a week doing these things even though we are paid horrifically. If you were to ask my friends outside of science they would tell you a postdoc is an individual who sacrifices their quality of life and their families for the pursuit of science.

Fundamental issues and challenges

This response can be distilled into one central issue, finances. In my case, as a US citizen, I can say with confidence other Americans are avoiding academic science or science altogether because it's the equivalent of slave labor. Very few people want to work more than double the time they are already underpaid for. I am a fellow at a prestigious institution in Boston and because of this, I am required to live in Boston (the avg rent is here $3758) and the avg cost of rent exceeds my monthly salary. THIS IS BLASPHEMY. I don't think this is too complicated to figure out why we can't recruit or retain fellows when they literally cannot afford to live on the salary provided even as a single person with no kids. Thus, I suggest that NIH salaries have a scaling factor based on the cost of living in the city your institution is located within. Amongst fellows, this is the most common discussion.Everyone all the time is considering leaving academia because we can't live or enjoy life on this salary. Frankly, if I were a PI, I would be ashamed to look the fellows in face paying them so little (in Boston) and expecting them to work double or triple the hours we are (under)paid to work.

Existing NIH policies, programs, or resources

It is difficult to focus on training when you do not make enough money to pay your bills.

Proven or promising external resources or approaches

I would like to reiterate. It is difficult to focus on training when you do not make enough money to pay your bills.

Response 2686

Perspectives on the postdoc roles and responsibilities

The position of a postdoctoral researcher is a position for advanced and trained researchers in my opinion. It is for people for have substantial knowledge in research acquired during their doctoral studies, and one where they continue acquiring additional research experience on the way to becoming an independent group leader. All postdocs will not go on to become group leaders and supervise laboratories at academic institutions but it is my goal to get there.

Fundamental issues and challenges

I think the lack of substantial financial support and uncertainty about future prospects is a major challenge for recruiting and retaining talented individuals in academic research.

Existing NIH policies, programs, or resources

NIH should seriously think about how they set salary cap for some arguably some of the most talented, passionate and hardworking people in society. The current minimum salary does not do justice to the work postdocs perform. There is also no reward for additional hours or better performance and no maternity leave or child care support.

Postdocs should are not actively encouraged or required to teach. This is not good training for faculty positions where teaching is necessary. Postdocs should be required to teach and should receive appropriate training to become excellent future mentors.

Proven or promising external resources or approaches

No response

Response 2687

Perspectives on the postdoc roles and responsibilities

In my opinion, postdoctoral position prepares one to be an independent investigator, contractor, enterpreneur, etc.

Fundamental issues and challenges

Covid-19 pandemic

Starting families

Not knowing exactly what one wants to do in the career

Existing NIH policies, programs, or resources

IRACDA can be advertised more

Different grants (such as ones for personal leave such as having a baby) can be advertised more

Proven or promising external resources or approaches

Once NIH-funded programs and resources are advertised more, postdocs are more likely to join them and get the training they feel they need.

With knowledge of different grants, this will give the postdoc incentive to perform well at work and apply for the grant. They will have a higher chance of getting the grant, which leads to the postdoc’s satisfaction and makes them more competitive in the future.

Response 2688

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a “postdoc” regardless of funding mechanism. “Trainee” is seen as diminutive by many, and should be avoided, while “scholar” or “fellow” is more appropriate.

NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.

The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.

International postdocs face unique challenges; the NPA's 2023 Postdoctoral Barriers to Success report shows 86% were negatively impacted by cultural

transitions into the U.S. NIH should work with the State Department and USCIS to accelerate and simplify the visa and immigration process for these world-class early-career researchers. NIH should also expand funding opportunities to visa holders through K99/R00 and new programs.

Short contracts create immigration headaches. NIH should encourage contracts with lengths commensurate with the intended postdoc periods, longer termination notices, and ties to institutions not PIs. NIH should also support adoption of policies such as vacation accrual rollover to support international travel, subsidized visa costs, and insurance with dependent coverage, while prohibiting use of part-time postdoc positions to avoid provision of benefits

Existing NIH policies, programs, or resources

Many PIs lack formal training in mentoring and personnel management. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors.

Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or

expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs, while providing clear differentiation between these positions and postdocs.

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible.

Per the NPA's 2023 Postdoctoral Barriers to Success report, more than 90% of postdocs are negatively affected by the lack of clarity in transitioning to next

positions. More than ever, postdocs are paying a significant opportunity cost for limited faculty positions and 86.6% are impacted by job security concerns. Additionally, 'disenchantment with academia' is trickling down from overburdened faculty, making these positions less desirable to early career researchers. Career

outcomes and tangible benefits of pursuing a postdoc are often misunderstood. NIH should provide early career scientists with actionable information and transparent data to make informed career choices before and during their postdoc periods, including increased awareness of career options/

Proven or promising external resources or approaches

Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money.

NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of

federally-funded research but also its community resources.

We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH's policies and programs that

have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored

training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

Response 2689

Perspectives on the postdoc roles and responsibilities

This is supposed to be a bridging position, providing mentorship and training to help the trainee reach their career goals and potential.

Fundamental issues and challenges

Work/Life balance. Poor mentorship from doctoral student to career academic researcher, ie skills and opportunities in grant writing, sitting in on study section meetings, meeting grants officers, and a transition to managing a research lab instead of conducting experiments. The lack of opportunities to network and develop collaborations with peers to share expertise and efforts on grants.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2690

Perspectives on the postdoc roles and responsibilities

A key upside to an academic postdoc is the freedom to pursue questions based on their intellectual merit, rather than a potential profit motive; these questions can be developed independently or with input from the postdoctoral mentor. I also think the postdoc should contribute to the community of the university and the mentoring/training of younger scientists—but they need protected time/money to do this. Ideally, the postdoc is a junior collaborator to the PI, getting support and training but also granted a fair degree of independence. A postdoc is an incredibly vulnerable position: the power of the PI over the postdoc's current and future jobs is extreme and this mechanism of control can be dangerous for the postdoc.

Fundamental issues and challenges

Key time of life—parenthood, want to buy a home and not uproot. A postdoc often is not at all competitive financially with other jobs a biomedical PhD could take; if benefits could be improved, this might slightly ameliorate the issue.

Existing NIH policies, programs, or resources

Paid parental leave and funding for a technician or similar during parental leave would be huge. Criteria for K99 award often means postdocs have to choose between using it and getting a faculty position immediately—it should be given earlier in the postdoc/have fewer publications required. Dedicated, mandated time and/or money for professional development—so it is easier for postdocs to justify time away from research to gather other skills that will benefit them and the whole scientific mentorship (e.g., management, mentorship, and similar training).

Proven or promising external resources or approaches

Take mentoring seriously when funding grants for PIs: anonymously solicit feedback from their postdocs; require training if they are abusive. Somehow reward institutions that have robust postdoctoral services—often, no one is really looking out for the postdocs; universities have a much bigger interest in keeping PIs happy than postdocs. This is true for funding bodies, too, and is a major source of abuse targeted at postdocs. What if a postdoc needs to leave a lab due to abuse—could funding bodies provide bridge funding for them to go elsewhere? This would help with retention in the academic system.

Response 2692

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is a unique period in a person’s academic career, with minimal teaching or administrative responsibilities and maximum opportunity to focus on research and continued research training. A postdoc should not be treated exclusively as a well-qualified research assistant performing tasks they mastered in graduate school for the purpose of forwarding the research of the laboratory’s principal investigator. A postdoc is also a trainee whose training and education in new skills and additional knowledge should continue to advance during this period and can be used to further their independent career. The postdoctoral period should be

1. a time for an early-career researcher to gain additional independence and responsibility in a research group while still benefiting from the mentorship of a more senior researcher and/or
2. a time for a researcher to expand their methodological repertoire with the guidance of an experienced mentor and gain new skills that can help the advance their field. An academic postdoctoral position also offers the ability to gain experience mentoring graduate and undergraduate students.

Fundamental issues and challenges

A clear issue facing postdocs and the mentors who wish to recruit and retain them are the poor salaries and benefits associated with the position. Postdoctoral trainees are well-educated researchers, often expected to work long hours and assume considerable responsibilities. Postdocs are productive and valuable members of a research team and their pay and benefits should reflect this value.

Recruiters must remember that postdoctoral trainees are in the laboratory to continue their education and training and must be provided with opportunities to develop the skills necessary to contribute to the future of their own field. This will not only benefit postdocs, but improve the quality of U.S. research as a whole, ensuring we have well-trained scientists able to compete with international developments and continuing research advances.

Currently, many academic research programs are still heavily animal-based, despite the well-known problems with translation and replicability of animal research. Many researchers trained in the use of animal models lack the time, funding, or institutional support to receive training in emerging, human-relevant research technologies. The postdoctoral training period is an ideal period during a scientist's career to familiarize themselves with new and/or unfamiliar technologies.

As the range of animal-free testing methods expands, researchers whose graduate training was animal-based will need training with these tools to keep pace with these pivotal developments and redirect their research as needed and ensure that the U.S. science workforce does not fall behind other countries. Increased postdoctoral education and training initiatives will help ensure we are creating a robust biomedical workforce that is able to compete with a rapidly-changing scientific landscape and respond to increasing calls for improved translation of biomedical research findings into human health advancements. Specific training in advanced, non-animal methods for postdocs would better prepare them for a robust, innovative, and satisfactory career in academic research.

Existing NIH policies, programs, or resources

- Institutional Training Grants can be provided for postdoctoral researchers to receive training that would allow them to make the transition from animal to non-animal research methods.
- Continuing Education Grants can be offered with the explicit purpose of establishing educational programs to train postdoctoral researchers on available non-animal methodologies.
- The NIH Director's Early Independence Award could prioritize postdoctoral applicants who currently use non-animal, clinically-applicable methods; are making the transition from animal to non-animal methods; or are developing and/or validating non-animal methods.
- The NIH Bench-to-Bedside and Back Program could prioritize pairing basic science postdoctoral researchers using animal models with Intramural Research Program (IRP) clinical researchers. The goal would be to assist those researchers interested in permanently switching from animal-based research to clinical work.
- Program Project Grants or Center Grants can be offered to mentors of postdoctoral researchers who wish to gain experience establishing centers for non-animal methods at their institutions.
- Grant supplements can be offered to postdoctoral researchers who wish to switch to non-animal methods mid-funding.

Proven or promising external resources or approaches

Some supplemental training programs have been developed to begin to fill the gap in adequate training in non-animal methods. For example, in the EU, the European Commission's Joint Research Centre hosts a summer school on non-animal approaches. Many online resources by experts in the field also exist, including those offered by PETA Science Consortium International e.V. and the Physicians Committee for Responsible Medicine. The Dutch Transition Programme for Innovation created a series of "helpathons," action-orientated workshops built around a specific question that encourages researchers through a community forum to think creatively and harness the power of coincidence in the discovery of new opportunities with regard to non-animal approaches.

Response 2693

Perspectives on the postdoc roles and responsibilities

Given word limits, I pasted my thoughts in the following three spaces but they do not fully connect to the prompts. I am extremely grateful for having received an NIH F32, but as I detail below, there are many ways it massively disadvantaged me. For example, those of us who paid for our own fellowships were paid less and given worse benefits than postdoctoral fellows paid on R01s, which is bizarre given that having F32 funded postdocs is good for the university and for mentors. There is also data to suggest that we are

more successful in the long term given that we worked hard to cover our own salary/research funds and that hard work leads to longer term persistence. One thing that did not fit elsewhere is that there are also large within-NIH disparities in terms of support. Some institutes have trainings and programs to help postdocs get mentorship, write Ks, to help K recipients write R01s, etc. My institute had none of these.

Fundamental issues and challenges

I got an F32 to fund my postdoctoral training. While waiting for my NOGA, my mentor hired me on her R01. I negotiated for a salary above the NIH postdoc rate which, given that my postdoctoral fellowship was in NYC, was a reasonable salary for a trainee given the cost of living there. However, once I got my F32, my department decided to just pay me the NIH postdoc stipend and I instantly had my salary cut by more than $30,000 a year. My understanding is that the NIH stipend is supposed to be a *subsistence* level stipend. It is not intended to necessarily be someone's entire income—especially given differences in cost of living across the US. However, universities seem to see it as something they do not need to supplement, and may even think they cannot. If my mentor could have supplemented my salary through her R01, it is possible I could have convinced them to not reduce my salary. However, NIH rules prohibit NIH F32 recipients being paid with other NIH funds.

NSF includes moving costs in their fellowships. It would be great if the NIH could do the same.

I am single which means my health insurance had to come through my workplace. My married/partnered colleagues had their health insurance through their partners' workplaces. This meant that my F32 research funds (the institutional allowance?) in part paid for my health insurance—and this is on top of what I had to pay every month through my salary for my health insurance. This also meant that married/partnered colleagues had more research funds than I did, which seemed fundamentally unfair. One colleague even married her partner in order to make sure she got her full research fund amount for her F32.

Existing NIH policies, programs, or resources

This prohibition of NIH F32 recipients being paid through other NIH grants has another negative implication that unfortunately can have long term implications. During my postdoc, I helped my mentor write NIH R01 grants. I helped her carry out the research once they were funded—despite the fact that I was fully funded by an F32 and thus conceivably could focus 100% on my own research. I did far more work on the actual writing of the grant than did her co-Is (who were largely chosen because they are senior, well-funded, and well-known)—but they were paid thousands of dollars each month despite doing possibly less than 10 hours of work per year. I now have an R00 and asked my mentor if I could be written into her grants and have a certain percentage of my time covered by her grants given the amount of work I have done, and continue to do, for her. Despite the level of expertise and work I brought to her grants, she cannot add me on as a funded co-I given that there isn't sufficient funds in the grant. Had I been allowed to be funded on her grant at say 10% from the start, despite my having an F32, that could have meant that my contributions were acknowledged and valued in a way that was commensurate with my skill level and my actual contributions. Now instead I am stuck doing unpaid work on her R01s—or I have to decide to stop doing that work and threaten that relationship. This could have been prevented.

There are huge disparities in the support and help provided by program officers—mine is VERY hands off which I feel disadvantages me relative to others.

Proven or promising external resources or approaches

Mentorship on F32s: There appears to be a strong preference for mentors on F32s who are more senior and who are NIH-funded. This puts mentees and junior investigators who might have relevant expertise at a distinct disadvantage. As an F32 recipient, my mentors were all very senior and very well funded people. They were so busy and so senior, they were not particularly interested in, nor did they have time for, mentoring me. They also were so senior that their advice around professional development topics (like job searches) were not particularly relevant. If the NIH explicitly valued the unique mentoring contributions of junior faculty, I would have had mentors who were more invested in me and whose professional development experiences were more closely aligned with my own. Now as an assistant professor in the first year of my R00, I was asked to be a mentor on a postdoc's NIH K01 application but then was told I was too junior to do so and was taken off. I know that I will be providing mentorship to this postdoc once they get the K01, but it will now be informal and thus not something that really supports my tenure application nor supports my building of a reputation as a mentor so that I can become a primary mentor on a K. I think this leads to situations of shadow mentorship where junior people are doing invisible labor mentoring postdocs and students without getting formal credit for that mentorship. This also particularly

disadvantages us from groups that are underrepresented in biomedical sciences as we are likely to be asked to serve as unofficial mentors very often due to shared experiences with trainees from those same groups.

Response 2694

Perspectives on the postdoc roles and responsibilities

I see the postdoc as an opportunity to learn a new set of skills that, when combined with those gained from my PhD, grant me a unique angle/approach to the scientific problems that I will address in my future lab. In this light, I believe that postdocs should be treated as collaborators.

Fundamental issues and challenges

The lack of mentorship and collaboration in the academic labs I've considered postdoc research in have been a major reason I chose to leave my postdoc. People around me are over-committed, stressed, or hyper-strategic about their science, which I also find discouraging.

Existing NIH policies, programs, or resources

I feel like NIH has a lot of resources for early career researchers, which is amazing. I don't know how NIH can affect the culture of the places that employ them.

Proven or promising external resources or approaches

Response 2696

Perspectives on the postdoc roles and responsibilities

Having the individual F32 postdoctoral fellowship is an ideal role for me personally and I believe anyone who is transitioning from being a graduate student to being a faculty member. I think it is an incredible opportunity.

Fundamental issues and challenges

The biggest challenge I encountered was the uncertainty around whether or not I would actually receive the award before I had conferred my degree. This caused an incredible amount of personal distress. I had to pay for my relocation out of pocket and luckily, my sponsor had funding to support the time period in between my completion of my degree and the start of my F32. I believe this is unacceptable. Please give a

notice of award contingent on degree completion and have bridge funding so the student who is preparing to defend their dissertation does not have to worry about whether or not they even have a job waiting for them afterwards.

Furthermore, the status of fellows as a non-student, non-employee comes with many annoyances. Everything must be reimbursed, even health insurance. Worse, I do not have access to all campus resources and sometimes have to go through an onerous process to access such resources. It gets in the way of doing research and sometimes it gets in the way of my quality of life.

Existing NIH policies, programs, or resources

Given the previous points I made, it would be wonderful if remote work was accepted for postdocs. I understand the benefits of being immersed in the intellectual environment where you receive your fellowship. But the cost of having to move to a new place where you may not even be given access to the campus resources anyway is not worth the payoff of the supposed intellectual environment. I think there would be no shortage of postdocs if the policy explicitly allowed remote work.

If you aren't going to do this, then the stipend should be adjusted for cost of living in the area where the fellow moves to.

Proven or promising external resources or approaches

No response

Response 2697

Perspectives on the postdoc roles and responsibilities

Postdocs are in the early-career stage of their development as researchers.

Fundamental issues and challenges

It is difficult for postdocs to be classified as "trainees" and not be given full benefits. NIH should be stronger in its recommendation on benefits and compensation to compete with business/industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2698

Perspectives on the postdoc roles and responsibilities

Postdocs are hired to do the bulk of the projects for the PIs, sometimes left to your own devices with little support. Sometimes the PI expects you to mentor graduate students and interns. This is a temporary job with uncertain career goals, with very low salary, and this induces anxiety to postdocs. If you move to a different city to do a postdoc, there is no relocation fee. Postdocs are not considered as students, so you lose all the student benefit such as gym membership, writing center, etc. All of these add extra financial burden to postdocs. Particularly for international postdocs, visa is tied to employment, making them more vulnerable to mistreatment by toxic PIs.

Fundamental issues and challenges

1. Lots of grants and training opportunities are US citizens or permanent residents only. International postdocs are only eligible for K99. If you are doing a post doc in a department that doesn't get much federal funding, you wouldn't get much support to write your K99.
2. Low salary, no relocation fee, high financial stress, as most postdocs are in their early 30s, at the age of starting a family or having a child.
3. Very narrow career development options. Faculty positions are of limited supply, and highly competitive. If you want to go into industry, why do a postdoc?
4. If you want to stay in your postdoc institution, the job options are limited.

Existing NIH policies, programs, or resources

1. Increase the amount of grants, training opportunities, to international postdocs. This is not limited to the NIH, but also the AHRQ (Agency for Healthcare Research and Quality).
2. Increase postdoc salary, and provide relocation fee.
3. All institutions should give higher priorities to post doc career development.
4. Give postdocs the same benefits as students, such as gym membership fee, writing center, etc. in universities.
5. If postdocs need to have teaching responsibilities, their teaching effort should be financially compensated.
6. For Institutions: when you recruit a postdoc, consider keeping them after they finish their fellowship. And this should be made clear at the beginning to the fellowship.

Proven or promising external resources or approaches

No response

Response 2699

Perspectives on the postdoc roles and responsibilities

I view my role as a bridge one between trainee and principal investigator, but that errs much more on the leadership side than the trainee side. I am doing a postdoc to gain expertise in some new techniques, write grants, and mentor/manage other more junior scientists. But I consider myself a fully formed scientist in the majority of respects. So most of my role is to be a leader in the lab, and get used to running my own little mini-lab within the context of a larger lab, so prepare for my eventual goal as a PI. And of course my main goal is to produce research and publish good papers that I can use to build the rest of my career (and find myself a good position at an R1 institute).

Fundamental issues and challenges

My perspective is that there are two main issues that postdocs face:

1. extremely low salaries that are not commensurate with the amount of experience we bring and
2. extremely little power given how much of the actual science (both hands-on, day-to-day and big picture) we drive.

It is extremely mentally taxing to put up with #2 given #1. Postdocs are (almost always) postdocs because they see a future as a leader of an academic/government lab, and (maybe I'm generalizing but this applies to me personally), what drives that is wanting to have autonomy over the science that is done. But it's an extremely long road ahead to get to that point (and getting longer!!) and, since postdocs are likely to be personalities who want a lot of control over what they're doing, or they would not be doing postdocs in the first place, the constant reminders that you are a "trainee" who is a full adult with years of experience are grating. More often than not, I know one thousand percent more of the science than all of the principal investigators I interact with, because techniques have changed so much since they ascended, but I'm paid pennies, and stuck having little power and having to explain the basics to them in meetings. That feeling is really really challenging on mental health, and at a certain point every postdoc I know considers quitting, because if I'm going to spend 5-7 years having no power while being so highly skilled (and then maybe not even get a job), why wouldn't I at least go make 2-3x as much money and have better work-life balance?

Existing NIH policies, programs, or resources

- The #1 thing every postdoc is going to tell you: way higher minimum payscales for NIH postdocs; I'm talking starting at close to 90k in coastal cities. If this reduces the number of postdocs overall, I think that is totally fine. Academia should not rely on postdocs to the degree that it does. They should be much more competitive to get and be seen as a LEADERSHIP position within the lab. The main role of a postdoc should be to learn a few scientific techniques and then develop skills in mentorship, management, and grant writing.
- The unwritten rule that postdocs should change institutions after PhDs is annoying, penalizes folks with personal issues for staying in 1 place or being unable to move. The NIH should make sure this is not penalized in fellowships/grants.
- The K99 is a silly grant that is almost impossible to write ("look at how accomplished I am already! but I promise I need TWO MORE YEARS of training, despite already having a PhD and 3 years of postdoc, because Reasons."). I don't know what the solution is, but the K99 is bad. Perhaps more F32s and smaller R00 mechanisms for senior postdocs.
- NIH should explicitly reward team science. Post rules that it's fine to switch co-first authorships around on CVs if it's different from what is listed on the DOI. Do not allow reviewers to comment "but what did they actually *do*" in co-first papers. Science is slow, and it's more efficient in a team. Gone are the days where you can do 1 western and get a Nature paper. It's time for study sections to stop penalizing this —the rugged, ego-driven individualism is making us all mean and miserable.
- Require PIs on NIH grants to take mentorship/management classes and solicit PI reviews from trainees regularly.

Response 2700

Perspectives on the postdoc roles and responsibilities

We have adopted the National Postdoctoral Association's 'postdoc' definition, and we highlight the word "temporary" when sharing this definition to emphasize to faculty, postdocs, and institutional leaders that postdocs are not long-term lab technicians, managers, or other support personnel. Furthermore, we recognize postdocs as being intersectional trainees; that is, they are contributing to the research enterprise, acquiring and learning a wide range of skills, and mentoring and being mentored. This recognition is central to how we advocate on behalf of postdocs.

We surveyed university faculty, postdocs, trainees, and staff, with 46 responding, to learn what experiences are most important for postdocs to have while training. All responders combined ranked these highest:

1. Networking;
2. Independent Research;
3. Business of Science Training;
4. Interdisciplinary Pursuits;
5. Mentorship Training.

Over 77% of faculty respondents placed Networking and Independent Research and Faculty-led research amongst their top five important postdoc experiences, while 82% of postdocs placed equally high value on Interdisciplinary Pursuits, Leadership Opportunities, Networking, Independent Research, Supervising Trainees.

When asked to assess which experiences are most difficult for postdocs to pursue, all responders and faculty ranked these highest:

1. Grant Writing (Lead PI);
2. Leadership Opportunities;
3. Teaching Experience;
4. Technology Commercialization; and
5. Independent Research. Postdocs, and separately

Training Grant affiliated (TG)-postdocs, mentioned similar experiences, but also included Opportunities to Supervise Trainees and Grant Writing (Any Role).

Fundamental issues and challenges

Our 46 survey responders identified the following as inhibiting recruitment, retention, and quality of life:

Challenges Inhibiting Postdoc Recruitment:

All Responders described low postdoc wages, low wages compared to industry, better work/life balance outside the academy, limited funding for international scholars and visa sponsorship, and low candidate pools as factors inhibiting recruitment. Additionally, faculty highlighted the lack of relocation funding and support as an inhibiting factor, while postdocs cited scarce faculty positions and low representation and diversity in the professoriate as inhibiting factors. All responders and Training Grant Affiliated (TG)-faculty groups had identical responses. TG-postdocs highlighted the lack of discipline-specific recruitment events as an additional inhibitor.

Challenges Inhibiting Postdoc Retention and Quality of Life (QoL):

All responders described the increased costs of living, low postdoc wages, scarce faculty positions and opportunities for career advancement, minimal time for social activities and networking, burnout and as inhibiting retention and reducing overall quality of life. Additionally QoL Policies and Benefits (e.g., postdocs not receiving the same access to vacation, sick, parental, and disability leave benefits as other staff types; relocation policies and programs not being consistent across the country and/or excluding postdocs; support programs for navigating work conflict; university programming to reduce isolation and increase belonging; and participation in standard annual raise processes given their role spans standard trainee and staff mechanisms). Additionally, faculty highlighted minimal federal and local support mechanisms (e.g., seed funding and pilot awards) for postdoc-led research and minimal support for retaining postdocs (via raises, relocation/onboarding support, and/or independent research funds). Postdocs highlighted lack of time for socializing and burnout as inhibiting their retention and lowering their quality of life. Training Grant affiliated (TG)-postdocs and faculty responses fell within those reported.

Existing NIH policies, programs, or resources

The following items were highlighted as existing programs and resources that could be improved in the NIH postdoc training ecosystem:

- More oversight and enforcement from NIH to ensure that PIs are paying postdocs, who are appointed to research grants, living wages, and that these postdocs are allocated dedicated time to pursue professional development and career advancement opportunities in addition to time spent on research activities.
- More oversight and enforcement to ensure that all faculty receiving NIH funds participate in mentorship and inclusive excellence trainings, and that these individuals are using individualized development plans (IDPs) and mentorship plans for postdocs in their labs.
- Higher pay lines, modular budgets, and reduced caps for all research grants, which will allow for increased salaries for postdocs and other trainee types.
- More funding opportunities for international scholars. This could include

1. allowing international scholars to be appointed to training grants;
2. offering diversity supplements to existing training grants for this purpose, especially in fields with limited numbers of domestic scholars;
3. expanded individual fellowship opportunities for international scholars and/or grant opportunities that include pathways to citizenship.

- More early-stage funding opportunities for postdocs to allow for preliminary data collection that can be used for pursuing existing mechanisms (e.g., K99s).
- Flexibility on including non-citizens on postdoc fellowship training grants. Highlight how much of the nation's postdoc workforce is international. Forging relationships between this community and NIH would be a great way to shore up pipelines into the U.S. research community and to maintain U.S. preeminence in emerging fields of science in the longterm.
- Expanding individual fellowship opportunities to allow non-citizens to participate.
- Make institutions commit to inclusive excellence institutional changes as a requirement for any received training funding.
- More recruitment initiatives at the national level across the biomedical science continuum to aid in identifying and recruiting potential postdoctoral candidates.

Proven or promising external resources or approaches

1. More engagement and information gathering from the postdoc community to inform future policy and programmatic changes. This could be accomplished by engaging with postdoc-led networks at local and national levels, such as university postdoctoral associations and the National Postdoctoral Association. A committee of postdocs could be established with rotating appointments to advise NIH leadership on emerging trends within the national postdoc workforce.
2. The Southern Regional Education Board's Institute on Teaching and Mentoring (SREB-ITM). (https://www.sreb.org/institute-teaching-and-mentoring)

SREB-ITM is an external resource that has dynamic engagement across disciplines, career stages, and diverse socioeconomic variables that is focused on the retention and increased quality of life of diverse scholars in STEM, biomedical, and clinical fields. The purpose of SREB's ITM is to provide equitable access to support structures that train participants in the non-academic experiences needed to succeed in the academy and industry that their home institution might not provide. Specific items they cover in their curriculum include: how to navigate the job academic job market, how to effectively network, how to mentor and advise trainees as a new faculty mentor, and how to be an effective educator. Although SREB-ITM is primarily focused on doctoral trainee experiences, we believe the approach could equally benefit the national postdoc community. NIH could do something similar to this by deploying a business of science curriculum that all NIH-affiliated trainees participate in.

Response 2701

Perspectives on the postdoc roles and responsibilities

Advancing skills, applying for grants successfully, publishing first author papers, establishing scientific connections and collaborations, attending conferences to increase visibility of your work, learning how to mentor and manage a lab, how to write grants, exploring and expanding research interests

Fundamental issues and challenges

Cliquishness, poor mentorship, mentors using your ideas and underpaying you while expositing your expertise and commitment; blackmail—nonstop work or no support, sexism. Stifling environments where collaborations do not flourish; mentors who are too old to care; mentors who don't mentor; mentors who don't understand the research you are doing in their lab; mismanage of funds; going for the low hanging fruit

Existing NIH policies, programs, or resources

Something needs to be done so that mentors are vetted before they are allowed to take on postdocs. There should be smth like rate my professors but for science mentors

Proven or promising external resources or approaches

Mentoring, training, all of these needs to be improved and there should be an anonymous way to report misconduct, negligence of your PI.

Response 2702

Perspectives on the postdoc roles and responsibilities

Postdoc should has more training and more financial support to continue career also 4 years after degree to get K99 should be moved to 5-6 years

Role of postdoc should be increased to participation in conferences specially oral presentation

Also there is great challenge to keep yourself in the track for academia without fair salary (minimum wage)

Fundamental issues and challenges

There is alot of positions but when someone apply you don't get response

The main challenge is financial after suffering you are not sure from the future if you will get position or not

any novel ideas that we participate with PIs will not return to us as financial benefit

Some PIs keep them and start to use that ideas after we leave the Labs

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2703

Perspectives on the postdoc roles and responsibilities

A post-doctoral position gives opportunity to work in a research group and develop the capability to build your own research group. As a postdoc, you learn from your mentor and utilize your skills in solving the problems for the benefit of the community.

Fundamental issues and challenges

Post-doc position is a short-term transition state from the PhD to a long term academic or industrial job. Therefore, a post-doc passes through the recruitment process and always worried about the next step. Although a post-doc position provides a very healthy and fulfilling experience but there are only three problems:

1. Immigration issue associated with the J1 visa and two year home stay rule
2. Uncertainties associated with the job market and too much dependence on the advisor
3. Low salary with respect to the cost of living and increasing family responsibilities due to age

Existing NIH policies, programs, or resources

I have some suggestions so that a post-doc can focus more on research and contribution to the community.

1. Some housing related expenditures should be compensated by either providing housing by the university or rent sharing
2. Some steps should be taken so that a post-doc position should not remain a transition state
3. A post-doc contract should be 3-5 years
4. A post-doc should be considered either as a student so that they get some recognizable degree certificate or they should be treated as a staff so that they should be less dependent on their advisor

Proven or promising external resources or approaches

The overall training system is wonderful.

Response 2704

Perspectives on the postdoc roles and responsibilities

The postdoc in Academia is a highly qualified (young) professional with a deep knowledge in one or more scientific fields (and technical skills) that takes leadership in one or more research projects in the lab. He has the responsibility to strategize on the best way to answer scientific questions using biomedical tools available and/or creating/improving methods/techniques available in the field. The postdoc is also invested in grant writing as well as in analyzing the obtained results and eventually writing manuscripts and submitting them to peer-review journals. In the postdoc position, the individual is preparing his/her him/herself to grow toward an independent position. While a postdoc is responsible for the progress of his/her research, he/she also mentors and trains undergraduate and graduate students at earlier stages of their careers.

Fundamental issues and challenges

1. Low salary for highly qualified and interdisciplinary work such as the postdoc, competition with industry salary is an issue.
2. Many postdocs are not US citizens or residents causing recruitment issues.
3. Only a few faculty positions are available every year making the postdoc training very competitive and not always productive.
4. Postdocs are mostly on short contracts, thus considered individuals "in training" rather than in a real job position impacting job satisfaction.

Existing NIH policies, programs, or resources

not sure

Proven or promising external resources or approaches

No response

Response 2705

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism. "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate. Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.

Fundamental issues and challenges

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts

in areas with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step.

Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.

Academia contains remnants of structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups still today.

Postdocs from historically-marginalized groups and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. Examining and acting on these power imbalances is key to creating a more inclusive and safe environment. I also believe it is vital for mentors to get annual training on cultural competence and learning ways to support their mentees.

Existing NIH policies, programs, or resources

NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.

To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be especially cost-prohibitive for researchers from low socioeconomic backgrounds, those with increased familial commitments and internationals.

Collecting metrics on postdoc satisfaction on an annual basis will position NIH to be nimble in its response and adjust policy accordingly based on the needs of postdoctoral researchers. These data will not only provide key insights that will determine if new policy changes are effective, but will allow postdocs to provide honest, anonymous feedback without retaliation.

Proven or promising external resources or approaches

The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA

Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

Currently, institutions and NIH IC’s each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc’s personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.

We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH’s policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

Response 2706

Perspectives on the postdoc roles and responsibilities

Thanks for bothering to ask for long time coming feedback need-bottom up type.

It would be useful to also be wider advertised at every stage in professional publications and organization. We are keeping tuned for the results.

A give all and have all taken of the brightest, most talented, hardest working and most dedicated humans with NO returns to benefit a livable life for the 99%. of them. The responsibility of profiting from the mere presence, let alone interacting with, taking the ideas and full time work of the world's most valuable resources should come with equally high responsibility and protection of them. It does NOT. When we'll all soon be back in caves, it will be too late to lament the refusal to pay the postdoctoral scientists their worth and to shelter them from neverending disrespect, bullying, harassment, assaults, violence, robbery, and ruin by the lowest lows who get away laughing. There should be a law signed to protect those human progress and development owes to. There is NO "Stop anti-scientist hate crimes" legislation. The world's incalculable loss continues.

Fundamental issues and challenges

- Lack of livable wages and benefits: medical/health insurance and vacation are basic human rights of every full time worker in most of the civilized world
- Lack of clear career path—eg you labor on minimum wages a decade to become a doctoral what? An "appointee" whose check bank tellers laugh at???)
- Lack of REAL JOBS for the 99% with doctorate in sciences
- Lack of professional REQUIRED of departments and institutions training offerings on peer reviewed article and grant writing and submission
- Lack of PAID family/caregiver support
- ALL the above and countless similar handicaps set the postdoctoral scientists up for housing and food insecurity, and render them ideal, easiest targets for crooks, violators, thieves, and limitless perpetrators all who get away every time with everything they do to the penniless, helpless scientists with doctorates everybody but them profit of.
- Lack of PAID studies/feedback. A fraction of the time let alone expertise and practical significance of a survey like this is paid $ hundred(s) by focus groups, on line surveyors, etc. Guess which ones will more and more poverty-stricken "postdocs" going to do in the future?

Existing NIH policies, programs, or resources

- Reduce "postdoc ing around" to 2 years, maximum 3 and make available REAL jobs with REAL salaries and REAL benefits at the end of the postdoc tunnel or nothing will be fixed sustainably. There is NOTHING between postdoc ing and faculty (for the 1% at a 400/opening) to give the doctoral scientist a livable salary with minimum benefits. NO other profession does this to the past college level: medical doctors get a 2 year fellowship and residency after which they become physicians with mighty well paid salaries (with a 4 years of medical school. Lawyers and MBAs after mere 3 years triple a scientists' salary. Don't be surprised if there wont's be any more fools to postdoc forever till abandoning science altogether in the near future.
- PAY LIVABLE WAGES and BASIC BENEFITS, especially health/medical and " retirement" (God forbid pension, which all high school mates with college degrees have!) to ALL "appointees"—is that even a decent professional title for someone to tell the public what do they do "for a living? the brightest and hardest workers currently humiliated at below bachelor-and even high school diploma holders wages, at poverty limit!
- Make training/workshops in peer review article and grant writing and submission required of every PI in every department at every institution responsible of graduate students and postdoctoral trainees
- Expand the options for NIH and other grants by postdoctoral scholars beyond the handful (Ruth K and Ks) at livable wages with HEALTH/MEDICAL and RETIREMENT BENEFITS
- Provide Maternal, other caregiver PAID benefits and subsidies (eg for child care) as well as nursing rooms in/around departemnt
- REQUIRE professional STEM conferences to accept at least at some sections/events STEM mothers/fathers with infants and well behaved children accommodate them
- Expand hybrid and work at home work options
- Subsidize housing vouchers, affordable rent, home buying support

Proven or promising external resources or approaches

- Hold PIs, departments, and institutions accountable for benefiting from working with and profiting from humanity's brightest and hardest workers: every NIH grant application and promotion/tenure application should include name by name former graduate students and postdoctoral trainees' current paid work positions and other professional and/or personal achievements as a result of the named grant/promotion/tenure applicant's mentorship, guidance, etc. There are "prestigious" dementors who-while "serving" on women and minorities committees neglect and/or abuse and/or sabotage women and minorities' careers and lives
- Provide national hotline to report individuals, departments, institutions bullying, harassing, and/or turning a blind eye to postdoctoral trainees -especially internationals—being harassed, abused, assaulted, robbed, and ruined by communal aggressors currently laughing away freely after destroying the lives of the world's brightest and hardest workers because nobody wants to hear about these heinous acts committed on the most vulnerable minds that shoulder this country's and the world's progress while being paid laughable wages way off the affordability of $300/hour lawyers and do not have time for being dragged through legal battles they did nothing to deserve.

Thanks for reading. I wouldn't have burnt every dish I tried to cook today (of a decade old garden bean seeds) because of preparing this survey unless my daughter, also a number one Ivory Tower STEM doctorate earner from this country and awardee of countless honors like her mother is wouldn't have also left academia she once entered with enthusiasm, endless creative ideas, and all-out hard work but was driven away elsewhere.

Letting the brain drain gush over generations of the world's best over and over and expecting different outcomes? It does not matter who said it. It is what is being done to doctorate-level scientists. now.

Response 2707

Perspectives on the postdoc roles and responsibilities

Our University views a postdoc as a temporary (generally 5 years or less) training position in which a postdoc pursues a program of research and advanced training under the direction of a faculty mentor prior to obtaining an independent position in academia, industry, government, etc. Despite this, there is disparity in the ways postdocs are treated (as research trainees or as professional scientists contributing to the research mission). A clear definition from the NIH would help focus efforts to improve the postdoc period. If they are trainees, they should develop a clear training plan with their mentors with regular review and accountability. The outcomes of the training plan should be tracked and mentorship oversight provided. If they are not trainees, they should be paid market rates and have a clear professional development plan with accountability built in for both the postdoc and their mentor.

Fundamental issues and challenges

There are several ways in which the NIH could help resolve some significant challenges faced by postdocs. Much has been said about raising recommended stipend levels and providing cost of living adjustments. Postdocs experience wildly disparate quality of mentoring, and the NIH could expand access to (and require or strongly encourage) CIMER-developed mentor and mentee training. One problem that must be solved by the NIH is the requirement that fellowship recipients are not considered employees of the university. This requirement results in numerous problems for postdocs including a loss of benefits, loss of access to retirement accounts, loss of tax documentation and income documentation, etc. By treating the F32 and T32 awards as research grants like the R series and K99s, postdocs on these fellowships could remain employees of the university and avoid myriad problems.

Existing NIH policies, programs, or resources

As noted above, increased access to CIMER-developed mentoring curricula would take advantage of a valuable NIH-supported resource to enhance training.

Proven or promising external resources or approaches

Providing or supporting a centralized postdoc hiring hub would enhance recruitment and training. Utilization of CIMER-developed mentoring curricula could improve the working environment and mentoring. Facilitating the sharing of best practices and outcomes from programs across the country would provide a valuable resource.

Response 2708

Perspectives on the postdoc roles and responsibilities

Postdoctoral training should be a defined time period to prepare for an academic research career. There should be additional skills gained and refinement of skills achieved in graduate training. It should not be a holding pattern or a second PhD. The postdoc is still a training position but also the postdoc needs to contribute and be aligned with the PI/mentor's research while defining their own pathway. This inherently poses challenges. The postdoc for me is also research training following my clinical doctorate training. While I am pursuing my second research doctorate, I am still technically post-doctorate of my clinical doctorate. That presents a unique scenario of being both a pre-doc and post-doc at the same time. It's an ill-defined scenario with fewer mechanisms to support it. It is a bit of an anomaly. For me, this postdoctoral training time is concurrent with my graduate research training. If I wasn't pursuing a research doctorate, I would be a "pure" postdoc following my clinical doctorate. However, by pursuing a PhD, I become a predoc? That seems inconsistent.

Fundamental issues and challenges

It is especially difficult for individuals with a prior clinical doctorate pursuing a second research doctorate because they are simultaneously post-doc (post a clinical doctorate) while also being a predoc. There are fewer mechanisms to support us and classification is difficult. Further, those with clinical doctorates are often older, and have lost income potential for a substantially longer time period with clinical training. It is not just income but also lost benefits of disability, retirement, and other benefits. Increasingly, it is becoming financially untenable. Further, on the other side of postdoc training is academic jobs with poor job satisfaction and an increasingly difficult funding environment. This makes postdoctoral training even less desirable.

Existing NIH policies, programs, or resources

For those with clinical doctorates, the K08 pathway is a unique opportunity for clinician scientists. However, there are few opportunities for those with a clinical doctorate pursuing a research doctorate. They are technically eligible for postdoctoral fellowships (T32 postdoc and F32 postdoc) yet since those are only for 3 years, that eligibility can be used up during their research doctorate training and then during a post-research doctorate postdoc, they have no eligibility left for the F32 and there are no longer any other support mechanisms. The F30 is meant for this situation but only if there is a formal dual degree program, which often doesn't exist for non MD/PhD tracks and also doesn't benefit those who want to enter research later. There should be greater opportunities for clinician-scientists, those with dual clinical and research doctorates and those with clinical doctorates pursuing research doctorates

Proven or promising external resources or approaches

No response

Response 2709

Perspectives on the postdoc roles and responsibilities

The postdoc position is an advanced training opportunity before transition to academic or industry leadership.

Fundamental issues and challenges

Most universities (especially those that run like business enterprises) do not recognize postdocs as employees (they call them trainees) depriving them of a sustainable wage, retirement benefits, bonuses, immigration help or tax assistance. In other words, they profit off of postdocs tremendously without due monetary compensation. Universities trying to behave like corporate America should be discouraged, especially when it comes to education.

Existing NIH policies, programs, or resources

The NIH must make universities take responsibility and give proper compensation and recognition as employees.

Proven or promising external resources or approaches

I believe if postdocs are compensated well and recognized with retirement benefits, bonuses etc. there will be a boost in recruitment numbers.

Response 2710

Perspectives on the postdoc roles and responsibilities

When I started, my ambition was to explore the unknown and understand mechanisms underlying diseases. While technically we strive to uncover new findings, it almost seems redundant in the scientific community and acquiring funds for less explored areas is tough. As a postdoc/research associate, I have largely taken on all responsibilities from experiments, writing, grant reviews, and largely what feels like technical work that should not consume so much time (e.g., ordering, equipment maintenance, inventory). I am happy to help, but it takes a lot of valuable time away from doing what is needed, publishing. Postdoc/research is not so much a joy of exploring the unknown but a race to publish as this is what defines you. In some ways, it is not fair when you are responsible for so many tasks, which spreads you thin in a small lab versus big labs that have the resources and maximize postdoc needs.

Fundamental issues and challenges

Unfortunately for myself, I feel the graduate to postdoc path has been more of a struggle than an enjoyment. I went into research because it has been a long time interest of mine, to understand the unknowns. But in short, I will not promote my kids to go into the postdoc route, nor others nearing the stage of considering PhD. First, the pay and benefits make living tough. I had to take out additional loans to get by. Second, one year contracts for PhD is stressful. Because of one year contracts, I always felt I needed to work 7-days per week. It also does not help to hear your PI say you must work all the time. Three, there are not enough guidelines/policies that help protect postdocs/grad students from abusive PIs. For instance, I had submitted a first author paper with my PI. Upon request for edit/resubmission, my PI removed my name all together as an author and my institute said it was fair practice. It hardly seems fair my first authorship can be stripped without at the very least informing me. Nor did I get any authorship. Harassment is real and it seems PIs are highly protected because they are the funded individual. Lastly, it wraps back around to pay. It is hard seeing so many other professions with 2 year degrees making more money than someone who has been committed for 5 years in training, and several more in postdoc life making 20k less than other professions. Our benefits are still bad, vacation is far less. I couldn't even take more than a week for my newborn child. It just becomes sad. Everything feels competitive and difficult.

Existing NIH policies, programs, or resources

After reaching postdoctoral status, I quickly realized that my training did not include anything regarding the NIH/grant funding process. When I was asked to submit a grant on my own, I quickly realized what a burden and daunting task that was. Especially having a PI that claims they have no idea how to submit a grant (which was not the case unless they outsourced writing/submission of their own grants). Going into graduate school, I wish I had known so much more about options. For instance, if I could start over, I would have worked towards a MD/PhD track. But I only learned about that option when it was too late. Statistics is crucial, but you are also not required to learn. Instead, graduate school felt like a repeat of my undergraduate degree. I would have like to learn more about the options/opportunities out there. Receive training for things that become crucial in grad school and postdoc (e.g., statistics, grant writing, funding mechanisms throughout ones career path). Highlighting these things in advance I think would have gone a long way in planning and decision making.

Proven or promising external resources or approaches

Respect for trainees goes a long way. Pay that matches our degrees and benefits would make life/job satisfaction much greater. NIHs presence needs to be much more early on in life (college) so students become more aware and knowledgeable. I typically learned of how others were sucessful when I was no longer eligible to apply to funding sources making stuck in a hard place. I was not eligible for K awards, but not quite established enough for early stage investigator. Not all is bad. I have had many great experiences but the pace at which things move along seem way too slow. Especially after obtaining a PhD in biochemistry, which is no easy task in a poorly funded laboratory. The playing ground for young researchers is not equal. Maybe increasing salary with some funds for research is needed for successful PhDs. Some strategies to allow us to explore our ideas rather than being forced to do specifically what the

PI wants. I feel I did more complaining but that is the only way to know what to improve on. I do feel it is sometimes hard to convey in words especially without tone. Happy to elaborate and discuss. [redacted for anonymity]

Response 2711

Perspectives on the postdoc roles and responsibilities

Necessary milestone along the way, maybe most fulfilled laboratory research time, during researcher career.

Fundamental issues and challenges

High level of administrative burdens, including general administrative issues in the academic system, residency related issues, difficulties to find appropriate grants and funding for adequate trainee time (not too short and not too long).

Existing NIH policies, programs, or resources

Fundings, programs and grant opportunities from postdoc position to partial independency are very underrated and not well established. Especially for Resident-alien researchers.

Proven or promising external resources or approaches

Mentoring should be the most important cornerstone for a postdoctoral researcher. A mentor with vision and care towards the postdoc can override the difficulties of the early carrier postdoc and can help to achieve necessary milestones, but for this, both mentor and mentee need appropriate financial and administrative support from the system.

Response 2712

Perspectives on the postdoc roles and responsibilities

I want to note that the outset that I don’t think discussions about postdocs can occur without also discussing graduate training. The two are inextricably linked, and NIH should do more to support graduate students and ensure equity within and across institutions. I think this is all very important, I will email you. If you do elect to publish anything I write here, I do ask that it not be linked to my name. I just think it’s important to give you an opportunity to follow up with me if you think I have said anything interesting or valuable.

In my view, postdoctoral positions are intended to extend training, further skill development, and facilitate the transference of skills and perspectives from one laboratory into another laboratory. Postdocs have much to offer; and in theory, they still have much to learn in service of their ultimate career goals. In my experience, their responsibilities generally include writing papers and grants, assisting with training of graduate students, sharing their knowledge/expertise, and developing new skills that enhance their career. The last point is worth emphasizing: postdocs must be engaged in activities that meaningfully enhance their career. That career need not be in academia because there are many research-related positions in industry that would benefit from well-trained postdocs.

Fundamental issues and challenges

With the word-limit, I want to focus on a few specific issues that I think have the largest impact.

1. Oversupply of PhD students. This oversupply of PhD students is particularly problematic when viewed against the available number of tenure-track jobs. I worry that many PhD students are simply brought into universities to help bolster revenue from tuition and fees since they serve as teaching assistants and help increase class sizes; they also boost other numbers that can be valuable (https://www.insidehighered.com/advice/2021/06/22/how-phd-job-crisis-built-system-and-what-can-be-done-about-it-opinion). Yet, as a country, we do not do enough to support our PhD students (see recent strikes across the country), and there are massive levels of inequity within and across institutions. We have to fix this.
2. Underpayment and too much variability in payment. Stipends should be tied to area (cost-of-living) and the time (inflation). The NIH numbers could be easily scaled based on cost of living. Moreover, it should not be left to the universities (or PIs) to pay more than the NIH guidelines because it introduces massive levels of inequity.
3. Too much diversity in roles and responsibilities. There is little to no standardization with respect to postdoc roles and responsibilities. Perhaps this is why there is so much variability in payment, but it seems like we could improve this. We simply cannot have Dr. X at Institution A and Dr. Y at Institution B earn different stipends (adjusted for cost of living) performing the same roles and responsibilities.
4. Use of postdocs has changed over time. The NSF did a study of how use of postdoc positions changed from the 1960s to the 1990s. The results at the time were interesting (https://www.nsf.gov/statistics//issuebrf/sib99310.htm), and it would be worth following up 30 years later. Perhaps those data do exist and I simply missed them.

Existing NIH policies, programs, or resources

As a recipient of the F31 and F32 and also being someone who attended a graduate institution that was highly supportive of graduate students and postdocs, I am fortunate to have a tenure-track job (and soon to have tenure if all goes well). These programs helped me immensely. I suspect I also would've benefited from NIH efforts to enhance diversity, but I did not know about these programs till recently and I didn't realize that I qualified (first-generation college student from a low-income part of South Carolina).

How can you modify these policies and programs? One simple thing would be to add a submission and review cycle for all fellowships and any K-award aimed at postdocs. This is important because these are time-sensitive positions. Having an extra submission cycle (and faster turnaround time) would almost certainly increase the odds that a trainee will be successful.

NIH should also look into the disincentive of earning a F32 at some institutions. Once I received my F32, I lost all my benefits, I received a pay cut, and I was effectively demoted. My mentor had no control over this, and it was simply the university trying to pass the buck since these awards do not (as far as I can tell) include fringe. Of course, universities aren't always thrilled to get these prestigious awards because they don't get any overhead on them. I realize you'd have to award fewer F32s if they all included fringe and overhead, but maybe that would work out fine if we had fewer PhDs entering into the crowded system.

Proven or promising external resources or approaches

I am less familiar with external resources or approaches, but I think there could be more collaborations with industry.

Beyond these resources, I really think NIH needs to take a close look at the data we have in this country. How exactly do universities differ? How do those differences contribute to postdoc training and success? Let's collect some data and study the problem.

Response 2713

Perspectives on the postdoc roles and responsibilities

It is good way to explore own ideas, to learn additionally from seniors and colleagues.

Fundamental issues and challenges

Response 2714

Perspectives on the postdoc roles and responsibilities

When I was finishing my PhD I could not wait to start a Post Doc because I failed in love with the science behind my project. I use to tell people that when start Post Doc, I will be doing beautiful science there is no need for me to rush to finish things. I believe postdoc is the time that you really interact with science and put it in application

Fundamental issues and challenges

The majority of Postdocs are just at the point where they are finishing the PhD and ready to also pick up on all other aspects of life that they have put on hold during PhD. For example getting married, having a baby, buying a house or both. Unfortunately, you just need to do a simple calculation to realize that you can not afford any of them with a postdoc salary in academia. Some of us who did insist to go for postdoc no matter what, it was okay to leave a rent a room in Boston when I was still single. After I got married and inspected my wife got pregnant in 2 weeks. It was a disaster financially. The only solution was to leave the postdoc and move to a cheaper city

Existing NIH policies, programs, or resources

Collaborations

Response 2715

Perspectives on the postdoc roles and responsibilities

In our view, postdoctoral training is critical to prepare junior scientists for both academic and biotech/pharma career paths. Although there are many positions that newly minted PhDs can consider without postdoctoral experience (e.g. positions in non-profit organizations or in scientific publishing), for recent graduates on either academic or industry/pharma tracks, postdoctoral training provides the necessary experience for attaining independence. After getting their PhD, postdocs often change fields or experimental systems. Starting a completely new project can be challenging, but mentored training will provide the necessary advanced experience. For industry/biotech/pharma, 2-3 years of postdoc experience may be sufficient, as a high profile 1st author publication is not critical for obtaining this type of a position. However, for postdocs on an academic track, in addition to a solid set of papers, years 3 to 5 of postdoctoral training provide an opportunity to transition to independence by:

a) Developing a K99 or similar transition project/awards or assisting with the preparation of R01/R21 grants.

b) Preparing not only a strong draft of their 1st author or collaborative paper, but leading or co-leading the publication efforts from inception to final acceptence.

c) Leading or co-leading interdisciplinary collaborations, which provides postdocs with an opportunity to work closely with a wider group of investigators and develop leadership skills.

d) Receiving invitations (facilitated by their mentors and collaborators) to participate in peer review.

e) Providing postdocs with mentorship training to establish better mentee-mentor relationship and to develop mentorship skills, as well as additional skills needed to successfully lead a research group in academia or industry.

f) Exploring teaching opportunities and mentoring undergraduate students.

Fundamental issues and challenges

No Response

There are several major issues and challenges.

a) Undercompensation is a major issue for many postdocs.

b) The "costs" of dependent health coverage and parental leave/child care are challenging, which may preclude postdoc training, especially for those with families.

c) Low number of URM mentors and mentors trained in Diversity Equity and Inclusion who can properly support the needs of URM postdocs.

d) Many first-generation/URM PhDs often support other family members from their salaries (e.g., parents & younger siblings) and cannot elect or accept to stay in a postdoc position when other positions offer better compensation and benefits, diminishing retention and diversity in research

e) Postdocs are concerned about the uncertainty of their future or next career step and they seek a reasonable level of expectation regarding their next step in the career advancement. To reduce a sense of uncertainty, particularly for international postdocs, schools should consider multi-year appointment letters.

f) Even at schools with established postdoctoral programs, postdocs are not well integrated within their departments/centers/institutes. Too many PIs are recruiting postdocs to perform routine laboratory tasks and do not actively support postdoc training.

g) Finally, there is a disturbing concern among international postdocs who are particularly worried that they will be targeted or fired due to the pay increase burden on faculty mentors.

Existing NIH policies, programs, or resources

a) Funds provided by NIH for postdoctoral training should be increased;

b) Eliminate disparity between post-docs paid from different sources and the restrictions of using NIH dollars to supplement stipends;

c) Need to ensure that NRSA-funded postdocs have the same access to benefits as employee-classified postdocs;

d) Need for increased support for K99/R00, T32, IRACDA grants and F32 fellowships, moreover, the funding for F32 and K99 at some institutes is minimal (for example NIAID);

e) Need for more support for URM trainees and trainers at every level (undergraduate, graduate students, postdocs and faculty);

f) A large population of postdocs are international. Therefore, NIH should consider opening up eligibility criteria for F32 fellowships—similar to the K99/R00 awards;

g) g) Need to support meetings and conferences that bring together trainees at different stages of their career (at Penn, we call it "vertical integration");

h) h) NIH should require that PIs report on the mentorship plan and activities related to post-doc training in annual reports. The section on mentorship in the RPPR should be expanded or emphasized.

i) i) Need to support efforts of the Coalition for Life Sciences to collect and analyze outcome data on postdocs. Currently, these data are presented at the national level. However, analyses at the level of a specific university, school or a department will be important to fully understand outcomes and trends.

Proven or promising external resources or approaches

We would be glad to share how we in the [redacted for anonymity] attempt to enhance the postdoctoral training ecosystem.

Response 2716

Perspectives on the postdoc roles and responsibilities

Fundamental issues and challenges

I am a doctoral student who was on the job market this academic year. I did not consider postdoc positions because the salaries for these positions are incredibly low. Many of them are lower than the salary I was making as a research assistant with a bachelor's degree before entering my doctoral program. To me, this was unacceptable. After training in a top doctoral program it was financially irresponsible to even consider earning less than what I made prior to my doctoral training. Even though some of the research opportunities connected to postdoc positions could have been great, I did not consider them or apply to them because of the salary. I received multiple offers for tenure track assistant professor positions at R1 institutions, but if I hadn't I would have gone into industry rather than taking a postdoc.

Existing NIH policies, programs, or resources

The pay for postdocs has to be significantly increased. It's a very simple answer.

Proven or promising external resources or approaches

No Response

Response 2717

Perspectives on the postdoc roles and responsibilities

It is great platform to build our profile to become competitive and acquire R01 funding to be able to secure an academic position.

Fundamental issues and challenges

Long working hours, followed by minimum wage standards which leads to poor work life balance and loss of motivation because we need to find second source of income just to survive specially with family.

Existing NIH policies, programs, or resources

Integrating postdoctoral fellows as staff in the academic and non-profit corporations so we can get similar benefits as other staff members.

Proven or promising external resources or approaches

Most of the places are helpless in taking any actions against bad mentors as they bring in the money and post doc are often left at their mercy. I don't think there is anything that could change this in near future.

Response 2718

Perspectives on the postdoc roles and responsibilities

The postdoctoral training period allows for a young scientist to learn new skills, scientific and professional, and enjoy a period of research that does not include distractions such as course work, teaching, or administrative duties (unless sought-out). It allows a young scientist to continue to learn the "art" of scientific investigation under the guide of an established scientific mentor. It also provides the opportunity to further establish a publication record that will assist in obtaining employment in any area of science.

Fundamental issues and challenges

Some of the biggest challenges include:

1. Non-payment of moving expenses from city of graduate studies to city of postdoctoral studies. Especially problematic for young families.
2. Post-doctoral stipends are too low in most cases (NIH funded).
3. Not all postdoctoral fellowship come with health insurance.
4. Lack of other benefits such as paid leave, savings plan.

Existing NIH policies, programs, or resources

All NIH-funded fellowships should address the issue in the previous section.

Proven or promising external resources or approaches

No Response

Response 2719

Perspectives on the postdoc roles and responsibilities

Developing and leading projects, training technicians and undergrads/grad students, helping write grants for the lab, lab orders, maintenance activities not directly related to my project

Fundamental issues and challenges

PIs and institutes use the words "training" to overwork postdocs and pay is abysmal. At [redacted for anonymity], I literally cannot afford to have kids with my partner who is also a postdoc. Discussions about supporting women in STEM are all BS if you don't support women in stem and postdocs financially!!!

Existing NIH policies, programs, or resources

Postdoc base salary should be adjusted for high cost-of-living areas like Boston and institutes receiving NIH funding should be required to pay the same in the same city ([redacted for anonymity] 5th year postdocs as of 2023 make less than first year postdocs at HMS). There should also be support/funding/childcare subsidies for new mothers who are also postdocs working on projects funded by the NIH.

Proven or promising external resources or approaches

Postdoc base salary should be adjusted for high cost-of-living areas like Boston and institutes receiving NIH funding should be required to pay the same in the same city ([redacted for anonymity] 5th year postdocs as of 2023 make less than first year postdocs at HMS). There should also be support/funding/childcare subsidies for new mothers who are also postdocs working on projects funded by the NIH.

Response 2720

Perspectives on the postdoc roles and responsibilities

When I started my academic postdoc four years ago, I was envisioning to obtain more trainings and improve my skills in my field so that I could transition to an independent career as a faculty. However, I am now basically a "technician" (though my title is still a Postdoc) helping multiple PIs without my own project that I can move forward with. I think a postdoc is very crucial in driving the biomedical research and education. The roles and responsibilities of the academic postdoc should not only be helping the PIs in their projects and train students in the lab, but the postdoc should also get opportunities to develop his/her own project and get additional trainings, including grant writing.

Fundamental issues and challenges

Based on my experience, the fundamental issue regarding the recruitment, retention, and overall quality of life of postdoctoral trainees in academic research largely depends on the PI. Many PIs, but not all, view the postdoc as a "technician" helping in their projects without any proper guidance/training on career development. I think the main challenge is funding, but even with PI having multiple funds I have witnessed a very unsupportive behavior from the PI when a postdoc asked for career enhancement, including grant submissions.

Existing NIH policies, programs, or resources

I think the NIH should extend the K99/R00 eligibility for postdoc until after at least 7 years of PhD. The current eligibility criteria says "Applicants must have no more than 4 years of postdoctoral research experience at the time of the initial or the subsequent Resubmission application." I was one of the "victim" of the current policy for K99 because after my PhD in 2018, I was working in the pandemic for almost 3 years where everything were uncertain. So, I couldn't manage my application during the hard hit pandemic and now I am ineligible to apply for it.

Proven or promising external resources or approaches

I think more training is needed for NIH-funded mentors to provide more inclusive, and supportive environment for the postdoc.

NIH also should take an effort to increase base salary of the academic postdoc.

Response 2721

Perspectives on the postdoc roles and responsibilities

I take it as additional training that prepares you for an independent research position (i.e., Principal Investigator).

Fundamental issues and challenges

The most common issues I see are

1. significantly low salaries,
2. Many institutes that claim to follow NIH guidelines for salaries just monitor the starting salary when postdocs are recruited.

But then after, most PIs do not give any raise in salary whatsoever for another five years even though postdocs are performing well. We have several examples on our campus.

Existing NIH policies, programs, or resources

No Response

Proven or promising external resources or approaches

No Response

Response 2722

Perspectives on the postdoc roles and responsibilities

As a postdoc, I want to take the opportunity this position provides to deepen my scientific and management knowledge and adequately prepare for a future role as a team leader in academia or find a satisfying alternative career path.

Fundamental issues and challenges

In order to be productive in my position as a postdoc, I require adequate child care. To me this means, ideally on site child care and most importantly no waitlist. A direct consequence of the waitlist is a stressful search for alternatives with no clear timeline. The waitlist itself appears as a black box to a foreign national. Resources and referral services are only accessible by phone (meaning you need a US number) and require knowledge of where you are going to live (which is something you likely have no idea about as a foreign national before coming to the country). This ultimately means you are on your own in finding daycare from a foreign country with no knowledge of the US system.

Existing NIH policies, programs, or resources

If child care policies could be broadened and more inclusive for foreign nationals.

Proven or promising external resources or approaches

No Response

Response 2723

Perspectives on the postdoc roles and responsibilities

I see postdoc positions as a high responsibility. We have to get data, help on writing grants to renew out own salary, and/or earn our own grant to pay our salary. Add to this we have to learn how to be independent and write our own grants, write the papers if we have some, train technicians and students, and do management of the lab. It you are not from US the opportunity to get a position is even decreased.

Fundamental issues and challenges

A fundamental issue is having all this responsibilities together, depending on the group you have, some times it turn to much work for only one postdoc. My guessing is in a lab where the Pi is young or is compose by more postdocs this responsibilities is share. It is not my particular case. The issue is you have to do all this things to continue in the system, therefore, doing postdoc/young PI work is demanding and some time not so rewarding. In part I think is because recently the way to do science changed, and it is way more competitive in the US.

Existing NIH policies, programs, or resources

I think opening a few short opportunities for postdocs (specially the ones are not resident) could be helpful. Now, I just know K99/RO1 for postdoc non resident. A few fellowship that you could apply at your first few years of postdocs would be very rewarding, and would make people prepare and practice what would be the future of becoming a PI.

Also the salary, is very low. So people tent to go to the industry because is too much work for not that much amount of money. Having a more strict regulation on the University management of the salary could be helpful.

Proven or promising external resources or approaches

No Response

Response 2724

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is

a) learn new scientific skills to become a successful independent investigator, and

b) produce quality science. For me, this means a special window of time where you are able to design and implement experiments to address interesting questions with a high level of independence.

In reality, postdocs are responsible for driving most of the science in the U.S. As such, our prestige as a leader in the worldwide scientific community is in jeopardy unless some serious and substantial changes are made to the existing system to better reward postdocs and keep them in science. I outline specific changes below.

Fundamental issues and challenges

The lack of adequate pay and benefits afforded to postdocs is the fundamental issue challenging recruitment, retention, and overall quality of life for postdocs.

Originally, a postdoc was a 1-2 year position after graduate school that almost inevitably led to a faculty position. For such a temporary position, it was ok to forego a decent salary and benefits knowing that a permanent job lay shortly down the line. Today, postdocs are extended positions (often 5 or more years) with no guarantee of obtaining a faculty position. However, we are still expected to earn a barely livable wage and miss out on contributing to retirement benefits all with no guarantee of obtaining a permanent academic job.

This system is no longer tenable. With low pay, no benefits, and no guarantee of a faculty job, it is not surprising that F32 applications have fallen precipitously over the last 17 years (https://report.nih.gov/nihdatabook/report/62). Why would someone opt for such a stressful, uncertain job when many PhDs can earn upwards of 100k with benefits immediately after graduation? Of course, the

reason why so many still go the postdoc route is because we love science. At this rate, however, only the independently wealthy will be able to pursue an academic position. I predict that, without a substantial increase in pay and benefits for postdocs, the quality and prestige of science will quickly decline as more and more talented and hard-working scientists move into industry where they are appropriately rewarded for their hard work.

Existing NIH policies, programs, or resources

The NIH needs to provide much clearer salary guidance and document avenues for rewarding postdocs that procure their own funding. For example, how can an institute give a postdoc a raise if they obtain a fellowship like an F32? If the F32 is supposed to provide a stipend for 100% of the postdoc's salary/effort, how can the postdoc's PI utilize funds from other grants? Is this even allowed? It should be.

As for existing policies, a quick scan of the links above revealed almost nothing relating directly to postdocs. So, the first step would be to provide more resources that are directly relevant to postdocs. Almost everything was devoted to grant funding, applying for other awards, etc. The only relevant policy I found was for childcare funding for postdocs: "Each full-time NIH-NRSA-supported fellow is eligible to receive $2,500 per budget period for costs for childcare provided by a licensed childcare provider (NOT-OD-21-074)." Announcing this benefit through an NOT makes it almost impossible to find. As a policy, NIH should provide a box on each grant application asking if they want this support rather than hoping postdocs discover it on the internet, e.g. "Check this box if you are requesting $2,500 per budget period for childcare costs" . When I applied for my F32, there is no way I could have found this information among all the other NOTs and grant application requirements. Currently, the U.S. tax code is easier to navigate than NOT announcements.

Next, childcare and other benefits need to be increased. Something is better than nothing, but $2,500 would cover approximately one-month of full-time childcare in most of U.S, which does not provide any relief from the already high financial stresses of being a postdoc and attempting to raise a family.

Proven or promising external resources or approaches

I don't know of many. As I mention above, NIH needs to integrate financial increases and relief for postdocs into awards rather than posting things on the internet and hoping postdocs discover them while navigating experiments, obtaining funding, etc. The default should be for NIH to ask if postdocs want a particular benefit rather than forcing postdocs to search for resources on the internet.

This last part is for the section above but exceed the word limit:

Last, fellowships need to be financially restructured. My life became HARDER financially once I was awarded my F32 as taxes were no longer withheld and I had to pay estimated tax payments. The NIH needs to figure out a way to, at the very least, not INCREASE the administrative and financial burden on a postdoc that receives and NRSA.

Response 2725

Perspectives on the postdoc roles and responsibilities

Academic postdocs are the workhorses of biomedical research in the United States, and they are responsible for training other lab members.

Fundamental issues and challenges

The NIH postdoc salary hinders the recruitment, retention, and overall quality of life of postdocs because it makes it very difficult for postdocs to save money and start families. Some of the most sought-after postdoc positions in the United States are concentrated in and around cities like Boston, New York, and San Francisco--cities with the highest cost of living in the country. Even in a city like [redacted for anonymity], where I hold a postdoc position and the cost of living is not nearly as high, the cost of daycare for my child makes it almost impossible for me to save money. Ever since becoming a parent, alternative careers outside academia have become more appealing. Those jobs pay more and they do not come with the inherent insecurity of a postdoc.

Existing NIH policies, programs, or resources

Increase the NIH postdoc salary.

Proven or promising external resources or approaches

No Response

Response 2726

Perspectives on the postdoc roles and responsibilities

Fundamental issues and challenges

I am writing from the perspective of being a postdoc with three children, ages 5 and under. And, although not relevant here, I am also speaking from being an F31 awardee with young children and who gave birth during the F31 award. I gave birth to another (third) child during a T32 position. First, when a T32 position is offered, the candidate should be given the opportunity to delay the start of the position without penalty (i.e. without losing the spot) if childbirth is imminent or recent. Second, if a postdoc on a T32 (or other NIH award) uses maternity/parental leave during the award, that time lost should be added to extend the total time of the award. It is completely unfair to force trainees with young children (who are already in a more challenging position) to get the necessary training in less time compared to childless trainees. Third, 8 weeks is much too short of a leave following the birth of a child. It should be 16 to 20 weeks of leave, minimum, for the birth of a child (and maybe 12 for a non-birthing parent). Fourth, childcare funds are appreciated, but far too low to make a significant difference especially in high cost of living areas. I would suggest a higher amount for children younger than kindergarten (or Pre-K in areas with universal Pre-K), and the amount given should be for each child to reflect actual needs. So, perhaps $2500 per child in Kindergarten and older, and $5000 per child younger than kindergarten. Finally, I'm sure this has been shared abundantly, but the salary is far too low and should be region-dependent to adjust for cost of living. In addition, relocation assistance should be offered, especially for those with bigger families and therefore higher moving expenses.

Existing NIH policies, programs, or resources

The childcare assistance policy is greatly appreciated and should be praised on many levels. However, there are some changes and expansions that could make a big difference. First, it seems overly burdensome to apply for and receive the funds. Multiple grant administrators that I have worked with have had difficulty doing this. It should be easy. Second, the amount should be for each child, not just one flat amount for any trianee whether they have 1 child vs. 3 or more children. The cost of childcare depends on the number of children you have. Third, the amount should be higher for children younger than Kindergarten age since childcare costs are much higher before they are able to participate in public schools. The amount could be higher in general to have a greater impact (or salaries could be higher, but additional childcare assistance would also help until there are federal policies that address this financial burden).

Another policy that could be improved is having clear limits on the amount of the institutional allowance for training related expenses that can be used for administrative purposes. For example, for NRSA postdoctoral trainees, this amount is $12,200 per year per trainee. My institution only saves $1,400 for each trainee to use for relevant expenses such as computers, software, travel to conferences, etc. The rest, I can presume, is used for administrative costs. But $1400 is hardly enough to attend two conferences, which is expected of us.

Proven or promising external resources or approaches

No Response

Response 2727

Perspectives on the postdoc roles and responsibilities

As [redacted for anonymity] have trained >50 postdocs and was one post medical school. The postdoc fellowship is an opportunity for the individual to identify their long term career path—including domain of interest, approach and type of job. It is their opportunity to fully develop their scholarship, leadership, writing and presentation skills, thinking, and collaboration. It is a time to become a leader in ethical conduct of science including how they treat others. All of this requires substantial independence—the opportunity to succeed or to fall short of goals.

Fundamental issues and challenges

1. Postdocs are underpaid. Consequentially, we lose many of the best, or they never pursue scientific careers in the first place.
2. We train too many. This in the long run makes them unhappy, especially if they are not independently wealthy. It contributes to very long postdoc fellowships because faculty and good industry jobs are hypercompetitive.
3. We burden postdocs with much semi-irrelevant and always very time consuming formal training and formal processes.
4. Related to the formal burdens to which we subject postdocs is the fact that we vastly underestimate their initiative and the value of their interactions with mentors, colleagues and what they can access online. Instead, of giving them opportunity we mandate activities.
5. Increasingly, postdocs are small cogs in large consortia. It means little if they were one of 100 authors and not on the writing team. many of the analyses are cookie cutter. They get good at Zoom but otherwise don't learn as much doing this type of science. It seems that the ones who are most likely to succeed in such scenarios aren't very good scientists, at least in the classical sense of being independently creative, productive and intellectually acute.
6. Next, many scientists especially of the consortium type just described, will easily be replaced by AI, of which they haven't slightest comprehension. AI is a looming problem as well as opportunity for postdocs with a career ahead.

Existing NIH policies, programs, or resources

1. Stop creating new time-wasting programs (for example, grantsmanship workshops,, equity "training", and policies). Recognize that much of this training is ritualistic, more for the organization's benefit, and individual trainings take 10x as much time as they should At least let the test out with a short quiz.
2. Give postdocs access to more resources—preferably online and optional.

Proven or promising external resources or approaches

1. $—a proven, external resource
2. Access to the most advanced electronic lab notebook systems
3. Access to high speed computing and powerful laptop and handheld resources
4. Don't allow PIs to recruit postdocs who themselves are not outstanding scientists. If they are not, its useless to train them to be better mentors.
5. The supply of postdocs exceeds demand. Therefore, let's have fewer and pay them better. Create more Staff Scientist positions to come to terms with how modern team/consortium science works and thereby more postdocs can move on to meaningful, higher paying jobs.

Response 2728

Perspectives on the postdoc roles and responsibilities

Postdocs should be leading projects and building more administrative skills to help them succeed in the future. They should be presenting their research if appropriate and writing papers.

Fundamental issues and challenges

Salary is a huge roadblock. We are highly educated and skilled employees, but our paychecks do not reflect that. In face, the number of jobs with just a bachelor degree that pay higher have me wondering why I entered into science. I have no loans and am very conservative with money, but I can't even afford a house without it being run down.

Existing NIH policies, programs, or resources

Increasing the starting salary would greatly improve the postdoc training ecosystem. Many postdocs have families and struggle to survive on this low salary. The stress of worrying about money is not conducive to

productive work. Additionally, there is little to no training on the more administrative tasks like budgeting, team management, etc that would greatly help.

Proven or promising external resources or approaches

Increasing the salary would greatly improve a lot of the issues.

Response 2729

Perspectives on the postdoc roles and responsibilities

To me I see two different types of postdocs. The first is the postdoc that would like to stay in academic research and therefore starts a postdoc to build a research program. The second type is the postdoc that wants to gain specific skills in their postdoc to eventually move into industry/non research academic position/ etc. While the end goal is different, the common thread is a highly skilled scientist gaining additional training.

Fundamental issues and challenges

There are a number of issues in recruiting and retaining postdocs. Pay, long term job prospects, and job security are chief among those issues. I have a number of friends that have graduated and immediately went to industry positions with salaries and benefits close to or in the six figure range, I will be earning the postdoc minimum when I start my postdoc in September. Many postdocs that want academic jobs feel the pressure to go to big name labs at name brand institutions where they can get the CNS papers that look good on a CV. Given the fact that the number of faculty positions has not grown with the number of PhDs awarded each year that has made the academic market more and more competitive. Finally a challenging funding landscape that does not ensure long-term academic staff scientist positions or allow for flexibility in salary is a major challenge. The fact that the NIH modular R01 budget has not increased in almost 25 years is insane. The combination of inflation and labor cost makes it such that a singe R01 is not sufficient to run a lab in 2023. As a postdoc, I'm terrified of having to write grants one day that will barely fund a lab.

Existing NIH policies, programs, or resources

Increase the modular budget or get rid of it all together. Invest in basic biomedical science and not just translational research. Support permanent PhD staff scientist positions. Increase the postdoc minimum and ensure that postdocs are treated like employees (i.e. retirement benefits, insurance, parental leave, etc). Expand career development programs like IRACDAs.

Proven or promising external resources or approaches

If the US wants to retain a strong postdoc population, we must start treating postdocs like highly skilled colleagues that they are. Paying a wage closer their worth, expanding the number of staff scientist positions, and providing a little more job security are all things that will help make this happen.

Response 2730

Perspectives on the postdoc roles and responsibilities

Transition to an independent academic career, scientific independence, on the driver seat of important projects, leader and mentor for others in the lab, learning several other skills beyond science to become a PI

Fundamental issues and challenges

Low pay

Existing NIH policies, programs, or resources

Pay scale

Proven or promising external resources or approaches

Increased postdoc pay scale in many universities, HHMI pay scale

Response 2731

Perspectives on the postdoc roles and responsibilities

I think most labs consider postdocs as a pair of "pipetting hands" rather than highly qualified, trained individuals with terminal degrees. The same is true for most institutions, where postdocs are considered as trainees and the low pay and meek benefits are "justified" because we are getting "training". In reality, there is no structured training, no respect from the institutions but rather a modern-day exploitatory relationship where postdocs struggle for their careers, financial health, and mental health. In reality, if we were in different fields, both in social sciences and other STEM fields, a doctorate would be enough to start an academic laboratory and be treated as an expert. Also, it is really hard for me to understand why academic positions need to be paid less. Individuals with similar degrees in non-academic posts earn 2x more on average in all stages of the academic ladder. If postdocs and junior faculty are paid more, this would have increased the retention of the best and the brightest. I think since there are lots of international scientists who are trying to enter the US system and thousands of new Ph.D. graduates from US institutions, postdocs are considered expendable. In fact, we train students, technicians, and junior postdocs in the lab, write grants for our PIs, work countless hours, and perform many more tasks and most of the time end up with hundreds of dollars more in debt every month. This causes people to lose productivity and start to look for non-academic jobs as soon as possible. Fair pay for the job we are doing will ease the burden on the postdocs and force the institutions to see us as the valuable members of the community thay we are.

Fundamental issues and challenges

Low pay —would you be willing to get half of your earning potential for 5-7 years, in a high-stress environment? This is the root cause of all the problems. More money will solve the issues around childcare, stress, and reduced quality of life. If the postdoc pay started from 90k instead of 56k, you would see a boost in productivity, retention, and recruitment.

Existing NIH policies, programs, or resources

International postdocs are the majority of the postdocs. It is disheartening to see that in a system built on the efforts of international scientists, the only grant we can apply for is K99/R00. I understand that NIH may feel its main responsibility towards American scientists, however improving the resources for international postdocs will benefit the US academic system in general.

Proven or promising external resources or approaches

Increased salary, improved visa processing times for international scientists, and childcare support should be considered.

Response 2732

Perspectives on the postdoc roles and responsibilities

A postdoc is a highly-specialized researcher with a terminal degree (Ph.D.) in their field. They contribute to the conception of new research directions, as well as provide mentorship and training to graduate and undergraduate researchers.

Fundamental issues and challenges

Low compensation, lack of access to benefits, non-competitive salary compared to peers in industry, lack of career opportunities within academia that are not tenure-track faculty positions

Existing NIH policies, programs, or resources

1. Increase minimum compensation to $70K a year, with cost-of-living adjustments for different cities/ states.
2. Institutions must consider all postdocs full-time, benefits-eligible employees.
3. Expand NIH funding mechanisms to international postdocs.
4. Increase childcare allowances.
5. Put in place mentor training for PIs and consequences (such as probation or loss of NIH funding) for bullying/ harassment and other behaviors.
6. Expand non-tenure track research positions and other career options within academia.

Proven or promising external resources or approaches

Democratize the academic research environment. Power hierarchies within academia are outdated and need to be changed to create a more equitable and non-toxic workplace.

Response 2733

Perspectives on the postdoc roles and responsibilities

This is an additional training period in which the postdoc gets extensive training in order to become a successfull independent researcher. The postdoc should be pushing the boundaries and exploring new research directions. The postdoc also learns how to run a lab including managing students. The training goals also need to be balanced with the needs of the PI who also requires advancing the lab's own funded research projects.

Fundamental issues and challenges

The postdoc salary is a major deterrent for postdocs. For example, I had one postdoc leave after a year in the lab--he was happy with his project and in the lab, but wanted a better life than the postdoc salary afforded him (his words). He took a job in biotech. I see this as a growing concern that will especially harm new faculty.

Existing NIH policies, programs, or resources

Increase the stipends in F grants. And most importantly, increase the modular budget of R01 grants. The $250,000 modular budget is not enough to fund a small lab of >3 people, and requires the PI to write multiple grants to keep the lights on. This takes away from directed mentorship of postdocs and adds uncertainty to the postdoc timeline.

Proven or promising external resources or approaches

Postdocs tend to be resourceful. It might be worthwhile inviting Postdoc associations from leading universities to share their tips/tricks at a NIH sponsored meeting aimed at improving the postdoc ecosystem. But the #1 concern will likely be postdoc salaries, which are tied to PI R01 grants. So fix R01 modular budgets, and it will have a huge benefit across the board (since Graduate stipends can then also be increased---a whole other bag of worms).

Response 2734

Perspectives on the postdoc roles and responsibilities

I think some people genuinely view it as a temporary position immediately following their Ph.D. For many of us, we are using it simply to gain more experience to be competitive on the tenure-track job market. Long gone are the days where the pipeline was "graduate with Ph.D --> get hired as TT faculty". That puts postdocs in a state of limbo, where we continue our "training" to apply for TT jobs.

Largely, I think the role of postdocs is to generate data and papers for their PI and simultaneously help run the lab. It is probably not like this in every lab, but I think it is a good generalization.

Fundamental issues and challenges

Money, plain and simple. In high cost of living areas, the NIH minimum is not sufficient. Ironically, this is where many of the top-tier institutions are. Postdocs have to weigh their options and decide whether a low-salary job at a top-tier university will eventually be worth it for TT ambitions. For some, it is not tenable, and ultimately this create inequity in the faculty pool. For others, it means delaying the start of a family or making other sacrifices in order to make it work. Retrospectively, some postdocs may regret these choices, as the TT job market is hypercompetitive.

From the university side, universities NEED to start recognizing postdocs as actual employees. This means retirement and other benefits. I think the NIH could easily persuade universities to accomplish this.

Existing NIH policies, programs, or resources

Ditch the K99/R00 and divert those resources to other postdoc awards with higher pay.

Proven or promising external resources or approaches

Money.

Response 2735

Perspectives on the postdoc roles and responsibilities

It is a training position with more responsibility, including slightly more research independence and mentorship of graduate students and technicians. It is comprised of practical, hands on work in addition to fellowship and paper writing with the mentor.

Fundamental issues and challenges

Salary: it doesn't have to match industry, but it should be competitive and scale with cost of living by region.

Time for both lab work and preparation for principal investigator role like mentoring and writing. Most would benefit from a technician working under them to help with this balance.

Existing NIH policies, programs, or resources

Funding for technicians to work under postdocs.

Salary scaled by cost of living, closer to $100,000 to remain competitive with industry and provide critical support for a job that consumes most hours of the day.

To accommodate the ever lengthening time to obtain a faculty position and thereby the length of the postdoc, K99 deadlines should be pushed back to 5 or more years after completing the PhD.

Require that fellowship holders are employees of the institution so that they may receive the institution's benefits, such as retirement.

Proven or promising external resources or approaches

I currently hold a postdoctoral fellowship from a private foundation that gives me a much more fair salary ($86,000), especially for living in [redacted for anonymity]. I feel like I am treated well and able to live a comfortable lifestyle with this salary. They also mandated that I receive employee status, allowing me to have retirement and tax withheld.

Response 2736

Perspectives on the postdoc roles and responsibilities

We are in agreement with the definition of a postdoc as determined by the National Postdoctoral Association: "Postdoctoral scholars ("postdocs") are individuals in a defined period of mentored training following the achievement of their terminal degrees (e.g., Ph.D., M.D., M.Eng.)."

The academic postdoc is a time-restricted period (up to ~5 years) to build skills in preparation for the next step in the scientist's career. It is intended to be a temporary career step before transitioning to a permanent job in academia, industry, government, or another sector of employment. Since the postdoc is

in career transition, the quality of mentoring and professional development that is available to them is critical to their career success.

Fundamental issues and challenges

Challenge 1. Salary requirements of the Washington State Minimum Wage Act

- Washington State Department of Labor and Industries Minimum Wage Act (https://www.lni.wa.gov/workers-rights/wages/overtime/changes-to-overtime-rules) sets a minimum salary for exempt employees, including postdocs, that is significantly higher than the NIH minimum salary: https://www.lni.wa.gov/forms-publications/F700-207-000.pdf
- l Salary implementation schedule in 2022 dollars (tied to projected changes in the Consumer Price Index):

- 2023: $65,478
- 2024: $69,264
- 2025: $79,700
- 2026: $80,964
- 2027: $91,572
- 2028: $93,288

- The [redacted for anonymity] and our faculty are challenged to find ways to pay postdocs the required increased salary when NIH budgets have been static.
- l Many of our faculty plan to hire fewer postdocs. This could potentially affect the quality and pace of research, especially for our most junior and mid-level faculty.

Challenge 2: Increasing proportion of graduate students going directly into industry and a decrease in international postdocs

In the past several years, the proportion of graduate students who go into industry without doing a postdoc has greatly increased (anecdotal reports). In addition, Coalition for Next Generation Life Science (CNGLS) data shows that fewer international postdocs are coming to [redacted for anonymity] (e.g., the percentage of Fred Hutch international postdocs fell from 49% in 2019 to 25% in 2022: https://www.fredhutch.org/en/research/education-training/coalition-for-next-generation-life-sciences/postdoctoral-fellow-data.html). The combination of these two demographic shifts has contributed to a shortage of postdoc applicants.

In addition, our graduate students give a variety of responses about why they choose industry over a postdoc, including increased salary, better management practices, better work-life balance, and better benefits.

Existing NIH policies, programs, or resources

- The NIH provides Locality Pay (https://hr.nih.gov/sites/default/files/public/documents/2023-02/total-compensation-flyer-2023.pdf) to its employees dependent on where they live. It makes sense to provide a locality pay supplement to the postdoc NIH minimum salary for communities with a higher cost of living.
- l Allowing an NIH grant to pay the difference in salary for a private fellowship and the WA minimum exempt wage would help to solve the challenge from the WA minimum wage act. Implementation threshold schedule: https://www.lni.wa.gov/forms-publications/F700-207-000.pdf
- l Increase the number of K awards funded so there is a greater success rate for those pursuing tenure track faculty positions.
- l The issue that stipended fellows (e.g., T32, F32, K99 awards) can't receive retirement benefits, participate in a flexible spending account, or receive full WA state parental/medical leave benefits is a disincentive to applying.
- l Create an improved funding mechanism for non-tenure track staff scientists.
- l The career track into the biotech industry presents an opportunity to create a new funding mechanism that encourages industry to engage in academic postdoc training programs. This could potentially reside in the NIH SBIR program and/or engage the Foundation for the NIH (FNIH) to manage the public private partnership.
- Require programs in resiliency training, stress management and managing health and wellness for all T32 or F32 trainees and encourage it for all NIH-supported trainees. The NIH OITE Becoming a Resilient Scientist (https://www.training.nih.gov/nih_becoming_a_resilient_scientist_series) series is exemplary and is designed to be disseminated and implemented at any research organization. All scientists, from graduate students to junior faculty and beyond, could benefit from this training.
- It is commendable that NIH awards for graduate students and postdocs now include a childcare subsidy. It would be helpful if the childcare subsidy included a locality supplement for areas with higher COL and higher average childcare costs. The cost of infant childcare in Seattle can be over $2000/month.

Proven or promising external resources or approaches

The [redacted for anonymity] provides health care benefits, life insurance, disability benefits, transportation benefits, an employee assistance program and a childcare subsidy to all postdocs regardless of funding source. Parental leave, vacation and sick leave duration is sometimes subject to funding limitations. In addition to institutionally paid family and medical leave, [redacted for anonymity] provides up to 18 weeks of partially-paid family and medical leave to employees (not on stipends). Finally, salaried (but not stipended) postdocs receive retirement benefits and access to use a flexible spending account. All postdocs can also participate in our comprehensive professional development programs to help them successfully transition to a permanent position.

In addition to the above benefits, recommendations include:

- Require management and mentoring training for all faculty who will train postdocs and graduate students in their lab. CIMER Mentor Training (https://cimerproject.org/) is exemplary and is being implemented at many institutions around the US. This training will preferably occur early in their faculty career. The training should include an understanding of the unique vulnerabilities of minoritized and international postdocs.
- l Require a minimum level of benefits for T32 and F32-supported postdocs, including health care, paid parental and medical leave, and vacation benefits.
- l Require a minimum level of professional development for all T32 and F32-supported postdocs and encourage the same for all NIH-funded postdocs to help them move to their next career step.

Response 2737

Perspectives on the postdoc roles and responsibilities

We write on behalf of [redacted for anonymity]. Our Workgroup consists of ~20 investigators, research assistants, and trainees (graduate students and postdoctoral fellows) from [redacted for anonymity]. We

work to develop training and professional development opportunities for [redacted for anonymity], including ~200 trainees (RAs, undergrad/grad students, postdocs).

Our group had several thoughts for this RFI:

One of the primary concerns is the transition beyond postdoc. Unlike graduate training, many postdocs are indefinite with no clear end. Even things like F32's, while theoretically helpful, can prolong the postdoc phase. It is time consuming to start in a new lab, create a new research idea, write and submit an F32 or K99/R00, then wait to hear back. There are too many "career postdocs" ; clearer end-points and means of transitioning are needed.

In contrast, one-year post-doc appointments can dissuade potential applicants from clinical psychology programs, as they will have recently completed multiple application processes and will not want to begin the application process again so soon after starting the postdoc position.

Another noted concern is the role of postdocs within labs. While postdoctoral fellowship is an additional stage of training, it is not uncommon for postdocs to be thought of as "workhorses" within a lab where the PI of the lab restricts them to complete the PI's aims. The training of the postdoc becomes secondary to the goals of the PI. Though many postdocs may be aiming to transition to independent scientists, their goals and research objectives are often limited by the PI's research priorities/funding.

We feel it would be helpful to have more clear guidelines on training components necessary to transition from a grad student to a postdoc to an independent scientist.

Fundamental issues and challenges

Within [redacted for anonymity], many of our postdocs are funded from two-year T32s and diversity supplements. This is beneficial for postdocs and mentors alike, as positions can be more clearly and quickly offered to potential postdocs. As noted above, F32's and other mechanisms are beneficial, but the length of time to acquire such funding makes it harder to use as a recruitment tool. Several institutions within the [redacted for anonymity] are also part of the [redacted for anonymity] system and, due to new postdoctoral contracts, [redacted for anonymity] PIs are struggling and often unable to fund postdocs even at the required levels by the [redacted for anonymity] system. PIs need more financial support and flexibility to be able to recruit and pay postdocs a livable wage. We believe that expanding the T32 program may be beneficial to ensure that a larger pool of excellent candidates obtain funding. T32s also have a fixed 2-year time period, which can work for some candidates but having an option to extend for a few months in some cases would be helpful.

Existing NIH policies, programs, or resources

Existing career development K awards are highly valued funding pathways for postdocs, and improvements in the clarity of how K-awardees can achieve independence could further accelerate the success of these mechanisms and postdocs' career development. For example, there is a lack of information on how exactly a K99/R00 awardee successfully makes the transition to the R00 phase (e.g., when is it truly ideal to start looking for faculty positions during the K99 phase, what is NIH looking for in offer letters from institutes to kickstart the R00 phase, etc). Additionally, some postdoc institutions are not prepared to provide financial support for K applicants even though this is a required letter for K submissions. Having more communication between NIH and the proposed R00 institutions, and/or more clear information on which institutes are able to support K awardees for the R00 phase would be helpful.

Proven or promising external resources or approaches

While postdoctoral fellows are extensively evaluated before being accepted into a lab and/or receiving NIH funding, the same is not always the case for mentors. Yet mentors have one of the most profound impacts on a postdoc's training, experience, and transition into early career positions. Encouraging and, if possible, requiring mentors to receive ongoing training in mentorship and DEI (perhaps through something like the NRMN) would be highly beneficial for the mentor and their current and future trainees. Postdocs themselves would also benefit from explicit training on how to supervise and mentor trainees.

In learning to navigate larger NIH systems, it also could be helpful to employ more search engine optimization (SEO) techniques. NIH often emails out useful tools and webinars; however, outside of the email, it can be difficult to find resources through something like a Google search. Integrating more SEO techniques to raise the profile of resources for trainees on common search engines would be helpful, as Google tends to be the first technique trainees use to garner answers. For instance, in finding which NIH

PO to contact, https://reporter.nih.gov/matchmaker is a wonderful resource but does not readily show up when searching "find an NIH program officer" on Google.

Response 2738

Perspectives on the postdoc roles and responsibilities

A researcher within a lab working on an independent project. Still considered a trainee, but very little formal training, more of an apprenticeship.

Fundamental issues and challenges

Low salary compared to industry or alternative roles. For postdocs with families, very high cost of child care ($25-30k per year), makes staying it impossible to stay in low paid academic postdocs.

Existing NIH policies, programs, or resources

Raising the NIH minimum salary for postdocs. Providing grant support for postdocs for child care. Re-evaluating the NIH modular budget.

Proven or promising external resources or approaches

HHMI increased the minimum postdoctoral salary to $70k with the option of up to $90k for high cost of living areas.

Response 2739

Perspectives on the postdoc roles and responsibilities

From my current perspective, the roles and responsibilities of an academic postdoc center around conducting independent research that is semi-guided by the principle investigator. Although the postdoc period is still considered "training", postdocs are expected to be independent in their research pursuits. Additionally, postdocs handle many additional responsibilities at once on top of their intellectual/scientific pursuits, depending on the lab/mentor of course. It is my strong opinion that the postdoc should be solely focused on the research, as the research itself is extremely challenging alone in a vacuum. However, in reality, postdocs wear many hats (varied depending on lab to lab and PI style): lab manager, undergrad mentor, grant writer, document editor for PI, equipment technician, etc.

Fundamental issues and challenges

Overall, I think the biggest issue is poor pay on top of the deluge of non-scientific tasks that are expected of post docs. For example, why would one want to subject themselves to an environment where they are so overloaded with managerial responsibilities and helping PI secure funding, on top of their research pursuits, for substantially less pay? And in rare cases when things go south (i.e. overburden responsibilities and long hours lead to a few honest errors in scientific publications and presentations that can hurt a trainees scientific career before it even gets off the ground.) it is completely the trainees fault? From personal experience, I am convinced that no matter what I do, I am destined to fail at handling everything well while keep good progress on my research in a careful manner. There is such intense pressure to publish from the PI in many research groups. It's impossible to adequately focus when so many things are going on at once, which so much pressure. Throw family responsibilities into the mix (I am a parent) and it quickly gets too overwhelming. When, in comparison, if I were to go to industry I would receive maybe 2-3 fold higher compensation for less responsibilities and working more normal hours—and be able to put more focus on the research problem at hand while in the lab, to do good rigorous science.

Existing NIH policies, programs, or resources

1. increase the pay to compete with entry-level industry positions (industry positions for newly minted PhDs). Postdocs also have PhD level training and experience, and need to be compensated as much.
2. provide investigators with more resources to hire support staff (lab managers, technicians, etc). Relieving managerial burden most post docs deal with would greatly help postdocs focus on their research
3. encourage or require PIs to pre-print most of their scientific findings. Most PIs don't want other research groups to see the manuscript before publication, due to intense competition. But to me, pre-printing provides an extra layer of verification/feedback from colleagues in other labs in the field before the work is accepted for publication. Also pushes the PI to encourage and support the identification of errors in their work earlier in the manuscript preparation process, as the work will be viewable by other researchers earlier. Personally, I think this relieves a lot of the severe anxiety related with publishing that trainees face.

Proven or promising external resources or approaches

No Response

Response 2740

Perspectives on the postdoc roles and responsibilities

A postdoctoral position extends the PhD or MD Fellowship training of a junior scientist. This position involves data collection in the form of benchwork/participant recruitment and conducting study visits/accessing and analyzing big data (dependent on specialty), particularly learning new techniques, and gaining expertise in study design and grant writing with an experienced mentor or mentorship team. Often as postdoctoral fellows advance through this period, it is a time to learn mentoring skills particularly with more junior postdocs. For many scientists, this will be their first experience conducting a study from conceptualization to completion, so it is a valuable skill acquisition and experiential learning period. It is a time to build the skills that lay the groundwork for independent scientific success. Independent scientific success could be in any scientific arena: academia, industry, non-profit, or government.

Fundamental issues and challenges

1. Low NIH postdoc salary, which is often lower than that for research assistants that postdocs might supervise. This is an inequity and negatively affects quality of life. Postdocs have already gained a terminal degree and are qualified, without postdoc training, for many professional positions with much higher pay, a structured career ladder, and peer respect as experts. Many new postdocs are being recruited to industry, which offers higher salaries.
2. Institutional recognition as professionals and HR protections. Postdocs are continuously referred to as "trainees" and are not eligible for academic faculty appointments. They are a special HR type, which increases the risk for pay and benefit inequity/injustice and decreases HR protections against harassment and other forms discrimination.
3. Long work hours. Postdocs, personally invested in studies, often pick-up after hours and weekend work that research assistants do not do and must also immerse themselves in grant writing. Long hours lead to burnout and dissatisfaction.
4. Lack of a structured career ladder or fixed maximum term postdocs. Postdoc positions are perilous because they do not have the same HR protections as faculty positions. Some postdocs get "trapped" doing multiple postdocs, adding many years to their training and delaying independence. This is not in the interests of the postdoc, their field, or the funder. Many postdocs find the length of postdoc training unacceptable and end their academic career early to get a more structured, better paying job. It is in everyone's best interests to keep postdocs moving along a career ladder (or to alternative employment).
5. Lack of institutional knowledge. Because postdocs are not faculty, they do not attend faculty meetings and are often not on departmental faculty distribution lists. This makes it hard for them to gain institutional knowledge which could give them a stronger sense of purpose and identity within the institution.

Existing NIH policies, programs, or resources

1. K awards are too long, frustrating awardees. They provide salary support but very little funding to conduct any research, causing postdocs to be completely reliant on their mentors to do their research. More funds for research projects as part of K awards would alleviate this stress and promote earlier independence.
2. Higher salaries on T32—and F32-funded postdoctoral grants.
3. Problem 1 and other barriers mentioned above, including lack of transition between K and R awards, lack of a career ladder and institutional recognition/faculty protections, could be overcome by eliminating or curtailing K awards and replacing them with completely restructured K99/R00 awards instead. The K99 would be an initial K award, rather than a second/third postdoc award. Provide a 3 year K99 component, where recipients are expected to be faculty, before a three year R00 component. This would provide transition from the K to R stage (with R00 allowing more salary support than an R01, a progressive step down model as opposed to the current salary "cliff") and also the structure and assurance to move from a "trainee" to a faculty position within a defined and realistic time frame. Under this model, the K and R phase would require adequate funds for research projects, with maximal amounts higher in the R than the K phase. These funds could come from the shortened K phase of the program. Additionally, the heavy reliance on didactic training during current K awards could be more tailored so that awardees can gain more experience with grant writing and financial and personnel administration, which are essential for independent success but are not emphasized enough in current K training (partly due to lack of any research budget). This model provides visible and timely progression to independence for postdocs.
4. Adequate R01 funding so that mentors can support trainee activity.

Proven or promising external resources or approaches

No Response

Response 2741

Perspectives on the postdoc roles and responsibilities

It is serving as a critical link between my interest in science and how much of a meaningful impact I can make with this interest as a an academia. To me it has been a powerful force in building my scientific confidence and simultaneously building that of others.

Fundamental issues and challenges

My little experience has shown that one fundamental issue out of many is post doctoral remuneration. Many of the postdoctoral scientists are parents and they can hardly survive with current recommended minimum salary. Not forgetting that research work sometimes steal away their family time, but theit current salaries might not be enough to compensate for this family time loss.

Existing NIH policies, programs, or resources

Expanding on the number of local and international conferences that postdocs can attend to boost their professional development.

Proven or promising external resources or approaches

HHMI recently acknowledged the important role that postdocs play in raising new scientists and therefore made some policy modifications in their interest. A major aspect of these policy modifications is setting the minimum salary for new post doc to $70k.

Response 2742

Perspectives on the postdoc roles and responsibilities

An academic postdoc is an early career scientist hired to carry out a specific research program while gaining the necessary skills and experience to become an independent scientist in one of the many fields where a scientist is needed (i.e. academia and industry but also policy, justice, healthcare and journalism

to name a few more). Therefore, the role of a postdoc should be partly to move this research program forward and partly to develop his/her career towards the desired path.

As a trained scientist, a postdoc takes on many responsibilities including experimental design and implementation for multiple research projects, conducting experiments by performing various specialized techniques, data analysis and interpretation, training and mentoring students, writing manuscripts, and presenting the research findings in the scientific community.

In sum, our view essentially agrees with the NIH's definition of a postdoctoral scholar. However, we'd like to highlight the fact that this is not the reality for many postdocs, not even the ones employed to fulfill NIH's goals and perform NIH funded research. Most postdocs lack a clear and explicit agreement with their supervisors regarding what their role **and responsibilities** are. Therefore, being often the most skilled and experienced scientists working for their supervisors, they are overburdened with work. Often, postdocs take on some (if not all) aspects of laboratory management or serve as co-directors for undergraduate or graduate student projects without being asked or even acknowledged. And although they take on all these responsibilities, they are frequently not allowed to make big decisions on the research projects, or to work on their own career development. So, although they are supposed to be well on their way to becoming independent scientists, they shoulder the responsibilities but are in effect treated as trainees.

Fundamental issues and challenges

Unclear career trajectory and job insecurity: According to the 2023 National Postdoctoral Association Report, almost 86.6% of postdocs are impacted by job security concerns and over 90% are negatively affected by the lack of clarity in transitioning to the next position. The scope of graduate and postdoctoral research training is narrow and limited to seeking tenure-track faculty positions as the only accepted aspiration. After years of education and training, dealing with the uncertainty of their career prospects, along with an extensive workload, has made these positions less desirable to early career scientists. NIH should provide information and resources that will help newly graduated PhDs and postdocs to make an informed decision of their career choices before and during their postdoctoral training.

Low compensation: The inadequate wage has negatively impacted postdocs' professional and/or personal lives and resulted in a severe decrease in retention and recruitment of these researchers. The current stipends with respect to living expenses can be described as poor and discouraging. The NIH should increase its stipends to postdocs on NIH training and fellowship grants and enforce a regulation ensuring that all institutions respect the minimum salary requirements for NIH-supported postdocs.

Lack of mentorship: The lack of mentorship and guidance can create confusion and uncertainty for postdocs. This issue can be compounded by insufficient feedback and communication from their mentors, leading to feelings of isolation and dissatisfaction. NIH should invest in mentorship training for NIH-supported faculty and periodically evaluate the progress of the mentoring. Successful (or not successful) mentoring needs to be reflected in evaluations of the principal investigator.

Existing NIH policies, programs, or resources

Given the current crisis in low interest for PhD graduates to pursue postdoctoral positions, the postdoctoral experience must be revamped. This may be done by modifying current funding systems and expanding other successful initiatives.

Postdoctoral fellowships: the NRSA F32 program provides funding for postdoctoral researchers to conduct research in a variety of scientific areas. The program could be improved by

1. increasing the existing payscale to match the increase in cost of living experience since the last update to the pay scale; and
2. expand the eligibility criteria to include non-US citizens.

Immigration reforms: the J-1 visa is a very flexible program that allows foreign scholars to spend up to two years in academia. However, after 2 years scholars must return to their countries and spend two years before they attempt to migrate back to the US. In addition, J1 visa holders are in constant immigration peril since their legal status is dependent upon employment (i.e. they cannot have any unemployment gas or the visa expires). As such we recommend increasing the flexibility on current immigration restrictions imposed on J-1 visa holders.

Proven or promising external resources or approaches

Postdoctoral associations (PDAs), mentoring programs, and funding opportunities are crucial external resources for enhancing the postdoctoral training ecosystem. Strengthening partnerships with PDAs, implementing effective mentorship programs, and providing targeted funding opportunities are promising approaches that can create a more inclusive and supportive environment for postdocs, leading to increased job satisfaction and success in research.

PDAs provide a platform for postdocs to connect and network with peers and mentors, and offer professional development workshops to enhance their skills and knowledge in communication, leadership, and project management. They also provide workforce diversity and inclusion initiatives and establish policies to solve postdoc problems and hear their concerns. The NIH can partner with PDAs and leverage their expertise and resources to create a more inclusive and supportive environment for postdocs.

Mentoring programs are also essential for postdocs' success, and NIH-funded PIs can play a crucial role in implementing these programs. Effective mentoring improves the quality of mentoring and increases job satisfaction. The use of postdoctoral compacts, such as UW Madison, can enhance the quality of mentorship by establishing clear expectations between the PI and the postdoc. NIH-funded PIs should be trained in mentoring postdocs, including discussions on addressing the unique challenges that postdocs face. Additionally, PIs should build time into postdocs' training to attend NPA and/or PDA meetings to provide them with access to valuable networking opportunities and career development resources.

More funding opportunities in addition to NIH F32 and K-Awards is crucial for postdocs to succeed in their research. Additional fellowships provide targeted funding opportunities, financial support, and additional resources for postdocs' research and professional development. Greater financial support through fellowships removes uncertainty and will improve postdocs' work environment, leading to increased productivity and job satisfaction. NIH can work with academic institutions and external organizations to provide these funding opportunities for diverse postdocs.

Response 2743

Perspectives on the postdoc roles and responsibilities

My aim to do a postdoc is to prepare myself for a faculty position in academia and for an independently funded principal investigator position. I see postdoc as a training period to prepare myself for these next positions and also to become aware of my research interests, develop an expertise as well as a research niche. Also, postdoc is a unique chance to get experience in teaching and mentoring more junior scientists such as graduate students and technicians as well as establishing collaborations with other scientists which will be useful in the future.

Therefore, a postdoc's responsibilities include doing high quality research, engage in training and mentoring while he/she is also preparing himself/herself's next academic appointment. Postdocs are the essential pieces of the research groups who are highly skilled and educated people and maybe the main drivers of scientific work in the lab.

Fundamental issues and challenges

Unfortunately there are several issues and challenges that postdocs face during this period. The main challenge is the very poor pay that they receive which makes life very difficult. Although postdocs are highly trained, highly skilled people with already a doctorate, their pay is below the minimum wage. Especially, in the more expensive parts of USA (e.g. Boston Area), the rent for an apartment almost equals to a postdoc salary. The average age for postdocs is above 30 and it is very normal that these people want to start their families however due to these financial challenges this is not possible. Most postdocs are international non-residents and even going their home country to visit their families are almost impossible with such low salaries.

I have no doubt that postdocs are interested in science and academia, however because of this low pay and financial issues, many are considering to switch to academia where they can get at least 2-3 fold more of their postdoc salaries. In summary, how postdocs are paid at the moment is unfortunately "ridiculous". The situation is even worse for international female postdocs. The child care is around 3000 usd/month. Since they don't have families to support them with baby care here in USA, they have to quit postdoc and find a well paid job for baby care. For people who are above 30 and who are well educated, this level of financial struggling is very challenging and frustrating.

Existing NIH policies, programs, or resources

The postdoctoral salaries need to be increased "significantly". I believe that offering better pay will help recruiting postdocs with good backgrounds. Since they will not have to think about surviving anymore, they will be more focused to science and be more productive and engaged.

Proven or promising external resources or approaches

Response 2744

Perspectives on the postdoc roles and responsibilities

The postdoc is an essential training position in which the trainee learns skills essential to running a lab (such as grant writing and project management) while working to establish the basis of the research that will provide the foundation of their independent careers. Good postdocs are also a tremendous asset to the labs in which they work by pushing research forward, bringing in new expertise and ideas, and helping to train students.

Fundamental issues and challenges

Insufficient lab funding to pay adequate postdoc stipends and to support their research over the 4-6 years necessary for them to receive sufficient training to progress in their careers.

Existing NIH policies, programs, or resources

Increasing the modular budget is the #1 thing that could improve the quality of life of postdocs by allowing PI's to pay them a living wage appropriate to their skillsets. Increasing lab funding would also increase the number and duration of postdoc positions available, particularly in smaller research environments in which they are likely to receive more attention and higher quality mentorship.

Proven or promising external resources or approaches

Response 2745

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Fellowships punish you by taking away your benefits. This is asinine. Fellowship eligibility often ends after only a few years, biasing fellowship recipient demographics toward individuals who come from academic families (have people helping them) and/or have ended up in a well-funded lab with a supportive advisor and are working on a project that "works" (i.e., leads to publications). Many postdocs are not properly supported during training, are forced to work on dead-end projects, are taken advantage of by PIs (teach their classes with no additional pay and same research expectations, etc.). Many talented people are "not competitive" for fellowships because they are considered too "old" (in trainee years) to "still" require training support while many people (of varying talent and drive) are awarded funding based on the lab they are in, not their own skills and achievements. The rich get richer and the pipeline leaks. Postdocs (and grad students) need subsidized, on-campus childcare. We've tried everything else. We still have gender equity issues. Ask women in academia why they delay having children—it's because they feel they cannot (don't have time, can't afford) and still keep up. Government or campus-level resources need to be available to support parental leave or else PIs will always decide not to hire or reappoint someone who suddenly is pregnant or is working 10 instead of 16 hours a day following the arrival of their child. NIH budgets need to increase to take salary/stipend increases into consideration or else junior faculty will never be able to afford postdocs and.the rich (old tenured professors) will continue to get richer on the same old ideas, while we lose the new ideas and innovations of the younger generation.

Existing NIH policies, programs, or resources

Change eligibility for postdoctoral fellowships to not arbitrarily decide when a person is "past the point of needing additional training." Change NIH ESI definition to depend on the start of an independent career, not the date of graduation from PhD. That is ludicrous. You punish people for NOT giving up, NOT dropping

out of the pipeline by telling them it took too long for them to make it here. You reward luck more than you reward perseverance. Encourage universities to revisit the 5-year maximum that many have implemented for postdoctoral appointments. If the logic was to protect postdocs from "languishing" in their positions, it failed. It has lead to many hard-working, talented individuals being kicked out of their labs with little notice, their prospects for a career in academia destroyed because no one will hire them since a PhD level scientist costs way more than a postdoc. Ensure that NIH-funded labs supporting postdocs are participating in regular assessments of postdoctoral progress, career development, conference attendance, etc. Too many trainees end up in labs with PIs who don't care about their training, only their output. Trainees are vulnerable, fear speaking out, and frequently cannot easily change labs, especially with arbitrary time limits applied to their career development, which is frequently stalled by their PI.

Proven or promising external resources or approaches

No Response

Response 2746

Perspectives on the postdoc roles and responsibilities

It is an additional training opportunity to focus on expanding research skills and publishing under someone's super vision.

Fundamental issues and challenges

I think the two main challenges are

1. pay, and
2. academic culture.

After completing a doctoral degree, many people are in debt (and need to start paying back student loans), looking to start a family and/or buy a home, or occurring new health or family costs. While the pay is better than graduate student pay, it is still very low given the necessary qualifications, and in many states/cities, it is not enough to live on without constant financial worry, let alone start a family or purchase property. An increase in pay, or at least guidelines around cost of living pay, would definitely increase the interest in postdoctoral positions.

The other, secondary, issue is academic culture. Many people experience toxic work environments in graduate school and are eager to get into a culture that does not pressure 24/7 availability to work, puts less importance on number of publications, or is friendlier and less competitive.

Existing NIH policies, programs, or resources

Increase the recommended postdoc pay, since most positions, regardless of location, pay the NIH salary.

Proven or promising external resources or approaches

Make more trainings free for postdoctoral students.

Response 2747

Perspectives on the postdoc roles and responsibilities

Postdocs are integral part of the academic system and research. Most of the times, if not always they are one driving the objectives of the lab. They are ones spearheading most often the high risk projects of the lab. Personally for me its no different. I like to use this opportunity as a postdoc to learn as much as I can, not just in terms of just doing science but also how to manage and most importantly communicate science. I like to use my experience that I have acquired over the years to train the next generation of young and brilliant mind who often come to lab as an undergraduate trainee or PhD students. For me postdoc experience is one of the most fulfilling experience where I enjoy the freedom to explore various projects that may necessarily not in direct connection to my lab's objective. I hope to use experience as a postdoc to further advance my career in academia and secure a position as a faculty.

Fundamental issues and challenges

The Fundamental issues and challenges at the moment for most postdocs is the postdoc salary. The amount of money they get as a postdocs is peanuts. With most postdocs at this stage, have family and kids to looks after, with meagre salary that averages around $53000, it is almost living like hand to mouth, even worse in cities and parts of USA where cost of living is high. As an immigrant postdoc, the problems are manifold increases. The temporary nature of postdoc with so little pay, makes the life of a researcher and their dependents very difficult. I hope US science funding agencies such as NSF and NIH would take some concrete step towards alleviating some of the problems faces by postdocs currently specially with regards to salary.

Existing NIH policies, programs, or resources

Apart from the salary of postdoc that needs to be raised, I think yearly pay raise also needs to be strictly enforced. Lot of NIH labs do not do that including mine which means you continue to get the same salary even after years of experience and it is not sustainable given the rate of inflation that we are seeing.

Proven or promising external resources or approaches

I think NIH can hire some of the scientific experts and brainstorm ideas how to improve the overall postdoctoral experience.

Response 2748

Perspectives on the postdoc roles and responsibilities

Research, mentoring, gaining new skills, publishing, career advancing, networking, attending conferences, presenting research,

Fundamental issues and challenges

1. Salary is not enough. We postdocs live paycheck to paycheck considering the rent increase and inflation. This financial hardship makes it very difficult when you are responsible for your family. We do not feel appreciated or valued financially considering our contributions and previous training.
2. Most of the international postdocs are on J1-Visa which limits them to advance in careers like taking up internships or getting training in the industry. It also limits them to transition to jobs.
3. Some of the postdoc fellows do not get institutional health benefits.
4. Disparity in salaries for postdocs in different fields.

Existing NIH policies, programs, or resources

1. Increase the salaries for postdocs, including the cost of living as well as the inflation point.
2. Equality in postdoc benefits

Proven or promising external resources or approaches

No Response

Response 2749

Perspectives on the postdoc roles and responsibilities

Being a postdoc feels like being caught in limbo. You supposedly have more skills and knowledge than a graduate student and are using the position to gain further training, but you are still treated as a grunt worker, not often valued for what you bring to the table. You're supposed to have more responsibilities for experiments and mentoring than a graduate student, but everything (collaborations, trainings, grants, etc) require significant contributions from your mentor, restricting independence. I feel incredibly undervalued by my institution as a whole; I am luckier than some of my peers because I am classified as a full employee rather than a mere trainee and therefore enjoy more benefits (retirement fund, tax withholding, etc) than them, and I am frequently treated as "other" by my administration, and which does not seem to want to recognize how valuable my (and other postdocs) research contributions are. Essentially, being a postdoc feels like being a graduate student, with all those troubles and trials, but without coursework and with a slightly higher paycheck.

Fundamental issues and challenges

Institutions will only pay the minimum NIH-required stipend, with no adjustments for inflation or cost of living (and barely any raise from year to year to adjust for these factors or reflect the amount of work a postdoc is putting in). Benefits (health insurance, retirement funds (with institution matching), dental insurance, etc) vary widely depending on the institutional classification of a postdoc (employee vs trainee), and make it extremely confusing and difficult as funding sources dictate a switch in classification (and often a subsequent loss of benefits). There is less camaraderie or cohesion amongst postdocs as compared to graduate students, so there is not a built-in support group to help each other out. Work-life balance is abysmal, with long hours, nights, and weekends expected of you and few to no holidays and minimal allotted paid leave.

Existing NIH policies, programs, or resources

I genuinely don't know that much of this can be improved at the NIH policy level; perhaps an increase in stipend and standardized benefits would help? Much of the trouble seems to be with general academic culture and not the NIH specifically, so I'm at a loss for what to suggest.

Proven or promising external resources or approaches

Unknown.

Response 2750

Perspectives on the postdoc roles and responsibilities

Main Point: Postdoctoral scholars (postdocs) and other early-stage scientists funded by NIH Training, Fellowship, Career Development, or R25 Research Education Program awards are not required to receive formal coursework, evaluation, and practice in science communication during their postdoctoral experience in STEM. This omission can decrease the trainees' success and satisfaction in science, and result in an inability to engage effectively in discourse with colleagues and diverse audiences. Like the requirement to receive formal "Instruction in the Responsible Conduct of Research", we recommend that all NIH funded trainees be required to receive formal "Instruction in Science Communication".

In an era of science skepticism, scientists need to be excellent communicators.

- As early stage scientists that are preparing for a career in science, postdoc science communication (sci comm) skills such as public speaking are directly related to their success as leaders, influencers, and teachers.
- Science is a very collaborative profession, and we communicate with other scientists, as well as administrators, students, technical staff, and the publics. Effective communication requires scientists to listen to and engage in a dialogue with diverse audiences.
- During their postdoc experience, much emphasis is placed on scientific discovery, while very little on communication skills.
- The National Postdoctoral Association lists "Communication Skills" as a Core Competency that is considered essential for career progression. Postdocs must speak with policymakers, news media, funding agencies and a variety of general audiences; deal with conflict resolution; be able to negotiate; write scientific papers and op-eds; make conference presentations; teach; and, interact with others in the workplace, institution, and society.
- Scientists who have good communication skills can combat misinformation and disinformation.
- Distrust and denial of science threatens all of science. Scientist who speak well are seen as trusted and truthful.

Fundamental issues and challenges

- Right now, sci comm training for most postdocs is often informal, infrequent, sporadic, or entirely missing.
- Poor communication skills inhibit recruitment, retention, and overall quality of life of postdocs (and scientists at all levels).
- Postdocs with good writing and speaking skills report higher satisfaction with their work, more success in getting jobs and promotions, and an increased likelihood of receiving funding. Learning to communicate well helps the researcher think clearly, explain science logically and build trust with the audience. These skills are essential to combat science disinformation and misinformation.
- Data from NIGMS funded programs provide evidence that the decline in PhDs persisting in academic faculty careers is related to their ability to communicate science. Their research shows that trainees who engage in sci comm will be more likely to stay in an academic research career. (Cameron et al., 2020). R01-GM85600
- Scientists trained to communicate with the public and teach students are better prepared to stand up for evidence-based scientific data that informs policy and public health.
- Scientists can be taught to be clear, confident speakers, but this takes formal coursework and practice. A fear of public speaking (and engaging in outreach activities) is a disincentive for scientists to interact with the general publics.
- The best candidates for jobs demonstrate clear, confident speaking skills, simplify complex research data, and understand how to connect with a diverse range of audiences.
- To stay successful and satisfied in science, the postdoc must continue to communicate their scientific creativity, discoveries, and value of their work to society.
- Scientists who communicate well are successful and satisfied because they get funded, publish their research, are asked to give lectures, receive awards for their work, and are recognized as good teachers, colleagues, and trusted members of the organization.

Existing NIH policies, programs, or resources

- In FY2022, NIH awarded nearly $1.2 billion for ~6900 T, F, K grants, and R25 grants. Less than 1.3% of these awards mention offering any “science communication” training in the award abstract. (NIH Reporter)
- Providing formal science communication coursework (not just short-term workshops, seminars, or one-and-done training events) should be an integral requirement for receiving a T, F, K or R25 award.
- The NIH already requires trainees receive formal “Instruction in the Responsible Conduct of Science”. A similar requirement for formal “Instruction in Science Communication” would prepare our early stage scientists for future engagements with the people who support and depend on their work, such as the next generations of scientists, policymakers, and other publics.
- Communication is a core competency for NIH intramural trainees. The Office of Intramural Training and Education provides science communication training programs that could serve as models for extramural training sites.

Proven or promising external resources or approaches

- The reasons for improving our science communication in science has been recognized in reports from the National Academies of Sciences, Engineering and Medicine, and the American Academy of Arts and Sciences, and COMPASS.
- Early stage scientists want to become better communicators but often are not given access to learning opportunities.
- A recent Research!America poll indicates that the public wants to hear researchers talk about their science and careers in science. Americans are concerned about the impact of misinformation/disinformation on public health (88%), climate change (79%), and stable democracy (85%).
- Certification in formal sci comm coursework can bolster a postdoc's prospects for employment.
- Many training programs have emerged to prepare scientists to communicate and engage with different audiences. However, these programs are reaching only a small self-selecting subset of postdocs and must be greatly expanded. Institution, faculty, and Federal grant support is urgently needed to set up, sustain and grow these sci comm programs.
- Some universities and research centers already have sci comm programs that offer formal courses, certificates, or graduate degrees, and could be modeled. Examples are:
  - Harvard Chan's Center for Health Communication
  - Rutgers Science Communication Initiative
  - Duke University STEAHM Forum
  - University of Maryland Science Communication
  - University of Oregon Center for Science Communication Research (SCR)
  - Stony Brook Alan Alda Center for Science Communication
  - University of Wisconsin Life Sciences Communication
- Toolkits, curricula, books, videos, and instruction choices are available to teach sci comm. (for more information, see Resources at the Chalk Talk Science Project website .www.chalktalkscience.org)
- Literature supporting the best ways to communicate science is available. (National Academies of Sciences, Engineering and Medicine)
- A recent National Postdoctoral Association report found 82% postdocs report "Lack of professional skills development opportunities" as having a negative impact on their professional and/or personal lives.

Response 2751

Perspectives on the postdoc roles and responsibilities

I am a graduate student at [redacted for anonymity] planning to graduate in the next few months. Due to the inherent precarity and low pay of academic postdoc positions, I am essentially not considering an academic postdoc as my next job. This is a major failing of the social contract between postdoctoral scholars and the institutions responsible for them. Therefore, my perspective on the roles and responsibilities of an academic postdoc are that a postdoc is responsible for shepherding the vast majority of a lab's impactful research from conception to publication, and that postdocs deserve both higher pay and some guarantee of consideration for long-term positions, whether as a staff scientist or faculty member.

Fundamental issues and challenges

1. Low pay
2. Lack of assurance as to future career opportunities

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No Response

Response 2752

Perspectives on the postdoc roles and responsibilities

The postdoc is a critical time in one's academic science research career. While traditionally, the postdoc period is considered a "training" phase, many postdocs spend more than 5 years in this role. Additionally, many postdocs are of family-rearing age, but many times struggle with the disadvantages associated with being considered a "trainee" at their universities. Thus, I believe many postdocs struggle with the decision to remain in academia or leave academia (or research!) altogether.

Fundamental issues and challenges

Based on my own experience as a postdoc and as our university's postdoc association president, many of our postdocs struggle with quality of life due to the apparent inequalities among the PI/Postdoc relationships/arrangements across campus and the lack of retirement and other university benefits. This inequality was apparent for citizen vs. non-citizen postdocs, NRSA vs. non-NRSA funded postdocs (the NRSA-funded being the disadvantaged party), and among all postdocs due to lack of enforcement that protects elements that could contribute to improved quality of life among all postdocs.

Existing NIH policies, programs, or resources

The NIH could spearhead a more streamlined process for transitioning talented postdocs to and from NRSA-funded grants and require protections regarding the postdoc term and benefits provided to postdocs.

Proven or promising external resources or approaches

As our university's postdoc president, after experiencing my own issues as an NRSA-funded fellow and listening to other postdoc concerns, I wrote a letter to the university outlining my primary suggestions for how to improve postdoc recruitment and retention at our university (a goal outlined in our university's research strategic plan). As a postdoc, I had intermittently researched and collected information over approximately 2.5 years in order to learn more about how other university's across operated and their common issues. As the PDA president, was then able to work my suggestions all the way up to the Vice Provost's office who coordinated meetings involving different departments in an effort to implement some of these changes. Unfortunately, much of the senior leadership has since changed at our university and thus, I assume the issue was placed lower on the priority list. Regardless, I feel that a solution originating from the NIH would be the best option to improve postdoc recruitment and retention. I was, therefore, very excited to see this solicitation for feedback. I would be happy to share the letter and any other information I gathered over those years. I would also be happy to discuss this matter further if the NIH is interested. Thank you.

[redacted for anonymity]

Response 2755

Perspectives on the postdoc roles and responsibilities

Postdocs are by nature a temporary position —meant for people in transit. In the current climate, I feel like postdocs SHOULD be very much focused on skill acquisition, both technical and intellectual, with the goal of preparing for a next career stage whether that be an industry role or even the impossibly difficult academic faculty route. However, it FEELS like right now postdocs are not at all treated this way, and are instead viewed as an underpaid, highly trained workhorse that drives the progress of the labs yet reap almost 0 benefits for doing so.

Fundamental issues and challenges

Quite frankly, it's salary and career prospects. For highly trained people ie people who went through 6 years of graduate school to get a PhD, when faced with a choice between getting paid a pittance (~50k) for working long hours for a single digit percentage chance at obtaining a faculty position in an unknown location, or a choice between getting paid 3x that amount immediately to start in industry and already get a foothold onto a future career in biotech, the choice is oftentimes very simple. This also means that people who DO choose to do a postdoc oftentimes take a pragmatic approach to choosing postdoc labs, as it's very obvious that the large, well-funded labs provide the highest chance to obtain faculty positions. This leads to intellectual stagnation and bottlenecking across the entire scientific discipline, as we now have ended up in a state where only a few mega-labs spread their scientific progeny far and wide in faculty positions, choking out other perspectives/approaches from developing.

Existing NIH policies, programs, or resources

Significantly raise the NIH minimums for postdoc salary. At least 70k a year, possibly with cost of living adjustments for area/city. It may even require a higher salary if the current dismal state of the postdoc-to-faculty career path doesn't change; the uncertainty of poor long-term career prospects is much easier to stomach when the salary is calibrated to offset that uncertainty.

This is not an easy task and may not fix inequality, but as it currently stands the dire state of academia is already an incredible driver of inequality across the entire system.

Proven or promising external resources or approaches

No response

Response 2756

Perspectives on the postdoc roles and responsibilities

To my friends and family outside of science, I equate the postdoc to a medical residency or fellowship: you have the degree to practice in your field, but you are still affiliated with a professional mentor in order to

further cement or expand your skillset and establish your own independence as a practitioner. However, to be clear, I don't consider the postdoc to still be a "trainee" position, in the same way that anyone who works under a project manager in business or marketing would not still be considered a "trainee".

Fundamental issues and challenges

Money. Biotech now provides higher salaries and quality of life than academia by lightyears. The postdoc years are the times in earlier adulthood when people are planning families and beginning to plan for retirement, and wages are crucial to our quality of life. Academic science will dry up if there is not competitive compensation available to recruit postdocs, no matter how flexible the working hours are or how prestigious your institution is. The lack of financial security also deters individuals from disadvantaged economic backgrounds to continue in academic science, which directly contributes to the lack of diversity we see at department and institutional levels. If we are to prioritize the recruitment and retainment of underrepresented minorities in science, this has to include competitive financial compensation.

Existing NIH policies, programs, or resources

Money. Raise the minimum salary lines significantly for postdocs at all levels. Direct salary increases are the best way to improve overall quality of life and to enhance diversity within academia.

Proven or promising external resources or approaches

No response

Response 2757

Perspectives on the postdoc roles and responsibilities

I see the academic postdoc as a training position to learn new skills in the path to a more permanent career position. If the goal is to stay in academia, then the academic postdoc is meant to build up a body of work that will form the basis for a new laboratory.

Fundamental issues and challenges

Quality of life as a postdoc is hindered primarily by financial concerns. While I can get by, everyone is aware that similar positions in industry make 2-4x the salary of an academic postdoc. Coupling this with a lack of opportunities to stay in academia permanently, many postdocs may decide it is not worth the financial strain to stay longterm. Additionally, the postdoc period comes at a time when many scientists may aim to start a family, which adds additional strain, both financial and personal. It is difficult to withstand these pressures without adequate financial support.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2758

Perspectives on the postdoc roles and responsibilities

An employment opportunity to gain additional research training, mentorship from experts, and to have protective time to conduct postdoc-initiated research.

Fundamental issues and challenges

Not offering health insurance coverage, not offering a competitive salary, not paying postdocs a salary but as a fellowship stipend which keeps them from paying into FICA (social security and Medicare benefits), cannot apply for a mortgage to purchase a home when not officially employed as a postdoc fellow, and time spent as a postdoc does not qualify as qualified work towards the Public Service Loan Forgiveness Program, limited time off or services/resources for persons with disabilities or new parents or with child or elderly care responsibilities. The expectation that postdocs come from families with wealth and therefore can work for low wages for the experience. Nepotism is real in academia. It is difficult for postdocs who

are first generation or come from low income or marginalized backgrounds to "fit" in a system that is not supportive. Additionally, it is known that postdocs are for two purposes:

1. additional training before launching one's own lab or
2. "cheap labor" for a PI to pay someone to do their work. Sometimes it is difficult to know what postdoc one is walking into—actually training experience or working as cheap labor.

Existing NIH policies, programs, or resources

Hire postdocs as employees and pay postdocs a living wage based on cost of living/inflation and require health insurance coverage. Mentors need protective time to mentor and sponsor their postdocs in support of the postdoc career. Postdocs should not be viewed as "cheap labor" because the research enterprise does not pay research teams appropriately.

Proven or promising external resources or approaches

Examine the successes of the RWJF funded doctoral program, Health Policy Research Program, to learn how to recruit, retain, and support scholars from underrepresented and/or marginalized backgrounds.

Response 2759

Perspectives on the postdoc roles and responsibilities

Postdoctoral research is a training period where one may gain skills that may be missing, but is necessary for their chosen job market (mostly for academic positions).

Fundamental issues and challenges

While postdoctoral scientist is a transitional position, the research is taking longer and longer to output tangible achievements to better our job application packages. In our field of biomedicine/bioengineering, it is not unusual to postdoc for >6y, which is the longest time spent in a single institution/position since elementary school. Additionally, postdocs are in an age range where one frequently starts a family, and must start considering two-body options for settling down and feeding the growing household. Thus, postdoc package must come with income and benefits on which one may acquire housing and cover living costs, with some savings. Many of my fellow postdocs tend to switch careers to industry in their 2nd-3rd year of research due to these realistic concerns. Another factor is in the cut-throat nature of research output, where it is commonly believed that one must publish in a top-impact journal in order to secure a position in academia. If one does not have a project that is projected to publish in such top-tier journals before their 2nd-3rd year mark, they often quickly pivot to an industry position. Either way, many of my fellow postdocs leave academia after years of high-stress, feeling like failures.

Existing NIH policies, programs, or resources

Setting the example for higher standardized wage and benefits for postdocs. Funding more training opportunities and programs. Funding more DEI-driven hiring programs. More programs for early-stage academics so that they may be able to better afford postdocs once their income rises.

Centralized Postdoc-Mentor matching program/resource so that postdocs are able to find potential mentors and reach out to them more easily, and potential mentors are able to hire postdocs with specific expertise more easily. This proposal is based on the general trend that postdocs often have the best chance of entering a lab when they have a credible middle-man that can introduce them (usually the PhD advisor recommends their graduating PhD student to a potential postdoc mentor). Without such a network, many potential postdocs (often from smaller graduate labs or schools) are often left without any options, but to join the industry.

Proven or promising external resources or approaches

No response

Response 2760

Perspectives on the postdoc roles and responsibilities

The roles and responsibilities of academic postdocs can vary depending on the field of study, the institution, and the specific position.

However, there are some general Perspectives on the postdoc roles and responsibilities of academic postdocs.

Conducting research: The primary responsibility of academic postdocs is to conduct research. They work on research projects, design experiments, analyze data, and publish papers. They may work independently or as part of a team, and they are expected to make significant contributions to the research projects they work on.

Mentoring students: Academic postdocs may also be responsible for mentoring undergraduate or graduate students. This involves guiding students in their research projects, teaching them research skills, and providing feedback on their work.

Collaborating with colleagues: Academic postdocs often collaborate with colleagues within their research group or department. They may work on joint research projects or help to organize research seminars and workshops.

Teaching and outreach: Some academic postdocs may be responsible for teaching undergraduate or graduate courses or participating in outreach activities to promote science education.

Professional development: Academic postdocs are expected to continue developing their research skills and knowledge in their field of study. This may involve attending conferences, workshops, and training programs or seeking out opportunities to learn new techniques and approaches.

Overall, the roles and responsibilities of academic postdocs are diverse and demanding. They require a high level of expertise and dedication to research and teaching, as well as a commitment to ongoing professional development.

Fundamental issues and challenges

Postdocs drive the science in the labs and play a critical role in mentoring graduate students. Postdocs have been underpaid for decades. Today, many postdocs are parents and it is impossible to survive on the NIH

minimum of $56,484 in high-cost-of-living areas of the USA. High cost of living, extremely low salaries for highly skilled Ph.D.-level personnel, and increased competition with significantly better industry-offered positions and benefits.

Existing NIH policies, programs, or resources

The NIH scale should be significantly increased and funding per R01 should allow for this increase without burdening the investigators. At a minimum, the postdoc salary should increase to 70,000$ per year.

Proven or promising external resources or approaches

The new HHMI salary scale has the flexibility to bring on new postdocs at up to $91,000 in high-cost-of-labor areas where private industry competes with academia for the best scientists.

To ease the transition to the new, higher salary scale, HHMI established a Postdoc Bridge Fund to assist Investigators in increasing their postdocs' salaries.

Response 2761

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as the best opportunity for academic scientists to make their major individual contribution to the field as lead scientists. Entailed within this is establishing a domain of expertise and building out that domain of research.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Increase NIH Postdoc Minimum Salary to $70,000. This is the best way to retain talented postdocs in academia.

Proven or promising external resources or approaches

HHMI has just increased postdoc salary to 70,000 minimum with up to 90,000 for certain fields.

Response 2762

Perspectives on the postdoc roles and responsibilities

To advance a research aim and provide valuable insights and data on phenomena of interest.

Fundamental issues and challenges

Low rate of pay and stagnant NIH minimum salaries drive most people away from the field. Pay scales are similar to those for graduate students in many areas yielding no upward trajectory in wages despite more expertise. Pay is also generally only 30-60% of equivalent salaried positions of the same profession not stymied with NIH minimums being used.

Existing NIH policies, programs, or resources

Increase the NIH minimum salary for postdoctoral research and use an inflationary calculation to adjust it annually.

Provide funding within grants and programs to support salaried research staff within academic programs but outside of postdoctoral and graduate training pathways to retain high skill researchers that do not wish to remain within the trainee pathway or start an independent research program.

Proven or promising external resources or approaches

Pay scale is currently the largest hurdle as the cost of university training has increased and is now twice as expensive and cost of living in every area where advanced training can occur has also increased at rates far beyond inflation.

Response 2763

Perspectives on the postdoc roles and responsibilities

The postdoctoral position allows an individual to develop the skills required to be an independent scientist, particularly in academia. This position should provide ample opportunity for the postdoc to develop an independent project that can be used to start a new lab and advance the postdoc’s critical thinking, writing, and mentoring skill set in order to provide a good foundation for becoming an independent scientist. This position should provide a great level of independence and the postdoc’s mentor should be available for guidance, but allow the postdoc to control the direction of their project within reasonable limits.

Fundamental issues and challenges

1. Jobs in academia, especially as a PI are few and far between and the competitive nature of such is not appealing.
2. The politics associated with many academic institutions is a turn-off and postdocs in particular have little to no say in institutional changes at the department or university level.
3. Postdocs are incredibly undervalued, we have more education and experience than most MDs and lawyers but are making the salary of someone with one year of experience and a bachelor's degree. Universities don't treat us as equal to faculty and staff and therefore often do not get as good of benefits, no matched retirement, and fewer vacation days. Inflation far outpaces the salary that we earn and it is no longer a living wage.
4. There is little flexibility for a PI or university to increase a postdoc's pay. There is no opportunity to "get a raise". The yearly increase in postdoc salary is 1-3%, less than yearly inflation increases and there is no opportunity to receive a larger raise until you "phase out" as a postdoc (after 5 years). In all other PhD jobs, you can grow your salary much more quickly.
5. Postdocs end up taking on responsibilities outside of their job description. As a postdoc, I have spent most of my time training graduate students and writing grants for my PI. This has given me little time to work on my own independent project and develop my career.
6. You can make 2-3x more in industry without a postdoc than you can in academia, so why waste my time trying to get one of those coveted academic PI jobs, when I can just start my career 5 years earlier?
7. PIs now view a postdoc as a 5-year position when it was once considered to be a 1-3 year position.

Existing NIH policies, programs, or resources

1. Increase grant funding.
2. Change how PIs can use their grant funds, allowing PIs to decide how much their postdoc is worth rather than capping the amount that a grant can pay a postdoc.

Proven or promising external resources or approaches

No response

Response 2764

Perspectives on the postdoc roles and responsibilities

I saw it as a training program for a faculty position and how to be an independent scientist.

Fundamental issues and challenges

- Access to funding as an international postdoc, we are far less likely to get fellowships due to eligibility (MORE F05 calls!!).
- No actual formal training. Just "go and do science". If we're going to be trained to be faculty, then train us i.e. budgeting, hiring, grant writing, project management etc.
- Salaries are not in line with standard living wage and although we know we won't get paid the same level as industry, we would like to get paid enough so we're not living pay check to pay check with no savings or retirement.
- There are not enough faculty jobs for us all so the idea that we are training for faculty is very out of touch with the current academic world.
- The standard to "be successful" is so high i.e. CNS papers, prestigious fellowships, etc. that working 9-5 or even 8-6 every weekday is just not enough. This is also a major problem at the faculty level. There needs to be some sort of major overhaul to the system since this clearly is not sustainable. The level of burn out, depression and anxiety is through the roof.

Existing NIH policies, programs, or resources

https://researchtraining.nih.gov/infographics/research-scientist—no info for immigrant scientists. A recent Nature study showed that 60% of postdocs are international. Please make your resources clear for those too.

Informational webinars regarding how to apply for funding (maybe these exist but we never hear about them).

Proven or promising external resources or approaches

1. Increase payline to a minimum of $65,000 (in line with recent salary raises i.e. Princeton, MIT, University of Washington, Universities of California, St. Judes, Penn)
2. Make all fellowships eligible for those on visas—just like American Cancer Society did this year.
3. Define what a postdoc is and set out a training scheme to be implemented by universities—also get input and/or funds from industry since most NIH trained scientists ultimately go to industry where they didn't invest any money in their training.

Response 2765

Perspectives on the postdoc roles and responsibilities

Postdoc position to me means aquiring new knowledge and at the same time using the existing opportunities to make a progress in scientific carrier

Fundamental issues and challenges

I am disappointed by my progress hear and feel that I'm wasting my time here. My previous postdoc experience (outside USA) was disregarded, while I've already know a lot on grant application and conducting research with my own research group.

Existing NIH policies, programs, or resources

I was very disapointing to know that on my current place most of the funding is for faculty, so I just made a few steps back in my career. Most of the things that we have to listen on courses (i.e. cource of responsible conduct of research) I already knew, I just need real opportunities for carrier development

Proven or promising external resources or approaches

Modify the policy in the way that individuals can develop their path according to their previous experience. Publication record, years of postdoc experience, grants that person had earlier, should be taken into the account for promotion to faculty position, as these echievements evidence of individual's high independence and erudition

Response 2766

Perspectives on the postdoc roles and responsibilities

The postdoc position in the field of Immunoengineering is treated almost as a second PhD, where trainees either grow expertise in new areas or drill down into their established subspecialties. The outcome of this second round of training is ideally an independent career in academia, combining proficiencies from both PhD and postdoc training into a unique and innovative research program. As a postdoc, I am expected to drive several difficult projects to completion, train junior researchers, nurture collaborations, and support the functioning of the lab all while developing myself scientifically and professionally and preparing for the next step. I also serve on institute committees like DEI Counsels and perform community outreach. In short, it is a research-based second PhD with slightly higher compensation and enormously greater expectations and responsibilities, all under the often crushing impending crisis of getting a "real job".

Fundamental issues and challenges

In theory, the postdoc is the best job there is: a combination of scientific competency, creative independence, and security where funding is secured by the PI. In practice, it is a crushing juggernaut filled with economic stress, years of failed experiments, isolation from peers and family who are often far away, and career insecurity due to the hypercompetitive and statistically unlikely probability of securing

the holy grail R1 academic position. In Boston, cost of living is so high that postdocs continue to live subsistence-level no different from grad school, struggling to afford housing, flights home, enduring estrangement from spouses and families and limited work-life balance. All in contrast with peers who skip the postdoc and go straight to lucrative industry positions where they are immediately compensated much more for similar or less-grueling work. Postdocs in the life sciences can last 5 years—a second PhD—where the lost earnings and lack of benefits put us at financial disadvantage potentially for decades and prevent us from starting families during our waning reproductive years. We are told this sacrifice is necessary if we want independent academic research careers, which many of us enter the postdoc thinking we do, an unfair demand on every level. Many postdocs slowly realize academia is a dream that won't happen for them—too competitive, family concerns, geographic restrictions, timing, luck—and cycle out, often after a period of grieving and subsistence mental health that lasts for years. We cannot save money to secure us from financial calamity; we put our futures on hold to do the groundbreaking work that moves science and wealthy, established PIs ahead; we are beholden to the fates and our advisors for the high-impact papers and favorable letters we need to compete for the few academic jobs in our field.

Existing NIH policies, programs, or resources

Increased salary guidelines and scale to area cost of living! The current guidelines from NIH are not sufficient to survive in the high cost of living hubs like Boston and SF, and thus select for postdocs with extra sources of income, continuing cycles of disparity and inequity for researchers from underrepresented backgrounds. More fellowships! Implement more independent transitional funding pathways for postdocs to successfully enter the academic role; provide support for more academic positions including and outside of traditional PI like research scientists.

Proven or promising external resources or approaches

Encourage publication of negative results! Think of the billions of dollars in resources and time that could be saved by not repeating experiments and approaches that others who tried them already know will fail, of the H indices that would exist or grow from dissemination of negative results. Implement training resources for PIs who so often need management training and standardize PI mentoring review for accountability.

Response 2767

Perspectives on the postdoc roles and responsibilities

There are two types of postdoctoral roles

1. Training and
2. Post-doctoral Fellows are akin to Junior PIs.

The first involves gaining the skills necessary to manage labs, grants, junior and senior graduate students and more; typically adding some necessary research skillset to complete the fellows research program. The latter provides more to the environment as a Post-doctoral fellows can build out a niche under the umbrella of the lab's work adding to complexity to the work done in the lab while also contributing critical resource management to aid the primary mentor. Especially as labs of many sorts tend to move to a cascading mentorship model whereby postdoctoral fellows have responsibilities only second to the PI the discrepancy between the two positions decreases as the post-doctoral fellow becomes more advanced.

Fundamental issues and challenges

There are several fundamental issues with the post-doctoral fellow position that is devastating to retention. Compensation for postdoctoral fellowships has several issues—first the compensation rate has not kept up with reasonable income for a PhD let alone fair market value—PhD graduates have a highly desirable skill to organize, model, and synthesize data taking a post-doctoral scientific position requires that scientists be willing to take a 45.2% to 66.77% pay cut to work for public institutions. A recent senate and presidential (in the state of the union) call for public school teachers to make more calling for at least $60,000 a year; a post-doc fellow would have to work 4 years after a PhD to make this salary rate (a salary rate that is still 41.75% below market value). NIH fellow benefits are not comparable to post-doctoral faculty positions or industry positions. This leaves post-doctoral fellows balancing the benefit of the fellowship to their career against the personal cost to their ability to retire, have childcare, and manage their own taxes. These are not trivial costs to an inidvidual's time, wealth, or quality of life.

Inherently this contributes to a loss of lifetime wealth accumulation—a significant barrier to diversity in science esp those lack generational wealth. Second, there is no room in the compensation scale to provide performance-based distinction or to leverage. Different roles should have distinct pay scale and benefit for a postdoc that is learning versus providing a skill. 1-or-2-year structure of postdoctoral positions prevents the stability necessary to make important life transitions and alienates them from building community support negatively impacting quality of life. Training grants tend to emphasize trans-/multi-disciplinary work whereas departments tend to focus on having a person to fulfill a specific long entrenched niche.

Existing NIH policies, programs, or resources

1. Provide more comparable market value compensation scales including comparable tax and benefits—including more market comparable benefits for retirement and childcare—could match benefits of federal government for standardization
2. Provide different types of pay scales and contract lengths for different types of positions or roles (trainees versus emerging to junior faculty) with possibility for more like 4 or 5 year contracts
3. Incentivize universities to hire trans-disciplinary faculty

Proven or promising external resources or approaches

1. Provide more comparable market value compensation scales including comparable tax and benefits—including more market comparable benefits for retirement and childcare—could match benefits of federal government for standardization
2. Provide different types of pay scales and contract lengths for different types of positions or roles (trainees versus emerging to junior faculty) with possibility for more like 4 or 5 year contracts
3. Incentivize universities to hire trans-disciplinary faculty

Response 2768

Perspectives on the postdoc roles and responsibilities

To me, the postdoctoral position represents a critical stage in my academic career where I am expected to deepen my knowledge and expertise in my field of study, publish research, and contribute to the intellectual community. It is a period of intense learning, growth, and development that will shape my future career trajectory. However, the reality is that many postdocs are paid wages that do not reflect the value of their work and the skills they bring to their research institutions. This can make it challenging to maintain motivation and focus on research, particularly when the cost of living is high, and financial pressures are mounting. Furthermore, the lack of job security and limited opportunities for career advancement can be demotivating and create a sense of uncertainty about the future. It can be challenging to see the path forward when the prospects for job stability or advancement are limited, and the financial rewards are meager.

Fundamental issues and challenges

Lack of job security: Postdoctoral trainees are typically appointed on a fixed-term basis, and there is often no clear path to permanent employment or job security. This lack of job security can be demotivating and create a sense of uncertainty about the future.

Low pay and inadequate benefits: Many postdoctoral trainees are paid wages that do not reflect the value of their work and the skills they bring to their research institutions. They often lack benefits such as health insurance, retirement plans, and paid time off, which can impact their overall quality of life.

Limited career advancement opportunities: Postdoctoral trainees often face limited opportunities for career advancement within their institutions. This lack of career progression can lead to frustration and can inhibit retention.

Inadequate mentorship and support: The quality of mentorship and support can vary widely between research groups and institutions. Inadequate mentorship and support can lead to feelings of isolation and hinder the development of postdoctoral trainees.

Work-life balance: The demanding nature of academic research can make it difficult for postdoctoral trainees to maintain a healthy work-life balance. Long hours, weekend work, and limited time off can impact their overall quality of life.

Bias and discrimination: Postdoctoral trainees may experience bias and discrimination based on their race, gender, sexuality, and other factors.

Visa issues: Postdoctoral trainees face challenges with visa renewals and career changes tied to their visa type

Limited access to resources: Postdoctoral trainees may have limited access to resources such as funding, equipment, and space. This can hinder their ability to conduct high-quality research and contribute to the academic community.

Addressing these Fundamental issues and challenges requires a comprehensive approach that involves policymakers, institutions, and individual researchers to ensure that postdoctoral trainees receive fair compensation, adequate mentorship and support, and opportunities for career advancement.

Existing NIH policies, programs, or resources

1. Increase the basic postdoc pay to $70,000
2. Open the application to the NRSA F32, and T32 awards to international postdocs.
3. Expand the SWDO outreach
4. Diversity supplements to support postdoctoral researchers from underrepresented groups in biomedical research.

Proven or promising external resources or approaches

The National Postdoctoral Association (NPA): The NPA is a professional organization that provides resources, networking opportunities, and advocacy for postdoctoral researchers. The NPA has developed several resources and best practices for postdoctoral training, including recommendations for mentorship, career development, and work-life balance.

The Future of Research (FoR): FoR is a grassroots organization that advocates for the success and sustainability of early-career researchers. FoR has developed several resources and recommendations for improving postdoctoral training, including suggestions for improving mentorship, promoting equity and diversity, and enhancing career development opportunities.

The Academic Career Readiness Assessment (ACRA): ACRA is a tool developed by the University of California, San Francisco that helps postdoctoral researchers assess their readiness for a career in academia. The tool includes several modules that assess skills in teaching, research, mentoring, and leadership, and provides feedback and guidance for career development.

The Center for the Integration of Research, Teaching, and Learning (CIRTL): CIRTL is a network of research universities that promotes the development of effective teaching practices and mentoring for early-career researchers. CIRTL offers workshops, training programs, and resources for postdoctoral researchers to develop their teaching and mentoring skills and enhance their career readiness.

The National Research Mentoring Network (NRMN): NRMN is a nationwide consortium of biomedical professionals and institutions that provides mentorship and professional development opportunities for early-career researchers from diverse backgrounds. NRMN offers several mentorship and coaching programs for postdoctoral researchers, including the MyMentor program and the Entering Mentoring program.

Overall, these external resources and approaches can inform NIH’s efforts to enhance the postdoctoral training ecosystem by providing evidence-based recommendations for improving postdoctoral recruitment, training, working environment, mentoring, and job satisfaction.

Response 2769

Perspectives on the postdoc roles and responsibilities

I primarily view the academic postdoc as a launching point for applying for faculty positions or for more senior positions in industry. Thus, an academic postdoc should emphasize independent scientific research and opportunities for mentoring/teaching.

Fundamental issues and challenges

The biggest challenge is financial. Salaries for postdocs are often insufficient to support families. In some locations across the country, salaries are also insufficient to support individuals who do not have a partner who can provide additional income.

I also think that graduate students are hesitant to pursue an academic postdoc as they feel that faculty job prospects after a postdoc are slim.

Existing NIH policies, programs, or resources

1. An increase in salary.
2. Making sure that postdocs that receive NIH fellowships are still eligible for employee benefits.
3. Better support for postdocs who are/wish to become parents.
4. Proven or promising external resources or approaches

Response 2770

Perspectives on the postdoc roles and responsibilities

The postdoc position should be a transitional stage to allow for the fellow to still carry out research under supervision and guidance, but at the same time to gain more independence towards developing their own scientific path and career. As part of this training, the postdoc should gain experience in grant writing and in mentoring junior members of their host lab.

Fundamental issues and challenges

In a postdoc in biomedical sciences their is a bargain in which we accept low pay (around half our market worth in the industry), but have academic freedom and relative independence to lead a research project, as well as receive mentorship and support from our advisor not only on the science, but even more on building their academic career. Sadly, many times the second half of this bargain is unfulfilled, and some postdocs experience abuse and exploitation, and even without anything dramatically "bad", the prospects of landing an academic position seem bleak, and as postdocs become older, the idea of having a precarious position, with uncertainty about the future, and the possible need to uproot their entire family for the next position becomes less and less attractive, especially in regions where industry alternatives are relatively abundant.

Existing NIH policies, programs, or resources

Some key issues:

1. A huge proportion of postdocs in the US are on a visa, while almost no NIH training grants (except K99) are offered to non-citizens/permanent residents. More options for training funds will help retain the highly trained population of international scholars within the US, to further support US research activities.
2. Increase funding per award to allow PIs to pay postdocs more to carry out the proposed research.
3. Virtually no protection or support for postdocs that have to transition to a different lab (due to abusive PI, loss of lab funding etc.). The post doc is usually left to figure it out for themselves, and act fast enough to not lose their visa, if relevant.

Proven or promising external resources or approaches

Response 2771

Perspectives on the postdoc roles and responsibilities

- A stepping stone to an independent position, most likely in academia
- A mechanism by which one can gain additional experience in grant-writing and in mentoring junior trainees
- It is also viewed as a way by which trainees can judge whether they're interested in academia or not

Fundamental issues and challenges

The NIH-scale salary for postdoctoral fellows is highly outdated and falls much below the living wage of many of the cities. This is, by far, the biggest issue in recruiting and retaining postdoctoral trainees and seems, frankly, quite an easy fix to me. There are other challenges too (see below), but nothing surpasses how severely underpaid we are, despite having spent many years in our PhD training.

Existing NIH policies, programs, or resources

It is illogical that international trainees cannot apply for many of the NIH-sponsored grants. We pay taxes to the US government and contribute to the US economy and many of us receive our PhD training in the US itself, but we are viewed differently based on our citizenship status. Non US-citizens likely make up a huge chunk of the postdoctoral trainee workforce in the US. A higher salary, advocacy for ease in receiving US citizenship, and the freedom/flexibility to apply for any and all NIH-sponsored grants would improve the training ecosystem, increase postdoc applicants, and contribute to furthering academic research.

Proven or promising external resources or approaches

The NIH should advocate that international trainees (particularly those who also received their PhD in US universities) be able to receive US citizenship, which might improve the postdoctoral experience. The NIH should also consider formalizing the postdoc application process across Universities and set up a system wherein the training of individual postdocs is supervised by committees comprising of academic PIs from the department/University, from NIH (perhaps), from other Universities (perhaps), or even from the industry (perhaps). All of this together would provide a more well-rounded experience.

Response 2772

Perspectives on the postdoc roles and responsibilities

I view it as an in between graduate student and faculty, where you can work more independently with the critical scientific and thinking skills from your PhD. Become more involved with the academic field and start to formulate the questions you would want to answer with your own lab

Fundamental issues and challenges

quality of life & salary. I'm paid below the poverty line for my county so I have to heavily rely on parental finances to survive. Post-docs have the highest degree obtainable & not financially supported/appreciated to an according level. The salary isn't reasonable/reflective of cost of living in areas outside of the NIH or appropriate for raising children.

Existing NIH policies, programs, or resources

Increasing post-doc funding opportunities and training grants for international students who performed their graduate work in the US to retain and utilize the skills they learned here. Sponsor green cards

Proven or promising external resources or approaches

Academia remains discriminatory against women especially when considering starting a family. There needs to be financial support for maternity leave & childcare & not affect employment opportunities. Women continue to be treated below men with the same/more scientific experience (eg less lab space)

Response 2773

Perspectives on the postdoc roles and responsibilities

My postdoc encompasses many roles. As a I train to become a PI, I take on many roles of a PI. I manage multiple collaborations, mentor multiple students, conduct scientific research, design projects and experiments, construct and write papers, make figures, present at multiple meetings a year, aid in the peer review process for journals, support lab mates, grad students, postbacs, undergrads, design and run outreach events.

Fundamental issues and challenges

Income. I have 2 young children, and my salary barely covers the cost of daycare for them. Without my husbands income, I would not be able to stay in academia (and I love my job!). Our income does not reflect the length of time spent in training, to have the level of specialized expertise that postdocs have in

other industries would result in a much higher salary. Also, long non-workday hours and expected additional 'service' on top of our normal work can be demanding.

Existing NIH policies, programs, or resources

Increased salaries, help for working mothers and families. If we truly want to retain women in academia, we have to be correctly supported as we raise our children and be able to pay for their care while we work.

Proven or promising external resources or approaches

No response

Response 2774

Perspectives on the postdoc roles and responsibilities

Key stepping stone for PhD and for MD/PhD to complete their maturation and develop a research portfolio that can launch them into a career as an independent scientist, usually in academics in my arena but also in industry.

Fundamental issues and challenges

the cost of living and salary required for postdocs has grown tremendously at my institution while grant funding has been nearly flat for two decades. I know can barely afford a postdoc unless they have a T32 position or can gain F32 funding. Postdocs are demoralized by the job prospects and increasingly I'm seeing senior grad students skip postdocs and find a job outside of biomedical research where their data skills lead to a better salary and lower stress life.

For MD/PhDs completing residency, they have to accept a much lower salary to do a fellowship than they could otherwise earn and this is a disincentive for continuing in academic research careers. I am seeing more and more attrition even though our department comes up with creative ways to boost their salary.

Existing NIH policies, programs, or resources

1. F31 and F32 should be funded at a greater rate.
2. Stipends should be larger
3. There should be "F32+" options for physician-scientists to have a two year fellowship to bridge the gap from residency to faculty status. The academic departments could provide additional support for 20% clinical effort, but the base stipend needs to be more realistic.
4. K99/R00 program is very useful and

Proven or promising external resources or approaches

APA colloquium, NARSAD young investigator awards, K99/R00 is a good program

Response 2775

Perspectives on the postdoc roles and responsibilities

Our institution views the postdoc position as a temporary mentored experience focused primarily on developing the postdoc's research expertise and skills. We also strongly believe that the postdoc experience should include professional development that encompasses all the core components recommended by the National Postdoctoral Association (https://www.nationalpostdoc.org/general/custom.asp?page=CoreCompetencies) with the goal of supporting the postdoc in their move toward independence.

Fundamental issues and challenges

Our institution believes that there are several significant problems that make the NIH-supported postdoctoral experience less than attractive:

1) low salaries (compared with NSF, for example);
2) not allowing postdocs who are on fellowships (e.g., F32, T32) to be university employees (and thereby cutting them off from university benefits);
3) the paucity of NIH grant opportunities for international postdocs (an exception being the K99/R00);
4) the lack of small grant opportunities for postdocs (something like the R03) to support smaller independent projects;
5) having less-than-ideal mentors who, for example, do not allow their postdocs to pursue professional development opportunities and do not take into account the training/mentoring aspect of the postdoctoral experience. Potential NIH-based solutions are offered in response to the next question.

Existing NIH policies, programs, or resources

This institution believes that the following changes to NIH policies and programs would improve recruitment, retention, and quality of life for postdocs:

1) raise the minimum salaries for postdocs; this will improve quality of life for postdocs and entice more PhD's to pursue postdoctoral training rather than going directly into industry where they will make a much better salary;
2) allow postdocs on fellowships (e.g., F32 and T32) to be university employees; this will encourage more postdocs to apply for fellowships because they will be able to have/retain university benefits;
3) open up more grant opportunities to international postdocs; most of our institution's postdocs are international and therefore, most of our postdocs cannot apply for their own NIH funding (except for the K99/R00);
4) provide more grant opportunities for all postdocs, especially a small grant mechanism (a postdoc version of an R03) to allow them to conduct small independent projects and, thereby, be better prepared to apply for larger grants (K99/R00, R01, etc.);
5) require that postdocs who are hired on research grants (such as R01's) spend a designated amount of time/effort (e.g., 10-20%) on professional development

(https://www.nationalpostdoc.org/general/custom.asp?page=CoreCompetencies) require that the PI include a training plan that specifies what professional development activities the postdoc will participate in; and require the PI to report on the progress of that training plan in annual progress reports.

Proven or promising external resources or approaches

One of the most serious problems faced by this institution is that NIH does not allow postdoctoral fellows to be university employees and, therefore, we are unable to provide them with university benefits. This results in major inequities among the postdocs in a way that makes it seem like we are treating the NIH fellows as second-class citizens. This institution wants to provide the same resources to all of its postdocs, but it is not able to due to this NIH policy. The best solution to this problem would be for NIH to allow fellows to be employees. NASA is an example of a major funding agency that now provides postdocs the option of being university employees for some of its fellowships (e.g., https://www.stsci.edu/stsci-research/fellowships/nasa-hubble-fellowship-program/nhfp-host-institution-employment-policy).

Another serious problem is the low salary minimum set by NIH. If the salary/stipend were increased, this would improve recruitment, retention, and quality of life. Contrast the NIH salary/stipend with the much higher stipends offered by National Science Foundation (e.g., $80,000/year for fellowship in biology) and Department of Defense ($115,000/year).

There are very limited opportunities for international postdocs to apply (as a PI) for NIH funding. There are agencies (e.g., American Cancer Society, Department of Defense) that allow both citizens and noncitizens to apply. We believe that NIH should do the same.

Response 2776

Perspectives on the postdoc roles and responsibilities

A hybrid between training focused on the transition to independence and highly skilled thinker and worker.

Fundamental issues and challenges

Salary, benefits, job security make recruitment and retention difficult. Overall quality of life can be excellent IF there is a positive and supportive training environment and good communication between advisor and postdoc.

Existing NIH policies, programs, or resources

Increased salary guidelines, which would help the postdoc but put more strain on the advisor's budget. To combat that, higher percentage of F32/K99 grants funded.

Proven or promising external resources or approaches

Perhaps some specific training for advisors on how to support and mentor postdocs

Response 2777

Perspectives on the postdoc roles and responsibilities

Postdoctoral studies provide a necessary step in the development of biomedical researchers, allowing them to expand their scientific vision, technical skills, and experience beyond the narrow focus that is typical of graduate training. Postdocs have the opportunity to validate their success as a graduate student and develop the deep level of self-confidence in their abilities that is key to successful career outcomes long-term. As a mentor of over 60 postdocs through my career, I have seen many times the wonderful metamorphosis from an enabled and skilled technical scientist to a true scholar and independent investigator. This is also the period when critical communication skills are honed and highly informed career choices are made.

Fundamental issues and challenges

There is a current sense heavily circulated within certain academic circles, even emanating from NIH, and highly proliferated on social media that postdoctoral studies are highly undesirable for reasons spanning from mentors are unscrupulous to the training is a waste of time. In this period of highly active recruiting by industry and the leveling out of faculty positions, graduate students hear that there is no value in a postdoc. The pandemic has exacerbated a growing general anxiety in young people in general about the world falling apart (climate change, war, political polarization), which drives a desire to stop the education process and find employment immediately upon completing graduate training (if not before). What is missing in their viewpoint and currently underappreciated is the great value in a postdoc for their ultimate professional development—not just in academia, but in industry and other sector of the biomedical research enterprise.

Existing NIH policies, programs, or resources

NIH should be strongly advocating to trainees the values of postdoctoral studies. Of course, more funding for dedicated postdoctoral training in the form of T—and especially F-type positions would be valuable, assuming the funds can be found. The idea of increasing salaries is ideally a good one, but there is great concern that this becomes another unfunded mandate imposed on the essentially flat R01 budgets that fund the majority of postdoctoral fellows yet are not increased even in line with inflation.

Proven or promising external resources or approaches

Many good ideas come to mind but most of them would come with a hefty price tag. The most direct and feasible step would be to develop a approach where postdoctoral (and graduate student) mentors would be evaluated for their mentoring skills in order to be granted T, F (as mentor) or R funds for a postdoc (and/or graduate student). This should include data on how many students or postdocs have joined a lab, how long each trainee remained in the lab, and the reason for leaving the lab. This would provide evidence-based discussion to negate the sense that most mentors are poor mentors, and rather provide a platform to highlight excellence in mentoring along with advertising the value of postdoctoral training.

Response 2778

Perspectives on the postdoc roles and responsibilities

The postdoc position, as it stands, is not worth it unless someone is really keen on applying to academic professor positions. I had an excellent postdoc mentor, but otherwise, it was an infantilizing experience.

The university treats you as a student or as an employee, whichever is convenient to deny you access to resources. There are very few university resources and support specifically for postdocs.

Fundamental issues and challenges

I hope there are more eloquent responses with policy recommendations, but I will share my experience as a postdoc in neuroscience and my thoughts based on my time since being a postdoc. I completed a PhD in neuroscience and then was selected to participate in a T32 Autism Research Fellowship program. Participating in this program involved a cross-country move, and relocation expenses were not covered. Considering many graduate students struggle financially as it is (see news stories about universities opening food pantries for their students and teaching graduate students how to apply for food stamps), the only way I could do this was to exhaust savings. I then remained underpaid as a postdoc, and it wasn't until I took on my first non-trainee job that I realized how pursuing graduate school and then a postdoc position truly positioned me in a precarious financial position that will take years to recover, if ever. I cannot afford to buy a home in the city that I work in (DC) and my retirement savings are a joke compared with peers in my age group. Let alone any costs incurred for health and other such life expenses that come along the way. And I do not even have children. Many parents leave academic science because it is too unsustainable to support children (especially ones that need day/childcare) with the financial resources one has after years of being underpaid as a graduate student and postdoc.

Subjecting trainees to these struggles are not "testing their love of science." This old fashioned cultural attitude has contributed to the current problem of draining scientific talent from research and needs to be eliminated. Everyone has a right to pursue a job that will positively contribute to their quality of life.

Existing NIH policies, programs, or resources

The premise is that the university can go above and beyond the NIH pay scale, in reality, is not what happens. The NIH pay scale sets the tone and furthermore does not take into account cost of living adjustments. This absolutely needs to be raised in other to retain talent. With cost of living adjustments.

There is a storm coming as graduate schools bolster their resources to advertise and connect students to non-academic positions for STEM PhDs. Graduate students are learning that they do not need to subject themselves to further exploitation by the academic system by working as a postdoc. Two ways to improve the extramural research system from within is

1. Pay postdocs more
2. Develop more pathways in STEM for career scientists that are not academic professors, such as staff scientists and the like.

I didn't discuss this last point here, but there are other places to review this discussion.

Proven or promising external resources or approaches

Postdoc unions have collected data from postdocs to inform their union contracts. I suggest reaching out to them.

Response 2779

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a training position where the postdoc is given increasing responsibility and freedom to explore their scientific goals, while receiving ongoing mentorship towards achieving these goals. New skills should be learned and career development opportunities provided.

Fundamental issues and challenges

1. Salary—the main culprit here is NIH funding. Given the crippling stagnation of the NIH modular budget, low paylines and mandatory budget cuts, it is not impossible to pay a postdoc an adequate salary that is reasonable to cover cost of living in New York
2. Postdocs are getting longer and longer—mostly due to the burgeoning demands of journals and the now often 2 year process after submision to do revisions to get a paper accepted into a high impact journal. Postdocs are older, have family responsibilities and increasing frustrations with career uncertainty and stagnation.
3. The US is becoming inhospitable to foreigners. Many postdocs come from other countries and now see the US as an unfavorable environemtn for career progression.
4. As a junior faculty member, due to these factors it is nearly impossible to recruit a qualified postdoc. this is contributing to a growing disparity between the "haves" and the "have nots".—famous old HHMI funded (within minimum postdoc starting salary of $70,000 guaranteed) PIs are able to attract the dwindling numbers of qualified and motivated postdocs. Junior faculty dependent on modular budget + mandatory cut NIH grants, have no resources or name brand to attract good postdocs—these factors contribute to a downward spiral with junior faculty becoming less and less able to compete with the famous established labs to get science done, move work forward and publish well. This is simply unsustainable.

Existing NIH policies, programs, or resources

1. Increase NIH modular budget and increase postdoc salaries by at least double the current NIH minimum. If this comes at the cost of the payline, so be it. Funding at least some labs adequately is important otherwise the entire ecosystem will fail. One immediate strategy would be to minimize funding diverted to organized programs/science by committee and redirect funding towards investigator initiated R01s that are funded at an appropriate level, inflation linked an not as is current, linked to magical thinking about how much a modular budget with a mandatory budget cut actually funds.
2. Adjust modular budget based on cost of living in different place and allocate additional funds for postdoc stipends
3. Mandatory maternity/paternity leave and funding to cover this (including perhaps technician support to cover such gaps so that careers are not jeopardized.
4. Encourage preprinting and alternative publication models to reverse the journal driven trend of needing ore and more time to publish a high impact paper.
5. Provide NIH funded mentor training to all PIs.
6. Programs for long term, funded staff scientist positions.
7. Ban fully or mostly soft money based faculty appointments. Provide more long-term support for PIs and staff scientists.

Proven or promising external resources or approaches

1. More NIH oversight and no tolerance policies to minimize abusive environments.
2. More support for international trainees, including funds and support for visas, support for international trainees so they are not bound to abusive PIs and prevented from changing jobs.
3. More funding and career support for longer term staff scientist positions.

Response 2780

Perspectives on the postdoc roles and responsibilities

The postdoc role should be a short-term position (3 years or less) meant to supplement training received during PhD training. It is not helpful, however, for postdocs to be labeled as "trainees". We are a highly trained workforce that have completed 4-6 years of training in graduate school.

Fundamental issues and challenges

Postdocs are not compensated adequately—both in terms of pay and benefits. The fact that individuals can earn 2-3 times more in industry highlights just how undervalued academic postdocs are. The lack of compensation would be more tolerable if postdoc positions were truly short term (less than 3 years), but in my field it is routine to be in a postdoc position for 6+ years. I feel that the policies and structures around academic postdocs were built with the assumption that a postdoc is a short-term endeavor. The reality, however, is that postdoc training in many fields can last 6+ years. Being considered a "trainee" for a period of 6+ years is not a sustainable policy. The trainee label is used as an excuse to provide meager compensation to postdocs, when the reality is that most new training is received during first 1-2 years of a postdoc. The rest of the time is spent churning out data without major additional training.

These policies stunt professional and personal development of postdocs. I don't know how someone in their mid-30s with ~10 years of training beyond a bachelor's degree (e.g. 5 years as a PhD student and 5 years as a postdoc) is still considered a "trainee". In contrast, my peers from college who pursued engineering degrees are in mid-level management by now. Postdocs also fall behind their peers financially, with very little saved for retirement and little means to buy a house or pay for child care.

Existing NIH policies, programs, or resources

NIH should increase pay rates for postdocs to keep more in line with what individuals with PhDs can earn outside of academia (often 2-3 times the current postdoc pay rates).

I know that many universities have policies that postdocs must transition to a more "staff-like" position after ~6 years, however I feel that this should be applied earlier, perhaps after 4 years. This should include earlier access to retirement benefits. Academic postdocs are taking longer and longer, and the inadequate pay and benefits are not sustainable for 6+ years.

Proven or promising external resources or approaches

No response

Response 2781

Perspectives on the postdoc roles and responsibilities

While I view the postdoc as an opportunity to receive additional training, I will also have a PhD at this point. I believe that postdocs should be viewed as early career faculty and be compensated appropriately for their level of training.

Fundamental issues and challenges

Salary—the salaries for NIH T32's do not account for the cost of living or inflation. Many postdocs also have to move to a new city, and the cost of moving can be quite high.

Existing NIH policies, programs, or resources

No Response

Proven or promising external resources or approaches

No Response

Response 2782

Perspectives on the postdoc roles and responsibilities

I see a postdoctoral position as a stepping stone to academic independence. I view post-docs as wanting/needing to get additional experience or publications before applying for a more permanent role.

Fundamental issues and challenges

The main barrier that I see is the pay-grade. I know most graduate students who I talk to regularly at this point want to graduate and go immediately into industry without first doing a post-doc (or doing an industry one). I think this remains the biggest hinderance to recruiting and retaining post-docs.

Existing NIH policies, programs, or resources

I think changing the pay-scale would recruit more researchers to do a post-doc and also retain the current post-docs. I think having more information on the OITE site for post-docs could help with exiting the post-doc position into another role. This could include another grant that isn't necessarily a K99 path to independence. Some may want to pursue staff scientist or minimally supervised roles.

Proven or promising external resources or approaches

Response 2783

Perspectives on the postdoc roles and responsibilities

A postdoctoral position provides training beyond the terminal degree for junior scientists. This position involves direct data collection, particularly learning new techniques geared towards an independent research niche, and practice in study design and grant writing, in a safe environment with an experienced mentor or mentorship team. It is an opportunity to pursue a study from conceptualization to completion, which is rare during graduate studies. It is primary a time for assembling expertise and skills to launch an independent scientific career. Independent scientific success could be in any scientific arena: academia, industry, non-profit, or government.

Fundamental issues and challenges

1. Low NIH postdoc salary. Postdocs have a terminal degree and are qualified for many positions with higher pay and respect as experts rather than "trainees" (as postdocs are commonly referred to).
2. Postdocs are referred to as "trainees" and are often not eligible for faculty appointments. They are a special HR type, which leads to pay and benefit inequities and decreases HR protections against discrimination.
3. No structured career ladder to independence. Postdoc positions do not have the same HR protections as faculty positions. Many people do multiple postdocs over 5—10 years, adding years to their training and delaying independence. This is frustrating and unacceptable. The reason for multiple postdocs fall into many categories: being assigned or choosing very long projects (eg. long human intervention or observational studies), poor mentorship, lack of agreement with the mentor on what intellectual property belongs to the postdoc and what belongs to the mentor. Many postdocs find the length of postdoc training unacceptable and are ending their academic career to get more pay, equity, and recognition, and work less hours to achieve work/life balance.
4. Entering the postdoc without a clear vision or path to independence. Intellectual property issues may lengthen postdocs. Oftentimes postdocs have look for available paid positions or mentors with sufficient funding/projects/time rather than looking for positions that align with their overall career goals. Time to independence would be more finite.
5. Inadequate funding under K and T awards to conduct research.
6. R01 grants have not increased in dollar amount for decades. They are always unfunded and, often, award amounts are cut from the proposed dollar amounts. This leaves mentors with no time or money to support postdoc research projects but needing "cheap" postdoc labor.
7. No clear expectations or guidelines on the "right time" to apply for an R01.

Existing NIH policies, programs, or resources

1. More funds for research projects under K awards to promote earlier independence and provide a way for awardees to gain valuable financial and personnel management experience.
2. Higher salaries on postdoctoral grants.
3. Most major barriers could be overcome by eliminating K awards as they currently exist and replacing them with transitional K to R awards, similar to a K99/R00 grant but completely overhauled to meet current needs. The K portion would be the only available K award and would run for 3-4 years, with the end of the 3rd year tailored to the R transition—R00 application, interviewing at new institutions, etc. All recipients should be faculty. Follow the K with a 2-3 year R00 component, based on applicant progress and strength of the R00 application (3 years for those successful in year 3, 2 years for those that require reapplication into year 4). This gives recipients more NIH application experience and would provide direct transition from the K to R stage (with R00 allowing more salary support than an R01, to step down from K protected time). Both the K and R phases require adequate funds for research projects, with maximal amounts higher in the R than the K phase. The K didactic training during current K didactic component needs to emphasize experience with grant writing and financial and personnel administration, which are not emphasized enough in current K training (due to lack of research budget). This model provides visible and timely progression to independence.
4. Establishing targeted guidelines on optimal timing to apply for R funding. Many trainees wait too long to apply, or are advised to do so by their mentors to be more competitive. This creates unnecessarily long postdocs.
5. Adequate R01 funding so that mentors can support trainee activity.

Proven or promising external resources or approaches

No response

Response 2784

Perspectives on the postdoc roles and responsibilities

Given the current reality of the tenure-track academic job market, the majority of postdocs will not become independent researchers at academic institutions. With this in mind, it is not right to hire postdocs with salaries and benefits reflecting a "training" position. Postdocs provide a significant portion of research productivity in academia and this work should be valued.

Fundamental issues and challenges

Postdoctoral quality of life is challenging on the given salary. This is even more in our 30's when most of our peers have already had children and honestly we should be saving for retirement by now. We've been pushing back starting a family for our entire academic careers (4 years bachelors, 4+ years grad school) and here is another 4+ years of our lives. Unfortunately cost of childcare is very high and it is not feasible on a postdoc salary. We need child care supplements and higher salaries. Thank you so much for asking this important question, I think these issues are driving the "postdoc" shortage we keep hearing about.

Existing NIH policies, programs, or resources

Please please please make NIH salary guidelines cost-of-living adjusted. This is CRITICAL for recruiting talent to major cities.

Proven or promising external resources or approaches

No response

Response 2787

Perspectives on the postdoc roles and responsibilities

I view a post doc position as an opportunity to learn and develop your career. It should act as a stepping stone to becoming independent. It should also allow you time to develop yourself, needs and research in a collaborative environment. You should be treated as a senior researcher who comes with experience and skills but still need mentorship.

Fundamental issues and challenges

-poor pay, no work/life balance, bullying by PI's, no mentorship, PI's who are out of touch with careers, PI's who don't publish, zero opportunities to explore other avenues of science,visiting fellows are threatened by PI's that they will not to support visa's if they don't do what they are told to do, even if it's bad science, long work hours-told to work 12hrs a day and weekends, no family life, zero support on anything, post-docs do all the work and it is the PI's who claim the glory, staff scientists are are bad idea as if there are any opportunities it goes straight to them and not the post-docs, told you cannot take federal holidays/badly designed experiments (by PI's), waste of resources, mental health issues not supported by PI's—if you have one and trust your PI you are then told your contract won't be extended as you've done no work here, PI's are too old and are out of date with science and so don't do cutting edge experiments, immigration policies need updating-bad for spouses on J1 visa's, lonely experience—no team work, back-stabbing nature, PI's need to be accounted for their bad behavior, PI's need to be fired if they invoke threatening behavior, post-doc's need protection without retaliation, not publishing because the PI doesn't want to publish in the journal as its not high impact enough, site reviews need reviewing—PI will choose to publish which papers they want for that cycle meaning that fellows miss out on getting their paper published—fellows need this for their career, no stability or security, no voice. This has been the worse post-doc experience I have ever had (and this is my second). I would not recommend to anyone where I am.

Existing NIH policies, programs, or resources

You need to start with the lab chiefs and look at how badly they treat post-docs, as this trickles down to the PI's and their treatment of post-docs.

A VF should be able to move labs and the money goes with them, not the PI. If a post-doc puts in a complaint and it is known that the PI is a bad one then that PI shouldn't be allowed to recruit more post-

docs, there needs to be accountable for the PI and why management has allowed this to continue happening.

You need to make sure that meetings do not go past 5pm—this isn't fair for anyone, especially those that have children and most likely affects woman. A policy needs to implemented for 'core hours' that meetings must adhere too.

Proven or promising external resources or approaches

Need an external source that can come in (like site reviews) but can recommend in to departments and make changes (without repercussions to the young researches).

Response 2788

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdocs are treated poorly in terms of compensation and benefits. Postdocs' dedication to academic research is used to take advantage of them as cheap labor.

Existing NIH policies, programs, or resources

Developing an independent research program is the only path that is incentivized with the current structural. Staff scientists roles that are fairly compensated are needed to ensure high quality research in the academic environment (technical expertise, continuity of knowledge within the laboratory).

Proven or promising external resources or approaches

No response

Response 2789

Perspectives on the postdoc roles and responsibilities

We thank you for the opportunity to respond to this RFI on the state of postdoctoral research training at the NIH. We outline some of the notable challenges faced by current postdoctoral fellows—and highly qualified researchers who could complete a postdoctoral fellowship with the NIH—as well as proposed solutions to address these major challenges.

The shortage of highly skilled researchers pursuing postdoctoral fellowships in the biomedical sciences is driven by the quality of life issues faced by most postdoctoral fellows. Much of this, from our perspectives, stems from inadequate financial compensation, which not only limits quality of life, but also effectively reduces the diversity of the biomedical workforce. The economic and financial challenges detailed below are inextricable from issues of diversity, equity, and inclusion. Efforts to attract postdoctoral applicants from diverse racial, gender, and economic backgrounds may be stymied by the fact that for many applicants, the stipend that is offered to fellows cannot support individuals without supplementary sources of funding and income. The resulting bottleneck holds implications for the future makeup of our biomedical workforce, almost ensuring that it will resemble less and less the country overall and the communities we serve, who are likewise affected by socially and structurally determined health disparities.

These barriers to participation in the scientific workforce threaten to deny opportunity to the many interested, passionate, qualified future early career scientists in this country, and in turn, hinder the major potential contributions from these diverse, energetic minds toward solving the many daunting problems affecting U.S. population health. We strongly urge the NIH to provide to the postdoctoral research community a timeline outlining their decision-making activities on these matters.

Below, we share a list of the challenges we perceive to be most prohibitive to fostering a diverse body of biomedical researchers and potential strategies to address these challenges.

Fundamental issues and challenges

Challenges

1. Postdoctoral fellows living in high cost of living cities are paid much less than the amount required to afford living in these cities. In [redacted for anonymity], a standard requirement for renting an apartment is earning 40 times the cost of monthly rent. This means that postdoctoral fellows in NYC earn less than half of the annual income needed to rent a basic studio apartment. The inability to live on a postdoctoral income and no accounting for family inevitably means that postdocs are living paycheck to paycheck, struggling to make ends meet, and delaying life stages like marriage, having a family, saving for a home, opening retirement savings accounts, or saving any amount.
2. Postdoctoral fellows should be considered employees and not contracted workers. Treating postdoctoral fellows as contracted workers creates a large tax burden on fellows—coupled with being charged with paying taxes on our healthcare costs—means that every third paycheck is essentially paid back in taxes.
3. The childcare stipend, while an appreciated and much-needed benefit, is not sufficient to cover the costs of childcare for postdoctoral fellows who are parents.
4. The NIH Loan Repayment Program, while a critical initiative to reduce inequity and promote quality of life among NIH-funded investigators, only allows an annual submission and funds less than half of applications. Most funded applications come from mid-career investigators who have previously applied. The low rates of funding for postdoctoral fellows reflects a structural disadvantage that prevents life-changing loan repayment from reaching those who need it the most—early stage investigators with low wages who are living precariously in time-limited positions.

Existing NIH policies, programs, or resources

Solutions

1. Increase the stipend of postdoctoral fellows to provide competitive pay that fosters a quality of life and is based on the cost of living in the city in which fellows live and work.
2. Make postdoctoral fellows employees, not contracted workers. This will alleviate the unmanageable tax burden faced by postdoctoral fellows.
3. Integrate the NIH Loan Repayment Program into T32 and F32 fellowships so that fellows automatically receive life-changing student debt relief while working on training grants and carrying out critical NIH-funded research. Integrating the LRP into training fellowships for early career scientists provides necessary assistance at a time point in which career decision-making based on finances leads many to abandon research careers to work in industry to earn a living wage instead; thus, this change would retain scientists in biomedical careers who would have liked to stay but could not afford to do so.

Proven or promising external resources or approaches

We also invited comments from T32 alumni. We share their additional comments here.

Challenges:

The pipeline from fellowship to job is not always clear and not necessarily supported by the University, that is, from T32 here to faculty position here. Nor is applying for a K necessarily supported. Furthermore, the University may be more supportive of “soft money” positions than “hard money” positions, which likely speaks to structural inequities. Note: The current endowment of our university stands at $13.3 billion. With a hypothetical return rate of only 5% per year, that means the University could have investment income of over $600,000,000 per year.

Solutions:

Require a true public-private partnership such that Universities of a certain rank (to be discussed) and who receive NIH funding for training and/or non educational grants provide a certain percentage of in-kind salary support to T32 trainees. If they don’t, they get a slightly reduced indirect cost rate or a limit on the total grant monies they can receive. In line with this, provide a clear, financially supported pathway from fellowship to “hard money” positions for T32 fellows at the institution.

Response 2790

Perspectives on the postdoc roles and responsibilities

In my professional experience I would say that the postdoc roles and responsibilities in most labs are poorly defined. Whereas philosophically the postdoc is a trainee developing skills in independent research conduct they are more often used as a tool to fix gaps left in a lab due to poor structuring/planning/funding. Thus I would say that postdocs are more often found acting as managers, data analysts, technicians, educators, writers, artists, and community/profession liaisons, sometimes all at once, and sometimes simply relegated to a small handful of these roles. In my experience these roles are completed with the promises to receive morsels of guidance on grant-writing, career progression, and networking. This is simply not the experience which most graduates are hoping to get after competing tooth and nail for the position.

Fundamental issues and challenges

Salary and lack of a structured training program are the two largest detriments to the postdoc eco-system.

Some thoughts on funding:

1. The NIH minimum salary needs to be reconsidered, and monitoring of appropriate budgeting and salary progression needs to be implemented as a requirement of postdoc funding. After studying for close to 10 years (international), >10 years (domestic), PhD graduates enter the workforce with a salary that matches what many entry-level BS graduates might receive in a job with far fewer skill requirements. This is simply one argument in favor of increasing NIH R spending limits.
2. Budgets at the lab level are often made up of multiple grants with different start and end times. Although the NIH sets out a plan for salary increase this is difficult to match in many cases due to how salaries are constructed. To imagine that every postdoc is budgeted for out of perfectly timed R01s is to live in a fantasy land. The reality is that many postdocs continue to receive only the bare-minimum.
3. The lack of bursary programs for international trainees makes it difficult to relocate.

Some thoughts on training:

The NIH has a duty to enact policies which support the training of postdocs and protect them from exploitation. NIH funding of postdocs should require a training plan to be presented at the time of funding, and this should be monitored at annual and final reports.

Existing NIH policies, programs, or resources

Remove citizenship requirements for K-awards.

Proven or promising external resources or approaches

No response

Response 2791

Perspectives on the postdoc roles and responsibilities

I view it as a job NOT a learning opportunity. I learned as a graduate student now I am producing capital for the institution at a more efficient and higher rate.

Fundamental issues and challenges

Money, respect, options

Existing NIH policies, programs, or resources

PAY MORE MONEY

Proven or promising external resources or approaches

PAY MORE MONEY

Response 2792

Perspectives on the postdoc roles and responsibilities

Within academia, it's a means to publish and continue to the path of PI but comes with a lot of competition and hardships, including very low pay for the amount of work required and no guarantee. Non-citizen/PRs have an impossible situation in doing all of that while on a visa that can be easily threatened by the lack of PI funding and next opportunities.

Industry postdocs provide higher pay and industry experience, which usually ends up providing an H1B visa and much better job prospects.

Fundamental issues and challenges

1. Low pay! This does not support any kind of lifestyle, particularly if the postdoc is carried out in a city.
2. Competition with better pay and quality of jobs available/ work life balance in industry positions.
3. The ridiculous amount of power that academic PIs have with little to no oversight towards the wellbeing of their postdocs. Postdocs rely heavily on the PI for funding/visa and international postdocs are particularly threatened.
4. Very few PI tenure track job prospects in academia after postdoc.

Existing NIH policies, programs, or resources

1. Pay postdocs more.
2. Have some kind of oversight of postdoc treatment.
3. Have an age-limitation on PIs to open up more positions for junior scientists.

Proven or promising external resources or approaches

Industry pays postdocs more and provides a much better work life balance, visas and job prospects. Perhaps promoting collaborations between academic and pharmas would encourage postdocs to join.

Response 2793

Perspectives on the postdoc roles and responsibilities

The academic postdoc in its best form should be an opportunity to gain additional specialized training, develop a robust research portfolio, and transition from being a supervised graduate student to an independent researcher. Postdoctoral positions should, and often do, enable the individuals who take them to gain valuable new skills that will enable them to run their own research programs. While in the past, an academic postdoc was an optional supplement to the PhD research experience, at present it is an absolute necessity for all but the most lucky and/or exceptional researchers to obtain the most desirable faculty jobs, whether at R1 research institutions or small liberal arts colleges (my ultimate goal). The academic postdoc can be a tremendous opportunity to learn and grow, but it can also easily be an opportunity for abject exploitation by abusive PIs. Because postdocs are generally not part of some larger program at an institution (unlike graduate students) and do not receive hourly wages or overtime, many faculty correctly identify us as vulnerable to pressure from them to become publication factories, as a necessary period of academic hazing prior to obtaining our own status as PIs.

Whether one has a good or a bad experience as a postdoc (if one is lucky enough to only do one), it has become an essentially obligatory add-on to an already long PhD program. I am in an exceptionally good and supportive environment—many if not most postdocs are not so lucky.

Fundamental issues and challenges

The biggest issue is the low pay. While NIH provides a minimum postdoc salary, in practice almost all universities treat that salary as the salary that all postdocs will earn, not a minimum. While I am lucky enough to have a partner with a well-compensated job outside of academia, many postdocs are not so lucky. While some faculty and administrators may argue that this low level of compensation is justifiable due to the temporary nature of a postdoc and an expectation of higher pay in a future faculty position, the reality is that many people work as postdocs for 5 or more years and not all of us will successfully obtain tenure-track faculty jobs. We deserve fair pay commensurate with our high degree of training and the fact

that universities rely on both our labor and that of even more underpaid graduate workers to perform the research, publishing, and teaching duties that generate their prestige. The current system is unsustainable and will succeed in driving out most would-be scientists who do not come from wealthy backgrounds.

In addition, the quality of life for postdocs (and graduate students) is almost entirely dependent on the largess of their supervisors. I am lucky enough to have a very generous supervisor and numerous mentors who allow me flexibility in work environment and scheduling, intellectual stimulation, and the ability to take time off as needed. Most postdocs are not so lucky, and I have personally observed the intentional exploitation of international postdocs who have little recourse against abusive PIs. There need to be both institutional and national minimum standards that are actually enforced to prevent abusive PIs from yielding this exceptionally high level of power against vulnerable postdocs and graduate students.

Existing NIH policies, programs, or resources

As mentioned in my last answer, salaries are a huge issue. Similarly, minimum enforced standards for work environment, time off, etc. would be very helpful.

There are many funding opportunities to apply for, but as I am sure you are well aware, they are extremely competitive, so in reality most postdocs will never receive any extramural funding from their own efforts. It is unclear to me how to resolve that issue without a substantially increased budget or a dramatic reduction in the number of postdocs in the applicant pool.

Proven or promising external resources or approaches

See above. Better pay, better and more uniform job standards, more accountability for abusive PIs and institutions.

Response 2794

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Expand the budget for R01 and similar grants to allow PIs to pay higher stipends. Allow PIs to pay the difference between the institutional salary and the NIH minimum out of federal funds for those postdocs who are awarded fellowships (currently PIs/postdocs are essentially punished for being awarded fellowships, as they cannot pay the difference between the NIH minimum and the institutional-determined salary).

Proven or promising external resources or approaches

Response 2795

Perspectives on the postdoc roles and responsibilities

This response is from [redacted for anonymity]. This committee is comprised of 17 [redacted for anonymity] faculty members who represent basic science, clinical science, and social science researchers in the health sciences. We are grateful for this opportunity to provide our perspectives on this important issue.

Postdoctoral scholars are in a career stage in which they function both as highly skilled and valuable full-time employees and as advanced trainees preparing for their next career steps. This role is analogous to early-career employees in other contexts who receive on-the-job training but are also expected to contribute as employees. Although postdoctoral scholars receive training, they also have doctoral degrees in their fields and contribute important expertise, provide training to more junior employees, and are among the primary producers in the research apparatus. Thus, postdoctoral scholars deserve to receive remuneration comparable to that of full-time early-career employees within other organizations.

Fundamental issues and challenges

A major challenge to recruiting and retaining postdoctoral scholars, particularly in high cost-of-living regions, such as the San Francisco Bay Area, is offering competitive compensation. Highly qualified postdoctoral scholars often have significantly more lucrative opportunities outside of academia. Within academia, private institutions can offer more competitive compensation than public institutions can.

Both salaries and benefits for postdoctoral scholars need to be increased to make these positions competitive with other opportunities. For example, postdoctoral scholars at our institution have difficulty affording housing, face challenges accessing and affording childcare, and do not have access to the retirement benefits typically provided to full-time employees. More support for multi-year postdoctoral positions that include affordable childcare and retirement benefits would provide postdoctoral scholars with more latitude to focus on their work.

Finally, a lack of centralized policies and procedures for postdoctoral scholars at their institutions meaningfully impacts their quality of life. Postdoctoral scholars are often hired by individual labs or research groups rather than through centralized hiring processes. Thus, postdoctoral scholars have different levels of access to resources depending on their departments and PIs. Faculty are often the primary touchpoints for postdoctoral scholars to access institutional resources, but they are not always as knowledgeable about these resources as a centralized postdoctoral office would be, and their bandwidth to connect postdoctoral scholars to these resources may vary. Based on conversations with postdoctoral scholars, we believe that encouraging institutions to establish centralized offices to provide resources for postdoctoral scholars would help to improve their overall experience.

Although individual institutions are primarily responsible for addressing many of these issues, we feel that funding agencies like the NIH can both help promote institutional cultures in which postdoctoral scholars receive the necessary support and raise the current stipend to improve recruitment, retention, and quality of life for postdoctoral scholars.

Existing NIH policies, programs, or resources

The NIH should increase its pay scales for postdoctoral scholars to reflect cost-of-living growth and allow Pis to offer competitive compensation, particularly for postdocs supported on T32 grants. Furthermore, the sizes of NIH grants, such as R01s, should be expanded proportionate to cost-of-living growth in the United States over the last several decades. Caps on NIH grants should be revisited so that PIs do not have to compromise in other budget categories, such as by making artificial reductions to their own percentage efforts, to pay postdoctoral scholars competitively. Support to provide postdoctoral scholars with standard benefits, such as childcare stipends and access to retirement accounts, is also needed.

As representatives of a public institution in [redacted for anonymity], a region with a very high cost of living, we encourage the NIH to consider developing flexible policies to allow for higher salaries in high-cost-of-living areas, as is done for federal employees. Although we acknowledge that such policies can create new equity issues, we ask that the NIH carefully evaluate whether they can be constructed and implemented equitably, using cost-of-living adjustments for federal employees as a possible model.

Finally, we suggest that the NIH loosen the restriction that NIH Diversity Supplements and T32 grant funds cannot be combined with other federal funds. Currently, NIH Diversity Supplements for postdoctoral scholars are below the minimum salaries that postdoctoral scholars can receive at our institution. PIs must fill this gap with discretionary funds, which they often lack. Allowing NIH Diversity Supplements to be used in conjunction with other federal funds, such as R-series grants, would promote the use of this important funding mechanism for historically underrepresented postdoctoral scholars. Similarly, allowing PIs to supplement T32 grants with funds from their other federal grants would help them recruit and retain postdoctoral scholars.

Proven or promising external resources or approaches

First, we recommend that the NIH conduct surveys and qualitative interviews with postdoctoral scholars to better identify and understand their needs. These interviews should represent a broad range of disciplines (e.g., basic sciences, clinical research, population health, social sciences, etc.), geographies, and demographics. Second, we recommend that the NIH seek input from postdoctoral scholars and faculty to identify exemplar public and private institutions that have excelled at enhancing their postdoctoral training ecosystems. The NIH should then determine the key characteristics and practices that make these exemplars successful environments for postdoctoral scholars and broadly disseminate this information for emulation by other public and private institutions.

Response 2796

Perspectives on the postdoc roles and responsibilities

I am generally happy with my responsibility as a postdoc, that I have freedom to pursue my interests. This is mainly because I have a very good relationship with my PI. I am able to do research, and also participate in teaching and service with my PI's blessing. However I know that is not an option for everyone; some positions I interviewed for said that was not ok because my primary responsibility as a postdoc was research. This reflects the challenging status of "trainee"—because we are often treated as employees and denied options for professional development, but paid (lower) because we are trainees.

Fundamental issues and challenges

Pay is challenging especially where cost of living is high. I am only paid fairly because there is a postdoc union at my university. I received F32 which actually hurt my pay/benefits status at the university which I was told I should be ok with because of the "prestige." Prestige is not enough when I also lose retirement benefits and maternity leave, and it makes my tax status challenging because the university does not have to report my fellowship-funded wages to the IRS. Also getting my fellowship actually made funding situation more challenging for my PI because she has to pay the remainder of my salary + additional to make up for lost benefits (my wage is determined by the union) off of non-NIH grants, and most of the lab funding is from NIH.

Existing NIH policies, programs, or resources

NIH fellowships are very useful but actually hurt my pay as a postdoc. Having clearer policy about benefits and pay that come from NIH would make it harder for universities to lower the pay or reduce benefits of postdocs. Having cost of living adjusted wages or wage brackets based on cost of living would help reduce the burden on my PI to get non-NIH funding to supplement by F32-funded salary up to the pay level required by the university.

Proven or promising external resources or approaches

No response

Response 2797

Perspectives on the postdoc roles and responsibilities

The postdoctoral position should be a position that allows a newly minted PhD to conduct research in a semi-supervised fashion, forging their unique research niche in collaboration with their mentor. The emphasis needs to be on the additional training in techniques and intellectual novelty that best serve the postdoc —NOT an emphasis on simply churning out a high-impact paper for the lab.

Fundamental issues and challenges

1) money. The best postdoc positions are often in the highest cost of living area (speaking as a postdoc living in Los Angeles). The low pay is a serious detriment to the quality of life of postdocs, perpetuating a work-life imbalance by making it difficult to have a reasonable quality of life outside of work that then encourages more work. Importantly, as someone trying to have a child, I simply do not know how I can afford childcare while working in the lab. My partner also works full-time. University-sponsored daycare is 70% of the monthly salary. I moved away from family and friends for this position and have no personal network to rely on for childcare. It is a serious cause of concern and may make me drop out of the postdoc workforce.
2) job insecurity. I am a highly educated, highly trained professional, yet there are few positions that use my unique research skills outside of academia. If academic institutions had more staff scientist roles (that paid meaningfully better than an entry postdoc), there would be more career options for me.
3) work-life balance. The practical benefits of academic research (flexibility, freedom of scheduling) are not utilized enough, instead encouraging a 'work all the time' mindset rather than a 'create your own schedule' mindset.

Existing NIH policies, programs, or resources

Postdoc NRSA salary guidelines are used as a standard across most universities and are wildly low. They need radical adjustment upward, similar to the new HHMI postdoc pay guidelines (minimum 70k). NIH raising their NRSA salaries for postdocs would drive the entire country to do the same. This understandably causes a crunch on lab budgets, including R01s that have gotten weaker over the years. But something has to give. Raising postdoc pay may be enough pressure to drive an increase in R01 budgets that can accommodate the raise. But we cannot fix the system all at once. We can only fix one piece at a time. And we can start with postdoc pay.

Proven or promising external resources or approaches

No response

Response 2798

Perspectives on the postdoc roles and responsibilities

An important step transitioning from finishing training as a graduate student to more independent positions.

Fundamental issues and challenges

- Post-docs' pay should be better adjusted to current levels to stay competitive with the industry to recruit the best professionals and provide them with salary to focus on research. Institutions currently treat the NIH's recommended minimal post-doc salary as THE salary that post-docs receive, not as minimal recommendation. Therefore, it's crucial it would be adjusted to the market to stay competitive, especially in high costs-of-living areas. An annual increase of the salary to accommodate inflation, rent increase etc.
- Guaranteed benefits that are standardized nationally.
- Independent funding so post-docs wouldn't be trapped in abusive groups. And Individual Development Plans shouldn't be 100% dependent on the PI, as it may lead to further abuse.
- Institutions should be forced to publicly release all policies before recruitment of the post-doc, so it's known beforehand.
- A kind of ration of PIs should be implemented, where the knowledge of all publications, sources of funding, and most importantly, quality of the training (given by trainees) is available to the recruited post-doc candidate.

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

Response 2801

Perspectives on the postdoc roles and responsibilities

Post-doctoral fellowships are opportunities to hone skills, develop new skill sets, and explore career options. One critical component lacking in many traditional scientific post-docs is the inclusion of technology transfer (TT) training. Whether pursuing a TT career or another path, TT has become an important part of the research landscape. Post-docs may be exposed to TT through their PI's experience or if they seek it out themselves, but do not receive the full picture of the commercialization process. TT is necessary for basic research (materials/data transfers, etc.) and translational research (collaborations, patents, licensing, etc.). Thus, there is an unmet need for formal and expanded TT education for post-docs.

The National Cancer Institute's Technology Transfer Center offers several educational programs to suit various needs and interests of post-docs and would like to suggest that other institutions consider adopting similar programs:

"Technology Transfer University"—Free seminar series open to the entire NIH intramural community as a way to share information on TT topics, without the need to attend every session.

"Technology Transfer Ambassadors Program"—geared toward post-docs ready for a career shift who want to gain more in-depth and hands-on TT experience.

"Transition to Industry" fellowship—For post-docs interested in an industry career and are working towards commercializing an invention.

"Advancing Innovations through Mentorship"—Like I-Corps, post-docs participate or lead teams with NIH intramural investigators and business partners working toward developing research into commercial products.

Knowledge of TT and commercialization is vital for investigators whether they pursue careers in academia, industry, law, or non-traditional paths to navigate collaborative research or to bring new therapies and other impactful products to market to benefit public health. Therefore, TT should be included in a more strategic and purposeful way in the post-doc curriculum, including the adoption or expansion educational programs such as those mentioned above.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

One of the most exciting translational programs, I-Corps, has recently been made available to a limited number of intramural researchers at NIH Institutes/Centers. Advancing Innovations through Mentorship (AIM) is a new program for NIH investigators that pulls from traditional I-Corps programming but has been re-designed to meet the needs of and advance federal discovery/invention development arising from

the NIH Intramural Research Program (IRP). AIM helps participants gain valuable insights regarding how to translate technologies from lab to market.

AIM was developed through a partnership between NCI's Technology Transfer Center (TTC), NCI's Small Business Innovation and Research Development Center (SBIR), and NIH's National Center for Advancing Translational Sciences (NCATS). AIM is based on the I-Corps-at-NIH program, a successful entrepreneurial training that helps Phase-I SBIR/STTR-awardees assess technologies, recognize commercial opportunities, and build scalable business models. Recognizing the gap that no such program exists for the NIH IRP to support discovery advancement and development, AIM was founded.

Since 2020, NCI TTC has sponsored 15 teams (with 67 participants, of which 28 were trainees). AIM teams learn from stakeholder interviews what the most important market considerations are for their research. Feedback through post-course surveys and discussion showed that all teams thought AIM either met or exceeded their expectations, with one participant commenting: "AIM was great. All NIH scientists should go through this program."

NIH scientists who complete AIM report that they are better prepared to communicate effectively about their research to various audiences (business, scientific, layman), can identify how their research can make the largest impact & support the trajectory of their research, and have an expanded professional network of potential collaborators. Thus, the impact of AIM for early career scientists is substantial and the program would be beneficial as an NIH-wide initiative for all scientists and those across academia, especially post-doctoral trainees.

Proven or promising external resources or approaches

The pursuit of careers in research translation, commercialization, and industry is rapidly growing, but it doesn't seem like the traditional scientific post-doc has changed much to address this shift. For example, NIH might not be the typical organization post-docs turn to if they are interested in a career in industry or entrepreneurship, but there are plenty of NIH investigators with these commercialization skills and new pockets of training programs have sprouted to help NIH trainees interested in these areas. If NIH, or other organizations, are not traditionally known for these efforts, they are at a disadvantage for recruiting this subset of enthusiastic post-doctoral candidates.

To fill this need, the National Cancer Institute (NCI) recently developed a Transition to Industry (T2I) Fellowship for postdocs/research fellows in NCI's Center for Cancer Research (CCR). T2I Fellows spend 80% of their time in the lab and 20% learning to accelerate the development of an NCI invention towards commercialization. Trainees learn about business development and entrepreneurship, receive hands-on training with experienced Technology Transfer Managers and Small Business Innovation Research (SBIR) program experts, and develop a professional network dedicated to moving research from bench-to-bedside. T2I Fellows expand their skills at the bench and beyond. This uniquely positions them to do high-impact, translational research that has a greater chance of being commercialized, benefiting society and public health.

T2I and similar programs should be further developed, supported, and expanded across NCI, NIH Institutes/Centers, and academia to improve postdoctoral recruitment, bring new commercialization and patient focused minds to these organizations, and provide current interested post-docs with actionable experiences to better prepare them for industry.

Response 2803

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is most useful for learning new methods and developing a scientific portfolio and plan for getting an independent position.

Fundamental issues and challenges

The biggest tradeoff of the postdoctoral position is the pay that you leave on the table by not pursuing a job in industry. While postdocs function relatively independent, the position is considered a 'training' position so the compensation has been limited.

In addition the position has no definite end date, but is considered temporary. Thus there is a large amount of uncertainty when it comes to the length of time you will spend as a postdoc, and the geographic location in which you will end up once the postdoc is over.

For senior postdocs, the limited opportunities for external funding and the slow progression of transition awards to younger postdocs has made it more difficult to establish a history of success in getting grants. This hurts postdocs who are transitioning into new areas, work on fields that are traditionally slower, who had limited publication history as graduate students, or who must juggle family responsibilities. This also hinders the ability to get an independent position.

Existing NIH policies, programs, or resources

In addition to the K99 awards which now bias toward younger postdocs (and highly overlap with the age group for F32s), more transition to independence awards are needed for postdocs who have 'clocked out' of eligibility. The external funding for these awards are also now adding in time limits that more closely reflect the K99 award so the overall opportunities for more senior postdocs is limited.

Proven or promising external resources or approaches

No response

Response 2804

Perspectives on the postdoc roles and responsibilities

It is a mentorship/training experience that requires commitment by investigators and institutions to the career advancement of the trainee, while at the same time supporting rigorous and meaningful research. The trainee must be 100% committed to the training opportunity, the mentor, and the project and be willing to put in the effort to improve their scientific credentials and professional skills. Regular assessment of the training program is necessary to ensure that the experience is to the mutual benefit of the trainee and the mentor. The trainee must be committed to establishing specific milestones and working to the best of their ability to meet those milestones.

Fundamental issues and challenges

Not in order of significance, the following are increasingly impacting our ability to recruit and retain high quality applicants:

1. pay—after so many years of being a student and in most cases not having much/any income, it is increasingly difficult to convince well-trained, highly educated early career investigators to work for what we are having to pay bachelors degree research assistants—yes, passion is necessary to make it in science, but the world is changing and some improvement in pay for trainees would likely help the current dire situation;
2. benefits—many institutions do no supplement NIH training salaries (even if medical benefits are covered by the additional NIH allotment), which means no retirement benefits, no sick time, no vacation—a trainee supported by an R01 is far better off than one supported by a T or F, and neither one is as well off as they need to be to keep the workforce strong; and
3. expectations—I do not believe that the bar needs to be lowered for early career investigators to get their first grant (less expectation brings lower performance), but I do think the path to funding needs to be crystal clear and actively facilitated—young folks are often so discouraged about funding that they do not attempt to get funding —while those who submit applications are still getting funded —it is a matter of perception that needs some sophisticated marketing.

I also think that mentors need a roadmap so as to clarify and optimize their role in the training experience. Some terrific scientists are lousy mentors, perhaps because they had a lousy mentor and/or they were never informed as to what a good mentor is—word travels and trainees lose interest.

Existing NIH policies, programs, or resources

Increase pay, provide benefits, give guidelines to trainees and mentors so that the training experience is as positive as possible for both parties, and provide incentives for early career scientists to submit grant applications.

Proven or promising external resources or approaches

Recruiting fairs (especially at institutions that are not tier 1 research—there is a massive talent pool out there that is not being reached and that does not know the opportunities that exist), incentives with milestones, guidelines (for trainees and mentors) to clarify expectations and pathways to success.

Response 2805

Perspectives on the postdoc roles and responsibilities

Postdoc position is an opportunity for me to broaden my training, follow my passion and do a meaningful science to help people.

Fundamental issues and challenges

Very low postdoctoral compensation is a problem. Majority of my talented classmates leaves academia to work in industry as the postdoctoral salary is not enough for a person starting a family or even a single living in the NYC or California where we need to compete to rent expensive apartments with people having a salary many times higher than postdocs, frequently with a lower education status. It is really discouraging to stay in academia when you end up applying for income restricted units or ask your parents for support. Postdocs are not students anymore. Those highly educated people starting their families. Think about it.

Existing NIH policies, programs, or resources

NIH funding should be expanded for international researchers, who most of the time are discriminated and just not eligible to apply for most fellowships. That makes them go back to Europe to pursue their career being discouraged to stay in the USA without a chance to build up their rÃ©sumÃ©s.

Proven or promising external resources or approaches

There should be more training available preparing postdocs for pursuing a tenure track positions. More grant writing courses should be available. Moreover, PIs should be trained to be a good mentor for trainees. A good scientist doesn’t necessarily mean they are good mentors to support your researchers and encourage them to stay in academia.

Response 2806

Perspectives on the postdoc roles and responsibilities

For me is more than a training. You are already a professional scientist when you starts a postdoc, but it is the only alternative to grow as a researcher until have a faculty position.

Fundamental issues and challenges

Most of PIs look as postdocs as a cheaper hand for research, specially the international postdocs, where they belief there is no hours for relaxing even in the weekends, you should be 100% work

Existing NIH policies, programs, or resources

First, we are qualified professionals and should have an increase in the base salary. We are studying for years when we enter in a postdoc position.

Proven or promising external resources or approaches

Give international postdocs a more specific visa that could easily been transformed into green card, after proven of work and accomplishment in scientific career. Understand that post docs are very qualified people and need to be recognize by that, also in terms of salary.

Response 2807

Perspectives on the postdoc roles and responsibilities

I view a postdoc as a necessary transition phase from graduate student to independent scientist. For me, I hope to be prepared for a career as a PI in academia.

Fundamental issues and challenges

Money! The average pay for a postdoc starting is $53K. Are you kidding? I will be 29 when I get my PhD. I will have dual bachelors degrees and a PhD in neuroscience from [redacted for anonymity] and that's worth $53K a year? I don't think so. It's hard to want to stay in academia.

Existing NIH policies, programs, or resources

Raise NIH minimum postdoc salaries! Look at HHMI—$70K starting now.

Proven or promising external resources or approaches

HHMI minimum salary increase

Response 2808

Perspectives on the postdoc roles and responsibilities

postdocs conduct semi-independent to independent research and are, in turn, responsible for mentoring/training graduate students, undergraduates, and high school students. a high degree of professionalism is expected

Fundamental issues and challenges

postdoctoral salaries are not competitive with private institutes or industry; the lack of benefits, parental support also limits the talent that can be retained. the lack of parental support also places undue stress and limits research productivity; the calculus for deferring any meaningful retirement investment of a postdoc vs industry position means those who do a postdoc will need to work many more years and have less flexibility in career decisions

Existing NIH policies, programs, or resources

the NIH modular limits and budgets need to be aligned with new graduate student and postdoctoral stipends or there will be an imminent loss of productivity on grants due to personnel shortages

Proven or promising external resources or approaches

No response

Response 2809

Perspectives on the postdoc roles and responsibilities

- Opportunity to develop independent research trajectory in an environment that allows supervised training and mentoring
- Learn interdisciplinary skills
- Opportunity to enhance publication and leadership training

Fundamental issues and challenges

When to apply for a postdoc—time for a postdoc to actually start the position—be clear on how long the hiring process take

- Beginning of postdoc, share about pathways for retention, what are the options, and what is expected for the postdoc to have to get in there whenever they are at the end of the training
- Benefits—such as health insurance, dental, 401k, maternity leave
- Support for moving to a new location
- Better information about taxes report—W2
- Compatible salary for Ph.D. in other positions
- Mental health resources—work balance, career development—overcome the stress of uncertainty about the future
- Postdocs do work that is not related to their career development. Instead can be used to do all types of work when PI doesn't hire proper research staff.

Existing NIH policies, programs, or resources

- Eligibility of visiting fellow to K awards. Right now, only K-99, other institutions such as AHA, now ACS allow visa holders to apply for grants as long as the research is developed in US territory. Many international postdocs are on the pathway of permanent residence or citizenship. Limiting opportunities beyond of limiting science also limits the researchers from entering the residence or citizenship pathway.
- Expand benefits for 401k
- Clarity on policies for international researchers, what we are eligible and what we are not
- Allow international researchers to apply for diversity supplements. Same as the K award justification.
- Make the IDP mandatory and not suggested. Institutions and PI should have a clear contract with the postdoc on what the postdoc will provide to them and what the expectations are.
- Postdoc should have precise time for the development of independent researcher vs research staff activity, such as bench work non-research related research staff activity.

Proven or promising external resources or approaches

Recently the American Cancer Society (ACS) removed the legal permanent residency criteria for grant applications. The same approach was already taken by the American Heart Association (AHA) and the American Association of Cancer Research (AACR). As long as the project is developed and conducted in the USA, visa holders can be funded to conduct research with grant money from the US.

Response 2811

Perspectives on the postdoc roles and responsibilities

At [redacted for anonymity], we define our postdoctoral fellows (PDFs) in accordance with the 2007 definition by National Institutes of Health and National Science Foundation: "[a]n individual who has received a doctoral degree (or equivalent) and is engaged in a temporary and defined period of mentored advanced training to enhance the professional skills and research independence needed to pursue his or

her chosen career path." We consider our PDFs neither student nor staff, but a unique class of scholars that come to this institution to prepare themselves for careers of their choosing. Our PDFs represent an invaluable talent pool that enrich our institution with scholarly achievements and impactful contributions to the community.

We view the PDF position as one of training and growth. Time as a PDF should be designed to provide the scholar with the necessary tools and guidance to develop the skill sets, knowledge and credentials to embark on careers of their choosing. While day to day life of PDFs varies tremendously across fields, training is not limited to research, but encompasses all levels of professional growth through opportunities for coursework, teaching and mentoring, by enhancing communication and networking skills, and by exposing PDFs to various career opportunities. Although many PDFs seek careers in academia, we recognize the value in exposing them to a broad spectrum of career options across industry, government and private sectors. It is the responsibility of the institution and the mentor(s) to bring out the best in PDFs by providing an environment that promotes equity and inclusion, and that prepares these scholars as the next generation of leaders in research, education and service.

Fundamental issues and challenges

There are several challenges expressed by our community of PDFs.

- Financial: We require all PDFs regardless of discipline to receive at a minimum, the salary equivalent to year 0 of a NRSA fellow. While PDFs supported by NRSA fellowships receive annual increases, others do not necessarily receive these increases. Furthermore, most PDFs do not find even the NRSA pay scale to be competitive with other opportunities. Many PDFs are starting families and purchasing their first home, with many financial obligations.
- Childcare: The high costs in childcare are a significant burden to PDFs with families. This, too, can make it non-competitive for postdocs to stay in this type of training.
- Disenchantments with academic careers: A career in academia is becoming less desirable to recent PhD grads, based on struggles they witness among faculty, particularly with respect to maintaining work-life balance and having to sustaining research programs with low funding pay lines.
- International PDFs: In addition to the many challenges associated with moving aboard, international PDFs have limited funding opportunities. They also experience pressures to find employment after the postdoc as many would prefer to stay in the U.S. to conduct their professional work, but can only do so with the promise of a position that will sponsor them.
- Professional development: Our institution has professional development offices dedicated expressly for PhD students and postdocs, and we have policies requiring annual IDPs. However, we feel that faculty mentor support of professional development can vary, especially for PDFs who are exploring careers outside academia.

Existing NIH policies, programs, or resources

We very much appreciate all the current policies and programs sponsored by the NIH for PDFs. To help alleviate noted concerns and challenges, we recommend the following modifications:

- Require PDFs supported on NIH research grants and other federal sources to follow the NRSA pay scale for annual salary raises, and consider an external review of the NRSA pay scale in light of the current (non-academic) job market for scientists
- Expand the childcare subsidy program recently implemented for NRSA recipients to include all PDFs supported on NIH research grants.
- Develop additional funding mechanisms or expand on pre-existing ones to increase the number of grants PDFs are eligible for, particularly in the case of international PDFs which have limited options for funding.
- Require faculty funded by NIH research grants to complete a mentorship training program and to submit training plans for PDFs supported on research grants.
- Require all NIH funded PDFs to form mentoring committees comprised of at least three faculty, including one from outside their primary department.
- Increase NIH support for professional development, particularly with PDFs exploring non-academic careers. Require all NIH funded PDFs to engage in a minimum number of professional development hours per year, unrelated to what they are doing as part of their primary research.

Proven or promising external resources or approaches

Many private foundations, such as Loreal have PDF fellowship awards that include a funding allowance for research. This provides the PDF with a strong sense of independence, having an ability to create and execute research they may call their own. Our own institution also has a small number of such slots, but they also are supported through philanthropy. The NIH may consider modifying their current fellowship or F32 award mechanisms to provide certain PDFs with an allowance for research to foster independence.

Our institution has devised and implemented a number of university wide policies that ensure equitable and fair treatment of 1600 PDFs across 11 divisions regardless of PDF research discipline or funding source. One example of such equity is health care benefits. Many peer institutions struggle with inequitable health care options for PDFs on salaries versus stipends, whereby PDFs on salaries are automatically enrolled in staff health care plans while PDFs on stipends are required to find their own health care using the NIH provided institutional allowance. Our institution has solved this issue by creating an affordable health care plan just for learners where PDFs on salaries and stipends are automatically enrolled in through a fringe-based mechanism. The NIH may encourage other institutions to strive for similar equity among PDFs by providing guidance on policies and mechanisms for supporting PDFs on salaries and stipends alike.

Response 2812

Perspectives on the postdoc roles and responsibilities

I view this position as a period of expanded training, with emphasis on acquiring new skills, exploring a new discipline, maturing as a scientist and gaining more independence.

Fundamental issues and challenges

The biggest challenge facing post-docs is pay. The starting salary of a postdoc at my institution coincides with the NIH minimum, although I am located in San Francisco, an extremely high cost of living area. As a person in my 30s, I feel that I have few savings, no assets (no car, no home, no investments, little to no retirement savings), and am failing to meet financial and life milestones of my peers in other industries. I have to live in a shared apartment with roommates, because I cannot afford to live on my own. If I didn't have family assets to rely on as a source of emergency funding, I would not have chosen to do a postdoc. As a woman in science, I cannot imagine having children at my current pay scale, especially given the high cost of day care and the extremely limited maternity benefits (too little time off during pregnancy and postpartum, no financial support for childcare, little availability of childcare onsite at my institution).

Existing NIH policies, programs, or resources

NIH postdoc payscale needs to be radically altered to adjust for inflation and high cost of living in many institutions. Best institutions (often the ones that get the most funding) are largely located in high cost of living areas, and fellowships/training grants should have built in mechanisms to adjust for this. NIH, rather than private foundations, many of which provide fellowships with much better pay and benefits, needs to be a leader in terms of benefits related to work-life balance, maternal leave, and childcare subsidies.

Proven or promising external resources or approaches

Interact with postdoc unions!! Many unions have formed in different institutions across the US and they have a very up-to-do view on postdoc challenges and initiatives to address them. This is one of the most important and most effective catalysts for change in the postdoc communities that I have seen. NIH should support postdocs right to strike and unionize. NIH should also follow, or better yet, exceed, benefits that have been recently announced by HHMI ($70,000 minimum salary).

Response 2813

Perspectives on the postdoc roles and responsibilities

At [redacted for anonymity], Postdoctoral Fellowships are mentored training positions with a limited term (five years max) designed to support individuals' transitions to a wide variety of permanent career positions.

The inclusion of a "wide variety" in this definition reflects our efforts to support postdocs at a time when faculty-level academic roles are challenging to obtain and also recognizes the lack of career exploration

support historically provided at the graduate level. The "postdoc culture," largely propagated by outdated policies and norms that impact their experiences, needs to change.

In alignment with the response of our academic partnering institution, the [redacted for anonymity] we submit that:

For industry/biotech/pharma, 2-3 years of postdoc experience may be sufficient

For those interested in academia (faculty/teaching roles), 5 years of postdoctoral training are required provide an opportunity to transition to independence

We also believe that career exploration should be a more direct and focused experience during graduate training. This includes career paths that do NOT require postdoctoral training, from administration to science writing and similar career paths.

In regard to the postdoc experience, we also align with UPenn (and the National Postdoc Association, NPA) and believe that the following are critical components of postdoc training:

Protected time for professional development (lab management, science communication, mentorship, teaching, etc.), including soft skills

Grant writing AND reviewing experience

Mentor/mentee expectation setting

Required research-specific performance evaluations and individual development plans (IDPs)

Finally, we believe that the postdoctoral position needs to be reimagined to recognize postdocs as research professionals rather than "trainees." Postdocs commenting on this response shared that fellows are underpaid, underappreciated for their advanced technical skills, and not provided the room to grow as independent researchers. This is largely due to long-held scientific norms that diminish the critical role of postdocs in science.

Fundamental issues and challenges

Many issues and challenges factor into recruitment and retention. The following includes direct feedback from postdoc leaders in the [redacted for anonymity] community:

Insufficient salary for highly educated and trained researchers at odds with similar positions in industry and elsewhere, often which do not adequately consider cost of living (the NPA 2023 Postdoctoral Barriers to Success report indicate that salary has a negative impact on 95% of postdocs' professional and/or personal lives)

Perhaps associated with poor salaries, postdocs are frequently treated as highly-skilled, but inexpensive labor, with faculty treating them as technical workhorses without focusing on supporting their advancement to independence

Poor mentorship, often the result of lack of PI mentorship training

A poor work environment, often the result of a lack PI management training

A long-standing, propagated culture that postdocs "must go through the paces" of a challenging postdoc experience to earn their way to advancement

Uncertainty in the job market and financial climate leads postdocs to explore roles perceived to be more stable or financially worth the transition risk

Complicated visa and immigration processes and a lack of NIH funding opportunities for non-US citizen researchers

A lack of diversity in the US academic scientist workforce, especially among academic faculty

Existing NIH policies, programs, or resources

Funds for postdoctoral salaries and postdoctoral training should be increased

Expansion of or more grant opportunities like the K99/R00 Pathway to Independence Awards

Reevaluation of the T32 funding mechanism based on outcome studies showing that it may not be effective in producing intended career outcomes

K awards should provide funding for students/assistants/techs to support mentorship training of fellows, as well as providing technical research support

Additional grant programs supporting international postdocs

Graduate training should invest in formal career education and exploration, including hands-on training; part of that career exploration and training should include preparation for postdoctoral training as a means to enter academic/faculty roles

Additional financial incentive to create postdoc offices at underfunded institutions

Modify the Research Career Pathways infographic (NIH Resources webpage) to highlight how graduate research training compliments other career paths, including science administration and management, science policy, science communication, and regulatory science.

Faculty mentorship training should be required or strongly considered when evaluating NIH grant proposals

Mentee training for postdocs should be formalized as a fundamental competency for postdoc training

Mentoring committees should be strongly recommended or required for all fellows funded by NIH grant funds

NIH should create or expand programs to support staff scientist positions in academic labs (this would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs, while providing clear differentiation between these positions and postdoc positions)

Postdocs should receive equitable benefits packages (including well-being support), regardless of their source of funding

More data should be collected and presented, including outcome data, to ensure that the postdoctoral experience can be refined and shifted to meet the evolving needs of the US biomedical research enterprise

Proven or promising external resources or approaches

Create an External Resource Clearinghouse

The NIH Working Group should refer to the NPA Recommended Postdoctoral Policies and Practices, the triennial NPA Institutional Policy Surveys from the last decade, and more specific pieces within the NPA Resource Library. Currently, institutions and NIH IC's develop their own development resources, which is inefficient and leads to inequity among postdocs at different institutions. NIH should provide a centralized hub linked to resources from NPA, Postdoc Academy, PDHub, OITE, professional societies, and individual ICs/universities. In an increasingly virtual environment, a comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally funded research but also its community resources.

Reimagining the Traditional Postdoc Office

We recognize that the size and funding of administrative—and faculty-based postdoc offices (PDOs) vary wildly across the US. At [redacted for anonymity], we have utilized growth trends across the enterprise to create new tiers of support in what was originally a PDO with one administrator. Since 2003, we have grown to incorporate student programming, diversity, specialty research education programs, and research staff development to bolster our impact, bringing our total FTE staff to 16.

While this expansion may not be feasible at all research institutions, we believe that PDOs should take steps to "future proof" their offices by expanding their reach into other communities. In particular, career/research/professional development support for research staff (technicians, PhD researchers, etc.) aligns in many cases with programs provided to postdocs. Should NIH initiate changes postdoctoral salary/support/training, we may see a decrease in the overall postdoc population. Increasing the scope of support of PDOs will ensure that we don't see a knee-jerk reduction in PDOs and personnel during this period of change.

Response 2814

Perspectives on the postdoc roles and responsibilities

Gain training and more experience in the field to become an independent researcher and supervisor

Fundamental issues and challenges

Money. Hours. Work/life balance. Money, money, and more money. Whether salary or grant funding.

Existing NIH policies, programs, or resources

More experience in learning new techniques in our fields to help improve research aspects later on. More start to finish career pathways that are similar to K99 but allow for those that attended smaller universities to have a better chance.

Proven or promising external resources or approaches

Unsure

Response 2815

Perspectives on the postdoc roles and responsibilities

I view it as a stepping stone to a career in science. In other words, a temporary training position with increased independence after graduate school.

Fundamental issues and challenges

1. Faculty stress about funding, even when they are funded. PhD students see their major advisors constantly chasing the next grant and it is not an attractive career / lifestyle for most. They look for industry or jobs that don't depend on grant writing.
2. Industry salaries are higher, for the most part.
3. Inhibiting retention: There is a shortage of career technicians in most academic labs compared to 10 years ago, because salaries are not competitive. As a result, PI's are forced to utilize their postdocs for tasks normally performed by technicians (animal colonies, for example), Postdocs see no path to publication and leave.

Existing NIH policies, programs, or resources

Number one issue that postdocs bring up at least weekly in our postdoc office: the rule that postdoctoral fellows cannot be considered employees. The lack of a W-2 /1099 makes it difficult for them to obtain mortgages, or even leases. They aren't building retirement equity because no FICA. They want to be "adulting"and being a fellow does the opposite. (Not true for K-awards) Most postdocs supported by a T32 or F32 at some point change from an employee to a non-employee while at our institution and when this happens they have to go through all of the onboarding steps again as if they were a new employee. It would be such a relief to postdocs and admins to allow postdocs supported by training grants to be treated the same way as those supported by R grants.

Proven or promising external resources or approaches

No response

Response 2816

Perspectives on the postdoc roles and responsibilities

There should be well defined roles **and responsibilities** for postdocs. Most postdoc positions are non exempt positions, which means they are expected to work more than 40hrs per day if required and does not involve extra pay for the same. It is understandable that lab work cannot happen in the boundaries of 9-5 everyday, but there should be more specific boundaries under the 'non exempt' description so that postdocs are not exploited.

Fundamental issues and challenges

Roles and responsibilities for US postdocs are not well defined in most labs. They are expected to do anything and everything under the roof, and still considered as not enough. We expect to polish our training in research after our PhD. Sadly, we are not treated with respect and treated as cheap labor. Sadly, this is genuinely how most postdocs feel. There is zero work-life balance: I personally have been in labs where the PI directly orders to work for minimum 55-60 hours a week, in addition to sending aggressive emails. This is not what we envision when we start our journey from our home country to a foreign land, leaving behind our families and coming so far from home just to hone our skills and make our lives/careers better. In the fear of losing jobs, most postdocs remain quiet and tolerate these sufferings. We are here for the love of science, but that is what we are not allowed to do because if one is so mentally harassed and not happy, one cannot perform or contribute to science. This is the basic thing that most PIs do not understand, and they just impose tyranny in their labs.

Existing NIH policies, programs, or resources

There should be more guidelines for PIs in an institute just like for others, in the sense, yes they have the liberty to run their lab their way, but I think there should be some courses that they need to take on how to mentor, how to treat their employees. Regulations should be such that postdocs are not afraid to report the truth to the institute where they are employed at. There should be strict rules where PIs would be warned to a level that they do not treat their employees badly (after the institute receives atleast 2 bad exit interviews against them). Exit interviews should be taken seriously and not just as a formality. Bad PIs just keep continuing their bad deeds year after another, and postdocs keep coming and going. This way their happens no growth at the level of science nor at the individual levels (both employer and employee). This does not mean that good PIs do not exist, but that is mostly a rare event these days. Firing policies should also be reformed from time to time so that PIs cannot take advantage of the postdoc,s visa situtaion: most international postdocs come on a J1 visa which does not allow employment gap in between two employments. PIs take advantage of this particular situation and fire postdocs at their whims. Rather there should be proper work plans so that there is enough justification for firing someone.

Response 2818

Perspectives on the postdoc roles and responsibilities

Critical workforce for academia, and training of the next generation of scientists. Losing them to industry will ultimately grind an academia to a halt.

Fundamental issues and challenges

Need to pay them far more than we do

Retaining them is hard right now, and many talented trainees are leaving or bypassing post doctoral training altogether

Existing NIH policies, programs, or resources

Increase grant funding so we can pay postdocs more , provide more resources to keep them in academia

Proven or promising external resources or approaches

No response

Response 2819

Perspectives on the postdoc roles and responsibilities

Traditional postdoctoral training prepares trainees for becoming sole PIs of R-level grants in a tenure-track position in academia. Historically, many PIs amassed substantial funding without unfunded periods. This path is less and less common due to several factors:

First, the complexity of research has increased, and multiple PI (MPI) and large multi-site collaborations/consortia have become the norm. Large, multidisciplinary teams of many co-investigators are needed. To address this, NIH-funded postdoctoral training needs to train staff scientists and co-investigators who may not be PIs themselves but are key lab members. For them, postdoctoral training should focus less on 1st author publications, project leadership and competing for funding, and more on lab management and technical skills. The duration of training (e.g., T32) or mentored research (e.g., K award) may need to be longer to allow acquisition of increasingly complex skills.

Second, funding rates have decreased and it is harder to obtain a first R-level grant and to keep uninterrupted NIH funding. Many trainees and early stage investigators leave academia -despite a commitment to science—because of failure to obtain or maintain funding. This can be addressed by offering bridge funding and increasing funding rates for early stage investigators.

Third, NIH postdoctoral stipend levels have not kept up with salaries in clinical practice, industry or STEM start-ups. Of note, MD salaries during clinical training (residency/fellowship) are much higher than NRSA T32s stipends. Therefore, to recruit an MD to a T32 after clinical training requires a substantial salary cut. Not surprisingly, it has become very hard to recruit MDs and MD/PhDs to postdoctoral training grants. Likewise, K award and NIH salary caps are much lower than the salaries of faculty in clinical positions at the same rank. MD and PhD graduates are fleeing to positions in industry and start-ups, in search of fair wages.

Fundamental issues and challenges

One key issue is that the stipends for postdoctoral training and K awardees and the NIH salary caps are not competitive compared to the salaries of other jobs available to MDs and PhD graduates (e.g., industry, clinical practice and start-ups). Moreover, postdoctoral trainees and first time R01 awardees keep getting older and older. Therefore, they are more likely to have children and other caregiver responsibilities and their financial needs are higher. The increasing amount of loans from undergraduate and graduate school also contributes to this financial pressure. In addition, most large academic institutions are in urban areas with very high cost of living. Of note, these financial pressures are a key barrier to recruit and retain scientists of color and members of other under-represented groups, who lack family wealth to support themselves through long underpaid training. To keep MDs and PhDs in academia, these issues need to be addressed by increasing postdoctoral training stipends, K award stipends, the NIH salary caps and the R01 funding pre-authorization cap.

Another important issue is the lack of flexibility of NIH postdoctoral training to accommodate life events, family leave, illness, etc.

Finally, research is international; however non-US citizens and individuals on a visa are excluded from many training (e.g., T32) and career development (e.g., K23, K08) funding opportunities.

Existing NIH policies, programs, or resources

NRSA stipend scales and the K award salary caps need to be substantially increased and should be location-specific to cover at the cost of living in a given location. The NIH salary cap and the R01 pre-authorization cap should increase commensurate with inflation and with competing jobs in industry, private practice and start-ups.

T32 grants should provide protected effort/salary to program directors and should cover more administrative costs (e.g., for a fellowship coordinator) to be feasible/attractive to the PI and the institution. The administrative burden of applications should be decreased.

The indirect costs for T32 and other training grants should be higher (e.g., similar to that of non-training R grants), to reflect the true operational costs of the institution.

Citizenship and permanent residency restrictions should be removed from T32s and K awards. The current policy is inconsistent: why some grant mechanisms are available to individuals on a visa (e.g., K99/R00, R01, R21, etc.) while others are not (e.g., T32, K23, K08) is not clear.

NIH-funded postdoctoral training needs to offer opportunities to train staff scientists and co-investigators who may not be PIs themselves but are key members of a lab. For these individuals, postdoctoral training should focus less on 1st author publications, project leadership and competing for funding, and more on lab management and specific technical skills. Also, the duration of training (e.g., T32) or mentored research (e.g., K award) may need to be longer to allow acquisition of increasingly complex skills.

To decrease attrition, NIH should provide more flexible bridge funding, increase the funding rates for early stage investigators, and extend the early stage investigator period. It is our experience that many trainees and early stage investigators leave academia -despite a commitment to science—because of failure to obtain or maintain funding.

Proven or promising external resources or approaches

Comprehensive benefits, family and medical leave need to be incorporated in all training and other grants. This is a proven approach that attracts MDs and PhDs to other fields which offer these resources (e.g., industry, clinical practice).

Also, if a trainee or co-investigator is on extended leave, supplements should be available to cover grant goals or extend the grant duration. The childcare benefits for T32 trainees represent a first step forward but are insufficient.

Supporting laboratory leadership and mentorship training especially for diverse trainees.

Require practices that promote work-life balance.

Response 2820

Perspectives on the postdoc roles and responsibilities

Postdocs should have the ability and be encouraged to train/develop/participate in activities that build non-lab/bench skills during normal working hours. The NIH should work with institutions so that there is accountability and progress towards an environment that takes all forms of postdoc training seriously. Guidelines / formal mechanisms for official performance reviews as and onboarding so that both parties have clear ideas of scope, expectations, timing, etc. of the position.

Fundamental issues and challenges

Compensation should reflect the amount of education and training required to be a postdoc, it should also be subject to federal locality pay adjustments. To take my current position I had to take a pay cut even though my previous position was as a state employee (scientist) from a state with a lower cost of living and it only required a bachelor’s degree. There should also be a policy that postdoc pay is increased (to the appropriate level) with the fiscal year. My experience level increases 8 months into the fiscal year, because there is no bump at the start of the new fiscal year I spend 3/4 of the year at the previous fiscal year’s pay level. This year, there is a $1668 difference (approx my rent bill), this is exacerbated by the fiscal year splitting the calendar year in half. I will be moved to 2022 stipend levels in May 2023.

Existing NIH policies, programs, or resources

Postdocs should not lose their status as an employee for being awarded and accepting an NIH fellowship. If I were to accept a fellowship award I will lose: healthcare, disability insurance, dental insurance, employer matched retirement benefits, and all the protections that come with being an employee.

The NIH should expand programs and funding opportunities for staff scientists. There is a general attitude that after a postdoc you either go start your own lab or you leave academia. There needs to be real opportunities to continue as a highly trained scientist. In addition to providing another career trajectory

for postdocs it also allows for the continuity of lab knowledge from the day-to-day aspect in addition to the overall direction of the lab provided by the PI.

Proven or promising external resources or approaches

Having a central resource would be favorable for equitable distribution and access of resources.

Response 2821

Perspectives on the postdoc roles and responsibilities

Science communication is a core competency for all scientists and should be formally taught during early stages of their careers, as is cultural competency.

Fundamental issues and challenges

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2822

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Lack of stipend and salary parity with other non-NIH-funded positions available to MD and PhD graduates (e.g., industry, clinical care, VA, etc)

Existing NIH policies, programs, or resources

T32 and R25 grants should allow more flexibility for how funds are spent. For example: given the increasing specialization and complexity of methods, in many cases postdoctoral T32 trainees cannot find adequate training for a specific technique in the graduate school course catalog. Rather, tuition funds could be re-budgeted to attend a workshop or fund an away rotation in a lab to learn and master the technique. Another example is that for R25 grants the current caps for research-related costs are too low and do not allow trainees to lead any meaningful projects in expensive areas of research -e.g., MRI, stem cell, etc.—("Up to $5,000/year for individual NIMH R25-supported residents who are committing less than 50% effort in a given Post Graduate Year. In years where participating residents are committing 50% or more effort to the R25 program, up to $10,000 annually may be requested for research support"). Funds from other R25 allowed costs could be re-allocated to increase research-related costs.

For R25 grants, the current policy is that trainee effort needs to be cost-shared to the Graduate Medical Education resident fund. This is the case even if the residency program already has built-in research protected time. This policy should be removed for residency/fellowship programs which already have built-in research protected time.

Individuals on a visa should be allowed to obtain T32, R25, and K award funding beyond K99/R33.

Proven or promising external resources or approaches

Complete benefit and family/medical leave packages should be provided to all postdoctoral trainees.

Policies that foster work-life balance should be mandatory.

Response 2823

Perspectives on the postdoc roles and responsibilities

Given the career landscape and the lack of academic jobs, a postdoc should be a period of training for scientific positions inside and outside the academy, and not just faculty positions in the academy. Their role in the research enterprise should be acknowledged and their roles should be protected by the universities they work for, as opposed to being at the mercy of their PIs. Perhaps different types of postdocs should exist depending on professional goals of the postdoc and relationship to the mentor and the university with different funding models.

Fundamental issues and challenges

Pay; the NIH and universities are unwilling to pay postdocs what they are worth, and reliance on the federal funding for postdoc pay sets up a system that encourages less pay. NIH will need to demand that institutions pay more and request more funding federally.

Childcare, institutional racism, inadequate and hostile hiring practices at universities, unchecked mentors and a postdocs relationship with the PI instead of the university, terrible treatment of international postdocs.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2824

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] is an organizational member of the National Postdoctoral Association (NPA). We agree with the NPA's definition of a postdoc as "an individual holding a doctoral degree who is engaged in a temporary period of mentored research and/or scholarly training for the purpose of acquiring the professional skills needed to pursue a career path of [their] choosing" . Postdocs are first and foremost trainees and their position in a research lab should serve as a steppingstone toward their future career. A postdoc position should not be viewed as a long-term job, and it is the responsibility of both the postdoc and their mentor (i.e., principal investigator; PI) to commit to the postdoc's individual career development. For example, a postdoc pursuing an academic research faculty position should work with their PI to develop a project that they can take to their next institution. This postdoc should also receive training in grant/paper writing, leadership, and managing lab budgets from their PI and sponsoring institution.

Postdocs comprise a critical portion of the biomedical research workforce. Postdocs are experienced, highly trained scientists who conduct a large portion of laboratory studies that bring funding and recognition to institutions via grants and publications. In addition, they often serve as mentors to graduate students and lab staff, sometimes functioning as a bridge between the PI and other staff and trainees in the lab. The current academic system relies heavily on postdocs to generate data and drive research forward, yet postdocs receive little monetary compensation in return. Such a system is unsustainable, as NIH-funded institutions across the country struggle more each year to recruit and retain postdocs.

Fundamental issues and challenges

At [redacted for anonymity], salary is the number one barrier to recruiting and retaining postdocs. Like many institutions, [redacted for anonymity] postdocs are compensated in accordance with NRSA stipend levels. For a first-year postdoc, this would be $56,484/year. In contrast, a new PhD would make $83,000-$128,000 in industry. Many new PhDs forgo a postdoc position in favor of a job offering greater financial security. Low salaries also have a greater negative impact on parents and URM PhDs.

Postdocs funded by NIH fellowships are often not considered employees of their institution and do not receive adequate benefits. Due to ambiguous language in the NIH Grants Policy Statement, institutions do not know how they are allowed to supplement or classify NIH-funded postdocs.

70% of postdocs at [redacted for anonymity] hope to become PIs. However,

Existing NIH policies, programs, or resources

Generally, PIs want to offer higher stipends/salaries for their postdocs, but they are limited by their NIH grant(s). Over the past 3 decades, the average R01 grant amount has increased only enough to account for standard inflation. However, the costs of new research technologies have far outpaced inflation, and the amount of data required for publishing has also increased. PIs are being asked to do more and more with stagnant funding. The NIH must invest significantly more money into biomedical research grants if the current system that relies so heavily on postdoc labor is to continue.

The NIH should address the confusion and lack of transparency regarding employee benefits for postdocs. A first step would be a policy requiring NIH-funded institutions to provide employee-equivalent benefits for its postdocs. In 2012, the NIH Biomedical Research Working Group recommended this exact action. This same working group found that female postdocs who start a family often pause their research careers or leave academia due to the cost of childcare. Nine years later the NIH announced that NRSA postdocs could receive up to $2500 per year childcare support. While this policy is a step in the right direction, it is not sufficient and international postdocs are ineligible for this support. The NIH and the institutions it funds should offer childcare support to all postdocs, regardless of funding source, to ensure they have an equal opportunity to succeed.

To improve and standardize postdoc training and career development, the NIH could increase the number of T32 training grants that fund pre—and postdoctoral career development programs and open them to visa-holders. Additionally, the NIH could increase the availability of career development and transition awards that include a mentoring plan. These programs may encourage postdocs/their PIs to invest more into training and career development.

Proven or promising external resources or approaches

The Accreditation Council for Graduate Medical Education (ACGME) provides oversight of medical residency and fellowship programs. ACGME monitors teaching hospitals via surveys, data collection, and on-site visits to ensure trainees are receiving a high-quality education and are treated fairly. Residents and fellows also provide the ACGME with regular feedback about their programs. Because ACGME is a third-party entity, trainees are more empowered to speak up when issues arise, as there is less fear of backlash from their mentors. A similar accreditation system for research postdocs could help prevent exploitation and improve postdoc training.

To encourage PIs to devote more time and effort to career training, institutions could make mentorship a more important criterion for promotion and tenure. Institutions should better acknowledge and reward PIs who perform activities that foster a supportive culture, such as completing lab management/leadership courses, developing curricula for T32 and similar training programs, teaching undergraduate and graduate classes, and having regular check-ins with trainees. The National Academy of Sciences has made calls for these changes, recognizing that current tenure and promotion requirements emphasize scientific/financial productivity over many values of higher education.

To help postdocs explore non-faculty career options, institutions could offer fellowships or internships in which postdocs receive real-world job experiences. [redacted for anonymity] has a Research Administration Fellowship in which postdocs learn about the roles of different administrative offices and then complete a project lasting 6-12 months in a department of their choosing. Past fellows have found meaningful administrative careers in trainee affairs; DEI; and faculty recruitment. Another example is the Biotechnology and Life Sciences Advising (BALSA) Group at Washington University in St. Louis. BALSA is composed of local executives, faculty members, postdocs, and graduate students who team up to provide consulting services to biotechnology companies. BALSA alumni have become successful industry scientists, consultants, entrepreneurs, and patent agents.

Response 2825

Perspectives on the postdoc roles and responsibilities

Postdocs are the lifeblood of academic research. They have the skills, expertise, and resources (RE: time, which PIs do not have) to make the largest contributions to scientific progress. These positions are becoming almost uniformly 4+ years, which is essentially the length of a PhD, and those long periods carry immense pressure to be productive to set up and then follow through on job searching and also due

to low quality of life. Getting paid what is often near poverty wages for a PhD and then again for a similar period as a postdoc, all while working long hours in often stressful environments with varying (and often poor) institutional support is a huge barrier for anyone. Those barriers are insurmountable when individuals face additional challenges related to financial resources, health, and/or personal and structural discrimination. Still, a postdoc is often reported by successful academic faculty as the best times in their career due to the freedom and lack of administrative burden that weighs on faculty (though note the role of survivorship bias). Therefore, these positions have the possibility to be desirable if the quality of life is tolerable, and it is absolutely critical for the endeavor of science to minimize the stress and maximize the wellbeing and happiness of postdocs.

Fundamental issues and challenges

There are many factors at play, but for now I'll focus on financial burdens. Low pay during a PhD can be justified by the increased earning potential the degree provides on in industry or academia, but no such incentive can justify low wages for postdocs, who again are some of the most skilled and productive members of the scientific workforce. Many people unfamiliar with the academic career path are completely baffled by adding another 4-6+ years (standard for biomedical sciences) of "training" with low wages, poor-to-mediocre benefits, and a huge hit in opportunity cost for the earnings if one went to industry. This means only graduates with individual means can make it work, or they must make sacrifices in living arrangements, prolonging the start of a family, or tightly regulating spending habits that most people would consider standard or at least strongly desirable for adults in their 30's. Again, these problems are greatly amplified for parents, international workers with tenuous contract and visa status, and individuals that consistently confront discrimination in their workplace and personal lives. This is not a sustainable path, even for those who want to go for it. Science will slow and remain exclusionary unless these systemic factors are meaningfully addressed.

One other issue is the current credit system which only rewards first and last authors on papers. Most fields of science are becoming more complex and interdisciplinary, and therefore models for credit to members of large teams need to be normalized (e.g., hundreds of members of teams in physics).

Existing NIH policies, programs, or resources

Raise the stipend levels! At the very least, be very welcoming for faculty that want to use their grant budgets to pay students and postdocs higher than minimum wages, but more importantly, NIH sets the bar across the nation and to some degree the world for what other institutions pay their postdocs. If you change, that raises the floor for other sources of funding to follow your lead, and as long as you are paying poor wages, that justifies the same from other institutions.

Another issue is increasing requirements for management training. There are many bad apples in academic science, but there are also many faculty that are not intentionally biased but still have enormous negative impact on trainees through careless or ignorant actions. It's not clear how well training on sexual harassment and simplicity (and explicit!) bias work, and while those are important avenues to pursue, I believe that training in good management practices can mitigate many of these issues as well! Many scientists that become faculty have had little to no training in small business management (i.e., a lab), and therefore fumble through hiring and training, establishing lab culture, and supporting/accommodating trainees. The intense pressure for productivity (papers and grants) leaves these essential tools ignored. Adding explicit training requirements or other incentive schemes for FACULTY, who we all know are the least likely to take advantage of existing training opportunities, would be important for improving working conditions for postdocs and other trainees.

Regarding credit for team science, some way to credit postdocs for non first/last author work in grant reviews would be helpful. Perhaps instructions for reviewers to pay attention to a more diverse set of contributions would be helpful (e.g., other parts of the bio sketch).

Proven or promising external resources or approaches

HHMI is a leader in many of these areas, including funding models (see their recent increase to a minimum of $70k for postdoc salaries!) and training programs to increase inclusivity. Also note they require faculty to participate in these trainings when their students and postdocs are awarded grants!

Response 2826

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The NIH sponsors far more biomedical post-docs than could ever have a full-time academic career. In a massive survey of over 7,600 postdocs (the first of its kind), Nature recently found that 63% hoped for a career in academia, but 56% of them felt somewhat or extremely negative about their job prospects, and nearly 75% thought their prospects were worse than in prior generations.
https://www.nature.com/articles/d41586-020-03381-3

Look at the hard numbers.

—Number of PhDs awarded in biological and biomedical science in 2021: 8,149.
https://ncses.nsf.gov/pubs/nsf23300/data-tables

—Number of post-docs supported by NIH grants in 2022: 28,953.
https://nexus.od.nih.gov/all/2023/03/02/number-of-postdoctoral-researchers-supported-by-nih-grant-awards-fy-2017-fy-2022/

—Number of first-time R01s that NIH awarded to new researchers in 2021: 1,513.
https://nexus.od.nih.gov/all/2022/07/18/more-early-stage-investigators-supported-in-fy-2021/

The US is producing 5x the PhDs every year that could get an academic job with an NIH grant, and that we essentially have nineteen years of a backlog of post-docs competing for the few academic jobs that come available.

We could quibble over the specific numbers. But no one can deny that we are producing far more PhD's and post-docs every year than the number of tenure-track positions that come open.

This scenario isn't sustainable.

To add to the calamity, it isn't just about individual job prospects. When it is so competitive to get an academic job, researchers face a dual temptation: Study only marginal, incremental topics so that you can guarantee success, but then exaggerate the importance of your work.

The end result is that hypercompetition harms both reproducibility and innovation. In order to have high-quality science that pushes the frontier, researchers have to feel comfortable with failure. That won't happen unless we calibrate the number of researchers to the amount of funding available.

Existing NIH policies, programs, or resources

Many graduate students and post-docs end up being funded on R01 or similar grants, working for a principal investigator (PI) on that grant. The result is disastrous.

The direct result: People spend way too many years as a "trainee" because no academic jobs are forthcoming. In some unfortunate cases, they are susceptible to exploitation and even harassment by their boss, because they are beholden to his grant.

We have known about this problem for many years. Back in 1998, a National Academies panel recommended that "all federal agencies that support life-science education and research to invest in training grants and individual graduate fellowships as preferable to research grants to support PhD education."

Similarly, ten years ago, [redacted for anonymity] (then the president of [redacted for anonymity]) chaired an NIH working group that called on NIH to "divert funding from research grants to training grants for graduate students, support more postdocs on training grants, increase pay and improve benefits for postdocs, and boost the prestige and remuneration of staff scientist positions in academic labs."

The report argued that trainees are ill-served by being put on PI grants, because they are viewed as "laborers rather than scientists in training," and that with a greater use of training grants, "NIH could better monitor students' training and ensure broader exposure to careers outside of academia—and better training in the skills needed to perform well in those careers."

What has happened since these national reports in 1998 and 2012, respectively? Virtually nothing, at least not that would change the overall system.

We need to stop trapping so many people in trainee status hoping for an academic job that might never materialize.

Proven or promising external resources or approaches

First, NIH should only fund a limited number of post-docs for a limited time on training grants, rather than an unlimited number of trainees on other researchers' grants. Indeed, perhaps we should ban NIH-supported post-docs, or else limit them to 2 years at the most.

Alternatively, the NIH could simply mandate that post-docs be paid at least 3 times the average cost of a two-bedroom apartment in their vicinity. In some cases (e.g., Palo Alto, California), this would mean that post-docs would be paid over $120,000 a year. That sort of requirement would both keep the number of post-docs in check, and would help enable post-docs to survive on an income more in keeping with their abilities and training.

It is absurd for the NIH to allow a system in which post-docs (who already have PhD's) are kept in something close to minimum-wage-level poverty for several years. That is a disgrace both to NIH and to universities.

Second, universities don't provide sufficient information to trainees about their likely outcomes. They should be required to do so. Otherwise, trainees can be actively misled about their career possibilities. After all, how many college seniors would knowingly sign up for up to 2 decades of low-paid jobs only to get their first tenure-track job after age 40?

The National Academies recommended in 1998 that "accurate and up-to-date information on career prospects in the life sciences and career outcome information about individual training programs be made widely available to students and faculty." It's long past time for NIH to require that all universities track and publicly report up-to-date statistics on:

1. average length of graduate program before the PhD is awarded;
2. average length of a post-doc; and,
3. 1-year, 5-year, and 10-year outcomes for every graduate student and post-doc.

Response 2827

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

As industry positions are an increasingly common career path for postdoctoral trainees, NIH-funded postdoctoral training programs should incorporate training experiences within industry and foster collaborations with industry (e.g., rotations in industry to learn drug development and clinical trial methodology).

Training should include consulting best practices, investigator-initiated studies, etc.

Proven or promising external resources or approaches

No response

Response 2828

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

As an NIH funded postdoc at an institution in one of the most expensive cities in America (San Francisco), it is increasingly clear why colleagues of mine are leaving academia and not pursuing postdoctoral employment in academia and instead are choosing to enter the industry market: between $56,000-57,000 is not a reasonable or living wage for someone with a PhD. I have found that the need to make an increased salary is pushing me to find ways to leave my postdoc position early for research positions that would not incur the financial penalty of leaving my training early. To be paid less than what most people in the city (and at the very institution) I work in make in an entry level job with a PhD is disheartening and demoralizing.

Existing NIH policies, programs, or resources

In addition to the need for increased salary, it is imperative that the NIMH change their taxation policies; at this point in time, the requirement to pay quarterly taxes that can incur significant financial penalties if not paid correctly or on time is incredibly problematic. With the intention and hope of diversifying science, making difficult required procedures that are complicated, time-consuming, and potentially financially detrimental, the NIH is doing the opposite and making postdoctoral positions inequitable for those who are not well-versed in the financial system or have generational or spousal financial support to pay for expert assistance.

Proven or promising external resources or approaches

No response

Response 2829

Perspectives on the postdoc roles and responsibilities

We believe that postdoctoral scientists are training to be independent researchers within a mentoring network, and this should come with the freedom and opportunities to prepare them to transition to a career of their choice. Further, postdocs may have student loans, or their training may coincide with adult milestones like starting a family. To make postdoc positions attractive to PhD graduates, there needs to be:

1. a competitive remuneration structure, that includes market-appropriate salaries and policies around parental leave;
2. professional development resources
3. transparent, valued, and funded path(s) to career progression within the academy outside of tenure-line faculty roles. These benefits, policies and opportunities need to be equitable between postdocs across institutions, and independent of the funding sources that support them.

Postdoc training outcomes must be emphasized beyond T32 training grants into all grants and programs that support postdocs. Postdoc positions funded by any NIH/federal grant should require mentoring plans and professional development for postdocs, not just those grants explicitly focused on a defined training environment.

For postdoc training to be a valued aspect of research institutions, their training outcomes must be tracked and contribute to the promotion and tenure process of faculty mentors, similar to undergraduate or PhD student training.

Fundamental issues and challenges

NIH salary/stipend levels are currently not commensurate with a doctoral degree plus training and experience in their area of research, or responsive to cost of living within high volume research cities (such as Boston, where our university is located). NIH salary/stipend levels should be substantially increased and factor in cost of living. The current NIH salary and stipend levels are not tied to important economic drivers such as market or cost of living by region, which means they do not reflect the lived experiences/needs of postdocs.

Training postdoc positions (those funded by F, K, T) should be paid professional salaries and not stipends, as postdocs are professionals, though in training, regardless of their funding source. Receiving a stipend for living expenses minimizes their professional status, treats them as student employees, and reduces

the number of employment-based benefits institutions can provide and stay compliant with the terms and conditions of these awards.

International postdocs are a vital part of U.S. research enterprise, and yet they are not explicitly provided with the same access to training opportunities, support, and professional development as their domestic peers funded on training awards. It would also benefit this population if the NIH could partner with foundations and professional societies to create fellowship opportunities to support international postdocs.

Professional growth for postdocs is unclear and not uniform across institutions. While we can define the structure for growth, the practical reality is that these promotion pathways would still be primarily grant funded. NIH mechanisms to support growth in workforce for those in staff roles beyond the postdoc would help support career progression in the academy.

Existing NIH policies, programs, or resources

We would like to suggest that all postdocs are paid a salary rather than training mechanisms requiring a stipend, so that they can be fully included in our institutional benefits as employees. This will ensure that postdoc fellowships through T, F, K mechanisms are attractive to domestic PhD graduates or postdocs, as presently many choose not to apply so as to not alter the benefits they are eligible for at [redacted for anonymity].

Student loan debt affects postdocs from low socioeconomic backgrounds and can deter postdocs from underrepresented groups from persisting in the academy. Expanding the mechanisms that support Loan Repayment Programs for extramural researchers would remove a barrier many postdocs have to remaining in academia.

It would be helpful if R01 and other types of faculty-awarded grants also were restructured to explicitly emphasize training and mentoring postdocs. This would reinforce the importance of faculty building skills to mentor postdocs using culturally aware practices. There is a significant gap between the mentoring that is currently happening in many academic institutions and the mentoring that postdocs need to support their training and career transitions. [redacted for anonymity] has developed University-wide training opportunities to support faculty mentors to develop strong mentoring practices. However, there are limited incentives to reward the faculty that prioritize the time it takes both to develop these skills and intentionally mentor well.

Funding opportunities like the recent NOSI supplements acknowledge and recognize promising and demonstrated mentoring practices by PIs and are an important incentive signal to those not engaged. It would also benefit institutional programs to have access to funding calls to support innovative ideas in mentor training and faculty professional development, similar to the NIH BEST program that supported career development opportunities for PhD students and postdocs.

Response 2830

Perspectives on the postdoc roles and responsibilities

Prolonging my role as a trainee—as if a PhD wasn't long enough. But it seems like a postdoc (and often an extensive one) is a requirement for a career in academia, so if you want to do that you have no choice.

Fundamental issues and challenges

- Temporary employment, once again. postdocs are often in their early 30 by the time they start a postdoc but are still not able to "settle down"
- Minimal opportunity to gain management/mentoring skills when you are still mostly seen as a trainee yourself (might be an individual issue)
- Financially challenging in some research universities located in places with high living expenses, when salary is based on NIH stipends

Existing NIH policies, programs, or resources

As a non-citizen, I got the impression that a lot of NIH resources are not available for me. If that is a wrong impression, then the communication about this could probably be improved.

Proven or promising external resources or approaches

No response

Response 2831

Perspectives on the postdoc roles and responsibilities

In my view the academic postdoc is a mentored apprenticeship in which a scholar will advance their scientific training and professional development. This position will take the scholar beyond the graduate school level to a highly independent status preparing them to take on an independent position.

Fundamental issues and challenges

The biggest issue with the recruitment and retention of postdoctoral trainees is financial in nature. Given that the average PD time for those wanting to go into an academic position is 5-6 years this is a big stretch of time to be making less money and lower benefits than could be gained in biotech/pharma or most other industries. Especially as potential PDs consider starting a family and balancing work and life, this can be quite inhibitory.

Existing NIH policies, programs, or resources

While increasing PD pay is clearly essential it is critical that parent grants be increased accordingly. Otherwise PIs will simply hire less or no PDs moving forward.

Proven or promising external resources or approaches

No response

Response 2832

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity]) endorses the steps that NIH has taken to understand the current state of postdoctoral research training and career progression within the biomedical research enterprise.

[redacted for anonymity] believes that postdoctoral training is a formative step for those pursuing an academic career. Postdoctoral training provides protected time, dedicated mentorship, high-quality didactic and experiential training, resources to publish high-impact publications and to develop effective presentations, opportunities to develop new collaborations, write grants, and time to conduct a job search.

Fundamental issues and challenges

The [redacted for anonymity] notes several Fundamental issues and challenges inhibiting recruitment, retention, and overall quality of life of postdoctoral trainees.

These include inadequate salary support for postdoctoral trainees, particularly in expensive cities where many academic medical centers are located and rising debt for postdoctoral trainees which is substantial and a significant deterrent to candidates pursuing research training.

Additionally, NIH salary caps impose burdens when academic institutions are not positioned financially to supplement the NIH stipend. This is problematic for all institutions but particularly for departments and divisions with limited resources (e.g. where clinical services are provided at a loss, like primary care and geriatrics). It is also true for less resourced academic institutions where PIs with NIH grants cannot easily supplement salaries and benefits to livable wages from other sources. This not only leads to challenges recruiting candidates but also is a disadvantage to potential candidates from historically excluded or underrepresented backgrounds who may not have family resources to provide financial support.

We are also concerned that the expectation that institutions and, by extension, divisions and departments, have the resources to supplement faculty or staff time to support program operations can have a negative impact on mentoring and training for institutions that don’t have those resources available. This is particularly important to address given ongoing efforts to increase the racial/ethnic diversity of the

pipeline in academia, it will be particularly important to pay for the time of program directors who are from racial/ethnic minorities. Paying adequately for program director time would allow more faculty from historically excluded populations to serve in T32 leadership or faculty roles.

In addition, there are challenges accessing data expeditiously enough to meet productivity metrics early on (e.g., abstracts, papers); a lack of explicit and structured barometers for success both within and between institutions.

Existing NIH policies, programs, or resources

These are some recommendations [redacted for anonymity] has for improving existing NIH policies, programs and/or resources:

- Increase salary scale and adjust for area cost-of-living, e.g., both T32s and R01s
- Increase funding for T32/postdoctoral leadership, faculty, and administrators
- Combine loan forgiveness programs with postdoctoral training programs (T32s or K awards), in an effort to minimize the burden of debt and recruit talented trainees.
- Provide resources for postdoctoral training and coursework
- Increased the allowed tuition expenses for post-docs, including both those seeking an advanced degree, and those who are not.
- Increase the allowed per post-doc expenses to account for costs of family health insurance
- Support attendance to present at two conferences per year
- Require PIs to submit evidence of ability to mentor/train scientists and include training plans that support the postdoctoral trainee progressing towards independence
- Improve pathways to early-stage funding as well as loan forgiveness programs/incentives
- Consider parental leave and childcare stipends, including travel stipends for trainees with children to attend national conferences
- Develop clearer expectations of mentorship
- Develop clear expectations of T32 program leadership and administration (e.g., recruitment and selection practices) and support levels of faculty and staff effort commensurate with these expectations
- Provide early exposure of aging-oriented clinician trainees to researchers and potential research careers by partnering with professional societies
- Consider offering a "bridge" grant that supports the transition from trainee to faculty such that universities/institutions don't have to unilaterally bear this burden (e.g. the NIH StARR program)
- In order to build robust programs with enough slots for engagement, community building, and programmatic infrastructure, the above changes will necessitate increasing the 500K per year threshold for T32 programs.

Proven or promising external resources or approaches

The [redacted for anonymity] recommends updating the repository of NIH resources to better support individuals in finding a job after postdoctoral fellowship. This would provide incentives for people considering a postdoctoral fellowship. Also, providing resources for mentors and mentees that offer guidance for developing and implementing individual development plans (IDPs) and individualized mentoring plans would optimize the mentoring and training experience.

Response 2833

Perspectives on the postdoc roles and responsibilities

The postdoctoral position traditionally fills much the same role of an apprenticeship in other professions, where a less experienced professional works for a more experienced professional. The more experienced professional (mentor) gains the benefits of the work of the less experienced professional (trainee) for a modest salary, while the trainee benefits from the experience and connections of the mentor to eventually move on into independence and mentoring their own trainees. This mutually beneficial exchange is the basis of the academic postdoctoral position.

Fundamental issues and challenges

In brief, competition for too few slots has led to ever increasing requirements at every level of academia prolonging the predoctoral and doctoral experiences even before one could apply for a postdoc. You have people in their late 20s or early 30s who have already been working for years at the high standards of current academia for a graduate student stipend now being asked to "begin" their careers as an apprentice for a reduced salary for the privilege of mentorship. To restate, the postdoc experience asks people who have already worked hard and likely delayed their pursuit of personal life goals to work even harder and delay even longer for the ever diminishing chance of a faculty position where they will work yet harder for a pay level their friends outside of academia where making more than a decade ago. I am not oblivious to the fact that we pursue science for the love of science and not to get the highest paying job. But the current system asks postdocs to willingly cut themselves with a double edged sword of working harder for less pay and to keep cutting themselves for longer and longer. This pressure cooker has no reward structure for good scientists, and we've reached the breaking point where postdocs and graduate students have realized they are in fact well trained and highly skilled and deserve to have a life, and so they are going to careers where they are rewarded as the assets they are.

Existing NIH policies, programs, or resources

Why on earth is there a time limit on the K99? People aren't staying in postdoctoral positions because they want to, they are staying in it because science takes a long time, good science takes even longer, and the requirement gets higher and higher for a faculty position. Missing a single career milestone is terminal.

I won't say increase paylines, because I realize the reality of NIH funding. But it would be lovely to require that academic institutes hire us as full employees rather than this "gray area" of fellowship where we need to report our own taxes and take student level benefits with no retirement plan.

Limit or do away with postdoctoral positions, that by definition are in pursuit of limited faculty jobs, and create more positions and a culture of research scientists and non-tenure track positions. Recruit the person who is a technical expert to remain a technical expert rather than telling them their only change of career advancement is sitting at a desk writing grants.

Response 2835

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity], appreciates the opportunity to comment on the request for information on re-envisioning postdoctoral research training and career progression within the biomedical space. We applaud the National Institutes of Health (NIH) for recognizing the need to reimagine young investigators' research training and career progression. The future of academic science in the United States depends on the training of young investigators. Without these investigators we will lose understanding of complex rheumatic diseases and rational treatments. The NIH has been instrumental in maintaining this pipeline through grant mechanisms that directly or indirectly support postdoctoral training. In response to the NIH request for information, the [redacted for anonymity] has compiled the following: An academic post-doc is

meant for individuals with a doctoral degree to increase their training in a research career, either building upon a foundation established during a Ph.D. training program or developing research skills after completing clinical training (MD, PT, etc.). Successful postdoctoral training is generally seen as a prerequisite for advancement into a research-oriented tenure-track position in an academic medical center. During postdoctoral training, the trainee gains skills through an apprenticeship working on an established research program with the intent of developing a rigorous independent path. When the trainee is pursuing clinical training in parallel, as is often the case, they have additional responsibilities separate from the research program that requires the protections set forth by formal research training programs to ensure adequate time can be devoted to research training.

Fundamental issues and challenges

The [redacted for anonymity], appreciates the opportunity to comment on the request for information on re-envisioning postdoctoral research training and career progression within the biomedical space. We are now observing severe reductions in the number of trainees and early-career researchers pursuing careers in rheumatology in academic research centers. This attrition will harm our capacity as a nation to advance scientific and clinical innovations for the benefit of people with rheumatic and musculoskeletal diseases. The [redacted for anonymity] submits the following:

1. One of the most significant challenges in recruitment, retention, and quality of life is the current NIH post-doctoral stipend. This needs to be increased to be competitive with current market value and standards of living. This is particularly important as some Ph.D. training programs are unable to retain recent graduates due to competitive offers from industry. In addition, the salary increase for post-doctoral training should be reflected in the funding of all NIH mechanisms, which commonly fund post-doctoral fellows.
2. Clinical trainees pursuing research careers often face lower salaries/stipends to participate in a post-doctoral training program because they are limited from holding certain appointments within their institution. For example, an MD who has completed clinical training can either take a faculty position with greater pay and benefits or remain a fellow for T32-supported research training at a much lower salary and benefits package. Allowing for research training while holding a clinical faculty rather than a trainee appointment may entice physicians to remain on a research path.

Existing NIH policies, programs, or resources

The [redacted for anonymity], appreciates the opportunity to comment on the request for information on re-envisioning postdoctoral research training and career progression within the biomedical space. The NIH has been instrumental in maintaining this pipeline through grant mechanisms that directly or indirectly support postdoctoral training. Efforts to mitigate reductions in the academic rheumatology pipeline should be pursued by the NIH and professional societies like the ACR. The rhe submits the following:

- Address the challenges of attracting physician researchers by considering an increase in the T32 salary levels.
- Re-evaluate the restriction of being able to supplement salaries for both MD and Ph.D. T32 trainees.
- Expand eligibility to include international medical graduates, enhancing their ability to stay in the US and seek citizenship, thereby expanding the potential pool of productive academic researchers.
- Provide stability of funding for a minimum of two years in all NIH-administrative supplements so that postdocs will consider applying.
- Support post-doctoral fellowships independent of R01 grants or USA-mentored mechanisms that favor international collaborations to allow the influx of foreign post-docs in the USA.
- Work with medical institutions to increase the visibility of research training opportunities for rheumatology fellows. Partner with organizations such as ACR to facilitate awareness of research training opportunities by compiling a list of active NIH T32 training programs affiliated with Rheumatology fellowships (and other non-NIH training opportunities where they may exist).
- Re-evaluate the trainee title for rheumatology fellows so they can perform clinical duties concurrently with their training.

Proven or promising external resources or approaches

[redacted for anonymity]

- Physician scientist training pathway programs such as Oliver Langenberg Physician-Scientist Training Program at Washington University in St. Louis are an example of how to recruit, retain, and promote the success of graduates from Medical Scientist Training Programs (MSTP). Keys to the program's success include focused and integrated clinical and research training, career mentorship separate from research mentorship bi-annually throughout the program, monthly program meetings for career development, and significantly supplemented stipends above the post-graduate year benchmark. As a result, the program at Washington University has resulted in 58 out of 68 graduates being retained in academic research careers in the past 20 years, with 181 NIH-sponsored grants and over $100 million in funding through NIH and other sources.
- A similar course is the VERITY/Brigham Course in Rheumatology Clinical Research. This is a course for early rheumatic and musculoskeletal disease investigators performing clinical/epidemiologic/patient-oriented research. The course participants refine specific aims for a grant or develop methods/statistical analyses for ongoing/proposed clinical research projects. Long-distance mentorship is offered after the course from a VERITY faculty member to obtain further guidance on their research project and career development. Participants are eligible to compete for a grant opportunity for up to $20,000.
- Creating Adult Rheumatology Mentorship in Academia (CARMA) was established in 2018 and has attracted approximately 100 mentees and 56 mentors. In a recent review of the program, 90% of mentees strongly agreed that they had received valuable information from their mentor and were very likely to recommend CARMA to their colleagues. For mentors, 91% were very likely to recommend CARMA to their colleagues. The top 3 areas of mentoring were discussion of types of grants, research/science topics, and developing independence as a researcher.

Response 2836

Perspectives on the postdoc roles and responsibilities

Post-doctoral researchers are highly skilled individuals who are the (quite literally) working horses of academic science.

Fundamental issues and challenges

Post-docs are being significantly underpaid, especially when you think of the highly unique skillset that a post-graduate individual has, the amount of money someone with a PhD can make outside of academic science, and in comparison to clinicians. Lack of benefits, social security, paid family leave, and childcare, and the pressure to publish and submit grants is not helping either.

Moreover, foreign post-docs that are in the US on a visa are disadvantaged in severel ways: they often are significantly underpaid (willing to work for free to get a spot in a well-known university), don't always have access to the same funding opportunities, and face additional visa-related rescrictions (for instance, to be promoted to faculty level, post-docs are required to change from a J1 to an H1B visa, which often unnecessarily delays someone's promotion and career development).

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

I'd highly recommend taking a look at the current efforts that are underway in The Netherlands, to modernize the system of 'recognition and rewards' in academia: https://recognitionrewards.nl/

Response 2837

Perspectives on the postdoc roles and responsibilities

In my (4+ years) experience, my position as an academic postdoc has developed alongside my career as a scientist. My position included years 1-2 spent applying for grants and driving preliminary research, years 3+ spent working towards publication and preparation for the academic job market, and year 4 spent applying for faculty jobs. One challenge has been that time budgets and expectations are self-driven or driven by a mutual agreement between advisor and postdoc, while the realities of future job prospects are abstract. For example, there is no clear rubric for what a "successful" academic faculty applicant will look like with regards to teaching preparation, type and scope of service contributions, research output

and funding acquisition, and other factors considered important for a faculty role. This impacts the choice of activities to pursue during postdoctoral training, such as developing coursework and teaching philosophy alongside a robust research program. I have also found that additional administrative responsibilities build during this crucial transition towards independence, including project management, mentorship for younger laboratory members, and other administrative tasks relevant to the postdoc's role in the university/department/laboratory.

Altogether, the postdoc experience appears to transition from one that resembles the early stages of a PhD (project development, research skills training) into an administrative role that resembles a junior academic faculty member. This transition can feel ambiguous, as the next career stage may or may not require the skills developed during earlier stages.

Fundamental issues and challenges

The choice to pursue particular postdoctoral training experiences includes

1. scope and topic of the research,
2. relationship with mentor, and
3. quality of life in the place of residence. I believe that the third point currently drives many of the challenges facing postdoctoral recruitment, since postdoctoral salaries must be considered before choosing a location for postdoc training over 3+ years.

To put a finer point on this, many postdoctoral researchers past an age (30+ years old) where retirement savings, children, aging parents, healthcare expenses, work/life balance, and other issues are at the forefront of life and career planning decisions. I believe any of these can motivate an individual scientist's decision to stay in a given laboratory or even pursue postdoctoral training at all. Cost of living balanced with institutional training environment to motivate me to choose Philadelphia for my postdoc, rather than other more expensive cities with institutions that would serve my training goals such as Boston, San Francisco, or New York. The uneven cost of living between these environments has certainly motivated this choice for many of my postdoc peers.

Existing NIH policies, programs, or resources

I have benefitted from a successful F32 NRSA fellowship to fund most of my postdoctoral training, in terms of networking opportunities, research visibility, and freeing up resources and funding in my sponsor's laboratory. It would have been challenging to live on the NRSA stipend in a more expensive city and meet my other financial and life goals. I believe that NIH fellowship programs should increase postdoctoral stipends commensurate with other factors such as cost of living and health insurance costs. The Howard Hughes Medical Institute (HHMI) has just announced a $70,000 starting salary for postdocs and certain universities (e.g. the University of Pennsylvania, Princeton University, state universities in California and Washington) have announced recent increases. I believe that competitive NIH postdoc policies should include a similar stipend increase and healthcare considerations to meet the needs of postdocs today and remain competitive with these other institutions.

Proven or promising external resources or approaches

Extending or expanding career transition mechanisms (e.g. the K99/R00 mechanism) would serve postdocs well. Many postdocs who started before the COVID-19 pandemic did not receive K99 eligibility extensions despite their research being demonstrably affected by the pandemic. I believe this mechanism should be extended or expanded into other opportunities for career training, such as industry, policy, and science administration. Furthermore, I believe there should be additional mechanisms in place to promote the careers of senior staff/project scientists at academic institutions outside of government-specific opportunities. Given the high level of competition for academic tenure track jobs, these positions would be an excellent investment for laboratories to maintain long-term research programs and retain institutional knowledge that is lost when postdocs transition to other careers or locations.

Response 2838

Perspectives on the postdoc roles and responsibilities

I believe that it is a training period that enhances the experience and research depth of the candidate. Typically, recently minted PhDs are somewhat narrow in their research experience having been mostly

trained and guided within a single research group. The Postdoc allows them to extend their training and thereby become competitive and capable of success in an independent program.

Typically, I have to provide significant training to postdocs in order for them to succeed in learning a new field, and moving to a stage of productivity in that area.

Fundamental issues and challenges

There are inequitable challenges for entering postdocs to move institutions and sometimes, fields. These must be addressed with sufficient and appropriate support, such as relocation costs and accommodations for parental rights. However, the majority of postdocs require a large degree of additional training and guidance, and the degree of subsequent productivity is quite variable. The fact that most postdocs have been led to believe that they don't require such training has created a disconnect in expectations, and it makes it difficult to provide them the training they need to be successful.

Existing NIH policies, programs, or resources

As PhD training has proven to be insufficient for most independent scientists to succeed, there needs to be recognition that postdoctoral training is training. As such, it should be monitored and regulated not just by individual PI postdoc training plans, but also through university and disciplinary oversight. Learning objectives for postdoctoral training should be explicit, and should be used to monitor success.

No response

Response 2839

Perspectives on the postdoc roles and responsibilities

The postdoctoral fellow is a skilled scientist in the sense of the ability to think deeply about a project and design a plan with less and less "guidance" from the head of the laboratory in order to carry out research that tests or modifies a hypothesis. Further, this person is someone, who will grow into a laboratory leader over her, his, their tenure in the laboratory. As part of this growth, a postdoc should be given the opportunity to train/educate others, who are earlier in their scientific pursuits, including undergraduate and graduate students, to become better researchers. They should not, however, be the only person responsible for such training.

Fundamental issues and challenges

As I am sure most people, who responded to this survey, would state the stipend/salary issue is a major challenge in academic research to recruiting and retaining postdoctoral trainees. Regarding the issue of the overall quality of life would also include the lack of excellent and affordable child care support for our trainees. As a PI, I am very happy that my postdocs have children, but realize that this has not only a financial impact on them but also a downstream impact on their science, which in turn clearly impacts the quality of their lives, as they feel that they are a disadvantage relative to those without children.

Existing NIH policies, programs, or resources

Obviously, the first change would be to lift significantly the stipend levels of postdoctoral researchers that make them competitive with biopharma/biotech. However, if this were to be implemented the NIH should be obligated to increase the funding to existing grant holders, who currently have postdoctoral fellows on their grants, to cover the new stipends. Perhaps the NIH could open a new series of small grants that help postdocs with daycare expenses. Allow more senior postdoctoral fellows, beyond their 5th year, the opportunity to obtain funding using the K99/R00 route, which now does not take into account female postdoctoral researchers, who have started families during their postdoctoral training that interferes with their "scientific" progress. This seems inherently unfair.

Response 2840

Perspectives on the postdoc roles and responsibilities

Postdoc is a crucial step to transition from being a student to having the possibility to open your lab and manage a team of people working together in answering important questions to understand better humans and the environment where we live.

Fundamental issues and challenges

Some challanges to recruitment are fundings. Several PIs do not have the funding to support postdocs in their labs, mainly considering the recent salary increase, that was needed but was not paired with increase in funding. DEI and salary are important aspects that play crucial roles in the postdoctoral quality of life. Postdocs are getting more aware of their values and they look for places that share the same values and where they are valued and seeing as a resource.

Additionally, internationally postdocs are a very important resource for many laboratories and it is challenging for them to be as competitive as the American colleagues on the job market since there are less opportunities for them to apply for fellowships.

Existing NIH policies, programs, or resources

Ideally there would be:

- more financial support for PIs that hire postdocs
- more fellowships available for international postdocs
- push the institutions to hire Faculty that support DEI activities
- more grants that support DEI activities or postdoc career development activities
- push institutions to establish official postdoc training programs

Proven or promising external resources or approaches

Ideally there would be:

Response 2841

Perspectives on the postdoc roles and responsibilities

It is a stage of training that prepares one to become an independent investigator.

Fundamental issues and challenges

The purpose it serves is rather narrow, unless someone wants to become a professor, there are very few career trajectory that would require a postdoc.

As less and less people want to become faculty, or put it another way, that there are more and more PHDs trained but roughly the number of faculty position stays the same. It gives the people the sense that become faculty is just too hard, so people don’t ever try it anymore. If PhDs don’t want to become faculty, then they have very little reason to do a postdoc.

Especially you consider how laughable they are getting paid. Why would anyone in their early 30s and just forming a family want to go through that?

Existing NIH policies, programs, or resources

pay postdoc better.

increase the numbers of faculty positions, and shorten the avg length of postdoc. both makes it a more feasible option for people who might be interested in

Proven or promising external resources or approaches

No response

Response 2842

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salary. In my opinion, the salary is the number 1 issue and challenge faced by Postdocs. For someone to study many years and then do a PhD and end up getting paid very little is a huge challenge. The only reason a postdoc would live with this challenge is because they are passionate about science. But at some point, life priorities will result in postdocs leaving for other jobs such as industry just for the extra money which is in most cases at least 2x-3x what a current postdoc makes.

Existing NIH policies, programs, or resources

Fix the NIH review system. My experience with grant submission has been very discouraging. The reviewers are terrible and in many cases dont even read fully through the grant. They add weaknesses in the summary statement in which the response is in the grant and they just need to read through it. The future of a postdoc's career is usually tied to grants, especially training grants such as K99/R00. So if reviewers are not fair in their review process, this significantly impacts the applicant. I dont know what the exact solution is, but all I want is for my proposal to be reviewed in a fair manner to me.

Proven or promising external resources or approaches

No response

Response 2843

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The biggest issue is funding. With the increasing cost of living, postdocs are not being enough for the amount of work they do. Not being paid enough directly impacts recruitment and retention.

Existing NIH policies, programs, or resources

NIH needs to become more friendly to people who are not US citizens/permanent residents. Not being a US citizen/permanent resident puts us at such disadvantage and we are not able to apply for so many career development training grants, F32 or T32. Given the high percentage of postdocs who are not US citizens/permanent residents and the high quality of work that is being done by them despite being at such a disadvantage, they should be provided with somewhat equal opportunities as well.

Proven or promising external resources or approaches

No response

Response 2844

Perspectives on the postdoc roles and responsibilities

The primary role of a postdoc is to do research. If they want to continue on to a faculty position, then their time as a postdoc is also a training opportunity for their future as a PI. However, I think that a postdoc is much more a worker than they are a trainee.

Fundamental issues and challenges

The low salary and subpar or nonexistent benefits (retirement, childcare) are the biggest problems with doing a postdoc. I don't think any other issue can hold a candle to the poor compensation that postdocs receive.

Existing NIH policies, programs, or resources

Postdocs need to be compensated fairly for their work and expertise. If the NIH wants to recruit and retain postdocs, postdocs need to be paid more. I understand that this is difficult due to the funding supplied by congress, but I really don't think any other change to postdoc training will matter if salaries remain so low.

Fundamental issues and challenges

our institute keeps their levels at NIH levels, and one of our recruitment issues is lack of funding—people getting industry jobs and we can't compete.

Existing NIH policies, programs, or resources

Disparities with F32 funding, how much funding, and how that works out for % effort for their project? The percent effort is shrinking all the time, and nothing has been done to increase funding for these fellowships so a student can allocate more effort.

K funding—salary levels vary by institute and ether don't cover all salary, (sometimes even covering less than the 75% effort) while other institutes result in the PD's to receive large raises.

NIH should allow for budgeted PD raises? Outline funding cuts so people understand why a cut happened, and how they can still perform the research.

Proven or promising external resources or approaches

Maybe NIH can implement some sort of accountability from PI's regarding mentorship? Our institute tries to do this with the annual Postdoctoral Development Plans, but if required by NIH, maybe it will be more formal.

Response 2847

Perspectives on the postdoc roles and responsibilities

1. Opportunity to explore challenging and risky research questions
2. Opportunity to shadow a group leader, learn project management skills, and foster a group of scientists with similar research direction
3. Opportunity to mentor graduate students
4. Opportunity to establish potential lifetime collaborations

Fundamental issues and challenges

1. Low salaries
2. Poor job security
3. Poor job benefits (e.g., child support)
4. Lack of independence of thought and research direction
5. Short-term duration for postdoctoral fellowships
6. Few tenure-track academic posts
7. Pressure to "publish or perish"
8. Dependence of independent funding support (ie., funding should belong to postdoctoral fellowships and not PI/institution of training)
9. Low level awareness and mentorship
10. Needless administrative workload

Existing NIH policies, programs, or resources

ALL

1. Expanding funding support for non-citizens
2. Increasing nominal value of funding to match inflation

Proven or promising external resources or approaches

All the above

Response 2848

Perspectives on the postdoc roles and responsibilities

Lead more at least 2 projects managing the planning, execution, and keeping up with literature. Working more than official 8hrs and coming on weekends too. Giving less time to the family. Due to increased rent of 1 apartments, 55% of my salary goes towards paying my rent. After paying installments, not much is left for my family to enjoy.

Fundamental issues and challenges

Very low salary.

Increased rent.

Increased prices of groceries.

More expenses for an infant.

More expenses if the spouse is not working or cannot work due to limited educational background or work experience.

Existing NIH policies, programs, or resources

Increasing starting salary of a Postdoc to at least $75000 will enhance the quality of life.

Response 2852

Perspectives on the postdoc roles and responsibilities

A scientist working on independent research projects under the aegis of an established lab. The postdoc designs their own research plan, in consultation with the PI. They also train more junior staff or students who may help with their research, and may act as a mentor as well. Postdocs are expected to be working toward leading a lab of their own, but I think this expectation is unfortunate and precludes a lot of

valuable research and mentoring that more senior (postgraduate) lab members could perform if they were allowed to stay in labs for many years without needing to go on the job market.

Fundamental issues and challenges

Pressure to publish (only means we have of measuring "productivity") leads to intense work requirements, even without having a PI put those pressures on the researcher. Pay is not good compared to other careers I could enter with my skills at this point in life. Moreover, the outlook for getting an academic job is poor and the competition for tenure-track positions seems cutthroat and demoralizing, so I'm not confident the academic track will ever result in better pay or more stability/job security.

Existing NIH policies, programs, or resources

Collect and legitimize alternative metrics for "productivity" besides publications (e.g., extent of collaborative work and references from collaborators; ways of valuing teaching, mentoring, and service work that is expected of "good" senior scientists, but rarely rewarded).

Funding for postdocs who do not wish to compete for tenure-track positions or become head of an independent lab, but would like to stay in academic research as a career, making a modest but improvable salary.

PAY AND BENEFITS

Response 2854

Perspectives on the postdoc roles and responsibilities

I believe that an academic postdoc is an extension of our PhD training, with the added advantage of having more freedom to execute, plan and choose our projects. It's a chance to gain the kind of independence that you don't always achieve within the limits of your PhD program. Whether that Independence is to start your own lab or to choose a different career route should not matter.

As a postdoc, it is not just our responsibility to learn and gain independence, but also to teach others. As such, trainees should get the opportunity to teach and mentor during their postdoc, so they have a sense of what managing people or a lab would feel like.

Fundamental issues and challenges

I think one of the biggest hurdles with recruitment and retention of academic postdocs is the pay/salary. Postdoctoral researchers are often underpaid as compared to their counterparts in the industry, which makes retention difficult. Additionally, the lack of an alternative career path in the academic sector (other than being a PI and starting your own lab), contributes further to the lack of retention of academic postdocs. This disparity unfortunately has a profound effect on the overall quality of life of postdocs, especially those that are looking to have a better work/life balance.

Existing NIH policies, programs, or resources

Most postdocs are paid as per the NIH standard; hence I believe that this may be the first step to increasing recruitment to the academic sector. Additionally, introduction and creation of separate, additional career paths apart from being a tenure track professor would also increase the retention and recruitment of postdocs in the academic sector. Improved pay and improved chances for growth/ increase in career options will contribute to improving the quality of life as well.

Proven or promising external resources or approaches

Increasing engagement with the postdoc community, (like this RFI initiative) would be a good way to address issues.

Response 2855

Perspectives on the postdoc roles and responsibilities

I've viewed the academic postdoc as a stepping stone toward running my own independent academic lab. During my postdoc, I aimed to learn how to approach problems from new angles, expand my skillset and breadth of knowledge, and develop a unique research trajectory that will define the lab I run. In addition, I aimed to gain further experience grant writing and mentoring.

Fundamental issues and challenges

While I always understood that the postdoc would be a challenging phase of my career (as would grad school and becoming a new PI), the current state of the academic postdoc has deteriorated to the point where it is challenging to continue. Indeed, it often seems like there are no paths forward other than to leave academia altogether. What makes the situation particularly discouraging is hearing from new PIs how difficult it is to hire good postdocs (let alone ANY postdocs) right now with so many opportunities available in the private sector. Therefore, it is no longer that I have to "get through" the postdoc to establish my own lab, but now I worry even more so about the next steps. That is, even if I do land the TT faculty position I desire, the task of getting the lab up and running and hiring high quality postdocs seems nearly impossible. This, together with the stresses of securing funding, struggling to pay rent in a high cost-of-living area, among many other things make it all too obvious that the academic postdoc is not viable in its current state. The options in industry (even industry postdocs) essentially guarantee double or higher salary, better and well recognized work-life balance, and overall a vastly improved quality of life. There is no way I can start a family right now with the low funding, but leaving academia would allow me to do so. Oh ya.and it felt like a slap in the face when the K99 eligibility window extensions were removed. I was a starting postdoc at the beginning of covid and had no data for a year because of quarantine restrictions.

Existing NIH policies, programs, or resources

It's so obvious that paying postdocs better would make the world a better place. Because I am so stressed about my personal finances, the complete lack of any retirement savings in my late 30's, the inability to start a family, the K99 timeline, writing grants (For my PI), etc.there is no time to critically think about my experiments and conduct them in a thoughtful way. The current system forces quick, unthoughtful science and in my opinion is dangerous because it also promotes data mismanagement and fabrication. When postdocs are expected to secure their own funding, write grants for their PI, do experiments, mentor the newer postdocs and grad students in the lab, and teach courses, all while writing their manuscripts and applying for jobs, it would at least be nice to not have to stress about living with 5 roommates and whether I'll be able to eat anything other than a frozen dinner since I have to go back to lab at night to make sure I can accomplish all of the things necessary for me to achieve my career goals. The K99 needs to be reworked—postdocs should be able to apply for funding earlier with less of an expectation on publishing in the first couple of years. Publishing takes forever right now due to how overburdened everyone is, among other things, and it is insulting to have a K99 rejected for the lack of a postdoc publication. There need to be more resources for child care. Ultimately, if postdocs were paid better they would be able to focus more on their work, do thoughtful, careful and impactful science, have higher self-motiviation, and not be facing an existential crisis that is causing the current brain drain of academic postdocs. We just want to feel valued.

Proven or promising external resources or approaches

More institutional support. Institutional postdoc associations are in a sad place ever since COVID. The moral is low, people are no longer excited, everyone is leaving for better pay, so why not leave and do the same? There needs to be an increased sense of professionalism in what a postdoc is. At times, the postdoc and postdoc associations seem very childish—almost an excuse of a profession to not join the "real world" and tackle real issues. I think more professional events, or even meetings with NRSA, K award, etc. postdocs would help make this seem more like a profession and less as a hobby. Again, pretty much everything would be better with increased pay. When postdocs are happy (which they aren't right now), it's a positive feedback cycle. More postdocs will be encouraged to join the lab (instead of now when I tell them it isn't a good choice to move to a high COL area), postdocs will be more encouraged to train others as well as seek out new skills, postdocs will more collaborative and productive, and overall postdocs will be more satisfied with their positions when they feel valued and can go home and night knowing that they aren't one month's rent away from living on the streets. PAY US BETTER. But it's important this burden does not fall on PIs, or else how will I hire anyone as a new PI. -sincerely, a concerned postdoc that wants to stick around and see an improved, healthier academic system wherein trainees are happy and valued.

Response 2856

Perspectives on the postdoc roles and responsibilities

They receive advanced training and research opportunities, and provide high-level assistance and collaboration.

Fundamental issues and challenges

A lack of adequate and reliable funding.

Existing NIH policies, programs, or resources

I think all postdoc programs could benefit significantly from training in science communication.

Proven or promising external resources or approaches

No response

Response 2857

Perspectives on the postdoc roles and responsibilities

I've heard early/first-post-docs are for learning new skills or becoming familiar with new fields, and later-post-docs are for working on one's own projects; however, later post-docs have less chance of becoming professors as they are seen has having something wrong with them. I take that to mean only people who stay in the exact same niche after graduate school have a serious chance of becoming professors, which seems poorly thought-out since more complicated topics require broader expertise.

I have also heard that where graduate students learn to think through a research project, post-docs learn to manage multiple research projects and begin mentoring undergraduates. I think this is designed for social-climbers who think the end goal is managerial positions, social status, and prestige.

Fundamental issues and challenges

Academia will never outcompete industry with monetary reward. Instead academia offers academic freedom—in this context, the freedom to study the topic or problem the individual thinks is important. This freedom is rarely offered at the post-doc level. Instead post-docs must compete to become professors in order to obtain academic freedom.

Biomedical Academia trains too many people for professorship. Too many graduate students expect to become professors; however, there is too little funding for that to be realistic. Moreover, increasing funding would only be a temporary solution since PhDs grow at a rate far above the necessary replacement rate. Mathematically, if a professor trains more than one student to become a professor it will be twice the rate required for replacement. While some students may go to industry, at least half of students in my class plan to go to academia. If we assume a professor trains a mere six students, they are at three times the replacement rate. In the face of this basic math, newly minted PhDs are forced to realize that academia

has too much competition. It is simply unrealistic to hope to outcompete other post-docs and become a professor.

If we maintain the current career training narrative, this extreme competition eliminates the incentive to stay in academia and thus the natural response is to pursue other career paths in industry.

The fundamental solution is to create research positions that do not train, manage, or mentor but do retain a large amount of academic freedom.

Existing NIH policies, programs, or resources

While I'm not deeply familiar with existing policies, moving funding away from graduate students and towards positions analogous to PhD level staff-scientists should balance out the current crisis while preventing future repeats. This should minimize disruption to the research, and possibly even improve spending efficiency.

I would also encourage funding classical research professors—who are in the lab doing work rather than constantly writing grants. Specifically, not funding more graduate students unless there is a dramatic increase in demand from industry in the niche field.

Proven or promising external resources or approaches

I have read of non-profit research institutes outside of academia offering fellowships (2year) or even long term (6year) professor equivalent position funding for researchers without managerial responsibilities. Shifting funding towards grants such as these would be good.

I would also point out that many old-time famous scientists were not PIs. Watson and crick were the only authors on their famous paper. It is important to recognize these researchers themselves, rather than merely attribute all their work to their bosses. I recommend creating awards specifically for this class of non-managerial scientist. That type of recognition would be a substantial social incentive.

Response 2858

Perspectives on the postdoc roles and responsibilities

independent researcher who generates ideas and executes research to develop their own independent research program as they receive mentorship from their PI and gain mentorship experience

Fundamental issues and challenges

low salary is a huge challenge in addition to lack of benefits such as retirement plan, childcare, immigration benefits.in addition, bullying as a mean to use postdocs as labourers drives people out of academia.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2859

Perspectives on the postdoc roles and responsibilities

I see the postdoctoral position as the place where a researcher consolidates their knowledge and gets the freedom for independent thinking. During the postdoctoral training a researcher learns new skills that will prepare them for a future position as a principal investigator, industry or other jobs. Postdocs are highly trained scientists.

Fundamental issues and challenges

1. Low salary (imposible to live with this salary for postdocs with family). Postdocs are normally over 30 years old. Most of them with family. They can't afford living in underpaid conditions.
2. Poor benefits (most universities don't give retirement plan or help for daycare). Universities don't do much for postdocs as they do for PhD students.
3. Poor work/life balance. Its getting really hard to publish and stay in academia. Those who succeeds normally work 6 or 7 days a week.

Existing NIH policies, programs, or resources

Increasing the postdoctoral salary and benefits. That is the number one thing to change.

Proven or promising external resources or approaches

Postdocs are normally people over 30 years old. They are highly trained and smart. They are not leaving academia for the work environment or the training, they are leaving because they cannot afford living underpaid.

Response 2860

Perspectives on the postdoc roles and responsibilities

High skilled cheap workers.

Fundamental issues and challenges

Low wages for postdoctoral scholars specially ones with family really impacts their quality of life.

Existing NIH policies, programs, or resources

Increase in wages as per industry standards so that the skill set is properly remunerated for scientists in academic world.

Proven or promising external resources or approaches

Increase in job satisfaction by providing proper mentoring and competitive remuneration as per industry standards can help to improve the work—life conditions tremendously. They are more skilled than workers arriving on H1B visa but paid poorly.

Response 2861

Perspectives on the postdoc roles and responsibilities

As a postdoc, I am not only responsible for research, but also for general lab maintenance, student mentorship, and funding acquisition. This career path is a necessary intermediate step to a faculty position, which is my ultimate goal.

Fundamental issues and challenges

Salary levels should vary depending on location and factor in cost of living. Postdoc fellowships should include funding for benefits (insurance, retirement). Child care allowance should be included.

Existing NIH policies, programs, or resources

I would have appreciated more guidance on navigating NIH grant submission—not necessarily writing the application, but navigating relationships with SROs and POs. A description of how to select an appropriate institution

Proven or promising external resources or approaches

No response

Response 2862

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is an opportunity for continued training and development in two equally important ways. First, as a means to expand scientific training involving new subjects/fields, and/or techniques. Second, as a means to expand training in regard to career development and to gain experience relevant to those seeking an academic faculty position (ex. grant writing, personelle training/management, project management, ordering and budget management etc.). Generally speaking, I view the role of the postdoc as primarily independent but with guidance from the PI predominantly related to career development. It is also an opportunity to build one's network and CV-relevant accomplishments (publications, grants, awards, etc.) in the field of interest. In regard to general research responsibilities, I feel that a postdoc should have their own project(s) that are sufficiently differentiated from their PI and largely managed independently (albeit with guidance from the PI), which would serve as the foundation for their own future lab and career. However, a postdoc is generally also expected to assist with the needs of the PI in accordance with their current and future grants and applications.

Fundamental issues and challenges

The primary challenge for postdocs is the low salary coupled with the expectation or necessity for long work hours. Many prospective postdocs have spent the last 4-7 years in graduate school earning an extremely low salary/stipend, often resulting in personal debt and must also start or continue making student loan payments. Additionally, at this stage of their life/career, many have additional essential life expenses. On a postdoc salary it is virtually impossible to afford to buy a house (especially for those not in a household with a second income). Some may already have or wish to start a family, which one can hardly afford to support on this salary. This leads a majority of grad students to gravitate toward the considerably higher paying industry positions. Another major issue is that many postdoc positions come with the expectation of exceptionally long work hours and thus a minimal work-life balance (especially if one wants to be competitive for a future faculty position). Calculating out the effective hourly wage for a postdoc (especially one working 60+ hours/week) shows just how undervalued we are compared to almost any other position in or outside of the sciences. Furthermore, there is no guarantee that the desired position will ever be achieved despite these major sacrifices, due to their highly competitive nature. Finally, while career transition grants such as K-grants offer a great deal of promise, there is a short time frame for their application, which often competes with meeting PI expectations and thus further necessitates extra long work hours to be achievable. In summary, postdocs are often extremely exploited, undervalued, underpaid, and over-worked, under constant stress, and often fail to recieve the necessary career mentoring and freedom to achieve their career goals and maintain a reasonable quality of life.

Existing NIH policies, programs, or resources

Alongside increasing the criminally low salaries afforded to postdocs, the various training grants (ie. T— and F—grants) should provide higher stipends, as they are often only beneficial on one's CV. Many institutions do not even provide benefits to postdoctoral fellows, leading to an effectively reduced income to cover these additional expenses. These grants and NIH policies in general also make it nearly impossible to achieve any sort of raise (as would otherwise be standard in any other field, especially at this level of expertise) other than the meager (and only suggested) increase after each year as a postdoc. Furthermore, while it is commonly recommended to change fields from grad school to postdoc in order to broaden one's knowledge-base and explore other interests, this can make it exceptionally difficult to be successful, as the need for increased training time makes it difficult to reach critical milestones oobtain valuable grants and awards in the required time-frame to stay competitive. Additional grants for field transitions would be very helpful for those wishing to stay in academia while changing their field of interest. Additionally, policy changes to deter exploitation of postdocs (such as not allowing for the freedom necessary to achieve these grants and differentiate oneself from the PI) are greatly needed. Many PIs view postdocs as a means to accomplish their own project goals with little to no need for the provision of training or guidance. Finally, the shortage of desirable academic positions is inherently discouraging for postdocs, given the otherwise highly undesirable nature of the position. Increasing salaries as well as the availability of grants (with higher stipends) and ultimately achievable and desireable academic career opportunities and better mentoring is desperately needed if more postdocs are expected to be recruited and retained.

Proven or promising external resources or approaches

Industry positions are made desirable through higher salaries commensurate with the level of training/experience/expertise and a reasonable work life balance (ie. 40hr weeks with the potential for compensated overtime). Additionally, many PIs do not provide sufficient mentoring or offer promising project opportunities to properly prepare PhD students for an academic career and this is often discovered far too late.The current system favors those who join strong labs, never change fields, and are fortunate enough to work on very successful projects under very reputable PIs (despite this not necessarily correlating to future success as an independent academic scientist). This system discourages the majority of potential postdocs who were not so fortunate from remaining in academia. Other PIs drastically exploit and overwork their grad students thereby severely jading their view of academia. Improving the experience and mentoring for grad students seeking academic careers would go a long way toward enhancing postdoc recruitment. Furthermore, providing "fresh-start" opportunities for those wishing to change fields or labs/mentors (potentially from overly exploitarive or otherwise undesirable labs/mentors) that will better prepare postdocs for their desired career would further help with retention. There is a well-known "academic clock" by which postdocs must meet critical milestones (ie. 4 years for a K99) before their chances for achieving their desired career diminish significantly and thus lead them to turn toward industry jobs. Additionally, while career transition grants can provide a fast-track to independence there should be other opportunities to work your way up to an independent faculty position more slowly without effectively getting "stuck" in positions such as staff scientist (which is somewhat notorious for being harmful to achieving independent faculty positions in academia). Finally, to compensate for low academic job availability, alternative pathways, such as an entrepreneurship postdoctoral training program may also expand interest and retention.

Response 2863

Perspectives on the postdoc roles and responsibilities

An opportunity for a recent PhD holder to further their training, skillset and independence, preparing for an established career in academic science.

Fundamental issues and challenges

- Low, non-competitive salaries
- Quality of postdoc experience largely depends on the mentor and institution, so there's a huge ariability across the board
- Culture of "publish and perish" facilitates the creation of toxic work environments and poor science.
- The "PI" is the ONLY 'succesful' exit of the postdoc, which shouldn't be the case. Biomedical research requires a lot of staff scientists in permanent/semi-permanent position, who are highly skilled to do research but DO NOT want to progress into the managerial role of a PI position.

Response 2864

Perspectives on the postdoc roles and responsibilities

Training on being more independent, being an appropriate mentor and manager, and learning expertise on a technique one hasn't master yet.

Fundamental issues and challenges

Lack of financial stability. Currently I am a 5th year postdoc with a salary of 66,100 living in NYC, one of the most expensive cities to live in. As a postdoctoral fellow for 5 years, I have been penalized, instead of rewarded, with dealing with my own taxes, having health insurance counted as imputed income, which forces me to pay more money on taxes, and I have no retirement and other benefits. With lack financial

stability, as a child-bearing woman, as most entering female postdocs are, I am forced to stall family-life plans, or go through with them and suffer the financial/emotional costs, and career setbacks given the rigorous NIH timeline for funding. I have a partner who has a PhD and went down the biotech track five years ago (same time as me), and currently they make 4x the amount the salary a typical postdoc makes. If you compare our base salary and salary increases over the five year span, it does not match AT ALL. Why stay in a career where you are not pay your worth and effort, and are not given appropriate experience-based raises?

Existing NIH policies, programs, or resources

Set the minimum to match competitive salaries that biotech companies pay their postdoctoral fellows/scientists. Increase grant funding (i.e. RO1s) to allow PIs to pay their postdocs competitive salaries. Require/encourage universities to pay a portion of a postdoc salary if you can't increase RO1 funding.

Proven or promising external resources or approaches

Response 2865

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] appreciates the opportunity to provide feedback to the National Institutes of Health (NIH) on the re-envisioning U.S. postdoctoral research training and career progression within the biomedical research enterprise. [redacted for anonymity] is a public, academic health science center in [redacted for anonymity], in the top 2 percent of research institutions receiving NIH funding. Despite this funding, [redacted for anonymity] postdoctoral (postdoc) population has decreased over the last decade from 150 to 100 individuals, with two-thirds being international. Essential to [redacted for anonymity] research enterprise, postdocs are individuals who have received a terminal degree of Ph.D. or equivalent and are engaged in temporary research training. Because most postdocs still have not decided on a career path, [redacted for anonymity] requires all postdocs to enroll in a certificate program to foster the development of transferable skills.

Fundamental issues and challenges

Several factors have contributed to the decline in our postdoc numbers. Low stipends set to the NRSA scale are one reason, but career instability after postdoc training is a greater challenge. Many postdocs have lost interest in pursuing academic careers after witnessing mentors and early-stage scientists struggle to sustain active research programs, cope with burdensome institutional expectations, and maintain a healthy work/life balance. Another challenging factor that has driven promising scientists away from research is inequality in the training and training environments provided by mentors.

Existing NIH policies, programs, or resources

To address the above challenges, the NIH should continue to emphasize and strengthen programs that improve the research environment, including monitoring pay lines, identifying investigators at risk of losing grant support, and supporting career development and recruitment programs for postdocs. Regardless of the funding mechanism, the NIH can encourage stronger mentorship by requiring a mentorship plan be submitted for every trainee on a research grant and by providing guidelines on its research awards as to the expectations of the institutions, mentors and trainees.

Proven or promising external resources or approaches

More support for programs like Standford's Prism program and K99s and implement requirements for the use of mentor/trainee compacts and individual development plans, and establishment and implementation of AToRT policies.

Response 2866

Perspectives on the postdoc roles and responsibilities

The purpose of an academic post-doc is to gain additional experience prior to launching a career in academic science, biotech, or pharma. For those progressing to tenure-track positions, an academic post-doc provides time to amass data and resources necessary to launch an independent lab. Training gained

during the post-doc period is somewhat distinct from the pre-doctoral period when the focus is learning how to perform scientific research.

Fundamental issues and challenges

Competition with higher paid positions in non-academic positions is a major limiting factor. Additionally, post-docs are often expected to work longer hours for these lower wages.

Existing NIH policies, programs, or resources

The NIH could increase the stipend paid on all training fellowships (F30/F31/F32/T32) to match the current academic standard, which is around $45,000-50,000 for pre-docs and $60,000-70,000 for post-docs in major academic centers (or perhaps a tiered system based on cost of living). The NIH could consider supporting the salary of non-US post-doctoral fellows through these mechanisms. The NIH could decrease the administrative burden of running training programs by allocating a pre-negotiated number of slots to academic centers based on NIH funding levels.

Proven or promising external resources or approaches

I'm not sure.

Response 2867

Perspectives on the postdoc roles and responsibilities

Definitions provided by both the NIH and the University of California (UC) describe the postdoctoral researcher as an individual employed in a temporary position with fixed end dates for the purpose of receiving additional academic preparation and research training for academic/research careers. In general, I agree with the work duties and training goals ascribed to the postdoctoral position. I do believe, however, that the inclusion of the term "temporary" in the position descriptions for postdocs does not accurately reflect the years that most postdocs spend in this position. A recent survey showed that the average respondent spent 6 years between completing a PhD and obtaining a faculty position (Hsu et al., 2021, Sci Adv.). Relatedly, there is a disconnect between the NIH's 5-year limitation on the postdoc job period and the average time spent as a postdoc. I recommend that the NIH remove the "temporary" characterization from their postdoc definition as to not minimize postdocs' dedication to science. I also recommend the NIH extend the postdoc period to at least 6 and the eligibility of career development grants (like the K99) also by at least 1 year.

Fundamental issues and challenges

The union representing postdocs across UC fought hard during contract negotiations on several issues that, we believe, affect recruitment and retention of postdocs in academia. The biggest issue was fair compensation that reflects cost of living. In an effort to offer equity in the variance in cost of living between the 10 UC campuses, we made the following proposal that I think would work well for the NIH. We proposed a base salary for postdocs across all campuses and a supplementary stipend to account for higher cost of living in some cities. Specifically, we proposed that base salaries be determined such that 30% of the salary is equal to the average cost of a 2-bedroom apartment in the city/campus with the lowest cost of living. For example, if Merced, CA had the lowest, average cost for a 2-bedroom apartment, at $1,400 a month, a postdoc with 0 years of previous experience should start with a salary of $56,000 (determined so that rent is 30% of total salary). Then, for all other cities with higher costs of living, the difference between the average cost of rent for a 2-bedroom apartment in Merced vs. the other city will be offered as a stipend. For example, a postdoc at Level 0 hired at [redacted for anonymity], with an average rent for a 2-bedroom apartment at $3,000 (and a $1,600 rent difference with Merced), will receive the $56,000 starting salary plus $19,200 rent stipend. Again, this system was proposed to keep salaries equitable across cities with different costs of living and prevent rent burden amongst postdocs. This system could also be enacted at NIH, using national-level rent data. *Please note I am a volunteer with the union, not a formal representative.

Existing NIH policies, programs, or resources

An issue in the training ecosystem that I have witnessed is an absence of accountability for poor mentorship and/or abusive behavior from a mentor towards their mentee(s). NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs and mentoring

committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors. Mentors who are found to violate the ethical treatment of their mentees, as outlined in their mandated training programs should face repercussions from the NIH. A consequence to consider amongst possible repercussions is not allowing mentee funding without an additional mentorship team or a reporting structure within the PI's institute for any PI found to be in violation. I am offering this as a possible suggestion to consider. I recognize it may seem extreme, but I have also worked directly with mentees struggling with abusive PIs and it is incredibly frustrating to move a trainee out of a toxic environment, only to be dealing with the next mentee facing abuse by the same PI. I believe that required mentorship procedures and consequences for abusive conduct coming from the primary funding source will better motivate abusive PIs to adjust their behaviors.

I also support other policies put forth by the National Postdoctoral Association, including:

Requiring all NIH-funded postdocs to complete IDPs with their mentor on an annual basis and submit this as record to the NIH.

Expanding programs and funding to support staff scientist positions for postdocs needing more time to secure the increasingly difficult faculty positions.

Annual surveys of current postdocs on their job and mentorship satisfaction, if they are currently or soon plan to enter the job market, and metrics on the success of their job market search.

Proven or promising external resources or approaches

Again, I would like to echo the recommendations made by the National Postdoctoral Association. They would point you to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

As a women in science who is planning on having children, I also acutely aware of the very leaky pipeline in my immediate future. I hope to see the recommendations made by The Pregnant Scholar enacted into NIH policy, including: an increase in the allowable parental leave from 8 weeks to 12 weeks at least, inclusion of the non-birthing parent in the right to take parental leave, right to extend a postdocs current grant and early career researcher status to any postdoc who took parental leave. I would also like to personally suggest that the NIH create an office to coordinate parental leave rights with universities and follow-up with postdocs returning from parental leave to ensure that the relationship with their mentor is still strong and that no retaliation has occurred.

https://thepregnantscholar.org/parents-in-the-pipeline/

Response 2868

Perspectives on the postdoc roles and responsibilities

Spend a lot more time towards a career that will likely not result in a meaningful academic position. If it does it will likely not pay that well and require more personal sacrifices.

Fundamental issues and challenges

Pay, benefits, long-term career prospects.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Centering minorities and actually being proactive and real about DEIA efforts.

Response 2869

Perspectives on the postdoc roles and responsibilities

To me the postdoc position is a chance to develop skills in an area tangential to your PhD while also gaining leadership and lab management skills.

Fundamental issues and challenges

Postdocs are treated as neither grad student, staff, or faculty, which means they have no rights and no protections. They're basically a temporary worker with a PhD who have uprooted themselves and their family at the whim of a PI who they hope will be just and fair. Postdocs need more protections in terms of job security and to be treated as valuable members of the academic research enterprise. Additionally, post docs should be paid a higher salary and should be supported in part by the department as they often do a significant amount of training and service work.

Existing NIH policies, programs, or resources

More readily available postdoctoral training grants that aren't dependent on the PI, training grants like the t32 but for postdocs, and MUCH more involvement from the NIH to help potential post docs find labs that have grants where they listed they'd be funding a postdoc.

Proven or promising external resources or approaches

Postdoc recruitment is the one step of the academic pipeline that has no formal process. It's either who you know or you get lucky and cold e-mail someone and they have funding and are interested. Training and mentoring could also be improved to make sure that postdocs are gaining skills for future faculty positions and not just serving as a data generating robot.

Response 2870

Perspectives on the postdoc roles and responsibilities

Most postdoctoral researchers are more independent than they are given credit for. A postdoctoral research position is a regular job like any other and should not be considered a "training" position. Any training component of the position does not make it any different from a large number of other jobs that also have a training component. In any other field of work, you wouldn't call employees "trainees" just because the undergo sone level of training as part of their job.

Fundamental issues and challenges

Academics in general, but especially PhD students and postdocs, are largely underpaid, partly with the justification that they are just "trainees" . This rhetoric couldn't be more wrong. Postdocs and PhD students produce almost all of the Scientific research in the U.S. They ARE the main workforce in research, not simply "trainees" . Furthermore, the major motivation for postdocs has been the mostly fake promise that after working hard for a few years and being underpaid, they will get to enjoy becoming faculty and starting their own lab. This promise is mostly fake because the number of new faculty positions available is only a very small fraction of all postdocs who are ready to apply to faculty jobs every cycle. Given postdocs' underpayment, lack of credit for what they really represent, lack of hope of getting a faculty job, and lack of good alternatives to remain in academia, it is not a surprise that new PhDs are choosing alternative career paths to the postdoctoral position, leading to a postdoc shortage.

Existing NIH policies, programs, or resources

1. Increase postdoc salaries to make them competitive with salaries of alternative career paths in industry and other fields.
2. Modify the vocabulary and rhetoric used to describe postdocs. Stop calling then trainees, and make the positions sound exactly like any other legitimate job.
3. Take initiative to begin modifying the scientific labor system so that postdocs for whom there are not enough faculty positions have other opportunities to continue working in academic research, professionally growing, having proper salaries that account for their years of experience. These alternative positions should be sustainable over their entire working life span, and should allow them to properly retire after reaching retirement age. These positions should have all the features and benefits of alternative jobs, such as those in industry.

Proven or promising external resources or approaches

No resources to add, but I would like to emphasize again the inappropriateness of the usage of terminology such as "postdoctoral training" .

Response 2871

Perspectives on the postdoc roles and responsibilities

It is part of the career transition process, i.e., from being a graduate student to an independent principal investigator.

Fundamental issues and challenges

Poor wage. In a place like the bay area, it is impossible to survive on the NIH-prescribed post-doctoral salary as a single individual. At this career stage, we expect one to be able to afford a studio apartment and not have to live in a dorm-like situation.

Existing NIH policies, programs, or resources

Increase wage to HHMI prescribed post-doc salary scale and more.

Proven or promising external resources or approaches

No response

Response 2872

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Post-doc salaries are so low that nearly every graduate of our program takes a position in industry rather than applying for an academic post-doctoral fellpwship.

Existing NIH policies, programs, or resources

The NRSA pay scale is inadequate to support cost of living in most large cities. Many institutions are now establishing minimum salary requirements for post-docs that exceed the NRSA pay scale by 10-20%. The challenge for mentors is to find non-federal funds for salary supplementation. NIH should liberalize policies to allow mentors to supplement NRSA stipends from other NIH grants, such as R01s.

Proven or promising external resources or approaches

No response

Response 2873

Perspectives on the postdoc roles and responsibilities

In a nutshell, a postdoc is cheap, disposable labor for the PI.

Fundamental issues and challenges

Postdoc pay needs to better match postdoc abilities. Or at least be equal to other kinds of postdocs. For example, ORISE postdocs make more than the NRSA payscale—why can’t you match this? Funding instability is also a MAJOR issue. I need to be able to better plan my life at this age and the stress of having no idea if I would have a job in a year ultimately led me to jump off the academia train. I also deserve to have full benefits and it is absurd that NIH STILL has not fixed the issue of NRSA postdocs having fewer benefits than grant paid postdocs.

Existing NIH policies, programs, or resources

GET RID OF OR EASE THE NRSA PAYBACK AGREEMENT!!! This is a stressor for me right now, as someone who was a pandemic postdoc (an unstable time funding/job wise) and only allowed to have one year on a T32 because I wasn’t a “new” postdoc. It is unfair considering there are other government sponsored postdoc fellowships (e.g., ORISE) that do not come with this payback agreement. I have a position that I think will fulfill it but there is some uncertainty. What did you expect me to do after my 1 year on the T32 ended—take an unstable, low paid academic research position that I wasn’t sure would even last a year but was 100% sure the duties would meet the payback requirement, or take my stable, permanent

position where the pay better reflects my abilities??? It isn't 1993 anymore, getting a faculty position is harder, comes with more uncertainty, and you must now more seriously consider less traditional jobs as backups (which may be a mix of research and non-research duties). I can MAYBE understand why clinicians on NRSAs are subjected to this (their high salaries offset the payback), but see NO reason why those of us with research based degrees are. If you value postdocs, get rid of this or at least make it less stressful/uncertain to fulfill. For example, it's ridiculous that you won't accept someone doing 10 hours/week or research for 2 years, but are okay with 1 year at 20 hours/week. Why be so rigid? And the fact that this is an exception you might grant for disability, but only if cleared at the start of the payback period? You do realize that disability can happen at anytime?? This is exploitative.

Proven or promising external resources or approaches

No response

Response 2874

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are an opportunity to lead research of interest to the postdoc without all of the associated administrative burdens of being a faculty member. Postdocs are contributing valuable skills and are able to independently conduct research, all while learning new skills and/or topic areas and preparing for the next stage of their careers.

Note: Just because a postdoc receives training, does not mean that a postdoc isn't a highly skilled position. Many high paying and high status jobs also involve significant on the job training—the need for training does not necessitate a low salary in other fields and it should not be the case in academia either.

Fundamental issues and challenges

1. Salary/low pay
2. This is a primary consideration when accepting any job, especially a PhD-level position after years of low pay in graduate school
3. Suggestions for revisions include: Base pay + locality pay (per base NIH GS system), raises to match inflation, higher minimum salary
4. The NIH pays its own postdocs more than its suggested base pay for non-NIH-based postdocs
5. Benefits
6. Lack of benefits is a major hindrance and raises concerns about retirement savings and healthcare
7. Suggestions for revisions include: Access to 403(b), matching, maternity leave and childcare benefits
8. Postdoc descriptions
9. 3a: Postdocs are described as 'trainees' instead of scientists, situating people with years of training and relevant experience lower in the hierarchy than their background deserves. Postdocs are supposed to be prestigious but 'trainee' language does not reflect that
10. Suggestions for revisions include: Updated language that respects postdoc skills, education, and status
11. Student loan forgiveness
12. Many postdocs have student loans that further hinder them financially from proceeding in academia or accepting/staying with a postdoc position
13. Suggestions for revision include: Student loan forgiveness for postdocs
14. Perception of postdocs as expendable labor
15. Postdocs are sometimes seen and treated as cheap, expendable sources of labor, rather than as skilled colleagues who are leading research projects
16. Suggestions for revision include: Solicit feedback from postdocs and investigate researchers who are reported to be abusing postdocs. Create metrics for success and track postdoc trajectories
17. Career uncertainty
18. Postdocs are temporary positions for adults who often have families, mortgages/educational debt and career progression is critical
19. Suggestions for revision include: Better support in terms of funding for early career investigators, career development pathways including non-academic jobs

Existing NIH policies, programs, or resources

Provide additional budget support for hiring in grants

Update language describing postdocs from 'trainee' language to something that reflects their experience and training

Support postdocs in discovering their next career steps, in academia, industry, or government

Loan forgiveness for postdocs

Permit postdocs to take on outside employment opportunities such as consulting

* Thank you for putting together this RFI. It gives me some hope that things will improve, but please act meaningfully upon the findings

Proven or promising external resources or approaches

HHMI increased postdoc salaries to a 70k minimum: https://www.hhmi.org/news/hhmi-announces-postdoc-salary-changes

Consider the Nature survey of postdocs: https://www.nature.com/articles/d41586-023-00332-6

Universities including Princeton, Penn, and MIT raised their minimum postdoc salary to ~65k

Please consider other peer-reviewed research on the low life satisfaction and general unhappiness of postdocs: https://elifesciences.org/articles/75705

Response 2875

Perspectives on the postdoc roles and responsibilities

Postdocs are the intellectual boundary pushers of the lab. They develop new projects and avenues of research in the lab, while helping to train the younger scientists in the lab

Fundamental issues and challenges

The first year postdoc pay is so low that people cannot eat or rent a house in big cities such as San Francisco (where I am). It is the number 1, 2 and 3 reasons that I have trouble recruiting and retaining postdocs.

Existing NIH policies, programs, or resources

Minimum postdoc pay. Simple.

Proven or promising external resources or approaches

HHMI, MIT, UW all have raised their minimum postdoc pay.

Response 2876

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The compensation is not sufficient at all and has not scaled with inflation in recent years. In particular, computational postdocs are payed a lot less than market value. NIH recommended levels are used as an excuse to not pay a living salary to postdocs. The current salary levels make it very hard to stay in the academic track specially for postdocs supporting a family in expensive cities such as Boston, New York, etc. Right now, I pay 75% of my net salary for rent which is not sustainable at all.

Existing NIH policies, programs, or resources

NIH pay levels for postdocs should be increased significantly. They should also be adjusted based on the cost of living in different cities. It doesn't make any sense to have the same scale for a postdoc in Boston vs a postdoc in Illinois; the cost of living including rent is incomparable. Also, since the funds come from research grants to PIs, the R01s and other grants should be increased and adjusted accordingly based on the inflation in the last two decades.

Postdoctoral fellowships (F32s) should also be expanded to non-US citizens or permanent residents. It's unfair to deprive them of career development opportunities while they play a crucial role in the advancement of science in the US. Let's put this unfair policies to bed once and for all.

Proven or promising external resources or approaches

No response

Response 2877

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low salary. There is low flexibility for PI's to increase postdoc salaries when modular budgets are constrained and many investigators lack access to large amounts of non-federal dollars required to pay postdocs above NRSA-scale. Institutions are unaware and are resistant to allowing investigators to increase postdoc pay beyond the NRSA scale even when they have the resources to do so.

Existing NIH policies, programs, or resources

The childcare stipend given to NRSA fellows could be larger, although helpful, the stipend only covered 1 month of care for my family specifically. Additionally, postdocs paid from larger research grants (such as R01) should also be eligible for childcare stipends possibly through an easy supplement application. A greater variety of K-awards (such as K01's) would be helpful, as not all postdocs immediately decide that an academic career is what they want (and miss out on the tight window). NIH has a great deal of influence over policies at individual academic institutions, and clear guidelines for postdoc compensation would help tremendously.

Proven or promising external resources or approaches

See [redacted for anonymity] negotiated contract with postdoc union. The [redacted for anonymity] will now have a recruiting advantage over many other academic institutions.

Response 2878

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Postdoc salaries are too low, and institutions/labs with NIH funding are allowed to pay below the NIH minimum if the award is not directly to the postdoc. Additionally, postdocs who win awards often receive paycuts due to overhead taken out.

Existing NIH policies, programs, or resources

Require all labs with NIH funding to pay postdocs the NIH minimum. Raise the NIH minimum salary. Do not allow institutions to take overhead out of F31/F32 grants.

Proven or promising external resources or approaches

Higher pay improves diversity, equity, and trainee happiness. There is no single issue that comes anywhere close to postdoc pay in importance. The current postdoc shortage will only get worse until this is fixed.

Response 2879

Perspectives on the postdoc roles and responsibilities

I'm positive the postdocs are the driving force of the American research. Our roles expand way beyond our publication record and the advancing of scientific knowledge, but often represent training of undergraduate students, lab management, literature review and grant writing.

Fundamental issues and challenges

For sure one of the biggest struggles for postdocs currently is the pay inequity. The minimum entry-level salary for a position that REQUIRES as PhD is way too low in general and not adjusted for inflation rate annually.

In my specific case, being a postdoc in Boston with a wife a daughter, this gets even worse. Housing and childcare are ridiculously expensive, and impossible to afford by myself. As a foreign, it's common to not own a house and, therefore, to be in the hands of the landlords and potential abusive rental agreements. For example, I was requested an increase of 20% in rent from 2021 to 2022 due to new administration of the building.

Supporting the moving cost is also critical to attract postdocs, as its really intimidating to move from a country with a currency most likely weaker than the US dollar, and having to pay up to 4 months of rent upfront (security, first and last month + broker fee). Institutions securing part of the negotiation could help reduce some of this burden.

Additionally, as mentioned, postdocs with kids face a great lack of childcare support. Kindergarten cost can get up to 80% of the stipend of an entry-level postdoc, and even the ones associated with an institution are not that cheaper. Benefits are also not tailored for those with family, with healthcare getting a big chunk of the paycheck. Attention to postdocs with family is critical to maintain their adherence to the academic track.

Immigration could also be facilitated for postdocs. Many of these scientist come from foreing countries with temporary visa, that increase the pressure for fast production, stress and a source of power against postdocs by mentors and institutions.

Also, increasing of clarity in bullying, retaliation, and harassment policies.

Existing NIH policies, programs, or resources

For sure more effective ways to communicate such policies, programs or resources are necessary, as I'm not familiar with many of them. Perhaps by a standardized talk with the Postdoctoral offices to present main opportunities for that specific institution and on regular updates of such policies.

Additionally, opening of NIH K awards for foreign students should be a must, and is possible reality. The postdoctoral populations is already formed mostly by foreign individuals, with some labs having no resident individuals. This reduces the funding opportunities for a great chunk of the postdocs, that sometimes are asked to seek residency to increase funding opportunities, and punishes laboratories who doesn't have residents.

Proven or promising external resources or approaches

Some suggestions were included above. Although no direct approach will be mentioned, it's widely recognized that fellows transitioning to the private sector, which addresses many of the problems mentioned above, report an sensitive improvement in their quality of life and engagement with research. This even when performing similiar tasks as they were doing in academia.

Therefore, to keep the pace of the academic research, which is critical for both social and economical prosperity, actions need to be taken immediately to support the life of the Postdoc population, which has been neglected for many years now.

Response 2880

Perspectives on the postdoc roles and responsibilities

To me, the postdoc period should be protected time to mature as a scientist, develop additional professional skills needed for the desire career outcome, and to establish an independent research program if an academic career is the desired outcome. As it currently stands, postdocs are key to the academic system, often serving as additional (or sometimes primary) mentors for graduate students and providing highly skilled labor forming the backbone of many established labs.

Fundamental issues and challenges

One of the great tensions of the postdoctoral position is whether this should be considered a "training period" or simply a "career step" along the path to an independent career. Often, the fact that the postdoc

is a "training period" is used as a rationale to pay low wages and expect long working hours. Postdocs often lack benefits granted to typical "employees" such as retirement benefits and a salary commensurate with the level of education and skill. This is a particularly difficult situation for people in high cost of living areas and who do not have other means of financial support or who have families. There is no doubt that these financial pressures are a rationale for some to leave academia after graduate school. In the past 5-10 years with the biotech boom it has become very common for companies to not require any postdoctoral training prior to hiring for entry level scientist positions that pay much better and have the benefits and stability of a "real job". There is also a personal/social cost to feeling like you are falling behind your peers who have real jobs that pay real money and you are still "training" until you are 35-40 in many cases. Additional concerns include bullying and harassment due to the power dynamic of the PI over the postdoc and the ability to greatly influence a career outcome.

Existing NIH policies, programs, or resources

1. Funding for postdocs that is not tied to a specific lab or institution. This would allow postdocs to move labs more easily if there are problems with a specific mentor.
2. Increase R01 budgets!! For postdoc salaries to be competitive, we need the money to pay them.
3. Start the K99 clock based on the start date in the postdoc lab, rather than PhD degree date. For many reasons (family concerns related to moving cities, extending timelines to complete publications) many people are unable to start a postdoctoral position immediately after graduating and should not be penalized for these personal decisions.
4. Extend K99 and ESI "clocks". It is understandable that the NIH wants to minimize time in training, however this may disproportionately discourage certain groups to leave academia. Besides people who are unable to start postdoctoral training immediately it also penalizes people doing science that naturally takes more time, switching fields, or establishing something completely new. In my experience, K99 applications without publications are not successful, so let's consider a possible timeline: Maybe someone started their postdoc 6 months after their degree date, had to set up a new system in the lab which takes 1 year; does experiments and writes a paper for another 1 year; spends another year publishing; and now we're at the 3.5 year mark with one shot to apply for a K99. But, everything in the postdoc needs to go perfectly and efficiently with no room for deviations to make this work. There is no time for trial and error or working on big questions that take more than a year or two. For many areas of research, this is simply not realistic. The NIH needs to think carefully about what types of scientists do and do not benefit from this system.

Proven or promising external resources or approaches

No response

Response 2881

Perspectives on the postdoc roles and responsibilities

In my experience, an academic postdoc is usually treated as a staff scientist--they perform the majority of the work covered by grant funding. There is also an aspect of training to the position, as most people accept a postdoc position to improve their skills for independent research and eventually running their own lab. However, the training usually seems secondary to carrying out research, as postdoc position advertisements usually require certain skills up front.

Fundamental issues and challenges

It seems that there are three fundamental issues with retention of academic postdocs:

1. Postdoc pay is too low for the level of skill involved--far below market price were the postdoc to move to industry. Often the justification for this low pay is that this is a training position. However, as stated in the previous answer, the training generally seems secondary to actually performing the research the postdoc was hired for--if this were not the case, the mass postdoc exodus would cause little concern about funded research not getting done. Rather the main concern would likely be that not enough people were being trained to fill open faculty positions--something that seems patently false at the moment.
2. Following on this, the second issue is that the personnel structure of academia is fundamentally flawed and unsustainable. In a sustainable structure, each tenure-track faculty member would train on average only one or two postdocs, for a stable replacement rate. Instead, PIs train many postdocs, and without a substantial increase in open tenure-track positions year over year, the majority of postdocs must leave academia, regardless of interest, for lack of open positions. As of now, academic career paths for postdocs other than a tenure-track position are quite limited.
3. A third issues is that postdocs generally have to keep uprooting their lives to continue on the academic career path. Given that the time as a postdoc is also a time when most people are settling down and starting families, it becomes difficult to both pursue and academic career and have a comfortable, stable family life in one place until the postdoc gets a permanent position.

Existing NIH policies, programs, or resources

The fundamental issues in the previous answer could be addressed by changing the academic career pathway. As of now, great focus is placed on PIs starting up their own lab. Instead, there should be more emphasis on forming and funding consortiums of researchers for common goals, with staff scientist as a viable career trajectory with compensation at least somewhat competitive with positions outside of academia. I believe this can be achieved by changing the makeup of grants being funded to involve more collaborative work, as well as incentivizing universities to build such consortiums. Such a change would likely improve postdoc retention, as there would be viable career paths outside of starting an entirely new lab, and it may also reduce the need for postdocs to uproot their lives every few years to chase an academic job.

Response 2884

Perspectives on the postdoc roles and responsibilities

As a training program director funded by NIH, I think highly of the academic postdoc. For me, the postdoc is a time in which an academic in training can focus on developing their research agenda. They can go deep on methods they might have studied during their doctorate, learning how to really work with the methods to make discoveries and advance science. This time is also for making human connections with mentors, peers, and others who will support the academic in developing their career. Individuals who have a successful postdoc experience become leaders in field and strong mentors for the next generation. Postdoctoral positions do not receive the credit they are due as individuals who skip them often become burned out or rise quickly but may not have the ability to mentor others—this may be why we are facing the current crisis of the postdoc as many over the last decade have skipped postdocs in favor of lucrative private industry jobs or immediate faculty positions but which ended with them leaving academia. The postdoc period is special, and it requires robust mentorship to help someone develop into a productive scientist who will advance science while giving back to the field through mentorship of the next generation.

Fundamental issues and challenges

There are many challenges that face postdoctoral training programs. First, wage growth in the data sciences makes it challenging to recruit top scholars in fields like computer science, informatics, and biostatistics who can make 2-3 times more in the private sector. The PGY scale has not kept pace with inflation, especially in the past three years. Second, many institutions are hiring individuals who do not complete a postdoc leading many junior scholars to intentionally skip the postdoc period in favor of a non-tenured research track position. Third, rising health insurance costs put a strain on institutions to supplement training grant dollars. Moving forward, public universities and some private institutions will no longer be able to afford supplementing what NIH allows with respect to salary and fringe benefits like health insurance. Fourth, datasets and training related expenses (e.g., grad students) now cost more and the allowances offered in T programs are not sufficient to provide adequate support for post trainees. Fifth, many postdocs now arrive with a doctorate and a master's degree in a STEM related field. Asking postdocs to complete a formal degree is not necessary. Perhaps for MDs and other clinical doctorates but many PhDs also have MS and MPH degrees before coming into our program. Allowing these costs to be used for short-term trainings (methods workshops) and/or travel to conferences would provide more flexibility. Finally, recruitment requires significant investment of time and money. As training program director, I spent 5-10% of my effort recruiting postdocs. This is not covered by grant expenses, neither are the costs associated with advertisements which are also getting more expensive.

Existing NIH policies, programs, or resources

There are several modifications that would enhance the postdoctoral training experience. First, total support costs must increase. Salaries and fringe costs need to increase. Postdocs should also be supported with travel funds and have flexibility in how their training costs are spent. A workshop on a specific method or week-long class for developing propensity scores should be viewed as valuable training on par with a 3-credit course on biostats. These costs should be covered fully to allow for individuals with Masters degrees to forego a second masters in favor of some targeted methods development training.

Second, there need to be more resources to reduce recruitment burden. If the postdoc was more competitive relative to salary, fringe, benefits, etc. perhaps that would make recruitnig easier. Yet there are additional burdens that could be lifted if NIH were to stand up a centralized portal for postdoc positions that would become the Indeed of postdoctoral hiring. Let programs post their positions and

direct people to this site. It is hard to find details of postdoc positions through traditional platforms. Streamlining recruitment would reduce burden on training program directors.

Third, expand access to non-citizens. We receive 3 times as many applications for non citizens as we do for those who are eligible based on birth origin. If non-citizens could be funded we would fill our slots each year easily. Perhaps there are new policies like allowing someone who has been in the country for several years earning their advanced degree who demonstrates a desire to become a citizen to be allowed funding for a postdoc. These individuals desire to have science careers in the U.S. Give them the opportunity to demonstrate their skills and contribute to the knowledge base.

Proven or promising external resources or approaches

Our program focuses a lot on mentorship. We train all mentors and require them to attend periodic workshops to enhance their mentoring skills. We find it rewarding to have open discussions about our mentorship approaches, sharing ideas and discussing strategies. We also find it rewarding to discuss case examples where things went wrong. Our faculty embrace quality improvement and take ideas from these discussions back into their work with the trainees.

Response 2885

Perspectives on the postdoc roles and responsibilities

It is a training period that required heavy mentoring. Trainees have typically acquired good science skills but need to add a skillet, solve more risky, elegant problems. This requires mentoring, financial support, being recommended for opportunities that increase visibility such as seminars etc. Postdocs propel forward a labs productivity and need to be compensated better monetarily as well as more weight age for authorship.

Fundamental issues and challenges

Most postdocs are in their thirties. Approximately 50% of postdocs are women. This means most of them are in their prime child bearing age and yet many face the choice of either foregoing family responsibilities in lieu of their career or are forced to leave academia.

Better wages, subsidized childcare, accessibility to childcare can all increase chances of retaining women in science.

Further low wages again force postdocs, men and women, to leave academia to support their families.

Unclear rules regarding how to balance work-life, maternity, paternity, family responsibilities etc are exacerbated with abusive advisors.

Existing NIH policies, programs, or resources

NIH needs to expand their transition to independence grants (k99 etc). Also provide meaningful compensation for childcare. 5000 is ok but daycare costs $2000 PER MONTH. The small amount nIh provides doesn’t even begin to fill the gap postdocs face having to pay rent, daycare, and provide for the family.

Proven or promising external resources or approaches

Postdocs can be tailored to provide an appropriate training experience based on the trainees future goals. For e.g. a postdoc who wants to go to the industry needs a short 2-3 yr postdoc experience primarilyearning project management, unique skills, and training people.

Someone who wants to stay in academia needs to first publish a paper within 2-3 yrs, obtain a fellowship, and work on a bigger, more novel project.

This can easily be tailored for the trainees and still provide output for PIs.

Response 2886

Perspectives on the postdoc roles and responsibilities

It’s important for me to continue my academic career. It’s also important for me to be trained work individually.

Fundamental issues and challenges

VISA problem for international scholars, culture conflict, communication skill,

Existing NIH policies, programs, or resources

salary problem, paper pressure

Proven or promising external resources or approaches

research pressure,

Response 2887

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a launchpad to running an academic lab as a PI. I value intellectual freedom and independence during a postdoc. Postdocs should receive sufficient resources and support to take scientific risks and develop innovative new projects.

Fundamental issues and challenges

The job market to become an academic PI is hypercompetitive. Many exceptional postdocs suffer through 50+ job applications over multiple years and may end up with zero to few options at an academic institution. Meanwhile, we are poorly compensated financially and unfairly asking our families and partners to sacrifice their quality of life for our pursuit of scientific research. The geographic and financial limitations of being a postdoc and the lack of a secure future are immense challenges for retention and recruitment.

Existing NIH policies, programs, or resources

Increase NIH budgets and grants to compensate postdocs more fairly nationwide. In this economy, postdocs should receive a minimum of $85,000/year. Also, remove the salary cap for postdocs. Postdocs should be able to receive bonuses for exceptional work. Lastly, implement a retirement savings plan for postdocs. We are losing out on 5+ years of retirement savings without contributing to a 401K.

Additionally, build incentive for universities to hire more tenure track PIs. Expand funding for career transition awards so that postdocs receive more financial support and leverage when deciding on their next position.

Proven or promising external resources or approaches

No response

Response 2888

Perspectives on the postdoc roles and responsibilities

Learn new skills, develop as a scientist and professional

Fundamental issues and challenges

By far, the primary issue facing postdocs is salary. Especially in high cost of living areas, the average compensation for a postdoc is not enough to financially sustain a person, especially one in their late twenties and older. At this age, many postdocs are contemplating having children, or already have children, and daycare costs are not feasible with current postdoc salaries. Additionally, we are at the age where we should be saving for retirement. Not only do postdocs not have retirement plans available to them (401k etc), but the low salary means that many cannot save for retirement on their own either. This problem is additive, since postdocs have already lost 5+ years of decent salary as graduate students with low stipends. This is especially burdensome for postdocs from economically disadvantaged backgrounds — often first-gen graduates or from groups underrepresented in science. Thus, low postdoc salaries are fueling further gaps in diversity, equity, and inclusion in science/academia. When industry positions easily pay 2x the salary of an academic postdoc, it is understandable that PhDs are not choosing to go into or stay in postdoctoral positions.

Existing NIH policies, programs, or resources

Increase funding: both at the R level so PIs can pay postdocs more and at the F/K level so postdocs on fellowships are better compensated. Additionally, implement policies to ensure that postdocs are able to take full advantage of pay bumps they may get when awarded an F/K award. Numerous postdocs at a variety of institutions have not been able to draw the full salary of a K award due to institutional red tape.

Proven or promising external resources or approaches

No response

Response 2889

Perspectives on the postdoc roles and responsibilities

A postdoctoral fellowship is seen as a necessary but precarious step to becoming an esteemed, independent research scientist in academia. Although postdoctoral fellows are viewed as "trainees'' and compensated as such, they are highly trained researchers that produce the bulk of biological and life sciences research. However, unlike graduate trainees, they do not benefit from the structured training environment or student support offices offered by graduate programs. Postdocs are often not afforded the protections offered by formal employment, and thus these valuable early career scientists are vulnerable to isolation and mistreatment.

Unless the resolute goal of a trainee is to become an academic independent researcher, a postdoctoral position is generally avoided. Even if a doctoral degree holder ultimately seeks a professorship, the number of academic positions open to them is small compared to the number of people graduating with the same degree. Thus, pursuing an academic postdoc is often a gamble on their future careers.

Finally, the role of the postdoctoral trainee should be different from that of a staff scientist. While some of the duties of both positions may be similar, they have distinct purposes. The role of the postdoc should focus on honing the skills of a future primary investigator, while the role of a staff scientist is to use their doctoral training to produce research under primary investigators. As such, staff scientist positions should not require previous postdoctoral training, while postdoctoral training programs should focus on mentorship, grantsmanship, and professional development of the trainee. The differences between the roles of these two important groups in our ecosystem must be solidified and enforced. If one of NIH's major concerns about the postdoc shortage is research productivity, then additional staff scientist positions must be considered in that solution.

Fundamental issues and challenges

A highly generalized summary of the issues facing postdocs is that postdoctoral positions demand trainees sacrifice pay, benefits, and work-life balance for small, unguaranteed gains in professional development and career advancement.

Academia often expects postdocs to have a single-minded passion for research at the cost of their own wellbeing. Many potential postdocs have already delayed major life milestones, such as planning for retirement, owning property, starting a family, or caring for aging family members due to the length of predoctoral training. They are asked to do it again during postdoctoral positions, for which compensation and benefits are limited.

As the largest source of biomedical research funding, the NIH has an obligation to address the issue of low compensation for a specialized and heavy workload. Most research universities follow the regionally uniform NIH minimum stipend, which is often inadequate for living in locations surrounding research institutions. Benefits, such as health insurance, childcare subsidies, parental leave, and retirement savings opportunities vary by institution and not funding mechanism. Postdocs also frequently divide their attention between publishing predoctoral work, establishing new research projects, securing funding, managing junior lab members, and professional development. This leaves little room for much else. Consequently, postdocs often face isolation and lack of community. Low compensation also poses a fundamental equity problem, as trainees from historically marginalized and under-resourced groups are unable to afford these positions.

Finally, academic postdoctoral positions, unlike other postgraduate fellowships, do not offer clear professional development opportunities. They could be more valuable by offering formal training in key skills, such as mentorship, lab management, and grant writing. Additionally, the transient nature of the

postdoc model exacerbates existing economic and social challenges. This could be remedied by creating bridge programs at local institutions with a clear path to a permanent position in industry or academia.

Existing NIH policies, programs, or resources

The [redacted for anonymity] supports increasing the minimum postdoctoral stipend, even at the cost of fewer awards. The minimum stipend should start at GS-11, with locality adjustments, and increase with additional experience according to the general schedule. Because the NIH stipend is often the floor set at research institutions, this increase stands to benefit even non-NIH funded postdocs. However, this must be implemented such that it does not only benefit highly resourced institutions already supplementing stipends. One option could be guaranteeing a base stipend benefit per trainee while supplying additional NIH support on a sliding scale up to the full locality adjustment. This sliding scale, based on the endowment of the awardee's institution, would provide no additional funding to the highest endowed institutions.

Furthermore, NIH should find mechanisms to support benefits like affordable child care and health insurance, especially for under-resourced institutions. For example, NIH could allocate a percentage of an award to a separate category only for benefits. This could make postdoctoral positions more competitive with industry jobs.

Programs that should be built upon are the Institutional Research and Academic Career Development Award (IRACDA) and the K99/R00 Pathway to Independence Awards like MOSAIC. These programs offer a clear training time-frame, mentored research, and professional development training. IRACDA also offers specific training for teaching and other areas of interest to the postdoctoral trainee. Programs similar to IRACDA should be developed to focus on lab management or industry skills instead of teaching.

Additionally, postdoctoral T32 programs must be held to a higher standard to address academic culture and support systems. T32 applications must clearly define expectations for trainees' work hours, research commitments, and professional development in applications. Programs that build cohorts of postdoctoral fellows, integrate inclusivity into training, and build comprehensive alumni networks should be prioritized.

Proven or promising external resources or approaches

The National Center for Science and Engineering Statistics (NCSES) recently revamped the taxonomy of their Survey of Earned Doctorates and created the highly NIH-relevant field of Biological and Biomedical Sciences (BBS). From the most recent data, BBS is the only field to see a drop, let alone one larger than 10%, in the postdoctoral rate over the past 20 years. Collaborating with NCSES to better understand these trends and how they are distributed across groups could be beneficial to the ACD Working Group.

We also suggest looking at other successful postdoctoral programs. For example, the Lawrence Livermore National Laboratories' postdoctoral program allows trainees to allocate up to 25% of their time to professional development. How that time is spent is directed by the trainee. Additionally, this program offers a starting salary of $96,000 annually; 71% higher than the current NIH NRSA minimum stipend for postdoctoral fellows and more than $15,000 above the GS-11 locality pay. Finally, this postdoctoral program provides a clear path to a research scientist position at the lab, either in their current division or another division of interest.

The American Association for the Advancement of Science (AAAS) Science and Technology Policy Fellowship program is another postgraduate training program worth modeling. Although it is designed to bring scientists into policymaking, it has several strengths such as: a defined timeline, annual cohorts for fellow support during the program, well-developed alumni networks, and often a path to a permanent position post-fellowship in participating government offices.

Finally, we suggest looking at the Simons Collaboration Transition to Independence Awards, which outline specific funds to be used for professional development in addition to research support similar to the K99/R00 mechanism.

[redacted for anonymity] thanks the NIH ACD for its work and looks forward to continued stakeholder engagement on postdoctoral issues.

Response 2890

Perspectives on the postdoc roles and responsibilities

An academic postdoc gives scientists mentored time to explore career options while further developing research skills and knowledge. Postdocs might not be aware of all their career options beyond academic

research so NIH should support scientists at this stage to guide them to the professional path that best suits them and give them the training to succeed. It's a way to optimize our return on educational investments.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

I recommend more training in science communication of all forms: oral, graphical, written.

I'm a grateful NIH trainee (PhD training grant level) who now works as a scientific editor for a peer-reviewed journal and a research institution. I now realize the overarching importance of science communication. Being able to communicate your science to multiple audiences: funders, reviewers, legislators, collaborators, and the public is essential for a successful career.

Proven or promising external resources or approaches

I've seen a strong interest among early career scientists in workshops on grant and manuscript writing, oral presentations, and figures and tables. Thanks for the opportunity to comment.

Response 2891

Perspectives on the postdoc roles and responsibilities

Postdocs have full hands-on responsibility for designing, implementing, and analyzing experiments that form the core of NIH-funded research programs. They often mentor graduate students, undergraduates, and technical laboratory staff, and execute research for their mentor's program while endeavoring to build their own independent research portfolio.

Fundamental issues and challenges

Primary concerns are the lack of immediate financial and medium-term job security that dissuade many from pursuing academic postdoctoral positions.

Existing NIH policies, programs, or resources

The NIH should actively and routinely vet funded institutional T32 pre-/postdoctoral training grants to ensure they are fulfilling the training objectives they proposed to provide to trainees at the time of application. I was on a postdoctoral T32 at an R1 institution that literally provided no training to the grad students and postdocs on the grant. No journal clubs, no trainee seminars, no coursework of any sort, no interaction with training grant faculty, not even any kind of training in the responsible conduct of research. NIH needs to ensure that the institutional training grants that it supports actually fulfill their promise of educating postdocs as well as grad students. Instead of asking training grant PIs to report on the training activities that their T32 provides, all grant reviews and renewals should include surveys of current and former trainees funded through the T32 to assess if its training objectives are actually being met.

Expand funding support for academic staff scientists in R01-type grant mechanisms. Better yet, support funding for staff-level academic scientists at research institutions, to support a stable professional workforce of academic scientists. Not all grad students want to be PIs, and many default into a postdoc to get a job that is kind of like a staff scientist. Meanwhile, postdocs that are interested in developing their skills and research programs to eventually run their own research labs are all too often saddled with mundane, "non-promotable" work that is needed just to keep their mentor's lab running, to the detriment of their career advancement. This is especially true for women and minorities. Increasing NIH support for academic, staff-level scientists would help address both of these issues.

Proven or promising external resources or approaches

Match NIH/HHS postdoctoral stipend levels to those provided by other government agencies. For example, the Department of Energy currently pays year 0 postdocs a starting stipend of $92,000 per year at Los Alamos National Lab. This is over 60% more than the starting NIH-funded postdoctoral stipend level of $56,484, for what amounts to a government-supported scientist of equivalent training and qualifications. This discrepancy in funding across fields and federal government agencies cannot be explained away by private sector market forces, as biomedical scientists, like physical scientists, can make phenomenally

more money in private industry than they can in academia or government. If the NIH wants to maintain a top-notch biomedical science workforce across the national academic enterprise, it has to be willing to pay for it or risk losing talented young scientists to other sectors.

Response 2892

Perspectives on the postdoc roles and responsibilities

My lab is a post doc heavy lab with my PI being away most of the time. In this scenario my day to day learning happens because of very talented post docs around me. They have taught me the daily workings of building and executing a project. I see them as experts who bring in diverse ideas to the lab and test them while also being mentors to graduate students, undergraduates, and post-bacs.

They are experts not only in the area of research, but also in project management, time management, collaboration, good communicators of their work. These are all the qualities that I as a graduate student have learnt both actively and passively from them. If I were to imagine my PhD without post docs in the lab, it would be a difficult journey. Without their training and collaboration, I do not my work making any progress.

Fundamental issues and challenges

We all understand that the academic job market is tough. This facts hangs heavily on the shoulders of post docs. This keeps them stressed which often leads to overwork. While this requires a more systemic solution, some of the worries that they go through are economical. I have post doc friends living on the coasts of the country and are at times worried about having enough money after paying for rent and groceries. As post-doc ages are getting older and are stretching longer it is normal to expect to start saving some money. With the current pay this rarely happens. This day to day anxiety is debilitating and impedes progress in research. This leads to attrition of highly skilled and trained talent pool of the academia. The stress about daily bills leads oneself to question their wish to stay in academia. Post docs are working as much as a project manager in a company. When the corporate world values all the talent and the skill that post docs can bring, it becomes hard to justify to oneself to remain in a job that they love the most, i.e. to be working at the bench and training new generation of scientists.

Existing NIH policies, programs, or resources

As majority of the US post doc pool is made up of internationals, it is necessary to provide people with moving allowances at the beginning of the appointment. Secondly, most of the post-doc fellowships are not available for internationals. I understand that part of the reason is that NIH is a federally funded institute, but to keep this talent pool in the country it is essential to have more opportunities for internationals to participate in.

Proven or promising external resources or approaches

The recent news by HHMI to increase the base salary is appreciated by everyone. I think HHMI also takes into account the cost of living into account and adjust salaries accordingly. I think NIH needs to do this. We also need to think of rewarding post-docs on a yearly basis. Since it is independent work and most of the times post-docs may not be recognized for all the work that they put in to run the lab. A majority of the time spent on these issues are not acknowledged and accounted for. This needs to bring in more defined roles of post-docs in the lab while honoring their efforts in mentoring with financial rewards.

Response 2893

Perspectives on the postdoc roles and responsibilities

I am writing in my capacity as [redacted for anonymity]. Postdocs carry out the majority of scientific research in the United States and serve a critical role in mentoring graduate students. We at [redacted for anonymity] are very concerned that without decisive again—and action taken soon—that the future of academic research is imperiled. Many PhD students are opting out of continuing in academic science and are being drawn to the private sector. The dramatic reduction in the pool of postdocs applying to HHMI Investigator laboratories is widely acknowledged and concerning.

Fundamental issues and challenges

In our view, postdoc salaries are too low to reflect the contemporary reality that postdoc training now often extends well into their 30s, and postdocs are often parents. In inflationary times, cost of living has made the NIH standard starting salary of ~$55,000 unlivable in many high cost of labor cities. While salary is only one of many problems faced by postdocs in [redacted for anonymity] laboratories, a decisive and meaningful increase in salaries will rapidly improve the plight of our postdocs. Other problems that [redacted for anonymity] has noted is the drop in international scientists choosing to come to the US to continue their work here—due largely to immigration/visa challenges. The high cost of childcare and its limited availability are also challenging for postdocs with children. Issues with the long process and inefficiencies of scientific publishing unnecessarily extend postdoc training duration and slow the dissemination of science. However, in [redacted for anonymity] view, salary is the one first step that all institutions and funders can take now to improve the status of postdocs in the United States.

Existing NIH policies, programs, or resources

There is an urgent need to prioritize postdocs in NIH budget considerations. Starting on April 9, HHMI has raised the salary for a starting postdocs to a range between $70K-$91K. More information can be found at this website: https://www.hhmi.org/news/hhmi-announces-postdoc-salary-changes. To avoid this being an unfunded mandate, we have budgeted for a Postdoc Bridge Fund to ease the transition to the new salary scale. We urge NIH to consider increasing the NRSA minimum to $70K, and to implement corresponding changes to research budgets. The $250K modular budget has not changes in a quarter century and NIH must prioritize the people who do the science by taking bold and immediate steps to invest in postdocs.

Proven or promising external resources or approaches

Again: raise NIH NRSA minimum to $70K will have an immediate impact on the health of the US academic science ecosystem.

Response 2894

Perspectives on the postdoc roles and responsibilities

A big part of postdoc work is publishing. Being able to communicate clearly is crucial.

Fundamental issues and challenges

Many postdocs don’t know how to follow instructions by grant funders, nor the submission guidelines of academic journals. Many have been taught to write in a stilted, jargony, passive voice. This can hamper their careers.

Existing NIH policies, programs, or resources

Fund workshops for postdocs on

a) effective science writing;

b) grantsmanship;

c) following journal submission guidelines.

Proven or promising external resources or approaches

The Open Notebook runs a successful series of online workshops for science writers. There are also several excellent master’s programs in science writing. Perhaps an RFP inviting workshop development could target resources like this?

Response 2895

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

As a PhD level position, postdocs are working professionals, not only trainees. Often, the ‘working professional’ component of their role is rendered invisible by the inequitable access to policies and

practices that fully support them as workers and not only trainees. Areas of the Post Doc experience that can be strengthened includes:

- Pay inequities; the need for above low-income level salaries nationwide and need for inflation rate adjustments annually.
- Cost of living adjustments are needed, one possibility would be to use the existing GS-11 salary scale which is already used for government-funded researchers with similar experience.
- The current startup cost associated with becoming a postdoc (moving expenses, 4 months of rent up front in some cases) can increase barriers for people from historically marginalized communities to becoming a postdoc.
- Postdoc parents are currently really struggling. Support for them could be improved by providing childcare subsidies, 16 weeks for both maternity and paternity leave, cheaper family health coverage.
- The need for strengthened policies related to harassment and bullying.

Existing NIH policies, programs, or resources

Response 2897

Perspectives on the postdoc roles and responsibilities

A postdoctoral researcher is a highly skilled scientist, trained in a particular field who has proven to be capable of pursuing long scientific over many years, often in collaboration with other scientists. This involves project management skills, student mentoring, paper publishing and different types of presentation (informal (group meetings, 1:1 discussions, etc) as well as more formal (conference presentations, grant reviews). This role is not an intermediate role between the PhD and the next role, shall it be in academia, industry or startup, but a real job requiring all the previously mentioned skillset.

Fundamental issues and challenges

Despite being highly trained and skilled, postdoctoral researchers are often largely underpaid compared to what they would make in industry (at least 2 or 3 times more industry), largely impacting their ability to continue their postdoctoral journey and in a way limiting the postdoc to people who already have resources prior to starting their postdoc. The local cost of life (typically very high, especially in Boston) has increased significantly while the postdoc salaries have not. Inflation is not compensated in the salaries. Having a family is therefore becoming a luxury that postdocs cannot afford if their significant other is not making significantly more than they are. In addition, international postdocs are suffering from limited visa durations and types (often J-1) which doesn’t allow them to easily switch to other types of

positions and apply for grants. PI status is not often possible for postdoctoral researchers. In addition to the previously mentioned factors, postdoctoral experience is a very lonely experience and can vary from institution to institution significantly as well as within a specific institution and department, depending largely on the PI and lab size, culture. The mentoring varies significantly and may have a tremendously negative impact shall the PI not dedicate significant time and resources.

Existing NIH policies, programs, or resources

Several points could be made to improve the postdoctoral experience:

- A geographically dependent salary to account for areas where the cost of life is very high. Inflation based increased as well as annual experience-based increases should be taken into account. The salary received is currently too far from what industry offers to make postdoctoral position competitive.
- A better integration of what pursuing a scientific career and having a family at the same time means.
- Longer visa duration and a more flexible visa (H1B)
- A proper mentoring plan together with allocated time and resources from the PI and from the institution
- Institution based training for several aspects needed for the next stage of the career: grant writing, scientific communication, lab management and hiring.

Proven or promising external resources or approaches

The National Postdoctoral Association is providing many insights in how to improve the postdoctoral experience.

Response 2898

Perspectives on the postdoc roles and responsibilities

A research scientist position to either assist in accomplishing a lab's goals or, if independently funded, further establish the research program of the Postdoc. This is not a training role.

Fundamental issues and challenges

Postdocs aren't paid enough. That is the fundamental issue.

Existing NIH policies, programs, or resources

Increase Postdoc salary. The main reason I am likely to not continue to be an academic is I cannot afford to live on a postdoc salary in my high cost of living area.

Proven or promising external resources or approaches

Look at HHMI's recent restructuring of postdoctoral salary offerings and look at industry standards. That would have a significant impact on recruitment.

Response 2899

Perspectives on the postdoc roles and responsibilities

Postdocs are junior scientists preparing for a career in science. In training junior scientists, very little emphasis has been placed on communication, yet communication is highly relevant for professional success for scientists across different career trajectories including academic, government, industry, and non-profit. The skills to communicate scientific information and/or results to varied audiences (media, students, university administrators, civic society, government, etc.) is critical for scientists to learn and hone as early as possible. Communication skills including public speaking, written communication, and visual representation are directly related to a scientist's success as a leader, influencer, and teacher. Learning to communicate well helps scientists think critically, explain science logically, and build trust with the audience. It also builds listening skills, enhancing scientists' ability to engage in constructive dialogue and mutual learning.

The National Postdoctoral Association lists "Communication Skills" as a Core Competency that is considered essential for career progression. Postdocs must speak with policymakers, news media, funding

agencies and a variety of general audiences; deal with conflict resolution; be able to negotiate; write scientific papers and op-eds; make conference presentations; teach; and interact with others in the workplace, institution, and society (NPA document: https://www.nationalpostdoc.org/page/CoreCompetencies).

Fundamental issues and challenges

Successful and satisfied scientists get funded, publish their research, are asked to give seminars, speak with the media, receive awards for their work, and are recognized as good teachers, colleagues, and trusted members of the organization. Recent evidence shows that the decline in PhDs persisting in academic faculty careers is related to their ability to communicate science. Their research shows that trainees who engage in science communication (including writing, conversational speaking, and rehearsed presenting) and who have positive expectations about doing so will be more likely to stay in an academic research career (Cameron et al., 2020): https://pubmed.ncbi.nlm.nih.gov/32074107/.

Today, science communication training for junior scientists is often informal, uneven, sporadic, or entirely missing. Poor communication skills can inhibit recruitment, retention, and overall quality of life. For the grad student to be recruited to a postdoc position, or the postdocs to a junior faculty position, they must explain who they are, what they do and why they would be good candidates for employment. Individuals typically sought for these jobs demonstrate clear, confident speaking/delivery skills, the ability to simplify complex research data, and an understanding of how to connect with a diverse range of audiences. Those who cannot do this are at a significant disadvantage at every hiring and promotion opportunity throughout their career.

Existing NIH policies, programs, or resources

The NIH supports the development of junior scientists through an extensive system of training (T), fellowship (F), and career development awards (K). Providing formal science communication coursework should be an integral requirement of receiving any T, F, or K award, and most R25 awards. Training grant funds could be used, for example, to expand existing science communication courses, train more instructors, or set up new programs to help improve junior scientist communication skills. These funds would help incentivize faculty and their organizations to teach these courses.

Proven or promising external resources or approaches

The importance of communication in science has been recognized in reports from the National Academies of Sciences, Engineering and Medicine (https://www.nationalacademies.org/our-work/the-science-of-science-communication-a-research-agenda) to the American Academy of Arts and Sciences (https://www.amacad.org/publication/public-face-science-america-priorities-future). Scientists want to become better communicators and as reported in the just-released Research!America poll, the public wants to hear about their research (https://www.researchamerica.org/press-releases-statements/survey-shows-strong-bipartisan-support-for-investing-in-research/). As evidenced by my own career, communication has been crucial to my success as both a leading academic scientist and my current role as chief scientist for the world's largest conservation NGO.

Some universities and research centers already have science communication programs that could serve as models, and a few now offer formal courses in science communication (e.g., Harvard, Rutgers, Duke, Stanford.) Many Business Schools recognize the value of good speaking and have set up formal communication courses. For example, the Harvard Art of Communication (https://pll.harvard.edu/course/art-communication?delta=0) is designed for business students to learn speaking and writing skills. Similar courses could also be offered to junior scientists. The Harvard T.H. Chan School of Public Health has set up the Center for Health Communication (https://www.hsph.harvard.edu/chc/) with formal courses. Rutgers established a Science Communication Initiative "to enhance the effectiveness, coordination, and visibility of Rutgers efforts in education, research, and outreach" (https://scicomm.rutgers.edu/). The Rutgers program offers science communication education (courses, a minor, workshops, continuing education courses), research and outreach activities. One of the most well-known science communication education centers is the Alan Alda Center for Communicating Science at Stony Brook University (https://aldacenter.org/). This Center offers graduate degrees and formal professional coursework with dedicated staff and financial resources.

Response 2901

Perspectives on the postdoc roles and responsibilities

Postdocs are the driving force of the excellent science done by our institution. They are highly trained, motivated, and willing to take risks. They are often the ones driving innovation/projects/papers, while also training junior scientists (graduate students, undergraduate students, summer students, staff scientists).

Fundamental issues and challenges

The current payscale is not appropriate in our location (Boston area), where we compete with many companies that can offer much higher salaries. With current pay, postdocs feel severely undervalued for their important contributions. Here in the Boston area, the current NIH-set payscale is simply incompatible with life. Rents are incredibly high. Postdocs who plan or already have family face childcare costs in the 3k to > 4k range. I have seen many postdocs leave for industry jobs to support their families. If we as scientific community want to increase diversity at the faculty and leadership level, we need to ensure women, parents, and minority postdocs who might not have extra support will be able to complete successful postdoctoral training.

As PI, it has been very hard to recruit new postdocs. Graduate students do not even consider this possibility anymore, seeing the precarious situation of many postdocs.

Existing NIH policies, programs, or resources

Adjust the NIH payscale to reflect the value of postdoc work and allow them to live without having to worry about rent or childcare.

Increase funding to allow PIs to pay postdocs, including on existing grants so salaries can be increased immediately (e.g. as a supplement).

Proven or promising external resources or approaches

No response

Response 2902

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a transitional training period. This is a time when you do research and try to transition to independence.

Fundamental issues and challenges

The major issue is that if you haven’t come out of graduate school ready to be a faculty you have to write your grants and publish all within an unreasonably short time. An important study can take 2-3 years, if there is no real clear picture of the future when you enter a postdoc it becomes frightening to start one. On the other side, when hiring a postdoc there’s a tremendous burden to be confident you can place them: and all sorts of things can happen. The clock is so tight these days with the realistic way the world is structured. It’s asking too much to do the postdoc in 5 years, i think. It has the effect of condensing the

research program into the grant writing process and transition to independence process. There needs to be more transitional positions than only the K99 mechanism, perhaps staff scientists but without the burden of losing a path to independence. The problem is that when you embark on a postdoc you worry that it's career suicide and for some people it really is, and seeing that all around you is not reinforcing. Other people in "regular jobs" are starting to take flight and gain security by this stage and maybe that's not achievable in science but it has to be closer. It's not close at all now.

Existing NIH policies, programs, or resources

There should be a greater emphasis on exit plans. Postdocs can reduce your market value if they're not configured optimally and it can be scary to commit to do one not knowing the outcome of your research project (impossible) and sort of being beholden to the grant envious at the same time. It's not as much dedicated research time as it seems like it "wants to be" . I think this also reduces the quality of research in general because so much emphasis is placed on publication, job searching, and so on. The staging of how postdocs progress and are placed in jobs after is also highly lab dependent and I think this could be orchestrated differently. If people have a quality research program but it takes a little more time to get started—for example. Maybe the solution is extending the postdoc and k99 window with higher pay in the back years and creating more temporary staff scientist type positions that can still lead to independence. This would give more time to cultivate people in the research environment and let them stand on their accomplishments rather than relying on luck as much.

Proven or promising external resources or approaches

NIH probably has thought about the options. They're expensive and complicated and they are hard to implement. But mostly it's expensive. Salaries have been fairly level until recently. I think salary increases aren't as scary to program admins though as creating more transitional jobs because that could change the landscape of research.

NIH needs to make sustained investments in projects and people. Things like the postdoc are almost like 1-2 year commitments to research and then you spend a lot of time grant writing etc. not everyone is ready by that time. It's somewhat arbitrary how the clock starts in the PhD and not everyone is at the same level.

I think there is also just tremendous and obvious brutality in the ranking and sorting of postdocs where if you're heading in the right direction you're the golden child and if you're not you're a pariah and you basically suffer until you're choked out of the field. As people talk more on social media about what it's really like to live like that people are frustrated and scared of that kind of lifestyle and it's also not as meritocratic as people like to think. We all know there's some luck in science. But none of the policies provide for clear pathways. You just become miserable enough eventually that you apply to industry or wherever you think you'll be a human again. Not that this has been my experience but I know it has been the experience of other people I know who you'll probably never hear from because they left. But we hear from them more and more. It's a commitment to take people on and you have to be committed to where they go and how they're being treated.

Response 2903

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a scam that keeps early-career researchers in poverty and toxic work conditions.

Fundamental issues and challenges

We are asking these people to relocate with no expenses covered for a temporary job that often does not pay a living wage. Professional organizations typically offer travel and awards for graduate students and not postdocs. PIs see postdocs as short-term labor and often do not mentor them in any meaningful way.

Existing NIH policies, programs, or resources

Pay postdoctoral researchers a livable wage, provide opportunities for them to receive meaningful mentorship, community, and paid professional development. Make your PIs prove that their postdocs are able to find jobs afterwards before allowing them to take on more postdocs.

Proven or promising external resources or approaches

A 3-year research assistantship with cost of living adjustments and funding for relocation, professional development, and travel. Aim to have less postdoc fellowships that are extremely high quality.

Response 2904

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

- F grants could provide incentives and increased earnings in addition to the normal pay
- Fellowships not removing benefits packages (if there is one) at the institution (ie. you get a F grant, you lose retirement since you are no longer an employee) this is antagonistic since the postdoc wants to apply and receive grants but puts their financial situation in jeopardy
- R, P, U grants that PIs apply for have to have more funding for the postdoctoral researchers that contribute to the project

Proven or promising external resources or approaches

No response

Response 2905

Perspectives on the postdoc roles and responsibilities

The postdoc position is the opportunity to gain the research and nonresearch skills needed to establish an independent research program. But postdocs also play a central role in American academic research productivity.

Fundamental issues and challenges

Low salary makes the postdoc position very undesirable, especially in high cost of living areas. The low salary also makes taking and staying in a postdoc position until an independent faculty position challenging for individuals with families.

Existing NIH policies, programs, or resources

Adjust salary to account for cost of living. Adopt the cost-of-living adjusted scale for GS-11 to provide postdocs with compensation that matches their skills and worth within academic research.

Proven or promising external resources or approaches

No response

Response 2906

Perspectives on the postdoc roles and responsibilities

PI has too much power. NIH needs to add mentorship or letter from trainees as part of R01 grant review process. Toxic PI should not be given NIH grants

Fundamental issues and challenges

Salary not adjusted to inflation so postdocs are moving to industry.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

NIH grant review needs to add a process where the trainees are asked anonymously about their PI and how the lab is run to avoid bad apples ruining the academic experience.

Response 2907

Perspectives on the postdoc roles and responsibilities

Science today is really complex, and everyone wants to hit that Science or Nature paper. Learning new, complex technologies and concepts and framing the correct hypotheses to test, running several different assay systems at the same time, maintaining rigor and all datasets perfectly, etc., results in the most prepared postdoc. However, having this happen in less than 3 years plus, is very difficult especially for those postdocs who have a life and family outside the lab.

Fundamental issues and challenges

I have directed a legacy T32 from NIDA for the last 10 years. We have ~50% women and ~40 URGs over the last five years, so our program is successful in recruited top notch, diverse fellows. However, there is a very strong move in our mentees to seek careers that do not include tenure-track faculty positions. Thus, our T32 recent review noted that ONLY 40% were in faculty positions, even though 100% of mentees are in research-supportive career roles. In addition our fellows have partners and caregiver responsibilities and cannot survive on the NIH stipend level. To keep the best, we must find non-NIH, institutional monies to boost their salaries to over $100K—this is not easy to do in the current post-pandemic climate. With rising inflation and cost for housing, this is nearly untenable at present.

Existing NIH policies, programs, or resources

Based upon my comments above, NIH needs to reframe the philosophy underlying training programs. The NRSA scale should be a livable wage with benefits/insurance, and indexed to inflation. Because the R01is the main support mechanisms for postdocs, the NIH needs to raise the $500K cap to allow living wages for postdoctoral mentees. T32s and F award are actually punitive to appointed trainees, unless all awards carry terms and conditions, like the institution is REQUIRED to receive parity. NIH must end this.

There is inequality biased towards “super labs” with many many grants, mostly located on east and west coasts, indicating a “location discrimination”. There is great diversity of incredible science in the rest of the country and great laboratories which frequently get poor grant reviews because of their environment is great, but cannot compare to these super labs and institutions. This further widens the gap.

Proven or promising external resources or approaches

Smart postdocs see the landscape and are taking roles in industry of all sorts, because the have competitive pay, paid leave and support for caregivers. The positions are often now virtual allowing persons to live where they want. We are bleeding talent because academia is not competing. IMHO, this situation is only going to get worse.

Response 2908

Perspectives on the postdoc roles and responsibilities

I view my postdoctoral fellowship as the gateway to becoming an independent investigator in my field. The post doctoral training I’m receiving is fantastic and highly valuable to both future academic and industry positions. I am completely happy with the opportunities, roles, **and responsibilities** afforded to me during my postdoctoral training, but every single one of my personal goals and each of my responsibilities to my labs, departments, and the two institutions that I work for are substantially stifled by my financial circumstances. I have been handed an opportunity to follow my dream of becoming an NIH-funded independent researcher and yet my total work output is constantly lower in quantity and of poorer quality than it would be if I wasn’t constantly working under enormous financial strain.

Fundamental issues and challenges

I work in San Francisco and am paid 57k /year through my fellowship. I can never meet my bills each month and have to use credit cards. Neither of my parents graduated college and I am the first doctor in

my family ever. I already have >100k in student loans and I did not expect to have to take out more and higher interest debt during my postdoc, which has been a very stressful revelation and ongoing circumstance. I am willing to sacrifice to receive this training, but there is a limit past which it makes no sense to me, my institution/lab, or the NIH. Adequate compensation is required for me to meet my full potential and perform optimally. I am doing psychiatry research in a top 10 psychiatry department and yet I am constantly struggling and wasting enormous energy cutting costs and corners to lessen the debt I accumulate. I would need a minimum of 70-75 k as an entry level postdoc to be able to live in this city without debt or very poor quality of life. My PIs have additional funding, which they have offered me and I accepted. They have been trying to provide this additional support to me for 10 months now, but their hands are tied by NIH standards and institutional barriers to providing additional support to postdocs. Hopefully we will find a way, but for now, I am in a very bad situation. I am going to hold on as long as possible, which will hopefully be sufficient to allow me to get a CDA or K award, but depending on how long that takes, I may be financially forced to leave academia for an industry position due to the substantial debt load. Many postdocs have already left for industry for this reason.

Existing NIH policies, programs, or resources

My training is great. I don't need anything except a reasonable amount of money. Please provide us with adequate funding to not have to live on debt. We already do that during graduate school. I am a doctor with responsibilities for millions in grant money and I should get paid as such. Postdoctoral funding should be much higher overall and regionally-dependent. If you want brilliant people to stay in academia and you don't want to destroy the mental health and finances of the people who are already holding on by a thread, we need adequate support. We should be required to receive healthcare, all benefits, dental, retirement, etc. I do not currently have dental or vision or retirement. Postdocs do most of the scientific work. The current policies are reducing the quality of American scientific research. If we want to continue to be the top country in the world for scientific innovation, we need to pay our trainees like the doctors they are.

Proven or promising external resources or approaches

Paying people adequately will vastly improve recruitment, training, working environment, mentoring, and job satisfaction. Each of these is damaged by the stress of living on debt, bad food, and low resources overall. Many people don't even consider a postdoc because the salary is so low.

Response 2909

Perspectives on the postdoc roles and responsibilities

Its the only job an average PhD graduate can get in academia.

Fundamental issues and challenges

Low pay. No benefits at most universities for fellowships. Penalized for bringing your own F32. PIs do not want applications from postdocs unless they are eligible for T32. Postdoc Career development is low priority for many PIs. PIs expect postdocs to write the grant but can't be included as a Co-I

Existing NIH policies, programs, or resources

Give F32 awardees guaranteed benefits. Pay post-docs more in areas with a high cost of living. Make career development a requirement of the PI. Dont let PIs pay the bare minimum salary. Allow people to budget grants for postdocs with more than 1 yrs of experience.

Proven or promising external resources or approaches

No response

Response 2910

Perspectives on the postdoc roles and responsibilities

Skill Building

Postdocs should have access and time to further develop the skills they'll need in their next career step. This includes opportunities for professional and career development outside the lab. In particular, soft skills such as leadership, mentorship, and management need to be cultivated for postdoctoral success.

Independence

The temporary nature of postdoctoral training as currently defined by the NIH necessitates that postdocs need to develop themselves towards scientific independence. This is not to say they need to be monolithic. Rather, postdocs need to gain the skills and confidence to lead in their career of choice.

Mentorship

Postdocs should receive clearly defined mentorship from a senior faculty member who is an expert in their field and possesses the management and mentorship skills needed to help cultivate independence in their postdocs. Ideally, a mentorship team is put into place for postdocs, similar to teams established for new PIs.

Training

Postdoctoral positions are inherently about training and development. The faculty mentor should offer needed training to build research skills and allow for time for career and professional development. Additionally, mentorship plans and IDPs should be established to offer a roadmap toward independence.

High specialization

Postdoctoral trainees must have a doctorate (terminal degree) in their area of expertise. Postdoctoral training allows the individual to further specialize, potentially carving out a new line of research that they can pioneer. This hyper specialization may limit the faculty mentor options/postdoctoral positions available to the trainee.

Fundamental issues and challenges

Salary and stipend

While the increase in pay from graduate school is significant, the salary/stipend of postdocs is not enough to continue attracting academic-oriented scholars. When taking their talents to other industries, scholars receive larger paychecks as well as training, which is appealing when leaving graduate school with student loan debt.

Lack of institutional support

Postdocs spearhead a huge amount of the research conducted at universities/research centers; however, academia pays very little attention to them. There is a general sense of postdocs paying their dues before being allowed to become a professor. If they exist, postdoctoral offices generally have only few staff members and minimal budgets to oversee a huge portion of the institution's early career scientists.

Many institutions do not consider postdocs as alumni, so little effort goes into tracking outcomes after completion of the postdoc. Additionally, while training grants may want their trainees to continue in academic research, no career path should be considered failure should a trainee choose it over academic research. The lack of tracking exacerbates the lack of university support and adds to the sense of transience that many postdocs feel.

Mentorship standards

While the form/style of mentorship is unique to every relationship, mentorship is a skill that can be trained and honed. Yet very few postdocs and even fewer faculty mentors receive mentorship training. It is extremely rare for a postdoc to have an opportunity to reflect on the mentorship they are receiving and have that reflection lead to positive change. As mentoring achievements are not part of tenure, promotion, or grant awarding, faculty who create poor (even toxic) environments for their postdocs go into successful careers while using the data and experience of the researchers they mistreat. In extreme cases, poor mentorship leads to HR involvement in situations that could have been avoided had proper mediation channels existed.

Existing NIH policies, programs, or resources

To improve: NIH position about employee status of fellows

The NIH is clear about whether its fellows can be employees. The language used in the policies and regulations is open to interpretation. Most institutions have decided to act on conservatively by considering NIH fellows as non-employees. This creates disastrous consequences affecting the living and working conditions for fellows, as their health benefits may be more expensive than those of their employee-status peers, they may not be able to make contributions to a tax-deferred retirement, they may no longer be paying into Social Security (FICA) or Medicare, they may no longer have FMLA benefits, and their time as a fellow is not eligible for the Public Service Loan Forgiveness Program. This generates unjustified stress during a critical stage in the researcher's career. Also, with the average age of postdoctoral appointees increasing across the country, it creates difficulties for family planning, wellness, and financial stability.

Fund staff/research scientist

Protected time for professional development

Current language can be improved: 100% effort for research. It should say 100% effort for research, training, career/professional development, and other scholarly pursuits as defined by the institution

Hours per week

For T's you're able to work OUTSIDE of your grant time, allowing you up to 10 hours. NIH is saying "this is okay" for people to work 50 hours/week

Define postdoc experience

NIH uses no "less than 5 years of relevant research experience." On NRSA, "Relevant experience may include research experience (including industrial), teaching assistantship, internship, residency, clinical duties, or other time spent in a health-related field beyond that of the qualifying doctoral degree."

To modify: Inclusion of international scholars

Postdocs on temporary visas constitute more than 50% of the postdoctoral population in the U.S. Only K99/R00 mechanism (except for MOSAIC) accepts international scholars, who pay federal taxes as well as state and local taxes where required.

Proven or promising external resources or approaches

There should be training grants for various career tracks that have protected time for Postdocs to learn skills needed for jobs outside academia. NSF Accelerating Research Translation (ART) translational science, tech transfer, entrepreneurship, NIH could create similar mechanisms.

Create mentorship networks/teams

Redefine what a postdoc is

NPA resources and those of OPA offices across the country

Dedicated time for professional development as part of effort

Includes professional development in crucial areas for early career scientists. Career exploration and skill development. Immigration education/ tax education (support system for how to pay taxes in the U.S.)

Some PIs have MANY grants—and have created a research factory

National retirement—there was an age when people retired from NIH and federal funding, and now that has been removed. This has led to continuous funding to "reliable" PIs and so fewer and fewer Assistant prof jobs are opening up

Response 2911

Perspectives on the postdoc roles and responsibilities

Theoretically, the postdoc is a training position that bridges the roles of graduate student and independent investigator. This is absolutely why one should do a postdoc, however, this is a much longer position than one would prefer.

Fundamental issues and challenges

My main concern and the concern of many postdocs is a low salary. The choice for many to not do a postdoc is based on how many years can you afford to have a low income.

Salary caps should be eliminated nationally or at least eliminated from certain regions, ie Boston, New York and California.

Existing NIH policies, programs, or resources

Remove salary caps or raise postdoc salary to $100,000. In my institution, when I started an incoming postdoc made $53,000 whereas a starting technician made $80,000.

Proven or promising external resources or approaches

Mandatory management training

Response 2912

Perspectives on the postdoc roles and responsibilities

I believe the academia postdoc has now become a required additional "training" position to get most jobs in both academia and industry. Few will hire a PhD with no additional experience to perform wet-lab science, whether this is as a project scientist in academia or a scientist in industry. For those that want to continue into academia to become a principal investigator, it is a time of high-stress and competition as we are constantly reminded that there are few positions available in academia with the market saturated with candidates. We must therefore "sacrifice" in order to obtain a job in a field we want to pursue. That includes sacrificing financially, as postdocs are underpaid considering their degrees and experience, and with time. To succeed in a publish or perish culture, we have to dedicate majority of our time to work. We must also accept that we will live in a transitory state, as these are often 1 year contracts dependent on progress and that we will have to move again in a few years to anywhere in the country that will gives us a job if we are lucky. That could mean stalling usual next steps in one's life, such as establishing a family or stability.

Fundamental issues and challenges

Postdoctoral salaries and the bleak options future careers in academia.

Existing NIH policies, programs, or resources

Increase the salary requirements by increasing the NIH grant budgets. Provide better ways through funding for academia and industry to funnel trainees or collaborate on projects.

Proven or promising external resources or approaches

Punish PIs through preventing funding access when there are legitimate reports of misconduct and abuse of their trainees.

Response 2913

Perspectives on the postdoc roles and responsibilities

Being a postdoc is a means to an end for me. This is a temporary position until I am ready for the next stage of my career (hopefully a faculty position). I am here to learn new skills and, in the process, create a niche for my future lab.

Fundamental issues and challenges

The most obvious issue is the pay. At my institution, the minimum salary is ~$56,000. At best, a 1 bedroom apartment in this area costs $2k/month and doesn't include the cost of utilities, parking, etc. (tiny studio apts

Existing NIH policies, programs, or resources

NIH needs to make it clear that the stipend levels that they publish are minimums. Most institutions interpret these numbers as maximum possible salary which hurts postdocs and graduate students. Ideally stipend levels would be regional and reflect the cost of living or postdocs should be able to apply for a

housing supplement if they live in a high COL region (something similar to a basic housing allowance in the military).

Expanding K99 eligibility due to COVID would be beneficial. I finished my terminal degree in the spring of 2020 but couldn't start my postdoc for nearly 8 months due to a hiring freeze at my postdoc institution. NIH is ignoring that some of us had unproductive starts (1-2 years) to our postdoc research due to supply chain issues, lack of in-person training, and hiring freezes but they stopped extending the eligibility window in 2022.

Offering low cost or free career development opportunities to all postdocs would improve the academic environment. Not all institutions have postdoc offices and resources for postdocs. FAES classes and workshops should be more affordable as well.

Creating smaller/pilot grants (maybe $10-20k to cover supplies--not salary--for 1 year) for postdocs that don't require preliminary data. In smaller labs, it is difficult to start a project that is separate from my mentor's research. If I had a pilot grant, I could get preliminary data on my own independent projects that would help me apply for a K grant or help me secure a faculty position.

Proven or promising external resources or approaches

I've seen several institutions increase minimum postdoc salaries to $70k or $75k in addition to a starting bonus and/or money to cover moving expenses in an effort to recruit and retain postdocs.

Setting maximum time that someone can be a postdoc. For example, an individual can only hold the title of postdoc for 5 years, after which they are promoted to a different title with similar responsibilities and get an increase in salary. It is a huge disserve to let someone be a postdoc for 8 years given the low pay and the fact that you only have ESI status for 10 years after your terminal degree.

Response 2914

Perspectives on the postdoc roles and responsibilities

On behalf of [redacted for anonymity] more than 54,000 members consisting of laboratory researchers, physician-scientists, other health professionals, and patient advocates who constitute our national and international membership, we thank the National Institutes of Health (NIH) for the opportunity to provide information regarding postdoctoral research training and career progression.

Various pathways can be taken to successfully conclude a doctorate program, for newly minted Doctor of Philosophy or Medicine graduates that aspire to become independent investigators in biomedical research, it has become necessary for them to continue their training as postdoctoral researchers.

Postdoctoral researchers often plan and conduct projects from start to finish, train junior graduate students, work as teaching assistants, grade assignments, apply for grants, publish manuscripts, and balance the laboratory budget. However, they do this without job security, salary, or benefits that is comparable to their peers outside of academia. Within the cancer research and care workforce, early-career researchers are instrumental in making advances against cancers as they bring innovative ideas and highly original perspectives to their research projects. Graduate students and postdoctoral fellows are the largest share of the academic research workforce. However, published survey results from the National Science Foundation suggest that there has been a decline in the number of postdoctoral researchers, which could have dire consequences on the overall biomedical research enterprise and halt progress toward curing cancers. Postdoctoral researchers play an invaluable role and should be supported to grow the field of cancer science.

Fundamental issues and challenges

NIH defines postdoctoral researchers as individuals with a doctoral degree (PhD, MD, DDS, or equivalent) who are engaged in temporary, mentored research for the purpose of acquiring professional skills to pursue a career that they choose. Intramural postdoctoral researchers conduct their research in the laboratories of investigators at NIH. As such, intramural postdoctoral researchers typically have greater financial stability and access to the wealth of resource available through the NIH Office of Intramural Training & Education.

Conversely, extramural postdoctoral researchers are trained in laboratories of independent investigators that receive funding from NIH and is carried out at universities, research institutions, or corporate

laboratories. Recently published survey data from the US National Postdoctoral Association support what has been discussed anecdotally for years. Extramural postdoctoral researchers that completed the survey overwhelmingly stated that: professional and personal lives are negatively impacted by their low salaries; training for their next position is unclear; the amount of time they should spend as a postdoctoral researcher is uncertain; job security is not guaranteed; decreased funding to support their position; uncertain expectations from their mentor; toxic workplace culture; and vulnerabilities due to citizenship status. The message was clear in that low compensation, diminishing funding sources, and uncertain career trajectories were key drivers of dissatisfaction in extramural postdoctoral research training.

Existing NIH policies, programs, or resources

As described in the AACR Cancer Progress Report 2022 and the AACR Cancer Disparities Progress Report 2022, a robust ecosystem of flexible, inclusive, and individualized support is needed to foster retention of talented researchers within the STEMM pipeline. Currently, extramural postdoctoral researchers can be supported under their advisors' grants, competitive institutional "T" awards, or individual "F" and "K" awards, as well as competitive philanthropic awards. These awards cover stipend and research costs of postdoctoral scientists, which enables them to take on more ambitious research. The National Cancer Institute (NCI) and NIH have created several funding mechanisms to directly support the transition of postdoctoral researchers into becoming independent researchers such as K01, K99/R00, and R21 grants.

The NCI Center to Reduce Cancer Health Disparities (CRCHD) Continuing Umbrella of Research Experiences (CURE) program is an excellent example of how NIH supports development of scientists from middle school through the junior tenure-track faculty positions. CURE invests in trainees and scientists from groups typically underrepresented in biomedical research by employing a holistic approach that promotes mentoring, professional support, and career skills building, all surrounding the centerpiece of individually mentored research experience. In addition, the Intramural Continuing Umbrella of Research Experiences (iCURE) brings undergraduate students, postbaccalaureate and post-masters degree individuals, graduate students, and postdoctoral fellows into the NCI research community and supports mentored research experiences. These holistic approaches could be expanded to include research institutions that receive funding from NIH. When coupled with structured mentor training, clear employment standards and expectations, and a positive career outlook, postdoctoral training could be greatly reinvigorated.

Proven or promising external resources or approaches

[redacted for anonymity] is committed to the development of the next generation of cancer researchers. We work together with our funding partners to provide research training and fellowship grants, which support postdoctoral and clinical researchers as they progress through mentored training. We continue to support the cancer workforce by funding early-career investigators with active career development awards. These awards serve as a way for researchers to leverage our support to secure additional funding that will allow them to move the cancer research field forward.

Detailed in the AACR Cancer Progress Report 2022, NIH and NCI play important roles in fostering development of young researchers into becoming productive scientific and clinical leaders. With the support of its Equity Council in December 2021, NCI launched the Early Investigator Advancement Program (EIAP) to facilitate the advancement of scientists from diverse backgrounds to become independent investigators.

The cancer research enterprise needs a continuous flow of talent through the research career pipeline. A critical juncture is the transition from junior investigator to independent investigator. EIAP aims to enhance professional skills, guide preparation of an R01 grant application, provide access to a mentoring and peer network, and grow a community of emerging independent investigators from diverse backgrounds.

Furthermore, additional training in mentorship for successful senior scientists helps support the professional development of their trainees. Formal training programs, incentives, and compensation for excellence in mentorship have been shown to increase retention of underrepresented minority trainees and scientists. The success of these programs could be implemented across other NIH institutes and centers as well as research programs that receive NIH funding.

Response 2915

Perspectives on the postdoc roles and responsibilities

To grow closer to being an independent scientist while making meaningful contributions to your field of interest with the guidance of your mentor. Collaboration on other projects of interest to you and your mentor are also expected to utilize skills gained during your PhD or to learn new skills which benefits both you and your mentor's research goals.

Fundamental issues and challenges

The pay for persons with large financial debt, a desire to make significant changes in their lives (e.g. marriage, kids, house), or to gain stability following grad school could find it impossible on the smaller salaries offered during postdoctoral positions. This would be very helpful to recruit and retain more diverse students. Retention is challenging since this position is not meant to be permanent, but leaving prematurely could be prevented by fostering positive relationships between mentors and their mentees, and increased pay and benefits such as good insurance and better retirement benefits. Mandatory networking time or NIH supported networking events would also be very helpful to make sure postdoctoral trainees are getting that necessary experience beyond their contributions to in their field of interest.

Existing NIH policies, programs, or resources

Expanded loan repayment grants would be a great incentive for recruitment, retention, and overall quality of life. For perspective, I was fortunate enough to be funded through school and not need loan repayment grants, others I know are not so lucky and academia is not as viable an option for them.

Proven or promising external resources or approaches

Response 2916

Perspectives on the postdoc roles and responsibilities

Although I think the postdoc is a training stage, I think that after obtaining a Ph.D., postdocs are highly qualified and skillful personnel that drives Science.

Postdocs (especially senior postdocs) have multiple roles that go beyond doing science. They serve as mentors, co-review papers, greatly contribute to lab function and culture, etc.

I don't think that postdoc should be merely see as trainees. Junior PIs (which in their first year are basically senior postdocs) also need support, guidance, training and even committees. However, they are not considered trainees. I think the line is blur and, as such, postdocs should not be considered merely trainees but also staff.

Fundamental issues and challenges

1. low salary (not only the initial salary but also the increase per years of experience).
2. inadequate benefits (i.e. not being considered an employee and thus not having access to retirement plans, etc.)
3. no prospect of future career paths and stability: the most common academic path is becoming a PI, which nowadays it is harder and not guaranteed even if having a good CV and publications (because there are few open positions for the proportion of current postdocs). Moreover, many talented and skilled postdocs that would not want to become PIs and would stay as staff scientists, barely have this option; or even if they do have the option, the salary and benefits are not worth it or the position is not stable because it depends on one specific PI and their funding, instead of being an employee of the institution. Finally, as the postdoc training is considered a transition phase, for the next position, postdocs have to consider moving almost anywhere in the country or abroad even if they don't want to (i.e. personal or family issues). Many postdocs have families and children at this stage of their career so not offering stable, clear and even local future career paths within institutions creates a distress that deviates the attention of their scientific work.

Existing NIH policies, programs, or resources

As described above, I think that if postdocs were considered staff rather than merely trainees, a lot of the policies could change favorably in many institutions (salary, benefits, work conditions, stability, etc.).

Postdocs have been considered trainees because it is a transient phase. But so is being a PI where many move to different institutions, roles or even leave academia and go to industry and other alternative jobs. Thus, I think that having postdocs under the trainee category is hurting them and science in general more than it helps. Nowadays, the duration of a postdoc is very long (it typically ranges from 5-7 years). So with all the experience, contribution and length of this stage it is not reasonable that they are not considered staff and thus do not have an appropriate salary and benefits.

Also, postdocs that are awarded NIH fellowships should not lose benefits in the institutions where they are, nor should have a limit on their salary amount if the fellowship allows it. Many institutions lower the salary of the postdocs even if the fellowships they get (from NIH or other sources) do not have a salary limit.

Proven or promising external resources or approaches

Biotech and pharma Industry have many of the approaches that I mentioned above like Salary adjustments, employee benefits and being considered staff.

In the last couple of years there has been progressively less postdoc candidates in the academic market, more postdocs prematurely quitting and an increase of graduate students that decide not to peruse a postdoc in the first place. I think the main reasons are the ones so outlines above, and implementing some of the changes that I also mentioned would retain more postdocs and improve their working conditions.

Response 2917

Perspectives on the postdoc roles and responsibilities

Postdoctoral research is an opportunity to both refine and expand your skills as a scientist. In many cases it is a requirement for advancement into a preferred career path. Postdocs are largely independent and support more challenging goals of PIs. There may be opportunities to advance their own interest as well as that of their chosen lab. Even though postdocs are both independent and highly qualified and receive little to no individual training, however the NIH still considers it to be a training position. It’s not only laughable but a slap in the face to the accomplishments of postdocs. The nature of the postdoc position is transient. The purpose of the postdoc is to no longer be a postdoc.

Fundamental issues and challenges

Many of my peers chose not to pursue a postdoctoral fellowship. As more and more students chose not to the other options become more apparent. Students close to graduation talk to their peers and find that the ones that chose not to do a postdoc are make twice that of the ones that did. After struggling to make ends meet through graduate school for years the salary is more than convincing. There are still a group of people that will always do a postdoc: the ones that want to be a professor. The issue there is that those professor positions are few and far between. Even if you get that PI position funding and advancement will still be a challenge. These challenges are all apparent to students who see the struggles of their PIs in graduate school and want to avoid the same fate. For me the biggest issue is my family. Currently, after I pay for health insurance, contribute to an HSA and day for daycare through my institution I don’t have any money left. I am dependent on my wife to provide salary for rent, food and vehicle expenses. She really wants to have another child and we can’t do that if I stay. This will ultimately force me out of the postdoc position. Another issue is that industry positions largely want 2-3 years of experience. There is a pressure if you want to switch to industry that you should do so sooner rather than later.

Existing NIH policies, programs, or resources

The biggest thing to do would be to increase the minimum salary. Next would be to limit the length of the postdoctoral training program to 2 years—after 2 years you should be considered trained and move to a higher salary/position. Other government employees enjoy great benefits like low deductible insurance and retirement programs—include postdocs in these. Another option would be to provide more positions to bridge the postdoc position and the PI position (i.e. NIH funded research faculty, academic scientist position, or government lab junior PI).

Proven or promising external resources or approaches

No response

Response 2918

Perspectives on the postdoc roles and responsibilities

To me, being a postdoc means that a highly skilled PhD-level worker is soliciting a 4-6 year position in someone's laboratory to leverage on the skills they have and use them to answer a fundamental question in science. These skills enrich the environment of the laboratory they join, likely by postdocs developing and adding new technology to the host laboratory, as well as the postdoc getting exposed to additional skills and ideas that will continue to develop new avenues of research for the postdoctoral fellow. In addition to developing their independent line of research, a postdoc trains young trainees, including high school, undergraduate, post-baccalaureate, and graduate students. Training includes not only input or trouble shooting on experiments, but importantly it also involves providing feedback on written and presentation materials. Most of the time, postdocs review the initial drafts of younger trainees for later presentation to the laboratory PI. Postdocs also work alongside PIs to draft, write, and review grants to secure funding for the host laboratory.

Fundamental issues and challenges

The low pay lines when starting and maintained throughout postdoc tenure are a major factor preventing the retention of talented scientist in the academic pipeline. As a woman, I am consciously postponing starting a family since in doing so with a second-year postdoc salary will be highly insufficient. I have migrated from South America, so my support system in this country is limited and I do not believe I have the necessary system in place to have a successful academic career and a family right now. I cannot afford childcare fees of more than 30% my salary. However, there is only a few years more for me to keep postponing motherhood. Why do I have to choose between my career and my personal goals? This aspect prevents retention of women as postdocs in academia.

Existing NIH policies, programs, or resources

The policy that NIH postdoc fellowship guidelines impides the postdoc to be an employee at the host university should be immediately changed since it prevents fellows to access benefits. This policy impacts every postdoc on a fellowship, not just the ones on NIH funding and it creates inequality between postdocs on fellowships and the ones hired through the university.

I have had fellowships from 3 different private funding agents and, in all cases, I am not considered an employee from the university where I work, which prevents me to access benefits.

1. I cannot start a 401K to save for my retirement, which has critical repercussions for my life.
2. I cannot designate a portion of my salary to be protected from taxes since I cannot allocate it as a cost for healthcare-related expenses or dependent-expenses. I cannot make any pre-tax deduction since the fellowship income is considered "unearned income"
3. The worst one is that the money that the university subsidizes to pay for my health insurance is considered income when I do taxes. As a result, I end up paying taxes on more than 10K dollars that I never see as income and this additional money increases the amount of dollars that are taxed in the highest bracket. Why am I paying the most costly taxes on money that is not my income??

Proven or promising external resources or approaches

One aspect that was key for me was the establishment of a postdoc advisory committee. Graduate students get one, assistant professors get one, why not postdocs? My host department started such program and getting feedback from 3 other PIs was very valuable to my project and to my success rate securing additional funding.

Response 2919

Perspectives on the postdoc roles and responsibilities

I believe my roles as a postdoc include:

- doing research on the project(s) I am expected to investigate for a PI's lab
- training and mentoring other students in the relevant research areas
- maintaining certain instruments (when clearly communicated)
- following safety procedures and improving them when necessary
- taking a leadership role to guide certain projects
- manage researchers in a project (when clearly communicated)
- prepare and submit manuscripts
- prepare and submit grant proposals / reports

Fundamental issues and challenges

Salary is significantly lower for the same job in most industry starting positions. Health insurance and benefits are also not as comprehensive as most industry starting positions. A one year postdoc contract is quite hard for recruitment and retention and should be 2-3 year contracts. Unclear expectations can also take advantage of postdoc labor and worsens quality of life (work-life balance) and makes it hard for retention. Also, many academic communities do not properly value postdocs as part of the community and it makes it hard for quality of life if you don't feel like you are part of a community or valued in that community. There are programs and events and onboarding / orientation to promote graduate students to meet each other and form community, but there is nothing like that for postdocs in many departments / universities. High turnover every year also makes creating a sense of community harder.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Clear expectations and guidance, and having regular reports to see if the postdoc is meeting those expectations helps with job satisfaction.

If DEI work is expected of the postdoc, then explicitly compensate them for that labor as part of their job description. Otherwise, this is invisible work and that often falls on women and BIPOC scientists and if science values this work, it should be written into the job description.

Having clear mentoring plans also improves postdoc training. For example, one PI I know of has alternating meetings with a postdoc on research updates and professional development advancement as that postdoc wants to be a professor and the postdoc learns from the PI how to write grants, budget a lab, or other professional development skills. Having more formal mentor structures for postdocs help postdocs get more out of the training experience and helps PIs learn ways to do that more easily.

Response 2920

Perspectives on the postdoc roles and responsibilities

Critical for the health of research in ethics US.

Fundamental issues and challenges

While postdoc are in training, their compensation is not on parr with other professions. Moreover, compensation in academia is notably lower than in the private sector. We most bridge this gap by providing real benefits and by increasing compensation. In the US the model is to keep the same salary across the country. This is a problem as the cost of living in some cities (e.g. NY) is more expensive than in others (Iowa).

Existing NIH policies, programs, or resources

The stipend needs to be increased to at least 70K, or even 80K for cities like New York, Palo Alto and San Francisco. Perhaps, the NIH could put in place a system where the host institutions would be required to put some skin in the game--NIH provide 50K + benefits and the host institution provides the other 25K.

Proven or promising external resources or approaches

No response

Response 2921

Perspectives on the postdoc roles and responsibilities

As a current postdoc, this opportunity allows me to receive greater mentorship, broaden my connections, conduct research in a field I am passionate about. I have practiced grantsmanship and taking the lead on various research projects. Some researchers may not need this extra step after their doctoral studies, but I did. I consider the postdoc an opportunity to learn and a step toward becoming a leader in my field of research.

Fundamental issues and challenges

My pay is less than I was paid as a legal secretary with a bachelor's degree over a decade ago. If I was a single parent, after paying monthly rent, bills and student debt I would not be able to put food on the table for my child (and I would not qualify for reduced-price school meals). Thankfully, I have a husband whose income can supplement and a mentor that has allowed me to work remotely and not uproot my family for a temporary position in an expensive area of the US. However, this is not the case for many post docs. I also can't receive a mortgage because my debt to income ratio is high. Ultimately, it is not a livable wage anymore and is insulting for adults who have dedicated their time during their doctoral studies to becoming strong researchers. I would not have done the postdoc if there was a better-paying alternative entry into research and academia.

Existing NIH policies, programs, or resources

The NIH Loan Repayment Program (LRP), though with around a 50% success rate, should increase the likelihood of success. Reviewers should not take into account the stage of investigator when grading the application. In my opinion, it would be very helpful for post docs who apply for the LRP to be automatically be accepted into the program. This will provide us some initial debt relief and a financial leg-up as we enter the professional world. Make the competition greater among assistant and associate professors instead of us at the bottom. Additionally, we should be able to negotiate our salaries based on the cost of living where we are located.

Proven or promising external resources or approaches

I recommend looking at The Ford Foundation's staff policies. Minimum raise from year to year for post docs should be 3%. Rates for benefits should be proportional to earnings.

Response 2922

Perspectives on the postdoc roles and responsibilities

The postdoctoral position in my view is meant to provide an opportunity to deploy one's scientific mastery (which should have been acquired during the PhD) in a semi-independent manner. It's a chance to start being seen in the community as a colleague rather than a student, where training should be focused on non-scientific elements (how to network, which journal to submit to, how to "sell" yourself, how to teach, etc). Importantly, it should exist as a bridge between a PhD and an independent position and should last no less than 3 years; and no more than 6. It should be reserved for those aiming for independent academic positions, meaning hiring and funding stakeholders should ensure, if not enough, then more positions for postdocs. Short postdocs en route to professorial positions are not, in my opinion, good, as an inexperienced professor will often pass the buck on to their unwitting students. Long postdocs are soul crushing.

Fundamental issues and challenges

There is no horizon for the postdoc. It is poor pay for temporary work. The timing interferes with other life milestones (romantic partnerships, having and raising children). We push to the limits of human knowledge but are devalued. We are exploited and forced to perfect areas that were not in the job description: selling ourselves, being bullied, staying quiet in the face of ugliness, accepting a brutal reviewer system where everyone complains and nobody acts.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2923

Perspectives on the postdoc roles and responsibilities

Being a postdoc is this fantastic bridge between learning how to be a researcher in graduate school to going straight into a project and showing that you know how to conduct it. It is still a learning experience because there are new techniques being learned and new biological systems to master, but life is a continuous learning experience. It is beautiful in its idea and has been a really fun and exciting experience.

I have lucked out because my boss is incredibly smart and helpful in my research. We are well funded which gives me the ability to do really cool experiments. I am very fortunate and I will never forget that.

Fundamental issues and challenges

Unfortunately, due to the language in the laws, as a Postdoctoral Fellow with a T32 fellowship, I am not considered an employee of either the NIH or my institution. This leads to me being classified as self employed. I get a 1099-MISC instead of a W2. This has consequences when it comes to pay which ultimately leads to be being paid less after taxes compared to when I was a postdoctoral associate. Because of the language, my benefits, are paid to me as subsidy or a supplement, for which I am taxed on as income. Since it is not employer benefits, I have to pay taxes on this as it is income. This was not the case as a postdoctoral associate. Due to this, the federal government thinks I make $12,000-$13,000 a year more than what my contracts gives me for my stipend. These are the same benefits I had when I was a postdoctoral associate that I did not have to pay taxes on because they were from my employer. It seems from this single thing, my taxes have increased to a point where I am now making less money after taxes.

From talking to different departments at my university, such as the business office and postdoctoral affairs, in addition to multiple colleagues who have or have had fellowships, it seems that this is a well known issue that seem status quo. In a time where inflation is skyrocketing and pay is not following the same trajectory, it is disappointing to know that I am getting paid less for a prestigious position as compared to my fellow postdoctoral associates. I'm doing the same things as they are, spending the same time on experiments and data processing, going to the same conferences, and putting the same effort in.

Existing NIH policies, programs, or resources

From the previous section it can be seen that this is quite frustrating. It has made me think about what policies could be changed. The main one is to be considered an employee of my university. I do not see any benefit to considering me self-employed contractor. If this training grant is supposed to be training me to be a professor, then why am I not considered an employee of the university just like a professor is? This would solve the issue of me paying taxes on employer paid benefits. Currently the government thinks I am paid $12-13,000 more a year than what my contractual stipend is for because the NIH is giving money for my benefits. But neither the NIH or my university is my employer, so I pay taxes on them as income.

I can't honestly tell future postdoctoral fellows that this was worth it. There is no prestige in being taken advantage of without representation. My university is not unionized and the business staff openly agree that the mechanisms to deal with these issues are not user friendly. So I do not know who to turn to. Sure this may seem like only a little amount of money, but to me, a grossly underpaid for my education level, this little money is the difference between going on a a vacation or not. I work just as hard as anyone else, and just want to be fiscally compensated. I know I'm not here to make money, and to be honest, I'm ok with that. I love my work and I love doing experiments, but I have self worth. And it is frustrating to feel that I'm being taken advantage and have no representation for it and no employer to make sure that I'm taken care of.

Proven or promising external resources or approaches

To be honest, I do the same things as I did as a postdoctoral associate as a postdoctoral fellow. From what I have observed and collected from my colleagues, these fellowships are one of prestige and to help alleviate funding from their advisors. So far I haven't had to use any resources of the NIH or have had to approach the NIH (other than now). I will be going to a conference for my fellowship in a couple months, so I'll have to see how that goes and if it was useful for me and my research and for pursuing my career. Mainly, all I want is to be compensated, meaning after taxes, as my postdoctoral associate colleagues. So whatever has to be done, increase the pay in the form of a gross-up or for any other justification, to get me back at the same level, would give having a fellowship an edge compared to not having a fellowship.

Response 2924

Perspectives on the postdoc roles and responsibilities

In one perspective it is a training opportunity for an individual, having research and mentoring support for future scientific career. In another perspective postdoc is also an employee who needs a salary support for. Some postdocs also have families this further highlights the importance of having sufficient financial support for the work they do.

Fundamental issues and challenges

It is a two phase problem. In the first phase, postdocs in the hub cities (e.g., Boston, New York, LA) suffering from high cost of living in these cities. These cities are not affordable where renting a house takes more than half of your monthly paycheck.

In the second phase of the problem, postdocs do not want to move other affordable cities. As a PI in Richmond/VA, currently I am offering 60K/year salary full benefit and retirement for first year postdoc candidate. In Richmond a house can be rented around 1250$/month and city is very affordable. However, although my intense advertising the position I am not getting any application. So postdocs do not prefer other cities even though they are more affordable. This brings that it is not only the salary problem for postdocs but also they have city/institute preferences. Even though they have offers from other cities with better conditions, they are not moving.

Considering these, NIH should not mandate a single matric for postdoc salary. 75K/year salary could be good for Boston but considering affordability this salary is more than enough for postdoc in Midwest cities. So salary should be arrange based on the district/city considering affordability.

For a current postdoc mentality, I see that having a postdoctoral training in prestigious institutes are preferred this cause an equal distribution of postdocs across different institutes.

Existing NIH policies, programs, or resources

Postdoc should be kept maximum 5/year per institute per trainee. There should be more fellowship opportunities not only for US citizens but also for international postdocs that they can be supported with these fellowships (e.g. salary support).

NIH should implement a policy that postdocs are equally distributed across the states not only enriched in the hub cities. This a big problem for academic institutions/PIs located outside of these hub districts. For example a type of grant can be implemented for postdoc who is currently a trainee in Midwest cities or cities outside of the hub districts. This will encourage postdocs to consider moving other institutes.

NIH should design a matric for postdoc salary this should also consider city affordability so that in each institute , base don the affordability salary can be adjusted.

Proven or promising external resources or approaches

Implementing more fellowship opportunities for postdocs not only for US citizens/residents but also for international postdocs. Although putting up a new mechanism that initiate postdoc recruitment easy for early stage investigators would be benefitted.

Response 2925

Perspectives on the postdoc roles and responsibilities

Postdocs drive most of biomedical research. It is increasingly common for phds to take several (2+) postdoc positions while applying for tenure-track and other long-term employment in the field. Postdoc positions are badly needed for both the individuals who take them and the institutions/labs that supply them.

Fundamental issues and challenges

Low salary & lack of job security. It is increasingly difficult to attract the talented, highly trained candidates required for postdoctoral research because they are barely (and in many cases not!) paid cost of living. They are instead seeking employment in industry and/or abroad which means

1. we are on the cusp of a brain-drain and
2. basic/foundational research (which applied research absolutely relies on) is increasingly under threat of stalling out. This is an untenable situation.

Existing NIH policies, programs, or resources

Increase minimum pay for postdocs to 70k. Increase budget maxima to accommodate. This will enable institutions that have already made the switch to fund their students.

Proven or promising external resources or approaches

No response

Response 2926

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] views the academic postdoctoral position as one that is designed to be a short-term mentored appointment that prepares postdocs for an independent academic faculty position, or for a managerial role in the private, non-profit or government sectors. Beyond carrying out independent research projects, postdocs should have opportunities to work on developing other competencies such as laboratory management and grant writing. Overall, postdocs are immensely important to the success of the laboratory because of their expertise, their full dedication to research and because they drive innovation in the lab. Ideally, in the Principal Investigator (PI) to postdoc relationship, there is a mutual understanding of helping each other move toward their professional goals while advancing scientific discovery.

Fundamental issues and challenges

On the Fundamental issues and challenges inhibiting recruitment, retention, and overall quality of life of postdoctoral trainees in academic research, [redacted for anonymity] identifies low salary and lack of benefits (for example parental leave, childcare, retirement contributions) as top factors for postdocs to not pursue a career in academic research. Furthermore, academic institutions generally do not provide additional funding to support postdocs through temporary difficulties or less productive times (either due to scientific setbacks or personal reasons such as illness or family obligations). These issues are exacerbated in areas with a high cost of living, and disproportionately affect women and people from disadvantaged backgrounds. In addition, the shortage of academic positions and uncertain research funding levels makes an academic career a challenging one to pursue, and [redacted for anonymity] has seen a trend of more and more graduating PhD students opting not to pursue a postdoc and moving to non-academic positions soon after completing their degree.

Existing NIH policies, programs, or resources

There are opportunities where existing NIH policies, programs or resources could be leveraged to enhance postdoctoral training and academic research pathways. One suggestion would be for NIH to formalize guidance on how researchers can support their salary at each step of their academic career. This could take the form of a longitudinal pathway of award mechanisms (consistent across NIH institutions) that support researchers from trainee to independence. Another idea would be an NIH-wide expansion of the model of the NCI R50 mechanism for staff scientists, which would also retain additional talent in the

academic workforce. Additional mechanisms to fund laboratory managers or expert technicians would release postdocs from excessive maintenance duties. Additionally, increased pay lines and budget caps would allow investigators to fund postdocs at a higher pay grade and with increased travel funds to allow them to build robust scientific networks, generate collaborations, and move toward independence. Finally, expanding funding opportunities available to foreign postdocs would likely increase the retention of talent in the biomedical workforce regardless of nationality.

Mentors need mentoring as well. [redacted for anonymity] recommends NIH develop leadership training resources for Principal Investigators to improve the quality of training for their postdocs and graduate students, especially by providing guidance on the appropriate number of personnel that they should commit to mentoring. NIH funded institutions should have clear guidelines on the expectations of mentors and how they can formalize their interactions with postdocs to improve quality of training, maximize workforce potential, resource utilization, and improve scientific rigor.

Proven or promising external resources or approaches

There are promising and proven approaches and resources to improve postdoctoral training ecosystem. [redacted for anonymity] recommends that NIH formally and regularly interface with existing universities' offices of postdoctoral affairs, and with medical and professional societies to share best practices in improving the quality of training of the PhD workforce. For instance, [redacted for anonymity] has a very active task force focused on advancing the careers of PhD scientists involved in hematology research (https://www.hematology.org/about/careers/resources-for-phds) and also funds a Translational Research Training in Hematology Program (https://www.hematology.org/awards/career-enhancement-and-training/translational-research-training-in-hematology/about-trth) that is open to postdoctoral fellows and junior faculty. [redacted for anonymity] would welcome the opportunity to share with NIH the successes of our programs launched in support of this constituency.

Response 2927

Perspectives on the postdoc roles and responsibilities

Postdoctoral training is an extension to graduate training with the distinction that a postdoc has more independence in their research. A postdoc is also a valuable member of the lab to to other trainees.

Fundamental issues and challenges

Postdoc positions are not rewarding enough. The individuals are choosing a pay cut compared to industry jobs to continue their training. Those choosing to do a postdoc should do it without having to think about the financial constraints. If postdoc compensation was increased and competitive to that of alternate positions then postdoc appointments would be more competitive. Postdoc positions commonly fall into a non-compensatory, non-benefit eligible appointment. this should change.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Increase postdoc pay and employee benefits.

Response 2928

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows bring unique perspectives and expertise to any research environment. Since they are already highly trained and largely autonomous, they can assist with in-lab training as well as steering research directions within the lab. Furthermore, the opinions of postdocs provide an additional counterpoint to that of the advisor or PI. Having multiple informed individuals weighing in on experimental decisions, research directions, and lab priorities always enhances the environment of the lab.

Fundamental issues and challenges

More and more postdocs see the incredible bureaucratic burden placed on PIs and are steering clear. This, coupled with low wages, lack of perceived job prospects, prolonged postdoctoral periods due to the

market, have made it difficult for existing postdocs to remain upbeat. Regarding recruitment, graduate students are increasing seeking non-academic positions. Furthermore, there has previously been a healthy exchange of postdoctoral fellows between the USA and other countries. This is changing significantly. More and more, individuals are staying in-country, or within Europe or seeking other regional opportunities. It is no longer viewed as favorable to have an international experience (likely due to COVID).

Existing NIH policies, programs, or resources

There is no doubt that increasing salaries will be appealing to any/all postdoctoral fellows. However, I don't think this will largely alter the recruitment issue. That being said, fewer quality postdocs that are better compensated could prove to be the best model moving forward.

Proven or promising external resources or approaches

One thing that has always been critical to me for recruiting the best postdocs has been to provide the opportunity for serious candidates to interview in person and visit our institution and laboratory. This is a very effective recruiting tool and has led to very successful recruitment in my team. It is important for incoming postdocs to feel good about the new laboratory they are about to spend 2-4+ years in and to know that the environment is favorable to them personally and professionally.

Response 2929

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as primarily a stepping stone to other opportunities and that it's ultimately a trainee level position. It allows for people to gain additional skills while conducting science at a high level, but is ultimately not meant to be a terminal position given its nature.

Fundamental issues and challenges

Most forces acting a postdoc push them away from conducting interesting and innovative science at a level commensurate with their experience. Alternative careers often available to postdoctoral scientists are more lucrative, offer better work-life balance, and provide additional skillsets beyond traditional benchtop skills (in the case of the majority of biomedical science positions). While many academic postdocs chose to take the position as a stepping stone to becoming an independent laboratory investigator, the overwhelming majority of time and effort spent during postdoctoral work does not assist in developing the skillsets necessary to be an effective principal investigator. It is no surprise that these factors, coupled with the incredibly low success rate of ultimately achieving independence, lead to the absurd attrition rate of existing postdocs, and the difficulty with recruiting new ones.

Existing NIH policies, programs, or resources

Ultimately, all of the issues affecting postdocs in this way stem from issues surrounding achieving independence as an investigator. Academic science rewards behavior that is not reflective of a postdoc's ability to ultimately become an independent laboratory investigator and direct the effort of future trainees. Postdocs achieve independence almost entirely based off of their ability to secure grant funding and publish their research in high-impact journals, both of which are almost entirely exclusive to postdocs working in resource rich environments, and rarely correlate with scientific excellence.

The postdoctoral position should become less of a "repeat of graduate school" as it is in its current state, and transition more to a mentorship training period, where they become heavily involved in the mentorship process and are primarily rewarded by their ability to mentor and advance the careers and training of other junior scientists. By providing pathway to independence primarily to postdocs that have published in high impact journals, the system actively discourages trainees from developing the skills necessary to be a successful PI.

Proven or promising external resources or approaches

Distributing funding more equitably to postdoctoral trainees will allow more individuals to achieve independence, and make postdoctoral work more attractive as a result. When adjudicating a postdoc's career as a part of the grant review process, resources available to that postdoc that allowed them to conduct their work should be comprehensively evaluated in order to reward individuals who conduct science with minimal resources (and potentially actively penalize those for whom their work was possible

only because of large scale collaborations or expensive experiments conducted by contract research organizations or core facilities).

Response 2930

Perspectives on the postdoc roles and responsibilities

The shared NIH and NSF postdoc definition is "an individual who has received a doctoral degree (or equivalent) and is engaged in a temporary and defined period of mentored training to advance and enhance the professional skills and research independence needed to pursue his or her chosen career path."

[redacted for anonymity] believes that an academic postdoc position should be an established and temporary period that has defined goals for the advancement and enhancement of professional skills needed to pursue his or her chosen path whether it is in academia, industry, government, or another area.

The referencing of postdocs as "trainees" could have undermining values. Particularly, referencing postdocs and graduate students as "trainees" may devalue and fail to demarcate the training and expertise that a PhD scientist has earned through his or her graduate training years. The terminology "trainee" is also detrimental for international postdocs obtaining visas dedicated to a career that advances PhD-level scientists. Further, referencing postdocs as trainees could muddle the power dynamic in a professional environment, which may pose challenges for postdocs to exercise and reinforce supervisory and mentorship roles that are sometimes expected of postdocs.

Per the NIH, if postdoctoral training is intended to be a "defined period to enhance professional skills" , then professional development should be mandated and incorporated into the stipulated postdoctoral period and be valued equally to the conduct of research. Currently, professional development is left to the postdoc to initiate of their own accord, time, and at their own expense outside of the lab, provided their supervisor approves of their external professional developments.

The entirety of the postdoc role is to provide for the individual to "pursue his or her chosen career path," not just those careers paths in academia. NIH should strongly encourage the exploration of careers outside of academia.

Fundamental issues and challenges

The current system needs close oversight that will assist in mitigating some of the concerns outlined below. Along with oversight, better surveying on the following areas will allow NIH to observe trends and take proactive measures before any pertaining issues escalate.

Inequities in postdoc pay create significant financial barriers that can lead to physical and mental health difficulties. Currently, accurate guidance on how postdocs can be paid is lacking from the NIH, which enables institutions to treat postdocs not as employees but independent contractors depriving them of standardized pay, benefits, and employment protection. This creates a barrier, such that only those that have the means to become a postdoc without suffering financial hardships pursue that career path.

Without clear guidance from the NIH on standardized benefits for postdocs, inequities in benefits have emerged within institutions and across institutions that create discrepancies in terms of quality of life. To sustain and enhance quality of life, more and more early career scientists are looking at careers outside of academia for a healthier work/life balance and a better paycheck that they believe they are worthy of.

The treatment as a "trainee" is degrading and disingenuous as much of the workforce looks at new PhDs as top candidates and employees and far from a "trainee." These issues in a work environment manifest as prolonged work hours impacting work/life balance, strained mentee-mentor relationships, with bullying and harassment that can deter and drive postdocs to careers outside of academia. New PhDs would need to be recognized for their professional strengths and skills, rewarded with competitive salaries, enabling work/life balance.

Existing NIH policies, programs, or resources

[redacted for anonymity] believes that NIH can and should create positive change. While NIH cannot step in to oversee every employer relationship, NIH can make the programs it has oversight over more structured and standardized, inclusive, and supportive of postdocs across institutions.

Scholars feel compelled to move institutions to advance their careers (and these types of biases are reinforced by reviewers and the NIH FAQs for F32 applications), but the NIH could change review criteria to allow for this type of continued training at the same institution. This would be useful for the development of postdocs into faculty, which NIH could help to incentivize this transition. Thus, for those postdocs who want to stay in academia, this could be a mechanism to move from a temporary training period to full-time employment.

In addition to supporting increased diversity at the stage of postdoctoral transition to early career scientist through efforts like its "MOSAIC" awards, NIH should re-evaluate its F32 grant to increase diversity offerings. Only having 1 NIH IC with a diversity award under the F32 grant does not increase diversity. However, the F31 has a standard application and a diversity application. The NIH should look to expand the number or fields where these diversity opportunities are offered and that they should be expanded to other NIH ICs.

NIH should clarify language used for T32 training grants so that any postdoc who is listed as a trainee on a T32 grant is eligible for full benefits like their postdoc peers.

NIH should allow and promote the use of grant funds to help postdocs with relocation costs. Graduate students are financially disadvantaged to save up thousands of dollars to relocate for a postdoc position. Not providing relocation assistance creates inequities in the STEM ecosystem.

Proven or promising external resources or approaches

[redacted for anonymity] recognizes that many of the challenges rest within institutions, yet many of the solutions also are present there. NIH should work closer with institutions and keep institutions in mind when it is releasing guidance and directions.

[redacted for anonymity] recommends NIH:

- Work with external organizations that are focused on postdoc issues such as the National Postdoctoral Association and the National Black Postdoctoral Association and use them as resources to improve the postdoctoral experience.
- Strengthen its relationships with scientific associations that promote mentorship to foster a better mentorship education and relationship building between PIs and postdocs.
- Create a yearly mechanism, whether it is a survey or another reportable item within the funding grant, that will create a baseline for NIH and the public to view the postdoc experience especially regarding postdoc pay and benefits.
- Look to other fields that have similar training structures, such as the medical field, and incorporate best practices, such as limiting the number of hours qualitative worked, into the scientific training enterprise.
- Begin to treat the postdoc ecosystem not as a siloed institution, but cooperation with private industry and other areas, which will in turn strengthen recruitment and retention.

Response 2931

Perspectives on the postdoc roles and responsibilities

Conduct research from the beginning to the end. Purchase needed tools and reagents, design and perform experiments, analyze data, write papers/reviews for publication. In addition, mentor grad and undergrad students in the laboratory.

Fundamental issues and challenges

Very low stipend for so qualified job. Lack of a real position, sometimes we are treated as staff, sometimes as students, trainees, etc. The responsibilities and expectations are big but the stipend and rights are not befitting.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2932

Perspectives on the postdoc roles and responsibilities

I've been a professional science communicator for more than a decade and witness the importance postdocs have for bringing fresh and current perspectives to the scientific dialog. They are not naive nor set in their ways.

Fundamental issues and challenges

Postdocs often feel they're headed down a path with only on direction, they need to see science involved not just research but also leadership, administration, and paths to other roles and futures.

Existing NIH policies, programs, or resources

Communication is a core competency for all scientists and should be formally taught during early stages of their careers.

Proven or promising external resources or approaches

Formally add more soft skills to postdoctoral training, including communication and teamwork.

Response 2933

Perspectives on the postdoc roles and responsibilities

This is the most exploited position in academia. We are paid poorly, we are not given opportunities to prepare for PI positions. I, personally, had a horrific time in the grant process. My intelligence and ability to craft a research plan was ridiculed. I questioned why would anyone be allowed to write some heinous things for a TRAINEE GRANT.

This experience has been horrific. I hate the postdoc. I know so many smart creative people who left academia because of how terrible this life is. You have failed us. I don't believe you will change anything.

Fundamental issues and challenges

Money. This is such a stupid question. You know the answer to this. MONEY! Why should I waste my time answering such a stupid question.

Why are you sending out surveys when you KNOW WHAT YOU NEED TO DO.

Existing NIH policies, programs, or resources

Time limits and pressures. The whole system is completed messed up. The amount of work it takes to land a high profile paper that are going to most likely not be reproducible takes SO LONG but that's all you care about.

I can't get a grant bc I have not published. I can't get a job because I didn't get a grant. It's all a joke. Perpetuated by you!

Proven or promising external resources or approaches

Cluster hires, people do better together. Instead of putting us all against each other. Create hubs for new sets of postdocs to work together. To succeed together, to build skills that would build towards collaborative future.

Response 2934

Perspectives on the postdoc roles and responsibilities

The Postdoc position is the last step for becoming an individual scientist. With the help of this position, I can gain experience in how to lead a team. As a foreign researcher in the USA, I can reach last technologies in the field and communicate with the most prolific researchers in the world.

Fundamental issues and challenges

After the COVID-19 pandemic, Job numbers have decreased, and finding jobs has become harder. The second thing is visa application and receiving visa documents. I think financial issues have a big part in inhibiting factors of the quality of postdoc especially postdoc who has a family (and child). For example, supporting their child's educational needs is challenging.

Existing NIH policies, programs, or resources

Most researchers worldwide want to be a researcher in the USA because most US organizations offer the latest methodologies. However, people nowadays are more careful about their living standards than ever before. For that reason, improving financial and healthcare benefits will help postdoc researchers in the USA. In addition to this, no matter where you come from most private organization offers more flexible position than academic institutions around the world and graduate students want to have industrial jobs more than academic institutions. For example, in industry, some of the milestones are not related to publishing, and workers of this company can achieve these milestones without publishing, or presenting. In academic positions gaining a promotion is taking more time than usual jobs and these paths have huge standards to achieve it. In some of the J visa cases, postdocs are bound with their mentors and they can abuse by their mentors because their status depends on their mentor.

Proven or promising external resources or approaches

Recent studies showed that postdocs are vulnerable to mental disorders and some academic institutions are started to help their postdocs for reaching mental helps easily. Giving mental health training will help postdocs survive and pursue their jobs. Cultural differences are another topic that might give courses to the foreign postdoc about the US culture will help them to understand the meaning of the working environment in the USA.

Giving more financial benefits or giving milestones that are not related to just publishing article will also increase job satisfaction.

Response 2935

Perspectives on the postdoc roles and responsibilities

At [redacted for anonymity], we acknowledge that postdocs provide tremendous value to our institution in the form of their research and scholarship but also in a variety of other important areas. These include bringing new intellectual ideas and perspectives to our community, mentoring of graduate and undergraduate students, and driving forward technology commercialization and start-up company creation.

In our view, the intention of a postdoctoral associate position is to provide a continued opportunity for training in a specialty area for a limited amount of time. We believe a postdoc should receive active mentoring from a more senior scholar and ideally have a team of formal and informal mentors available to support them in their career and professional development.

In terms of responsibilities of a postdoc, we believe while their time will mainly be spent focused on research and scholarship, obtaining teaching, mentoring, and other professional development experiences can be crucial for them to transition to careers of their choosing. Importantly, we support the OMB's uniform guidance of the "dual role" of postdocs as both trainees and employees: "[those] in postdoctoral positions engaged in research are expected to be actively engaged in their training and career development under their research appointments" .

At [redacted for anonymity], we categorize our postdoctoral associates as research faculty in our human resources systems. This provides them access to near-equivalent employment benefits, including health care and retirement benefits, as other faculty at the institution. Fundamentally, we believe all postdocs should receive access to reasonable employee benefits and resources while recognizing that they are also in a time-limited, temporary training position.

We are agnostic as to what careers postdoctoral training prepares one for and believe the skills and abilities obtained through a postdoc can allow one to succeed in a variety of fields post-postdoc.

Fundamental issues and challenges

Visa & Immigration Challenges

A major challenge in postdoctoral recruitment is the current inefficiencies in the visa process in the United States. Processing times and bureaucratic hurdles make it difficult to onboard international scholars in a timely manner.

Budgetary Practices that Acknowledge Increased Personnel Costs for Postdocs & Staff Researchers that Lead to a More Effective Research Enterprise

The research skills and talents postdocs both bring to the university and develop during their training make them critical components of the US's research and innovation ecosystem. Many would like to continue working in academic researcher roles after their postdoc. Given their advanced training and skills, an individual transitioning from a postdoc to a more senior researcher role is (rightly) more highly compensated. At [redacted for anonymity], the increase in compensation from postdoc to a more senior researcher role is 30-50%. Even if faculty wanted to retain research talent through promotion within our research faculty ranks at [redacted for anonymity], current NIH Research Project Grant (RPG) budgets make this difficult. Furthermore, inflation and other costs have risen substantially since the NIH modular budget "cap" was put in place in 1998. The issue of higher personnel costs being necessary to address in NIH RPG budgets equally applies if faculty and institutions seek to better compensate postdoctoral associates to ensure a living and stable financial arrangement for the postdoctoral population.

NIH must strongly consider the message it sends in its RPG budget guidance as it relates to more adequately supporting the scientific workforce. Higher personnel costs should not be seen as a negative in the RPG review process but rather leading to a more stable, robust, and effective research enterprise.

Existing NIH policies, programs, or resources

Equitable Access to Benefits for Postdoc Fellows and Employees

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. This can prevent postdocs from losing employee benefits when accepting an NIH fellowship, making the acceptance of these prestigious awards more feasible. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.

Proven or promising external resources or approaches

Collaborate with NSF Programs, Including INCLUDES and AGEP to Identify Best Practices in Supporting Scientific Workforce

NSF's programs focused on increasing diversity in both the science and engineering workforce and professoriate could be excellent partners for NIH as we seek to support Ph.D.s and postdocs from historically underrepresented groups in their pursuit of employment at US colleges and universities and beyond.

Curation and Sharing of Resources and Best Practices in Postdoc Training and Development

The NIH should work to consolidate professional development resources and make them more accessible and available to postdocs, faculty, and postdoc offices.

The NIH Broadening Experiences in Scientific Training (BEST) awards provided significant resources to a select group of institutions to develop and share best practices with the broader community and, indeed, some data from this program have been presented and published. However, resources to ensure dissemination could continue after these awards' funding ended seems to not have been addressed. One specific example is the website that used to host publications and resources from the consortia of BEST institutions (NIHbest.org) is now defunct.

Building off this point, NIH's OITE provides amazing resources and workshops to aid postdocs in their career and professional development and other organizations such as the National Postdoctoral Association, Graduate Career Consortium, iBiology, and others have developed tools and resources that can benefit postdocs in their career exploration and planning process.

A well-maintained comprehensive data bank should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. In an increasingly virtual environment, the current and

future wealth of resources for postdocs should be curated, sorted and readily-available. This would complement federal commitments to open science by increasing not only the availability and access of federally-funded research but also its community resources.

Response 2936

Perspectives on the postdoc roles and responsibilities

My perspective is that the job of a postdoc as currently organized is to help a PI carry out the aims of a grant, while simultaneously developing their own plan to generate independence. In theory, a postdoc job could have intrinsic value as an additional layer of job training, but it is not typically viewed as such (and would require significant buy in from the PI supporting the postdoc).

As an assistant professor struggling to find people to work in my lab as a postdoctoral fellow, my perspective has changed to a degree. It seems like a postdoctoral fellowship is becoming more of a possible pathway to citizenship. Over the course of 3 searches, fewer than 10% of my applications were U.S. citizens (1). It seems likely that this experience reflects in part the location of where I work (rural area), but I think it also is worth stating bluntly as such. Either U.S. citizens are not interested in pursuing this line of work, or there are not many of them and they are taken in by prestige institutions.

I did a 5 year postdoc before being promoted to "research scientist". The starting salary my first year was $39k, which was raised to something more reasonable after a few years. By the time I left for an assistant professor position (at an R1 institution) my salary was 70k. I loved that job as it allowed me to be a full time scientist, and I would have been glad to work in that position for a long time if I had felt the role was safe and had some reasonable room to grow (in terms of salary). The nature of the job felt unsafe and tied uncomfortably to the random nature of funding.

Fundamental issues and challenges

Speaking to many Ph.D. students at my university —I'm only aware of 1 (out of ~10 that have graduated since I arrived) that have done a postdoc. Many of the students seem upset and bitter about the career prospects and want to leave for industry.

I don't know if this is fair —the starting salary for an NIH postdoc is much fairer than it was. I'm worried that maybe students are getting distorted analyses of what is really available in industry. However, this is a separate issue of LONG-term career prospects. Why would someone go into a career of being a scientist if it is only safe for a few years before there is only a VERY SMALL possibility of becoming a manager (i.e., lab PI).

Existing NIH policies, programs, or resources

The challenge of creating a sustainable job for scientists is that the math seems impossible. Take the following example. I hired a research faculty (i.e., a postdoc no longer allowed to be called a postdoc by NIH standards) who made ~58k per year. However, with fringe and (family) health benefits, the actual cost was $95k. Effectively the same person / salary but defined as a postdoc is costing closer to $70k. I don't know how a lab can manage this salary difference without the size of awards increasing substantially.

Proven or promising external resources or approaches

I think there are too many value-added extracurriculars that distract from science already. If people felt confident that their position would lead to a sustainable job in the future (whether academic or not) they will be happy to take the job. MD residents for example —are WILLING to deal with a challenging situation because they know there is a 99% likelihood of a better future.

Response 2937

Perspectives on the postdoc roles and responsibilities

I think a postdoc should be an opportunity to design and implement projects with some input from a PI. It should be a time when you are learning and applying new skills to expertise that you already have toward common scientific goals.

Fundamental issues and challenges

Being underpaid, being treated as a trainee after many years of scientific experience, and not being able to be a PI on grants prohibits postdocs from moving forward. Many postdocs are treated as technicians and micromanaged (I witnessed a lot of this while at the NIH), and fail to develop into independent scientists as a result. Other postdocs are left on their own with little or no input or feedback from their supervisor (this was my experience). There should be some way to provide feedback throughout the process rather than at the end or after someone has decided academic science is no longer for them. Many postdocs are also responsible for many administrative tasks, such as ordering supplies and reagents, which detracts from their time to do science.

In my own experience, being bullied as a woman has been extremely difficult and my work, which I was leading myself, has been frequently minimized by others because I was "only a postdoc"

Existing NIH policies, programs, or resources

K99 and other awards should not be restricted to postdocs with fewer than 4 years of experience, this discriminates against those who don't know about these opportunities as well as those doing multiple postdocs and not being able to get an academic faculty position. If these limits are kept in place, how about an award specific to helping those who have done 5+ years of work as postdocs succeed in the academic market? The expectations for experimental design and scientific vision could be higher for these more experienced folks.

One way that the NIH could improve the lives of postdocs across the board is mandating that postdocs funded through NIH grants be paid on the NIH scale at a minimum. I have 6 years of postdoctoral experience and 4 years as a staff scientist, I am now a postdoc again and being paid the same as someone with 2 years of postdoctoral experience. Leaving pay scales to institutions enables them to exploit postdocs with extensive research experience who are certainly no longer "trainees". There should be a different classification for postdocs and scientists with more than 5 years of experience—even something like "senior postdoc" or "research fellow" as this situation is increasingly common since so few faculty positions are available.

Proven or promising external resources or approaches

I think having more academic career opportunities aside from being a PI after doing a postdoc would retain a lot of people in science. Staff scientist positions particularly would suit a lot of people, help scientific labs succeed and providing a more stable work opportunity for people with expertise who do not necessarily want to lead their own lab. These types of positions are relatively rare outside of large research institutes.

Response 2938

Perspectives on the postdoc roles and responsibilities

A postdoc is expanding his knowledge gained during his thesis work. Its like a residency after medical school (or fellowship after residency) with in depth work on a particular topic. This can expand the prior knowledge or add new dimensions when moving into another filed aopolying expertise and skills learned during the thesis work.

Fundamental issues and challenges

1. Academic salaries are beaten by industry. We have difficulties finding good people that want to come, even to a top notch institution.
2. Life style compared to industry, less long nights etc.
3. Generational change, with people more emphasizing work-life -balance and to not be othered. I came to the US 20 yrs ago with two suitcases and left everything behind, now it seems there is no drive or will to do that anymore
4. Overall political uncertainties where the US isn;'t seen as attractive any more with daily shootings, racism and antisemitism out in the open and a fragile democracy on the brink of disaster.

Existing NIH policies, programs, or resources

You have to increase the R01 budget. This hasn't be adapted for 20+ years. Not even for inflation. We cannot even offer competitive salaries for postdocs on a single R01any more, certainly not on a modular budget but even more difficult on a cut detailed budget. At the same time institutions are executing mandatory postdoc salary increases for which the PIs have to find the money which ends up in having to write even more grants and making the PIs life even more miserable than it is—which in turn attracts even LESS people to science. This is an enormous problem and a downwards spiral. I recommend my kids to not go into academia any more. I changed my mind in the last few years.

Proven or promising external resources or approaches

Honestly—It all is hinged on the salary. If the salary is too low for a decent living in expensive cities (NY, Boston, SF etc.) they will go elsewhere (industry, consulting) to have a better quality of life. While 20 years ago we just clenched teeth and went through it this is not the case any more.

Subsidized housing, wellness plans are other things that might help

Response 2939

Perspectives on the postdoc roles and responsibilities

I think it can be a useful step in the training process

Fundamental issues and challenges

I will not be doing a postdoc due to the sub living wages I will make in this role. It is not worth it.

Existing NIH policies, programs, or resources

Increase postdoc pay

Proven or promising external resources or approaches

No response

Response 2940

Perspectives on the postdoc roles and responsibilities

At the first I thought it is really a way to get independent in research, but it is not. You are a well trained person in any lab doing a lot but gaining the less. You can't even thinking of applying for grant individually, there are always a stablished PI who can gain benefits from your efforts.

Fundamental issues and challenges

Imagine your project doesn't go the way it should be, I mean full of negative results specially the ones against previous findings in the stablished PI's of the lab would direct you to the hell. The quality of life is too low in comparison to the effort/time you spend in the lab. During the postdoc training duration you never learn how to manage the budget, which I feel would be a trouble for starting a new lab in your future career.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2941

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Salaries are too low and do not match a postdoctoral trainee's skillset. Academic labs are powerless to increase their salaries to levels commensurate with their training because THE NIH HAS KEPT R01 BUDGET LEVELS at a ridiculously low level. We cannot pay people what they are worth if we do not have purchasing power from our grant funding.

Existing NIH policies, programs, or resources

DOUBLE THE MODULAR R01 BUDGET

Proven or promising external resources or approaches

No response

Response 2942

Perspectives on the postdoc roles and responsibilities

A high level training opportunity, with service and mentorship responsibilities. The only difference from a PI is the lack of responsibility for total lab funding. Many postdocs are expected to be self funded by year 2 or 3.

Fundamental issues and challenges

Pay is way too low. Pay should scale with cost of living. Institutions that allow NIH funded postdocs should be required to give equivalent benefits to funded postdocs as those who are directly funded by the institution.

Existing NIH policies, programs, or resources

Require professional development. Require benefits from host institution. Add child care supplements. Provide funding for PIs to give relocation expenses.

Proven or promising external resources or approaches

HHMI has made great progress. Check out St Jude's postdoctoral fellowship stipends as well

Response 2943

Perspectives on the postdoc roles and responsibilities

I see it as a period for additional training and a career stepping stone. In my NIH R01 funded postdoc, I also have specific responsibilities to the grant, in terms of tasks I need to accomplish to support it. Aside from that, i see the primary goal of my postdoc as being obtaining a career-level position.

Fundamental issues and challenges

The primary issue is the availability of research-focused career positions. The rate of pay is a secondary issue. In my field, the number of PhD graduates that aim to pursue academic research careers greatly exceeds the number of available positions. This makes the environment very competitive and may increase the number of years on postdoc. Traditionally, postdoc was optional in my field and usually a 1 year experience. Now, it is essentially necessary and often is 2-4 years. My research area has a somewhat longer PhD length, 6-7 years, and the problem with the emergence of an unexpectedly long postdoc is that it disrupts life plans. This includes marriage, family planning, buying a house, retirement savings, and more. Given the current circumstances, many of us will not be reaching a career-level position until 32-35! This is not sustainable and is driving many academics industry positions. The secondary issue ties in here, in that all of the aforementioned problems are worsened by low salaries relative to our degrees and expertise. Although increasing our salaries from ~52k to 70k would not eliminate all of these problems, it would ease them greatly. For instance, it would make buying a house more feasible or having a child less stressful.

Existing NIH policies, programs, or resources

Pay us more or increase funding for career level research positions

Proven or promising external resources or approaches

Pay us more or increase funding for career level research positions. Although this would make the postdoc market more competitive, I think it would still be an improvement.

Response 2944

Perspectives on the postdoc roles and responsibilities

On behalf of the [redacted for anonymity], thank you for considering our comments on re-envisioning US postdoctoral research training and career progression. In addition to our comments, we also support and endorse the comments submitted separately by [redacted for anonymity].

We believe the postdoc definition or period should:

- Serve as a bridge to the desired career by providing "specialization" to prepare for a career transition, which should not be assumed to be an academic tenure-track position.
- Specifically state the individual has obtained a PhD.
- Have an expectation of maintaining a healthy work-life balance by providing sufficient salary and benefits, along with a professional culture that respects and values this balance.
- Incorporate policies that are equitable for all populations, including caregiver, international, neurodivergent, and other groups.

The postdoc definition or period should not:

- Use the word "trainee" ; this term has historically been used as justification to withhold benefits from postdocs, does not recognize the extensive training they have already completed, and fails to recognize professional expertise and experience already acquired. We note that a newly minted PhD beginning their career outside of academia is not generally considered a "trainee" . Alternative terms that would elevate this position include postgraduate scientist/investigator, early career investigator, or resident (akin to post-medical school specialization).
- Have a specific timeframe; a "temporary" position could imply that the individual should not be invested in by the mentor or institution. However, this should not be considered a permanent position either; using a "bridge to a desired career" in the definition could prevent this potential issue.
- Solely replicate training received during the PhD. The postdoc should include professional skills such as mentorship, grant writing, or others that are transferrable to their desired career.

Fundamental issues and challenges

Lack of adequate benefits are a major issue; benefits and salaries are variable between, and even within, institutions. For example, obtaining external funding can prevent a postdoc from access to institutional benefits, including health insurance. This can depend on the details of the institution's employment classification of postdocs, which may not be clear to the individual during the postdoc search.

- Furthermore, many postdocs choose to start families during this time, and variable access to benefits such as affordable on-site childcare creates substantial barriers.
- The current NIH salary scale is not sufficient to cover cost-of-living in most locations. We request that NIH provide transparency about how they determine the salary scale and critically evaluate how this scale is provided nation-wide.

Postdoc positions, when defined as "temporary" , can prevent access to employer-matched retirement accounts, with long-term negative impacts on financial outlook.

- The temporary status can also create unnecessary hurdles for international postdocs that are on temporary visas.

The expectation to move to a different location for the postdoc can create barriers that negatively impact careers, such as financial burdens associated with relocation and other disruptions that disproportionately affect postdocs with caregiving responsibilities or individuals with other attachments to their current community. Furthermore, moving away from existing support networks may contribute to feelings of isolation often reported by postdocs.

Existing NIH policies, programs, or resources

While many barriers to postdoc quality of life come from their direct employer/institution, NIH is still a powerful institution that can lead the way to generate change. We suggest that NIH:

- Explore including the treatment of postdocs, i.e. the benefits they are provided, in the assessment of "institutional environment" during the peer review process of grant applications. This would incentivize institutions to provide appropriate benefits to postdocs in order to continue receiving federal funding from NIH, which is the primary funder of biological and biomedical sciences. This could also lead to benefits for postdocs more broadly at the institution for those that may be funded through agencies outside of NIH.
- NIH adjust the Grants Policy Statement (GPS) to expand allowable costs for benefits beyond health insurance and allow funding from multiple federal sources.
- Clarify GPS language to allow fellows to maintain an employer-employee relationship with their institution, which would allow them to continue receiving benefits despite being on a fellowship.
- Create additional funding opportunities for international postdocs.
- Use Institutional Research and Academic Career Development Awards (IRACDA) as a model for postdoc transition into a desired career. While IRACDA is designed for teaching-focused careers, similar programs could be generated to prepare postdocs for careers in lab management, science policy, science writing, industry, etc.
- Invest in funding mechanisms that do not tie postdocs directly to an individual advisor; this could combat substantial power dynamics that link the future "success" of the postdoc to the relationship with their advisor. A model for this type of mechanism is the Katz ESI award, which supports innovative projects and does not require preliminary data.

Proven or promising external resources or approaches

The majority of resources currently available to postdocs are at the institutional level: salary, benefits, term limits, etc. Many of the dissatisfactions that exist for postdocs are beyond the policy level and extend to the human one: lack of emotional support networks, affordable childcare support, and sufficient mental health care, all can contribute to a distressed quality of life. We encourage the NIH to support:

- Childcare cost reimbursements through federal grants. Postdocs funded through some private grants have access to this benefit, which makes an enormous difference.
- Equitable methods for senior PhDs to search for and obtain postdocs that don't rely solely on the network of their mentor.
- Strengthening relationships with extramural organizations dedicated to improving postdocs' quality of life, such as the National Postdoctoral Association, and partnering to encourage widespread adoption of already identified recommended policies and practices.
- Work closely with institutions to communicate updates to the Grants Policy Statement, including the intended spirit and outcomes of the updated policies. NIH must keep in mind that universities typically interpret these policies to save as much money as possible, usually at the expense of postdoc benefits and programs.
- Working with external organizations to classify or rank institutions based on the level of support they provide to postdocs. This could increase pressure on institutions to improve in this area, as well as provide criteria for senior PhDs to choose an institution with a supportive environment.
- Apply existing methods to track postdoc conversion to tenure track faculty. NIH could assess these data and support institutional programs that use these methods for tracking careers after the postdoc in academia and other fields.

Response 2945

Perspectives on the postdoc roles and responsibilities

Typically, the goal of entrepreneurship is commercialization of a product or idea; but in our proposed context, providing training in intrapreneurship-the application of an entrepreneurial mindset and skills within an organization-would offer significant value to the postdoctoral training ecosystem. Our pilot

training program “Advancing Innovation through Mentorship” (AIM) looks to expand the ways academic postdocs think about their role in the biomedical ecosystem. By incorporating intrapreneurial skills and perspectives as a complement to research training, postdocs will develop the capacity to disrupt conventional ways of thinking and engage in creative problem-solving-thereby advancing scientific research goals within their labs.

AIM workshops focus on two major areas of skill development: project management and interviewing. This is a prime example of the transferability of entrepreneurial skills. In the commercial realm, inventors and entrepreneurs interview stakeholders to evaluate consumer needs, test out the marketability of concepts, and explore possible trajectories from idea to implementation. In the academic realm, postdocs may not see interviewing or working with focus groups as having relevance to their work-but, in fact, it is an invaluable skill. Formulating questions and probing the answers is at the heart of hypothesis-driven biomedical research. A core concept of the Lean Startup Methodology is customer discovery, which is taught through AIM training, and encourages creating hypotheses and testing those hypotheses with customer segments in the marketplace. In biomedical research, these customers are financial and regulatory agencies, government or otherwise. The customer discovery process allows entrepreneurs and innovators to quickly learn and iterate, and then learn some more, in order to get a product or service out in the market. Similarly, this mindset for translational researchers can be a critical lens to inform and add impact to their efforts in the laboratory and shape the impact postdoctoral researchers make in the scientific enterprise.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Hypothesis-driven research is fueled by the ability of researchers to ask the right questions, much like entrepreneurs must ask the right questions when iterating the creation of a product or service. Postdoctoral researchers often do their work within very specialized spheres. The benefits of specialization are clear; at the same time, there is a cost to not having a perspective on the broader ecosystem in which biomedical research occurs. By building intrapreneurship into the NIH postdoctoral training milieu, researchers will develop the ability to:

1. Look beyond immediate research outcomes to consider the longer-range implications and potential applications of their postdoctoral work,
2. Identify a full range of potential stakeholders and network with potential collaborators, and
3. apply entrepreneurial language and concepts to their role as NIH postdocs, and understand the relevance of the business model canvas to their work as part of the larger biomedical research enterprise. From the pilot study, we learned that NCATS intends to use the course to inform and train junior investigators on ways to disrupt the standard practices of problem solving versus programs such as I-Corps that are used as a means to validate the technology.

Proven or promising external resources or approaches

It is well documented the best entrepreneurial training experiences involve mentorship, hands-on skills development, and project-based practice. The same is true for optimal postdoctoral training. The idea of advancing scientific innovation through mentorship has already been piloted within NIH (both the National Center for Advancing Translational Sciences and the National Cancer Institute), resulting in valuable lessons for an intrapreneurship-focused AIM program for postdocs. Based on findings from the pilots, a full-scale AIM program model would include

1. an 8-week curriculum of intrapreneurial training to 15 cohorts of postdoctoral trainees each year,
2. cohorts with 3-4 postdocs working in the same scientific concentration, and
3. one mentor who is a senior scientist in the same field. Ideally, each cohort has members located at different postdoctoral placement sites to facilitate collaboration and cross-fertilization of ideas.

This structure would allow 3 training sequences over the course of the year, with 5 cohorts in each sequence and a potential impact of 60 to 75 postdocs and 15 mentors trained in intrapreneurship each year. Each cohort develops interview questions germane to the research project, identifies potential information sources, and conducts 30 interviews. Participants would attend required small group office

hours, where multiple teams ask questions and discuss areas of interest. This component is critical to build a nurturing postdoctoral environment, build camaraderie among participants, and build relationships with mentors.

Response 2946

Perspectives on the postdoc roles and responsibilities

I believe that being a postdoc means i have the opportunity to sharpen previously gained skills, pick up new skills, and receive the mentorship I need for future career prospects. I think this is an excellent opportunity for me to explore mentoring, teaching, and scientific experiment design as a semi-independent thinker.

Fundamental issues and challenges

PI/Mentors are not trained to be mentors. There should be some sort of guidelines, minimal requirements, etc to have PI/Mentors funded or even working in their lab. Most postdocs are not allowed to do independent work (even if they have their own funding mechanism), are not allowed to learn new skills, and are expected to be cheap skilled labor. Institutions are not paying livable wages, not providing good benefits/health insurance, don't host or match 401k, etc to postdocs. We are adults, starting families and thinking about our future prospects, but academia continues to topple our goals/desires. If institutions are known to abuse postdocs then NIH should step in. How can we trust that we have support when every level of research from department to federal institution won't be our champions.

Existing NIH policies, programs, or resources

There should be more IRACDA grants and even some focused on getting individuals the training to be better mentors and scientists. Currently, we focus on teaching at PUIs but need more expertise on mentoring at R1, R2, specialized research focused institutions.

Also, alternate K99/R00 programs—the cut off at 3 years, especially coming from pandemic, is difficult to meet unless you are in a supportive environment. The only postdocs that can get K99 are those that have a support system. There should be postdoc grants that focuses on the postdoc and their research ideas rather than the PI who will mentor them. This is a barrier that many postdocs in difficult labs or financial situations can't cross.

Proven or promising external resources or approaches

Fix the top down abuse. Mentors should be better trained, should understand the CURRENT plights of postdocs. PI/Mentors continue to think that a 4 year postdoc doing nothing novel will get you a faculty job—it won't! There is a bottle neck and they should learn how to help us navigate it.

INCOME! We need higher income for postdocs. We aren't children, we are HAVING children. We need fiscal and mentoring support during this career stage.

Response 2947

Perspectives on the postdoc roles and responsibilities

Academic postdocs are critical in moving science forward expeditiously in academic settings. The emphasis on training new individuals for the sciences is poorly balanced with retention efforts. What positions are we training people for when academic positions are rare and we are not rewarded for training people to move into industry.

Fundamental issues and challenges

A lack of long-term career stability or opportunities for permanent positions coupled with low pay, few benefits (minimal family leave, no retirement savings), and limited options for remaining in a geographic area (where one might find support from friends and family for childcare or advancing two careers for married people) are the primary reasons that people opt out of postdoctoral positions in favor of leaving research or moving to industry.

Existing NIH policies, programs, or resources

More options for permanent or long-term research positions, higher pay, improved family leave benefits, and retirement benefits.

Proven or promising external resources or approaches

Marie Curie fellowships that are specific for supporting people who have had a child in coming back to research. Staff scientist positions in the intramural program should be prioritized in academic settings to improve retention and speed up academic research (including training).

Response 2948

Perspectives on the postdoc roles and responsibilities

We view the academic postdoc as a highly skilled and knowledgeable scientist who brings state-of-the-art expertise in specific scientific disciplines (including the latest research and techniques in the field) and is typically one of the lab's greatest drivers of data generation and analysis. Postdocs play central roles in mentoring junior lab members, often providing hands-on guidance in designing and performing successful experiments/ensuring rigor in interpretation, which PIs have diminishing bandwidth to take on. Similarly, postdocs often help write grants for the PI, yet mechanisms to acknowledge these key contributions are lacking. As the postdoc fellowship is the final academic step before becoming a PI, mentorship focused on a path to independence is a critical part of this stage. Postdocs thus play invaluable yet widely underappreciated roles in the success of academic labs, and they should be recognized and compensated proportionately for their contributions—i.e. a lab can have unlimited funding, but if smart, creative, hard-working and experienced scientists are not treated fairly and compensated adequately, then the system is not sustainable.

Fundamental issues and challenges

Low salaries: one of the most significant factors preventing retention of postdocs in academia, as postdocs generally receive the lowest salaries of all PhD-educated scientists. This problem is exacerbated in very expensive cities that house major academic centers like New York, and for postdocs with families to support, especially if they are the primary caretakers. Biotech companies are increasingly seizing this opportunity by offering highly lucrative salaries to bring postdoc-level expertise into their R&D teams. Low salaries are thus leading to diminished diversity in the academic workforce. NIH has an opportunity to increase retention of postdocs by significantly increasing the postdoc salary cap, which would spur these changes across the field.

Inconsistent benefits: the access of postdocs to career-stabilizing benefits like retirement is highly uneven across institutions, which is increasingly problematic as scientists are stalled in the postdoc stage for larger stretches of their careers.

Lack of growth opportunities and mentorship/training: While the postdoc position is seen as a training position, the level of mentorship and training is also very uneven across institutions and PIs, especially in the area of career advancement, and particularly in building skills required for careers beyond academia like industry that are still widely seen as failure options or less worthy pursuits.

Toxic environments: Many postdocs are treated as workhorses rather than recognized as vital contributors to a lab, being expected to work around the clock, and frequently subjected to bullying/harassment/discrimination that institutions are slow or unwilling to address. Foreign postdocs are especially susceptible to these types of exploitation given their dependence on a visa, which makes them feel justifiably powerless to report mistreatment or attempt to switch labs/institutions. All of these factors take a major toll on the mental health of postdocs and diminish the appeal of academic career paths.

Existing NIH policies, programs, or resources

Curbing harassment: It is laudable that NIH is enforcing the policy of pulling funding from PIs whose institutions confirm findings of harassment. Yet by the time findings are confirmed, countless careers have likely been derailed. Enforcing greater accountability for PIs to detoxify their lab environments, including rewarding those who advance diversity, equity, inclusion, and belonging in the workforce, will be critical for enhancing postdoc retention.

Postdoctoral grant support for non-U.S. citizens/permanent residents: Many of our nation's most talented and productive postdocs come from other countries, and those in minoritized groups face disproportionate barriers that hinder their success. Granting these postdocs eligibility for NIH fellowships, just as non-citizen PIs are eligible for other NIH grants, would help level the playing field and advancing equity in the postdoc community. Training for foreign postdocs in NIH-funded labs on daunting tasks like visa applications would also be welcome.

Preparing postdocs for non-academic careers: Although the postdoc position was initially envisioned as unique to academia, postdocs have gone on to contribute to the biomedical research ecosystem across biotech, pharma, nonprofits, government, and more. The NIH Career Symposium helps expose postdocs to these opportunities; convening these in person (in tandem with major NIH-supported conferences?) and other mechanisms to maintain contacts would help postdocs build networks; NIH could also consider providing additional courses and resources to help postdocs prepare for non-academic career opportunities, including mandating these under institutional training grants.

Normalizing well-paying, stable staff scientist positions: many excellent postdocs leave academia because they cannot find tenure-track positions. Universities currently have few incentives to create more stable jobs for PhDs because postdocs provide disproportionately high value for enhancing research output relative to their cheap salaries. NIH is in an ideal position to incentivize universities to create staff scientist jobs for PhDs and battle administrative bloat.

Proven or promising external resources or approaches

Enhanced mentorship networks and committees: Mentorship systems like CIMER/Entering Mentoring and platforms like Chronus could be helpful for building mentor networks to help career advancement. Scientific mentorship could benefit from independent postdoc committees (like thesis committees) to ensure postdocs are assigned realistic projects, are working in decent conditions, and are not exposed to toxic environments.

Changing reward structures to acknowledge frequently overlooked postdoc contributions: Expanding the types of content that are permissible in the biosketch (perhaps Contributions to Science) to include things like (successful) grants written and unofficial lab leadership/mentorship roles in supporting junior scientists.

Rewarding scientists who advance diversity, equity, inclusion, and belonging by evaluating these contributions as a mandatory application component alongside scientific merit during the grant selection process. This is being done by many funders like NYSCF, HHMI, and more; the Health Research Alliance's Inclusive Grantmaking Initiative continues to produce resources and best practices in achieving this.

Response 2949

Perspectives on the postdoc roles and responsibilities

Conceive and develop a research project together with PI. Independently conduct research project. Mentor graduate students. Write manuscript draft.

Fundamental issues and challenges

SALARY TOO LOW. Needs to be competitive with equivalent industry position otherwise you will loose quality basic research.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2950

Perspectives on the postdoc roles and responsibilities

I hire post docs in my laboratory and train them in the field of mass spectrometry and proteomics. I view post docs as the "adolescents" of science. They are begging for independence but still need some guidance

and mentoring. They are there to broaden their horizons and to gain skills in science management, maybe some supervision, maybe some teaching, but also to start thinking more broadly about their science.

Fundamental issues and challenges

Salaries. If a new PhD graduate student can get a highly paid position in industry most will take it. The opportunity cost of post doctoral research is not what it used to be because of the salary differential and because faculty positions are much more difficult to get. Some institutions will only hire someone with a K award. And of course, limits on post doctoral salaries are tied to limits on grant budgets. The $500K cap on R01s has been in place for decades while inflation has been steady. The modular budget cap of 250K is meaningless now.

Existing NIH policies, programs, or resources

Expand the K award program to get the paylines up. Raise limits on R01 budgets so salaries can go up. Allow foreign students to be hired on training grants. Some of our best scientists come from away and we should encourage them to come and stay.

Proven or promising external resources or approaches

Allow money on grants to be used for recruitment expenses like moving expenses etc. Provide travel money awards so postdocs can compete for money (in a short time frame, e.g. not a 6 month turnaround) to attend conferences to network and expand their knowledge in a field. NIH conference grants are available but programs are very limited and it takes a lot of time and effort on the part of already too busy faculty to write one.

Response 2951

Perspectives on the postdoc roles and responsibilities

A postdoctoral position for me is a way to gain more experience and knowledge before going to the next step, in my case being a professor

Fundamental issues and challenges

The salary and working conditions are I think the main issue with the majority of postdocs. Also, a highly toxic environment where mentors don’t know how to manage people and sometimes end up in bullying and abusive situations with their trainees is another major problem. Funding is another problem, especially for international postdocs like me. There is very few opportunities for immigrants, this leads to a dependency on the funding from your lab mentor and can increase the power dynamics in the toxic situations mentioned before.

Existing NIH policies, programs, or resources

There could be more fellowships for non-citizens or permanent residents. The base salary should be increased too.

Proven or promising external resources or approaches

No response

Response 2952

Perspectives on the postdoc roles and responsibilities

Postdoctoral position should be a transition towards faculty positions and therefore should train postdoc for their endeavours in the academic world, including:

- leadership training
- mentorship training
- independent research
- work with students/staff to be exposed to management
- grant application training

Etc.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

- More funding support for international students
- More funding opportunities to support postdocs' independent research
- More accessible and maybe mandatory grant application trainings

Proven or promising external resources or approaches

There are none existing, but ideally there should be a platform where postdocs/PhD can grade their PI, the work environment, etc. to help newcomers pick the best options. And maybe NIH should also refer to such platform when identifying labs to fund, ideally encouraging PI with positive reviews from postdocs and PhDs.

Response 2953

Perspectives on the postdoc roles and responsibilities

I believe that postdocs are, by and large, essentially exploited as cheap labor. This problem is exacerbated by the over-emphasis on publication in leading journals such as Cell, Neuron, and Nature, and by "citation factor" in general. These journals play an unwarranted role in dictating the nature of research and distort the functions of academic and biomedical research. Many postdocs thus become involved in secondary roles in large-scale projects with little hope of later academic positions. This also results in competition rather than cooperation.

Fundamental issues and challenges

There is no simple solution. The creation of PLoS One was, at first, a step in the right direction but in the long run PLoS One became just another journal. Several things could help. Granting agencies could require career plans to be developed for each postdoc. A de-emphasis, or outright ban, on publication in journals that make value judgements about the prospects for future citation is a possibility.

Existing NIH policies, programs, or resources

Over the past 30-40 years there has been an emphasis on publication in so-called leading journals and on publication of larger projects, as compared to the former ridicule of "least publishable unit". Publication in journals such as Nature, Cell, etc. has become the basis for everything; hiring, tenure, evaluation etc. There have been scientific directors who expect at least one publication per year in a journal with a citation factor of at least 12 for each tenured or tenure track scientist, for example. This kind of thing leads to exploitation of postdocs.

Proven or promising external resources or approaches

No response

Response 2954

Perspectives on the postdoc roles and responsibilities

It is additional training in different or complementary skillsets to help find or further bolster one's research career. This is the stage where you learn to move from thinking like a trainee to more independently.

Fundamental issues and challenges

Paltry base pay for someone with an advanced degree. Increasing NIH base salary is necessary, especially if you take into account that most competitive postdocs are in high cost of living areas. Instead of a flat base maybe having a multiplier against the poverty line for the area. Look at the salaries offered by industry positions for the same level of experience and education. Why should pursuing an academic career negatively impact standard of living? After living on a meagre stipend for 5-7 years during doctoral training, a postdoc salary of ~50k simply won't do and is rather insulting and demoralizing. Most postdoc

positions require a move to a different state or city. Include moving expenses in the joining package. Advisors can't pay for moving even if they want to because the NIH doesn't allow it. Better maternity/parental leave. Postdoc is the stage when most choose to have children. Again, do not make us choose between pursuing a career in academia and living a normal life. Bottom line, increase pay, increase support for parents/maternity, include moving expenses. Basically respect us and treat as like humans who deserve more than the bare minimum living wage.

Existing NIH policies, programs, or resources

- Make postdoc appointments for 3 years instead of 1 year at a time. The uncertainty and job insecurity is used by advisors to bully postdocs into working long hours so that their contract is renewed. Its exploitation at its finest. Give postdocs security for 2-3 years with the option to truncate or increase that period by 1 year increments.
- Increasing NRSA stipend support for maternity leave to be literally anything longer than 8 weeks. Include parental leave for men.
- Removing ineligibility of K award if you've received an R21 and/or offering some sort of funding that isn't solely an F series for earlier PDs. Potentially something a bit shorter duration like a 1 year fund for getting that preliminary data (like a mini R21).

Proven or promising external resources or approaches

There's plenty of articles published in nature highlighting what is wrong with the current archaic postdoc system. Make academia lucrative because passion is just no longer enough to make this path enticing even if we wanted to choose it.

1. https://www.nature.com/articles/d41586-020-03235-y
2. https://www.nature.com/articles/d41586-020-03191-7
3. https://www.nature.com/articles/d41586-020-03109-3
4. https://www.nature.com/articles/520144a
5. https://www.nature.com/articles/d41586-020-03106-6

Response 2955

Perspectives on the postdoc roles and responsibilities

I view the academic postdoctoral position as an asset to the lab. I am bringing in a specific set of skills that the lab may not already have, I provide training to graduate and undergraduate students and contribute to the overall mission of the lab. In my opinion, the postdoctoral position should be a shorter term position than the Ph.D., designed to provide the additional training that the trainee might not have received during graduate school to help them secure a position when they go on the job market.

Fundamental issues and challenges

One of the main issues that I believe is contributing to the postdoc shortage in academic research is the lack of financial compensation. I understand that academic institutes cannot compete with industry salaries, but it is extremely discouraging to be making 2-4 times less than my colleagues that chose to leave academia. While a postdoc position makes significantly more than a grad student, it seems predatory and academic institutions are taking advantage of this pay increase to keep postdoc salaries low. I applied to graduate school understanding that I was taking a temporary pay cut to get an education, and I had hoped that I would be able to make up the financial loss in my subsequent position. In the current economic climate and with the NIH post-doc salary scales not increasing it has been extremely difficult to catch up with my peers. I rely heavily on a partner to support me financially, I have had to delay family planning due to a lack of finances and resources available to me, and I have not been able to start saving for retirement as aggressively as I would have hoped because of the limitations of my position. As much as I love my job, it is demoralizing to have dedicated so many years of my life to a career that does not seem to value my contributions, and I am tempted daily to exit academia in favor of a higher-paying position, that would alleviate much of the stresses I currently experience.

Existing NIH policies, programs, or resources

If the NIH was able to significantly increase the salary pay scale for postdocs (as well as adjusting for cost of living in specific locations) it would significantly improve my current outlook on the academic research career. I understand that the NIH pay scale was intended to be supplemented by academic institutes or investigators, but based on what I have heard from my institute, that is not and will not be happening so some form of oversight to make sure that postdocs are compensated more fairly would be helpful.

At my institute postdocs are not considered permanent employees so we are not offered many of the same benefits. I also understand that if we secure NIH funding through fellowships, we will lose our university-provided healthcare.

Proven or promising external resources or approaches

The HHMI has already increased postdoc salaries and I think the NIH needs to match this. There could be additional oversight to make sure that mentors are providing the resources and training that were promised in their NIH funded applications as I feel that many of these plans that are promised are not followed through upon.

Additionally based on the average age of postdoctoral trainees, I believe the NIH should also consider requiring institutes to provide some minimal amount of paid family leave.

Response 2956

Perspectives on the postdoc roles and responsibilities

Postdoctoral Researchers are professional scientists. They help a push a lab towards new research directions and collaborations. They help secure and manage new types of funding. And most importantly they help train and mentor students in how to do research. For the postdoc, as with other professional jobs, they build their experience in carrying out the above responsibilities.

Fundamental issues and challenges

Cannot pay postdocs enough to compete with industry roles where the responsibilities and career progression options are equivalent. Not enough institutional support and recognition of the postdoc role as a professional scientist prevents retention and reduces quality of life. Specifically, there is an issue with different health insurance and benefits (retirement accounts) for external vs internally funded postdocs, with benefits being better for internally funded ("employed") postdocs. This incentivizes postdocs to not seek external fellowships, which is at odds with the career incentive and recognition of receiving outside fellowships. This makes the postdoc experience confusing, and contributes to a sentiment of job insecurity compared with an industry role.

Existing NIH policies, programs, or resources

Increase the postdoc minimum salary.

Redefine the postdoc as a professional scientist in title (postdoctoral scientist rather than fellow).

Require that institutions receiving federal funds for postdocs must make job benefits (health, retirement etc) equivalent across all researchers and employees with postdoc in their title, regardless of source of funding.

Proven or promising external resources or approaches

Provide funding for the use of professional head hunting services to formalize recruitment, improve applicant pools and match make. This is standard in industry. This type of formalized recruitment is beyond the capacity of the individual research labs and so leads to simplest path recruitment through peer networks which exacerbates structural bias across all stages of the postdoc experience.

Provide professional legal and financial support services, particularly for non-citizen postdocs, to simplify navigation through the now complicated tax, retirement and collaboration experience.

Response 2957

Perspectives on the postdoc roles and responsibilities

Ideally, the postdoctoral position is a semi-independent research position that gives scientists an opportunity to develop a project of their own interest, to demonstrate its feasibility, and ultimately grow a wider research program around similar questions. This training period also should include opportunities to obtain new expertise, either from mentors, or through independent study. Though I see nothing wrong with this being a jumping-off point for careers in industry, I am also not convinced this is the best training to do that.

Fundamental issues and challenges

Postdoc training is too long and has too uncertain an outcome to recruit our brightest talent currently. Even the successful attainment of an independent research position no longer seems appealing to many postdocs, who witness at close range the high stress, increased administrative burden, and greater challenges of obtaining funding inherent in being a PI currently. Funding international students and postdocs is challenging, limiting our talent pool.

Existing NIH policies, programs, or resources

We must create a legitimate alternative to running a lab, that still includes fundamental biomedical discovery. These would be positions for building one's career in a stepwise way as an alternative to "running a lab". These positions need to be legitimized.

Funding for international scholars is crucial. Allowing international students/postdocs to apply for F awards while they train in U.S. labs would make a huge impact, even if a buyback clause were attached for trainees that leave the U.S.

Proven or promising external resources or approaches

Far too much attention is made on "mentoring" and "job satisfaction" as a solution to our broken pipeline and the dramatic reduction in postdoctoral scholars. These efforts are valuable, but they do not address the true problem: trainees view the current training system as a pyramid scheme, and in many ways they are right. We need to restructure things so that more scientists working through this training path can expect to achieve a career that is rewarding and enables quality of life while great discoveries are made.

Response 2958

Perspectives on the postdoc roles and responsibilities

A postdoc position to me was essentially the only job I felt equipped to apply for after finishing graduate school; I chose it not because I want further training

Fundamental issues and challenges

The most basic issue is that salary and benefits are extremely low relative to educational and research experience. This is more semantic, but I also fundamentally don't feel like I am getting "trained" in any meaningful way (or at least any different than any other new employee is when they start a job), but am denied other benefits as a "trainee"—ex commuter benefits, access to the same health care plans,—that I would be granted if I were a full employee at the same university.

Existing NIH policies, programs, or resources

There are few resources to help new postdocs get started in their research, but I and many postdoc I know felt like they were totally lost as they started in a new lab after grad school. Unlike in grad school, where there were clear resources provided by my university to help guide me in my new city, new lab, and new research, postdocs basically have to figure things out fully on their own. I can only imagine that is far more challenging for international postdocs who may have fewer personal connections.

Further, F32s should be available to non-American citizens; if these postdocs are going on to be training for faculty positions and are will later be eligible for other NIH-funded grants such as R01s, they should be eligible for similar grants as postdocs.

Proven or promising external resources or approaches

IRACDA provides a valuable resource to help postdocs connect to teaching positions, but should be dramatically expanded to more institutions. Similar programs could also be designed to connect postdocs to other career opportunities that span public/private research opportunities or science communication/science policy careers.

Response 2959

Perspectives on the postdoc roles and responsibilities

I view the postdoctoral position as a means to establish a research platform that will ultimately lead to an independent career in academia. Training environments can largely differ between institutions, but the postdoc is a pivotal step in establishing oneself as an independent research scientist.

There are several layers I expect to achieve from this stage of my career:

1. Expand upon the toolsets, knowledge, and critical thinking skills gained as a graduate level trainee.
2. Acquire new skills outside of my original training comfort zone.
3. Continue to develop and gain administrative experience, including grantsmanship and mentorship.
4. Establish a research platform that separates oneself from ones postdoctoral mentor

Fundamental issues and challenges

300 words is not enough to get every point across.

From my personal experience, one major source of stress that impedes recruitment, retention, or maintaining a high quality of life are largely due to financial factors.

Graduate students and (especially) postdoctoral researchers are inadequately compensated for the level of skill and experience gained throughout years of training. The simple matter that an associate level scientists within industry/pharma makes nearly twice the yearly salary a postdoc makes with 2-3 times less research experience makes it difficult for many postdocs to rationalize remaining in a high stress environment with poor recompense. To shift the weight away from lab funds, many trainees seek their own fellowships to fund a few years of their time in academic labs. However, these too if ten match the NIH set stipend. Furthermore, in the odd chance that a private institution offers an increase in stipend over NIH set stipends, the institution often will step in and decrease the postdoc's salary to maintain "parity" within the postdoctoral workforce. All of these situations amount to a highly competitive work environment in which compensation fails to match the level of dedication and time required of a postdoctoral research fellow.

Added to these stresses are the probability that postdocs are within a stage of their lives where starting a family is a high likelihood. Many postdocs delay starting families because of the time requirement needed within the lab but the exorbitant cost of childcare. Moreover, woman are disproportionately affected, as this era of their lives matches the time frame many women begin to have children. I know from personal experience that many woman have had to sacrifice their bright career in academic research in order to start a family.

Existing NIH policies, programs, or resources

Several private funding institutions have begun to set the starting postdoctoral salary at significantly higher amounts to offset the increased cost of living. However, these are on a case by case basis and many institutions remain fixed on NIH guidelines. Interestingly, postdoctoral fellows working directly within the NIH have a higher stipend than postdocs performing research at other academic institutions.

HHMI has recently increased their starting postdoctoral salaries to $70k-91k depending on the localized cost of living of that institution. However, there is an issue of parity here. Many institutions will not accept this pay increase with fear that a two caste system will be installed. One in which HHMI investigators are able to recruit postdocs because they have the resources and funding to afford postdocs at a higher wage category, while non-HHMI funded labs would struggle to compete.

Proven or promising external resources or approaches

No response

Response 2960

Perspectives on the postdoc roles and responsibilities

I view the postdoc period as a chance to shift from a trainee to an independent scientist. The nature of this change will vary across individuals, but can include increases in publications and grant applications, development of new skills critical to the postdoc's future work, and further theoretical development and specification, among others. The role of a postdoc should be to function as an affiliated but independent scientist, developing their own work according to self-identified goals and having research responsibilities that are more advanced and supervisory than graduate students.

Fundamental issues and challenges

The largest challenge to recruitment, retention, and quality of life is the financial limitations imposed through national salary recommendations (e.g., NIH training and stipend levels). These salaries are not only insufficient to reflect the cost of living in the majority of cities in the US (and postdocs have limited choice in where they live as training opportunities are not equally distributed across the country), but they represent significant underpayment relative to the training and skills possessed by researchers with highly specialized PhD-level education. The effect of this underpayment is amplified when seeking independent post-postdoc positions, which often take into account an applicant's most recent salary in generating job offers.

Existing NIH policies, programs, or resources

I think clarifying grant and fellowship calls, eligibility, timeline, and consideration factors would be of particular import for postdocs, who often come to the grant application system with no prior knowledge of or experience with NIH. Additionally, expanding opportunities that apply to trainees (often defined as graduate students) and early career scholars to postdocs, who exist in a time-limited and unclearly defined position would be helpful.

Proven or promising external resources or approaches

Although this would require adaptation for the diversity of positions postdocs hold, applying standards and training goals that required reporting back by postdoctoral supervisors would provide metrics of training and mentoring that the NIH and institutions could use to improve postdoc training. For example, many institutions utilize Individual Development Plans, but no formal tracking (akin to what is done for PhD-level trainees by professional organizations) by NIH is performed, rendering these of limited utility.

Response 2961

Perspectives on the postdoc roles and responsibilities

Postdocs are in the final stages of their training prior to becoming independent researchers with labs of their own. They are typically hired to contribute to research within an established lab, and in turn receive mentorship that prepares them to have a lab of their own in the very near future. Starting a lab of one's own requires a novel research program. Postdocs should be given protected time to design their novel research program, apply for funding, and apply for faculty positions. Postdocs that do not want to have a lab of their own should receive mentorship that helps them identify a suitable career path and make steps toward being competitive in that career sector.

Fundamental issues and challenges

Low salaries, challenges with benefits and employment status, and instability associated with the postdoc role make doing a postdoc an unattractive option for those without generational wealth, who are supporting families, or who want to start a family. Postdocs that are not classified as employees often have issues getting approved for loans, since they cannot provide the types of income verification that an employee is able to provide. Scholars who want to pursue a postdoc are put in a sometimes difficult place where they have to decide between their personal and professional priorities in ways that other career paths do not require.

In addition to low salaries, the greatest challenge to recruitment, retention, and overall quality of life of postdoctoral trainees in academic research that the NIH has definitive power to correct is the lack of money provided to cover the costs of employment for postdocs on training grants and fellowships. At the majority of US institutions the lack of money to cover "fringe" results in postdocs funded through training

grants and fellowships being classified as non-employees. This has direct implications for a fellow's taxes, benefits, and workplace protections. This also adds an administrative burden that many departmental administrative staff have trouble managing, resulting in delays that negatively impact the experience of the fellow. If all NIH postdoc funding mechanisms included money to cover the costs of employment then all postdocs, regardless of NIH funding mechanism, could and would be classified as employees. Furthermore, when there is a change to a postdoc's NIH funding mechanism, they would not be subject to changes to their employment status, tax withholding, benefits, and the personal and professional frustrations that come with these changes.

Existing NIH policies, programs, or resources

NIH Grants Policy Statement, section 11.2.9.8 on Employee Benefits, which states that ".institutions may not seek funds, or charge individual fellowship awards, for costs that normally would be associated with employee benefits" results in most postdocs on fellowships and training grants to be classified as non-employees. Researchers that are not classified as employees do not receive access to employee benefits or even workers compensation. In contrast, faculty may budget for postdoc salary and the institutional fringe rate when submitting an R01 proposal.

Employee health, dental, and vision insurance are far more cost effective and accessible than what fellows and trainees must find on their own through the national healthcare marketplace as non-employees. Funding for the costs associated with employment should be included with training grants and postdoctoral fellowships and the policy should be revised to make it clear to all institutions that postdocs must be treated the same regardless of NIH funding mechanism.

Proven or promising external resources or approaches

The National Postdoctoral Association provides guidance on best practices, which are informed by the postdoctoral community, and the faculty and staff that support the postdoctoral community.

Response 2964

Perspectives on the postdoc roles and responsibilities

To me, the postdoctoral position is a temporary job to help with the transition from become a graduate student to an independent PI. Here, postdocs should be able to develop independent projects that they can take with them when they start their own lab (while likely also working on some projects in the lab that they won't take with them) and also get training on how to run a lab.

Fundamental issues and challenges

The major challenge is money. Postdocs are severely underpaid. As a PhD student, you can make the argument that we shouldn't get paid much because we need so much training. But for postdocs—they already have a PhD! They're working independently, training and mentoring others, doing the bulk of the work in the lab—also often writing the grants and such. It's insane to me that postdocs get paid so little, and that there aren't guidelines for cost of living adjustments. I'm based in a US city with a high cost of living, and my institution has been pretty good at increasing the PhD students' pay based on cost of living and inflation—but not for postdocs, since labs just follows NIH guidelines for postdocs. It's at the point where PhD students are making almost as much as postdocs now! I'm grateful that my institution does a good job taking care of PhD students, but I feel so bad for these postdocs. They're living in poverty. They're miserable, always worrying about money and not having enough. They love the science and are passionate about it, but if you're constantly having to worry about money, it drains the life out of you. That's why so many postdocs are leaving for industry—they might not be as passionate about the work they're doing there, but at least they don't have to worry about their or their family's survival.

Existing NIH policies, programs, or resources

At the minimum the NIH has to change their guidelines for postdoc salaries. First of all salaries should be increased all around. Second, there should be different NIH salary guidelines based on cost of living. Maybe offer more programs or grants focusing on supplementing salaries, or something like that. Institutions use the NIH minimum postdoc salary guidelines as their maximum postdoc pay—they say, well, NIH says $XX amount is enough, so that's all what you're getting! If the NIH raises this, they institutions will follow.

If salaries won't be changed, then I don't know what else the NIH could do to help retain and recruit postdocs, other than like literally kidnapping PhD grads and chaining them to their lab bench.

Proven or promising external resources or approaches

It's all about money. Raise postdoc salaries.

Response 2965

Perspectives on the postdoc roles and responsibilities

A postdoctoral scholar is a highly trained scientist who is not yet ready to be an independent researcher. They are able to develop complex protocols, propose and develop research ideas, and supervise more junior lab members fairly independently. The time as a post doc may be used to learn a new lab skill but the scholar should also formally be taught about how to manage a lab -best practices for interviewing students and staff, determining staffing needs, peer reviewing journal articles, and creating and managing budgets. It should also be a time for the scholar to refine (and be productive with) science writing, develop a strategic sense of grant writing, and to prepare for next career steps by networking and optimizing their CV.

Fundamental issues and challenges

Pay is far too low for someone with a PhD. Currently NIH pay for a postdoc is equivalent to an administrative assistant with a high school degree and a few years of experience. However, now it is so hard to get into PhD programs that most PhD students already have several years of research experience plus a paper or two. By the time someone finishes their PhD, they are more like a mid-level manager and are often in their 30s, sometimes with a family to support. They are not like a young trainee just starting out as they might have been years ago. It is hard to recruit or keep postdocs because so many are going into industry where the pay is much better. Increasing pay on post doc training grants and increasing the

modular budget for R01s would go a long way toward helping academics to retain excellent, highly trained scientists in their labs.

Existing NIH policies, programs, or resources

In terms of training, I see that there are some formal online training seminars about the details of lab management—like making a budget and determining staffing needs, but they cost hundreds to thousands of dollars. Having some of these be included with post doc training grants would be useful.

Proven or promising external resources or approaches

It would be helpful for the post doc pay on training grants to be increased. In California, the post doc minimum pay is higher than the NIH pay, so faculty can't accept a post doc on a training grant unless they have unrestricted funds to make up the difference. It would also help if the modular budget for R01s increased to allow faculty to budget more for post docs while still having enough money to include the number of research participants needed to ensure sufficient statistical power.

Response 2966

Perspectives on the postdoc roles and responsibilities

Given the financial sacrifice, low chance of getting a good faculty position, and the emerging data that postdoctoral experience is not financially valued by industry when transitioning out of academia, the position as currently designed must be treated like a bit of a lottery ticket. It's an opportunity to change fields, push an independent research program as far as it can go, and hope that someone out their values your contributions and shares your vision for where your research can lead. But the fact that the chances of successfully landing a well-supported research faculty position (with start-up, tenure track, at an R1 institution, etc.) being so low, create the need for a year-to-year reevaluation of the pros and cons of being in this position. Is the financial sacrifice still worth the shot at landing that faculty position? How much has that opaque possibility of landing your dream job improved or regressed based on the progress and findings of your research? How can I decide whether I still have an open window at that dream opportunity or whether it's time to change my goals, publish to demonstrate my clear productivity, but drop the fantasy of "making it" where I want to go? It's a role where you often feel stuck in limbo--there's little to no clarity on your chances of getting where you want to go and that leaves one constantly questioning their motivation and validity in this system.

Fundamental issues and challenges

I think that the vast majority of these issues are $ related. I love so much of this job (other than what's described above): the creative thinking, the challenge of forging into unknown territory and excitement of discovery, the opportunity to mentor future scientists and train them how to become independent researchers, the flexibility to set my own schedule, design my own goals, plan my experiments independently, etc. But it's difficult to avoid thinking (almost daily) about the fact that my income is approximately half of what it could be if I transitioned into any of a multitude of industry roles. And while the benefits and ease of that transition I think are often oversold that income disparity is a constant buzz in the background, which makes folks feel like their time and talent are severely undervalued. And that income gap is often the difference that prevents folks from being able to purchase a home, have a retirement savings, invest, have children, etc. The academic environment depends on postdocs for research productivity; we are an essential component of this system. But the lack of "professionalization" for this position, the treatment of it as another "trainee" role, the lack of structured raises (we're so far behind the inflation rate that it's a joke), etc. These problems are not unique to post docs (it's the same for graduate students and fairly similar for early career faculty), but that income disparity is the driving force behind folks not being interested in sticking with their academic post doctoral positions.

Existing NIH policies, programs, or resources

From my perspective, the inability to retain post doctoral researchers comes from two things:

1. income disparity compared to industry roles and
2. increasing pessimism around the ability to obtain academic faculty positions. I think these issues could be significantly impacted by a raise structure that helps post docs feel like their progressing from "trainee" to "valued professional researcher".

While academia offers unique advantages over industry positions, the NIH F32 minimums and raise structure (which many universities and PIs use as a guide when deciding post doctoral salaries) fall short of the financial value of those advantages and account for cost of living variance across institutions. The extramural minimums need to be increased to

a) account for the rapid increase in inflation over the past few years,
b) better compete with industry opportunities, and
c) account for disparities in housing costs across the country.

A recent study published in Nature Biotechnology (https://www.nature.com/articles/s41587-023-01656-4) highlights these issues much better than I can in 300 words. I can confidently say that my wavering enthusiasm would significantly increase if my income suddenly matched those recommendations (after adjusting for years of experience [4] and cost of living differences between Boston and my current residence, my current salary of ~$55k would jump to the neighborhood of $75k. That difference would make me feel well valued, more financially stable, and 100% comfortable with continuing in my current role for years while I focus on my research and career development). With regards to the pessimism around the faculty job market, I would strongly encourage the NIH to look at promoting the development of more professional roles within the academic environment. Given the dearth of faculty positions, alternative careers need to exist that properly value the contributions of experienced, talented individuals like myself.

Proven or promising external resources or approaches

See the Nature Biotechnology publication again: https://www.nature.com/articles/s41587-023-01656-4. I'd also encourage the NIH to invest in additional support systems for extramural post docs that will help them accommodate the financial disparity between their role and industry positions. This could include resources like professional financial planning, family planning and free or subsidized childcare, retirement savings programs (a federal contribution matching program should exist!), improved healthcare benefits, expanded leave policies (more PTO and improved parental leave (there are so many sources that clearly show the benefits of 16 week paid leave policies, but here's one example: https://www.apa.org/monitor/2022/04/feature-parental-leave). The NIH has the power to make such resources a requirement for post docs paid on NIH grants--doing so would improve the quality of life for extramural post docs and help retain those individuals. I'll also take this opportunity to point out that these kinds of benefits are more frequently available in industry roles as well, which highlights another disparity between academic and industry positions! The NIH needs to SHOW extramural institutions how to become more competitive with industry to improve post doc retention. Otherwise, academic institutions will continue to underpay and under-support their postdoctoral staff, then cry foul when they can't retain those individuals. The current excuse is that PIs only have so much grant $ and so they will pay the NIH minimum as long as possible. While PIs could request higher funds for postdoc salaries on NIH grant applications, they will not do so because of concerns that it will compromise their application. They will only begin requesting higher salaries if they feel those requests are justified and in line with the NIH standard (which will only happen if there is a formal policy from the NIH!).

Response 2967

Perspectives on the postdoc roles and responsibilities

Conduct research with an increasing level of independence and less oversight. Assist in overseeing/training technicians. Possibly oversee training of graduate students (if they have an interest in continuing in academia, this is a good opportunity, but this should be optional)

Fundamental issues and challenges

Pay is low for someone with a PhD, especially relative to industry, and most PDs do not get retirement plans. Coupled with the uncertainty of being able to obtain a permanent position (whether as a staff scientist, non-TT faculty, or TT faculty), it is getting much harder to convince people to do academic postdocs.

Existing NIH policies, programs, or resources

Increasing the base NRSA stipend, which many institutions use to set PD salaries.

Proven or promising external resources or approaches

Providing supplemental funds to defray childcare costs; it is very difficult to start a family on a PD salary. Requiring eligibility for PDs to institutional retirement plans. This would require moving away from the notion that PDs are "trainees" rather than employees. Increasing R01 amounts. If increases to PD pay/benefits are an unfunded mandate not accompanied by an increase in R01 caps, this will just reduce the number of available positions.

Response 2968

Perspectives on the postdoc roles and responsibilities

Postdoc for me means transition from trainee to independent position. I see it more as a way to become better PI, better mentor, plus gain more scientific knowledge and expertise in the meantime. It is not a trainee as graduate student and doesn't have so much "freedom" as a PI.

Fundamental issues and challenges

Postdoc recruitment: it is mostly done independently by postdocs who are looking for job. Centralized database with postdoc job offerings at least within US would be an amazing help.

Postdoc retention: as a mother and postdoc, I find that combining those two is very hard. I need to be productive at the same level as others or usually even more, just to prove I can do science and handle parenthood at the same time. Lack of parental support especially with mobility requirements, is making things even worse.

Postdoc overall quality of life: the postdoctoral salary is too low, but allows to survive. The support for postdoctoral community is much lower than for other groups.

Existing NIH policies, programs, or resources

Grant eligibility periods: it is wonderful that extensions are offered, but maybe the cut offs are too short for current economy? Each discipline has its own flavor, in one postdoc will take 2 years, in the other 6 years is minimum. If we add family burden, supporting spouses in the development of their own independent career, it may take up to 10 years. There should be funding mechanisms allowing for further career development for such individuals above 8 years as for K22.

Parental support: each grant should come with a funding opportunity allowing for additional financial support for parents as well as (ideally) funds to hire part-time technician during maternity leave.

Proven or promising external resources or approaches

Postdoc bootcamps in Bethesda to allow networking, learning about job search, establishing new collaborations.

Response 2969

Perspectives on the postdoc roles and responsibilities

all junior scientists need to receive formal science communication training as part of their NIH award

Fundamental issues and challenges

Response 2970

Perspectives on the postdoc roles and responsibilities

A postdoc was initially explained to me as a brief transient career stage between a PhD and faculty. Now, however, I believe it has changed drastically. A postdoc is a critical element of the lab hierarchy and culture. Postdocs serve as mentors to every other member of the lab. Postdocs drive change and growth in a lab by bringing in expertise and training from their PhD, as well as fostering collaboration and connection across institutes. Postdocs can no longer be seen as a transitory career phase, but an integral part of the lab.

Fundamental issues and challenges

Pay and benefits, alongside feeling respected enough to earn these basic forms of compensation, given our skills, experience, and value to the lab. Postdocs come in with unique expertise and skills that help grow the lab as well as several years of experience in science and mentoring. The positions are no longer brief extensions of graduate school, but instead often last between 5-7 years. This time is often co-occuring as scientists are in their 30s and 40s, struggling to start families and build their lives. However, because pay and benefits are so minimal, postdocs are struggling personally to fulfill these parts of their lives. Despite the experience and skills that comes from our PhD, we find we are treated no better than we were in graduate school, and that lack of compensation only becomes harder as the years progress. At the same time, private companies are offering us vastly bigger salaries/benefits for the same job. Thus, even if one has a significant passion for their job within academic research, we feel as if we have no choice but to make the "smart choice" and move to private industry, where we will receive the pay, benefits, and respect we have earned.

Existing NIH policies, programs, or resources

Increase the amount of money that goes to labs so that they are able to increase salaries for postdocs more easily. Increase the minimum pay-scale to match a livable salary and, importantly, actually enforce this minimum for any NIH lab. Close the loopholes that currently allow PIs to pay less than the minimum postdoc salary. Further, the minimum pay-scale should be customized to a geographic region to account for cost-of-living and adjusted yearly. Include equity in pay-scale: Require additional salary and benefits for those with medical disabilities, dependents, or other aspects of their personal life that make it harder for an individual to live on the same salary as someone more privileged. Create an easy way for postdocs to report to the NIH when their PI, lab, or institution is denying them these benefits or their minimum salary and enforce consequences for those laboratories.

Proven or promising external resources or approaches

Unlike any other working company, academia has no "HR" where trainees can report incidents of abuse of misconduct. Often, they are required to report to their PI or institution, which may be the ones causing the problem. NIH has the capacity to act as a third party "HR" for all NIH-funded academic labs and make space for trainees to report when they are being mistreated. Adopting this type of approach could be extraordinarily helpful for postdocs and trainees as well as identifying people/institutions that are most problematic.

Response 2971

Perspectives on the postdoc roles and responsibilities

To me, being a postdoc is being in a position where you can learn new skills while building on your previous ones. Where you get to think about what you want to do as a future PI while also having time to mentor and train students/technicians. As a postdoc, we write, mentor, train, do experiments, present our research and we often get other more administrative roles.

Fundamental issues and challenges

The salary is too low. I am a postdoc in Boston and the NIH minimum salary is not enough to live a life where you're not stressed and barely living. Unfortunately, as a postdoc I live with a roomate as otherwise I would not be able to afford rent. In addition, postdocs are treated like cheap labor and exploited. we are being payed for ~40hrs/week but made to work >65hrs without further compensation. We are also not

considered employees so we don't have the same benefits like for example having a 401K. Overall, if we want to stay in academia, our retirement plan will not have any money until we begin faculty positions.

Existing NIH policies, programs, or resources

NIH should raise the postdoc salary NIH minimum. However, is not sufficient to only raise the postdoc salary, NIH needs to also increase the faculty funding. Because if only the first one is done, then faculty will no longer hire postdocs (as they won't be able to afford them). Institutions like StJUDES and HHMI have beginning to change their postdocs salaries. In addition, NIH could also supplement current postdocs grants like F32 and F99 where it could be used for childcare, insurance, or research.

Proven or promising external resources or approaches

St Jude's and HHMI have several resources to support postdocs and encourage recruitment and retention

Response 2972

Perspectives on the postdoc roles and responsibilities

I see it as a training period to acquire new skills and learn new areas of science prior to launching my own independent group.

Fundamental issues and challenges

The cost of living most places postdocs want to train is too high for the postdoc salary to be liveable and comfortable. This makes it overly stressful to stay in the postdoc in those areas. Additionally, it selects for only individuals who have outside support to complete the postdoc.

Existing NIH policies, programs, or resources

Expanding options beyond just PIship. Things like Senior Scientists, or Staff Scientists should be viable roles with appropriate wages attached to them.

Proven or promising external resources or approaches

No response

Response 2973

Perspectives on the postdoc roles and responsibilities

To me, an academic postdoctoral position is a temporary position where someone is conducts research. This should involve training in several aspects of research, including scientific approach and communication. A mentorship plan should be individually tailored for each postdoctoral research.

Fundamental issues and challenges

Postdoctoral researchers need to be provided a salary that is in accordance with the cost of living in the research location.

Clear and transparent expectations should be provided.

Comparisons to other positions outside of academia should be fully disclosed. For example, the deliverables in academia (i.e., training, advancement of knowledge) are different than the deliverables in industry (i.e., a drug that is sold).

Existing NIH policies, programs, or resources

Salary support in accordance with the cost of living in the research location.

Proven or promising external resources or approaches

Investigators with citations of abuse should be banned from receiving NIH funding.

Response 2974

Perspectives on the postdoc roles and responsibilities

Postdocs are the main drivers of scientific discovery. Generally speaking, post docs have the experience and skill required to ask and answer the toughest questions in any field. They are the ones in the trenches exposing themselves to chemicals, overseeing animal work, writing grants and manuscripts, physically demonstrating techniques to trainees, and so much more

Fundamental issues and challenges

As a postdoctoral researcher i received a T32 training grant after working at my "prestigious" university position for several months. I was grateful and excited to receive the grant and was hopeful it would boost my prospects for someday leading my own group. I was also happy to please my advisor by essentially becoming free labor for them.

However, to be as brief as possible, i quickly found out i had to "resign" from my university position in order to accept the grant. This meant i lost my 401k retirement plan and all the unvested balance, my health insurance plan, and also had my salary reduced. Moreover, to add insult to injury, i had to sign a document known as a "payback agreement" stating that if i did not stay in an appropriate job for a long enough time i would then owe the meager 48k salary i was receiving back to the NIH. I find it perplexing we live in a society where senators dont even need to show up to vote and they can collect full salary and health benefits while i exposed myself to chemicals and gave medical grand rounds lectures to doctors who i couldnt even afford to go to for medical treatments.

It was incredibly demoralizing and i did the best i could.

Please find a way to do better for the next generation and if nothing else do away with payback agreements for PhDs. These agreements were not conceived to torture aspiring scientists but were meant to prevent mds that accept fellowship grants from walking away after accepting. Thank you

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2975

Perspectives on the postdoc roles and responsibilities

In my experience, postdoctoral researchers are instrumental for the research in the lab. Responsibilities involve lead multiple research project by conducting experiments and analyze/interpretate results; write scientific papers; train, supervise, and mentor students and lab techs; etc etc

Fundamental issues and challenges

At this point, the most urgent fundamental issue is the dire cost of living situation for postdocs in Boston and other regions. For me and many of my colleagues the NIH minimums are insufficient to account for regional cost of living and adjustment of postdoc salaries to regional cost of living on short term is absolutely critical to recruit and retain postdocs in academic research.

Existing NIH policies, programs, or resources

Adjustment of postdoc salaries to regional cost of living on short term is absolutely critical to recruit and retain postdocs in academic research.

Proven or promising external resources or approaches

Adjustment of postdoc salaries to regional cost of living on short term is absolutely critical to recruit and retain postdocs in academic research.

Response 2976

Perspectives on the postdoc roles and responsibilities

Postdocs should be applying the scientific process and subject expertise gained in a PhD to delve into a related but slightly different area. They should be able to focus on expanding their skills to make them unique from their PhD advisor and working toward establishing a clear research direction. I also believe Postdocs should take a role in mentorship of graduate students and attempt to seek out additional opportunities for growth (i.e. teaching opportunities if they are interested in future faculty roles or filing patents/expanding upon industry knowledge if they are interested in industry). They should have more research autonomy than a graduate student and seek out opportunities for funding based on their research interests.

Fundamental issues and challenges

Postdocs are highly trained scientists and are not paid as such. They are also (more often than students) working to support their family with their stipend. The way that the NIH and institutions decide to funnel funding to postdocs often puts basic benefits (health insurance, life insurance, etc) into question depending on funding start/stop dates. This is unacceptable when that health insurance also affects my children. In general, the stipend is too low and too rigid to economic changes including inflation, and benefits need to be more intentionally constant and seamless with the university. In short, recruitment and retention would improve with improvements to postdoctoral quality of life.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 2977

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a fundamental step to grow in independence and skills in the academic setting, while still under supervision of a more experienced mentor. It is important that the postdoc acquires and strengthen knowledges that will allow them to work independently. And possibly, to publish relevant research that demonstrates advancements as well as learning how to securing funding.

It is also an opportunity to further explore whether the academic career is a possibility or not or what path in the academic career one can be more successful in.

Fundamental issues and challenges

For international postdocs, visa are still a challenge to recruit and retains students. I had one postdoc leaving a previous job to move to my lab and then discovering the visa was denied two times on no relevant basis (indeed, a different visa worked out the third time). As an immigrant in the country, I found this extremely painful to navigate.

For national postdocs, salary is a big challenge and criticalities varies immensely whether one lives in the coasts or in the midwest.

Existing NIH policies, programs, or resources

Include quotas or allow in general applications from non-American citizens—many postdocs (and Phd students) cannot apply to fellowships that are fundamental in building a CV, creating a discrimination in the career progression that is sort of odd since the same postdocs are anyway paid on federal grants (from NIH or NSF).

There should be some sort of grant also for figures that are not PI but are exploring a scientific career in academia, such as staff scientists and research instructors. The reason is that we currently conceive the sustainment to academic research only through supporting the research programs (which is great) and thinking about how to create new PIs (Independence path awards). All of this is great. But we need to help retaining talent in academia that is also not going to be a PI, but a highly qualified scientific workforce. I think that not all postdocs aim to become a PI and making more attractive the position of

postdocs without offering them a future it is one of the reasons postdocs prefer industry to academia. Offering support and recognizing the importance of the role played by people at intermediate levels between postdocs and PIs is a way to provide visibility to those that are in these positions and highlight a possible pathway in the academic life.

Proven or promising external resources or approaches

It would be great if the NIH would provide indications of salary adjustments for life and if this would be something that is computed or evaluated as part of the overhead cost of a grant. Paying more the postdocs will not solve the problem since there are very different living costs (more will help though). However, if any difference between region should be introduced, it should not fall on the PI research program (would make very difficult to compare budgets), but being wired into other type of negotiations.

One important note about salaries. I am totally in favor of increasing postdoc salaries, but please consider making guidelines and funding for more senior positions. I am not begging for PIs, which may have a decent salary, but what I start to see are postdocs with limited experience getting paid more than people with 10-15 years of proven experience because of regulation. There is no instrument often to correct for that or to provide the adequate payment to these other people, since there is no push from federal funding to help them. Staff scientists and research instructors on non-tenure track are sort of invisible to the system and often "abused" in the current academic system for what concerns salary and work.

Response 2978

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism. "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate.

- Gain independence and skills
- NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.
- Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth.
- Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.
- Better role definition
- Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings.
- Requiring postdoc and PI participation in formal performance reviews as part of an NIH award will better define, formalize, and evaluate factors of role, mentorship, and professional development, while differentiating postdocs from staff scientists.
- The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs are negatively affected by a lack of professional development opportunities (81.7%) and intellectual freedom (71%). NIH should establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities. This will assist postdocs, PI's, mentors, and postdoc office (PDO) leaders in creating a climate for success. Additionally, the NIH should provide tools to assist academic institutions in adhering to these requirements and incentivize compliance.

Fundamental issues and challenges

- The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels.
- Per the NPA's 2023 Postdoctoral Barriers to Success report, more than 90% of postdocs are negatively affected by the lack of clarity in transitioning to next positions. More than ever, postdocs are paying a significant opportunity cost for limited faculty positions and 86.6% are impacted by job security concerns.
- Additionally, 'disenchantment with academia' is trickling down from overburdened faculty, making these positions less desirable to early career researchers. Career outcomes and tangible benefits of pursuing a postdoc are often misunderstood. NIH should provide early career scientists with actionable information and transparent data to make informed career choices before and during their postdoc periods, including increased awareness of career options (e.g., academia, industry, government).
- The NPA's 2023 Postdoctoral Barriers to Success report shows a majority of postdocs are negatively impacted by a lack of healthy workplace culture (70.8%) and harassment/abuse (54.9%). Postdocs also often cite high instances of isolation and poor mental health. NIH should hold institutions accountable for fostering inclusive and supportive training environments, including expanding the current requirement for institutional commitment to preventing discrimination and harassment
- NIH should require a percentage of indirects on all NIH grants supporting postdocs to provide postdoctoral offices (or offices with similar oversight) with increased resources to foster stronger postdoctoral communities with healthier, sustainable cultures.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible.

- NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.
- NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.
- Many PIs lack formal training in mentoring and personnel management. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute substantial, reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors.
- Postdocs' difficulties to remain in academia due to limited faculty positions contributes to dissatisfaction. To retain top research talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs, while providing clear differentiation between these positions and postdocs.
- Collecting metrics on postdoc satisfaction will not only provide key insights that will determine if new policy changes are effective, but will allow postdocs to provide honest, anonymous feedback without retaliation.

Proven or promising external resources or approaches

- NPA Resources
- The NPA has a wealth of resources developed by committees consisting of postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library. (85 words)
- Consolidate professional development resources
- Currently, institutions and NIH IC's each develop their own professional development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In a increasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources. (89 words)
- Engage with key stakeholders
- We encourage NIH to work closely with institutions that host postdocs and NPA on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change. (34 words)
- Thanks to NIH
- We sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. We applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps. (62 words)

Response 2979

Perspectives on the postdoc roles and responsibilities

I am a professional research scientist not a "trainee" the idea that we're still somehow not fully qualified is insulting.

Fundamental issues and challenges

Us postdocs on J visas are not wanted by the NIH. You're happy to take our cheap labour and not allow us to progress our careers. More than 50% of postdocs in the USA are on J visas.

Existing NIH policies, programs, or resources

Open all postdoctoral fellowships to J visa holders.

Proven or promising external resources or approaches

Better pay. Equal career changes.

The current system doesn't mean the best scientists rise to the top and increase the productivity and quality of research in the USA. It means many average US passport holders make it into faculty positions at the cost of better qualified and skilled international researchers.

Admit we do not have a meritocracy.

Response 2980

Perspectives on the postdoc roles and responsibilities

NIH should adhere to a consistent universal definition of a "postdoc" regardless of the funding

mechanism. Labeling a postdoc as a "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate.

Professional development training outside the laboratory should be mandatory. Protected time should be given for postdocs to learn key skills in areas such as general administration, budget management, communication (written and verbal) and other transferrable skills. Training topics should also include career exploration, new experimental techniques, and other matters related to expanding the postdoc's skill set to further their scientific endeavors.

Postdocs should be guaranteed to attend a minimum of one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

PI and postdoc expectations must be continuously assessed and documented. Specifically, it should be clear that postdocs have their own projects and receive the mentorship and resources to pursue independent careers. That is the difference between a "postdoc" and a staff scientist.

Fundamental issues and challenges

The most fundamental issues facing postdoctoral workers that we experience are

1. the unsustainable salary of postdocs
2. the imitations surrounding international postdocs
3. poor working conditions through ineffective mentorship, and
4. lack of punitive measures for investigators who fail to create a positive work environment for their postdocs.

We propose to address these issues as follows:

1. Grants should require that postdocs are paid according to the GS-10 federal pay schedule relative to their years of experience and should increase annually.
2. Visa lengths should be tied to the duration of funding. For example, if the funding is for three years, the duration of the visa should also be three years.
3. NIH grants must require structured and reportable mentoring training for PIs and postdocs, similar to those provided under NIH mentored training programs. Such training should be offered to non-PI's acting as postdoc mentors as well.
4. Annual reviews should be compulsory for funding continuation. Supporting the workforce and creating a positive environment should be incentivized, and aspects such as poor publishing opportunities, lack of upward mobility, toxic work environments, and the like should be penalized through reduced funding and opportunities as an investigator.

Existing NIH policies, programs, or resources

The most useful action the NIH can take at this junction is to expand training grants and individual (F32) fellowships to include internationals. Internationals overwhelmingly make up the postdoctoral community and should be afforded equitable opportunities for conducing science in the United States.

NIH should mandate that all NIH-funded postdocs develop an IDP and that PIs support and submit

documentation of progress.

NIH should require grant funded postdocs to receive employee-level benefits regardless of the source of funding. i.e. Postdoc individual fellowship vs. R01 funding. NIH should require grant-funded postdocs to receive paid parental leave and childcare subsidies.

NIH grants supporting postdocs should permit moving allowances to ensure postdocs from all socioeconomic backgrounds can pursue careers in research. Postdocs coming from abroad should be extended a one-time payment to offset the expenses of moving to the U.S. to perform NIH-funded research.

Proven or promising external resources or approaches

Implement an accreditation system of institutions and/or investigators according to various metrics incorporating the postdoctoral experience (e.g. suitability for internationals, recorded evidence of workers

moving onto better opportunities, gender/disability parity) similar to the Athena Swan system used by the UK to measure gender parity in STEM fields. A similar system may be used to open a greater tranche of funding opportunities at the institutional level and at the investigator level, incentivizing good performance within this accreditation system.

The NIH should align with the wealth of resources offered by National Postdoctoral Association wealth their Recommended Postdoctoral Policies and Practices.

The [redacted for anonymity], the Postdoc Association and all of our stakeholders sincerely thank the NIH for the opportunity to share our ideas regarding the critical need to reshape postdoctoral training. We draw from our experiences of over 17 years of a formal postdoctoral office and training program. We wish the working group all the support and insight they can muster to keep the postdoc tradition of scientific training, including mentoring and career exploration, a vital ecosystem to the future of science and human advancement in the United States of America.

Response 2981

Perspectives on the postdoc roles and responsibilities

On behalf of [redacted for anonymity], we appreciate the opportunity to respond to the request for input on re-envisioning the U.S. Postdoctoral Research Training and Career Progression within the Biomedical Research Enterprise. [redacted for anonymity] is a nonprofit national association representing more than 2,500 individual members and more than 800 master's and baccalaureate programs of professional social work education. [redacted for anonymity], also a nonprofit organization, is dedicated to the advancement of social work research, representing more than 1800 members internationally and more than 200 universities and institutions. [redacted for anonymity] and [redacted for anonymity] are committed to supporting early career researchers in social work. Our organizations desire to see more support for social work researchers interested in pursuing careers as faculty at research institutions.

The academic postdoc provides an opportunity to advance prospective and early career faculty as independent social work researchers. This position can provide key professional development opportunities, the opportunity to build a strong publication record, and a competitive edge, particularly for gifted social work researchers who graduate with a PhD from programs with less access to resources and opportunities. The academic postdoc is a crucial stepping stone to a career as an independent researcher committed to justice, equity, inclusion, and diversity in communities. As such, the NIH must ensure that there are support systems in place to transition postdocs out of the position and into a permanent faculty position. This may include but is not limited to, career development services, mentoring support, funds to accelerate research independent of their mentor's research, and more.

Fundamental issues and challenges

Compensation continues to be a challenge for supporting and sustaining postdoctoral trainees. Salaries remain a hurdle for the recruitment, retention, and overall quality of life for postdoctoral trainees in academic research. Those in this position must often find additional sources of compensation which may include grants or fellowships from private foundations that offer more compensation than the NIH fellowship and training stipends. Likewise, some postdocs, specifically those in a clinical discipline, engage in work opportunities outside of their research to make up for the funds needed to live and support themselves and/or their families. Moreover, the limit imposed on time that a postdoc can spend on non-research activities (10 hours) is often a barrier for researchers who are interested in NIH postdoc supported positions.

Additionally, the length of time for the average postdoctoral training opportunity can be a disincentive for individuals with aspirations to reach a level of compensation that provides a good quality of life. The pathway to independence for researchers must be accelerated to attract gifted researchers to academic postdoc positions.

The challenges listed above create unintended barriers to reaching academic success and independence for those particularly from underserved or disadvantaged backgrounds who aspire for a career as an academic researcher. After years of education, without additional support, many individuals are not able to afford another 5 to 6 years earning reduced wages.

Existing NIH policies, programs, or resources

NIH policies must be expanded to support increased compensation for postdoctoral fellows which includes but is not limited to increased funds for stipends, benefits, and travel. Currently, the post-doctoral training-related expenses are capped at $12,200 per year at non-federal and non-profit institutions. This cap penalizes the postdoc fellow for any out-of-pocket fees that accompany selecting health insurance that supports family members. The NIH must move towards supporting all health insurance costs for trainees to remove the burden of any remaining balance on the individual or the research institution. We commend the NIH for moving towards supporting childcare costs for postdoc trainees, however, $2,500 is currently insufficient. According to Care.com, the average cost for childcare is about $226 a week per child, which varies depending on location. The current $2,500 per budget period is a misalignment with the development stage of many postdocs where growing their families is critical.

NIH must also consider expanding programs that can leverage the talents of non-US citizens. Currently, many foreign postdocs are limited to the K99/R00 mechanism for supporting their transition from an academic postdoc to an independent researcher. Independent and training fellowships should also be open to foreign postdocs. NIH must work with HHS and Congress to move forward with a legislative strategy to address this issue. In the meantime, NIH must consider developing an administrative supplement for foreign postdocs to be supported by a T32 program at a research institution. Moreover, NIH must consider expanding the career development award opportunities to provide more opportunities for foreign postdocs. The career development programs at many ICs are underutilized and largely only used by clinical researchers. Mechanisms such as the K01 or the K22 must be expanded and used across all ICs and topic areas like the F32 and T32 mechanisms.

Proven or promising external resources or approaches

NIH must consider methods that will dramatically improve the working environment for postdocs. Postdocs are highly skilled scientists who should be treated as such. Academic institutions should have HR support in place to support postdocs. Specifically, there should be clear policies, procedures, and reporting structures to ensure postdocs feel safe and protected in their working environments.

NIH should also work on formalizing mentorship and career development opportunities for postdocs. The National Institute of General Medical Sciences recently designed the Maximizing Opportunities for Scientific Academic Independent Careers (MOSAIC) K99/R00 program for postdocs to transition into their independent careers. The MOSAIC program builds in mentorship, career development, and professional networking to support career advancement. Lessons should be taken from this program to inform all programs with NIH supported postdocs. It should be a requirement in NIH grants for NIH training programs and fellowships to include educational activities that will support the transition from postdoc to independent researcher. Unfortunately, these important programs remain limited in numbers and funding, but NIH can change that scenario.

Lastly, following the COVID-19 pandemic, we witnessed the positive impact of remote and hybrid work on the work experience of many individuals. We have the technology to work remotely and collaborate across the globe. More flexibility in our approach to work and productivity is needed in research institutions to support postdocs who can remote and/or hybrid work without hindering progress in their research. In disciplines where onsite laboratory work is not required, hybrid/remote work for researchers can contribute positively to productivity and quality of life.

Response 2982

Perspectives on the postdoc roles and responsibilities

I think the main role of a postdoc is to learn to be a project manager, which is applicable to many careers. This involves many facets, such as managing/mentoring, learning new skills, time management, and taking formal professional development training.

Fundamental issues and challenges

For perspective, I am a first-generation woman from a rural, disadvantaged background outlined in NIH notice on diversity.

Recruitment: cost of living, moving expenses, representation, support for visas!

Retention: pay, lack of 401k/benefits, the culture, and lack of childcare subsidies or options drives women out. support for visas!

Quality of life: cost of living, clear expectations on time off, defined training and roles

Existing NIH policies, programs, or resources

Increase F32 stipends and provide some tangible benefits. When I was a PhD student, a postdoc in my lab was awarded an F32. She found out that it was essentially a pay cut due to moving from a W2 employee through the university to a stipend. She lost all of her benefits. This postdoc had 2 children and struggled to cover childcare and make the K99 deadline. She was pushed out of the pipeline.

The K99 4-year timeline is pushing people out. I am a postdoc who started in July 2019, so there is no automatic COVID extension for me, and NIH program officers act like COVID never happened or affected my career. I submitted my K99 application but only have one opportunity for review due to this. I will leave academia if it's not funded as I am geographically restricted, so I know it will be needed for being hired in my area. Another postdoc in the lab is developing a truly cutting-edge research program, but his big papers were not ready for the 4 year timeline. He cannot apply for the K99 now.

Postdocs are tired of NIH telling us we do not need a K99 and citing old data. Every person I know who was hired since 2020 had a K99. The market is getting ultra-competitive, so even using 3-year-old data predating the pandemic is not fair. Increase funding of K99's and increase the timeline if you want to see any meaningful change.The 'first R01 before age 40' statistic is ruining potential careers.

Create infrastructure for staff scientists or Co-PI ran labs in extramural, even for small labs! Many people would love to be staff scientists or co-PI. Increase modular budget on R01. Science is too big and requires so much expertise for one person to run a lab now!

Proven or promising external resources or approaches

Lobby for more NIH funding. OITE resources/training for intramural should be the gold standard for extramural.

Greater flexibility on timelines, did I mention the K99 4-year eligibility is ruining lives?

Response 2983

Perspectives on the postdoc roles and responsibilities

I love what I do and I love academia. I feel that I'm making a difference in people's lives. That's why I chose this career path. However, I feel that my work life balance is terrible and my salary does not justify the amount of time I put in. Postdocs have extremely important roles. We run labs, mentor the next generation of researchers, write grants, and produce most of the manuscripts that come out of our labs. We're also increasingly tasked with reviewing manuscripts and being part of academic committees. I do not view postdocs as trainees, I view us and early career faculty without the title.

Fundamental issues and challenges

Overall quality of life as a postdoc in clinical psychology is very low. The main issue is salary. The NIH starting postdoc salary is way below what the value of a postdoc is. It is below the starting salary of most bachelor degrees and this is unacceptable. It is even worse for those of us with families. We are expected to do high level research while applying to grants and helping run labs. This takes at least 60 hours a week. However, I don't have enough time to also take care of my kids and clean my house. And I'm not paid enough to afford any help. So the only options are to not sleep or to not spend any family time. This means low quality of life. This in turn will be a fundamental issue for recruitment and retention moving forward. I have always wanted to become a faculty member. I am now strongly reconsidering that. Especially with tenure under attack in certain states. I do not recommend that people pursue my career path and this will mean that talented scientists will choose other career paths. This will become even more true for candidates coming from underserved background who cannot afford to live their whole lives underpaid in the name of science.

Existing NIH policies, programs, or resources

I would revise the grant programs offered. Specifically, F grants are almost pointless. They are great for putting on your C.V., but for the amount of effort that goes into them, they barely provide you with any

funding. Especially F32s. It's not hard to find a research postdoc position so why spend all that time applying for a grant that doesn't give you money to run a study.

There are a number of issues with the K mechanism. First, the K99 traps you into staying at the postdoc level for such a long time that it feeds into the low quality of life and poor salary issues I discussed above. The other K mechanisms trap you at an institution for such a long time that it becomes hard to leave. I wish there were more legitimate postdoc level R01/R21 type grants that we could get that wouldn't impact our early investigator status. It feels like we're not being treated as real researchers, only trainees, so there aren't any grants for us.

The other issue with the K mechanism is that the balance between doing something novel and gaining training is very hard to navigate. On the one hand, we're being asked to put forward a novel research study that is of the quality of an R01. And at the same time, it has to be something new to us in order to fit a "training grant". I wish it were clearer that the K mechanism provides an avenue for training so there could be some leeway regarding the innovation of the research project. Part of this issue would be alleviated if the F grants was improved to be a more viable option.

Proven or promising external resources or approaches

All of these things are going to vary by institution and are ultimately out of the NIH's control. The main way to increase recruitment and job satisfaction is to be paid according to qualifications and job expectations. I think a $70,000 minimum would be far more in line with a postdoc's value.

Response 2984

Perspectives on the postdoc roles and responsibilities

The postdoctoral role has changed significantly in the past decade or so. While originally a temporary step in the path towards a professor job, it is now taking longer and can lead to various career types. Postdocs are also taking more responsibilities in the lab and in mentoring students, and many are even teaching classes for experience. Changes need to be made to allow postdocs to have the time and resources to be successful. These include more formal training to lead their own lab in the future and being more inclusive of alternate career paths.

Fundamental issues and challenges

Some major challenges in recruitment and retention of postdocs are stability and income. A new PhD can apply for jobs in industry that will pay double or more the current postdoc salary and have a track for growth in the company. Whereas a postdoc salary is barely enough to live on depending on the city, and the future is uncertain. Postdocs are seen as temporary, but there are not enough academic jobs for all postdocs. Also many postdocs are at the age where they have or want to start families, and on top of the salary not being anywhere near sufficient, there are no benefits or required leave for postdocs to be able to do so. In addition, international postdocs have the added stress of having their contracts renewed and applying for visas because postdocs are classified as temporary jobs.

Existing NIH policies, programs, or resources

The policies need to include relocation costs and salaries that are proportional to the cost of living in the area and raises need to keep up with inflation. Protections against harassment and overworking are necessary or else postdocs will leave for jobs that offer better environments. Programs need to stop considering postdocs to be temporary and on yearly contracts because the job market is no longer in line with that. Postdocs need better training and resources to set them up for success throughout their career.

Proven or promising external resources or approaches

Research into the need for salaries to be in line with the cost of living and the worth of postdocs: https://www.nature.com/articles/s41587-023-01656-4

The importance of science advocacy for postdocs: https://www.nationalpostdoc.org/page/ResourceLibrary#Advocacy

In general, scientists agree that having people with different perspectives is the best approach to solving problems, yet postdoctoral policies are highly limiting the type of people who can and want to pursue postdocs.

Response 2985

Perspectives on the postdoc roles and responsibilities

I believe an academic postdoc is a non-tenured researcher. We preform tasks within a lab, that is not our own.

Fundamental issues and challenges

I think there are a couple of things. Most importantly the pay. Individuals with PhDs are extremely high skilled labor yet we are not as paid as such. What confounds this is the concept that we are "trainees" . In most cases postdocs operate as a workforce/labor and are not given either formal or informal training.

Existing NIH policies, programs, or resources

I believe the pay scale is one of the biggest things that should be changed. Also creatong better protections against toxic lab cultures and bad PIs.

Proven or promising external resources or approaches

No response

Response 2986

Perspectives on the postdoc roles and responsibilities

Postdocs are essential members of the modern scientific laboratory. The postdoctoral position is a time where a highly skilled employee works to advance a PIs research agenda. The roles and responsibilities of the postdoc are dependent on where the PI and potential postdoc employee find common ground in their professional needs. For example, where the postdoc is interested in a career in academia their roles will include to further develop their grant writing and experimental skillsets while constructing the footprint for an independent academic career. These roles are best accomplished when the employing PI is interested in maintaining their academic laboratory through publication of manuscripts via data generated and interpreted by the postdoc, acquisition of NIH funding via preliminary data and grant writing by the postdoc, and through increased likelihood of supporting future employees by external fellowships via demonstration of their trainees to obtain academic positions. Alternatively, a postdoc may be interested in learning a new technique or area for a career in industry and their roles and responsibilities will focus on generating data for the PI to be used in publication and grant proposals.

Fundamental issues and challenges

1. Lack of true commitment by the NIH to support postdocs and grad students—The Fundamental issues and challenges have been known and the NIH to wait so long to address the issues is inherently a problem and a failure of the organization.
2. Pay is too low.
3. NIH permits institutions to revoke benefits upon earning an external fellowship. Postdocs need to earn fellowships to demonstrate ability to earn funding but do so at the expense of losing health insurance.
4. NIH permits institutions to cap budgets requested for K award winners based on whims of administrators.
5. It is a fundamental issue that the only time issues with the postdoctoral position are thought to be addressed are when PIs complain that they can't recruit them.

Existing NIH policies, programs, or resources

Just bump the stipend on F and K grants and increase the size of the R01. There isn't some magic workshop or eBook that will fix this problem in any other way. Spending time and money to evaluate interventions that don't address root issues is time and money that could be sent on something that would improve postdoc experience.

Proven or promising external resources or approaches

St Judes postdoc salary increase.

HHMI postdoc salary increase.

Response 2987

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a job that allows you to work with scientists outside your graduate mentor, branch out to other areas, and develop and refine your research program.

Fundamental issues and challenges

A major issue is the low pay. NIH minima (on which many salaries are set) may allow for reasonable standards of living in cheaper cities but can fall very short in certain areas (Boston, NYC, SF, etc.). This can go as far as to exclude people without means to accommodate an extra 3-6 years of low pay. This is probably an even bigger issue for postdocs with families and all the costs associated with that.

A huge issue is the precarity of the position. It used to be easier for PhDs to land tenure-track positions; now it can be uncertain even after a postdoc. This obviously affects retention.

Existing NIH policies, programs, or resources

It may sound easy to say, but more money needs to go to research and paying for researchers. Grants with hard limits (like modular grants) can be adjusted for inflation.

Eligibility for pathway to independence grants (K99) may need to be extended beyond 4 years.

Also as a note—I don't have a recommendation for that issue—a few hiring committees, either effectively but in some cases explicitly (as, in the job posting) have made a K99 a requirement for hiring—effectively outsourcing the burden of selecting candidates to the NIH.

Proven or promising external resources or approaches

Each school having somebody who can act like an ombudsperson for postdocs may be helpful, some institutions have been doing this.

Response 2988

Perspectives on the postdoc roles and responsibilities

To advance the current knowledge pool by the performing cutting edge science. This aids the PI who is funded by the NIH and at the same time advancing his/her own career by gain valuable expertise

Fundamental issues and challenges

Low salary that doesn't increase with inflation.

Existing NIH policies, programs, or resources

International post docs are not eligible for majority of funds like their native counterparts.

This severely impacts future careers of the international as they are viewed as unproductive and not competitive

Proven or promising external resources or approaches

No response

Response 2989

Perspectives on the postdoc roles and responsibilities

research and learn

Fundamental issues and challenges

very low salary, visa restrictions, no future guarantee

Existing NIH policies, programs, or resources

Response 2990

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity], the nation's largest professional association of research scientists and physicians who are dedicated to understanding the immune system through basic, translational, and clinical research, appreciates this opportunity to comment on postdoctoral research training and career progression within the U.S. biomedical research enterprise. We begin by endorsing the thoughtful comments submitted by the Federation of American Societies for Experimental Biology on April 6, 2023. In addition, [redacted for anonymity] wishes to emphasize the following points.

[redacted for anonymity] views postdoctoral scholars ("postdocs") as skilled scientists who have significant expertise in a particular field and a multitude of capabilities, and who should be valued as such. The "trainee" label does not reflect their expertise and skill, and [redacted for anonymity] urges NIH to reevaluate its use. The postdoc position should be a period of advanced training, designed to foster independence, that serves as a steppingstone to a desired career. It should have a defined timeframe appropriate for the postdoc's ultimate career goals and enable the postdoc to make contributions to their scientific field.

[redacted for anonymity] believes that principal investigators (PIs) and institutions should invest in the postdoc's research and career development, whether in academia or other sectors (e.g., industry, policy, law, etc.). This could include meaningful training in obtaining funding, mentoring, leadership, running a lab, budget management, data management, study section service, and pursuing careers outside of academia, etc. While a postdoc's responsibilities include a level of dedication to the research and a respect for their PI's goals, time, and resources, a postdoc should not be treated as a laboratory "workhorse," and the expectation should not be that the postdoc position is a period of unreasonable personal sacrifice. It is essential that the position accommodate family responsibilities, provide sufficient financial stability, and offer health and emotional wellness benefits.

Fundamental issues and challenges

One major issue that inhibits recruitment, retention, and overall quality of life for academic postdocs is insufficient compensation. [redacted for anonymity] believes that postdoc compensation should reflect their level of education, expertise, and knowledge; they should be paid as professionals and should not have to live "student" lifestyles. Current stipend levels do not always reflect regional cost of living, representing a barrier to recruiting and retaining postdocs in high cost of living science hubs (e.g., New York, Boston).

Another major barrier is the lack of available and adequate benefits, including parental/family leave, accessible and affordable childcare (a barrier that disproportionately affects women), and retirement benefits like employer-matched contributions. Scientists often enter their late 20s—mid 30s without having significant retirement savings or financial stability and may never catch up to their peers in other sectors. Low pay and inadequate benefits select for well-resourced individuals, as compensation is often inadequate without other external support.

The academic postdoc position, intended to be a temporary and transitional career stage, is often ill-defined in terms of length, expectations, next steps, etc., creating a period of instability that may be looked upon unfavorably compared to other opportunities. A fundamental issue affecting recruitment, retention, and quality of life is uncertainty about future career prospects during the postdoc period. Many graduate students are unwilling or unable to make the financial and personal sacrifices required of an academic postdoc, and many postdocs choose not to pursue tenure track faculty positions in academia, in part because of the difficulty of attaining such a position and of securing and maintaining funding as a PI. These and other challenges may make other career paths more attractive.

Existing NIH policies, programs, or resources

To improve the postdoctoral training ecosystem, NIH should consider allowing NRSA fellows and trainees to maintain "employee" status at their institutions so that they may receive institutional benefits (health insurance, retirement benefits, etc.). In addition, developing and enhancing mentoring opportunities that

allow postdocs to depend less on their PI and their PI's networks will improve the academic research career pathway, as will making new and/or expanding funding mechanisms that bridge postdocs to academic careers, like the K99/R00 award. Furthermore, NIH should consider addressing the imbalance in the number of awards given to Ph.D. students and postdocs. For more than two decades, the number of awards for Ph.D. students has been increasing while the number of awards for postdocs has steadily declined. Addressing the reasons behind this imbalance, and reevaluating relevant funding mechanisms (for example, the limited timeline to apply for the K99/R00), may help to optimize the academic biomedical research pipeline.

NIH should consider ways to enable postdocs to obtain and thrive in stable academic scientific positions (other than as a PI), such as staff scientists. Providing grant support or other funding mechanisms for such positions would enable more postdocs to maintain careers in the academic research workforce. The National Cancer Institute's Research Specialist Award is an example of a funding mechanism for a stable research position that is not an "independent investigator." [redacted for anonymity] suggests NIH evaluate this award to determine whether it might be a useful model for similar funding mechanisms outside of NCI.

Proven or promising external resources or approaches

Many institutions provide higher pay, benefits, defined postdoc policies, etc., that the NIH should consider adopting for the postdocs they support. NIH should also create and model "best practices" for academic institutions to emulate and provide a meaningful incentive for them to do so. Finally, NIH should encourage institutions and universities to track and report postdoc career outcomes and statistics (e.g., salary/stipend, average length of postdoc).

NIH should work with other federal agencies to facilitate the recruitment and retention of qualified international scientists who may wish to receive their doctoral degree or pursue postdoctoral training in the U.S. NIH should also provide needed support to international scientists currently studying or working the U.S.; this could include assisting with the visa process and increasing the funding opportunities for which they are eligible.

NIH should also consider partnering with the National Postdoctoral Association (NPA), which is dedicated to advancing the best interests of postdocs and the biomedical workforce. The NPA has knowledge of the current postdoc landscape and ideas on how to enrich the postdoc experience and help early career scientists embark on fulfilling careers.

[redacted for anonymity] applauds NIH for their past and current efforts to improve postdoc training, thanks NIH for seeking stakeholder input on ways to improve the postdoc experience, and appreciates the opportunity to provide feedback now and in the future.

Response 2991

Perspectives on the postdoc roles and responsibilities

Postdocs are the most productive researchers in our system. Their primary role is to perform research with a secondary role in helping train more junior lab members. As a student your primary goal is to learn as a Professor your primary role is to support the member of the lab in various ways and teach, as a postdoc your primary role is to get research done. Therefore, postdocs are essential to research progress and competitiveness.

Fundamental issues and challenges

The main challenge is competing with high salaries currently being offered in industry. The academic research program of the United States will suffer if we are unable to compete with industry. The cost of living continues to increase and the NIH needs to provide the funding to pay postdoc's a competitive wage or our global research competitiveness will suffer.

Existing NIH policies, programs, or resources

As an early career researcher the limitation on the amount of resources that can be requested from an R35 MIRA either at the initial application or more importantly during renewal is a major deterrent to research progress. Established researchers can get MIRA awards with significantly larger budgets while early career researchers are limited to only specific budgets even at renewal. This makes it difficult to recruit postdocs and compete as an early career researcher. The existing NIH policy that could be modified

to enhance the postdoctoral training ecosystem would be to allow early career MIRA holders request more than at 10% increase in funding when renewing their award.

Proven or promising external resources or approaches

No response

Response 2992

Perspectives on the postdoc roles and responsibilities

I view the postdoc as a critical step in my career toward becoming an independent investigator. It is a position that requires substantial experience and independence, but in the end, it is still a job, and my contributions should be reasonably compensated.

Fundamental issues and challenges

The biggest single problem with recruitment, retention, and quality of life for postdoctoral trainees is the wholly inadequate salary/stipend that postdocs receive. Especially in high-cost-of-living areas, the salary for postdocs unlivable. And because the NIH has barely increased postdoc salaries, nor do they provide geographic cost-of-living adjustments, PIs are unable to pay postdocs what they deserve. The excruciatingly low salary for postdocs makes it much more likely that graduate students will go straight to industry, where their skills and contributions will be more fairly valued. This is especially true for people from marginalized and under-represented backgrounds who do not have the family financial support needed to survive on an unlivable wage.

Existing NIH policies, programs, or resources

The NIH needs to pay postdocs more and incentivize NIH-funded institutions to pay postdocs more.

Proven or promising external resources or approaches

Salary.

Response 2993

Perspectives on the postdoc roles and responsibilities

I am currently in my second postdoctoral fellowship. For context, my first postdoc mentor left my prior institution early in my tenure there. My exposure to two postdoctoral training environments (including different mentors, institutions, and funding mechanisms) has taught me that the expectations of a postdoc are inconsistent. More specifically, it seems that some may view postdoctoral fellowships as a mechanism for cheap labor with no accountability on the part of the institution or research mentor as regards training and mentoring. Furthermore, postdoctoral support through a training grant looks very different from that of a project grant. For example, it seems that there are no expectations for training/ mentoring (or at least no accountability) if a postdoc is employed through a project grant.

In my experience as a postdoc and in my observations of and discussions with other postdocs, the academic postdoc is a jack-of-all-trades. Job responsibilities include any and all of the following: scheduling and conducting data collection sessions; mentoring undergraduate and graduate students; processing and analyzing data; writing manuscripts; presenting at conferences; managing lab equipment; procuring hardware/ software; cleaning lab and office space; submitting grant applications; functioning as a teaching assistant; and engaging in various training opportunities. In many ways, exposure to a wide variety of tasks serves to provide exposure to the diversity of tasks required of a faculty member. Yet, this can be in conflict with the notion of "protected research time", detracting from the more visible—and, thus, critical—productivity that is desired during a postdoctoral fellowship (i.e., publications, presentations, grants).

Fundamental issues and challenges

The pay and expectations of a postdoctoral trainee are at odds with the priorities one should have at this stage of life. Expectations that each training experience be completed at a different institution and acceptance of low postdoctoral salaries preclude fiscally responsible choices (e.g., owning a home, maintaining an emergency fund, saving for retirement). These also place added strain on romantic

relationships and family. The sacrifices required of a postdoctoral trainee are becoming increasingly difficult to justify, and they can discourage a researcher from seeking additional training. But they can also be interpreted as exclusionary; for some trainees, such sacrifices preclude their participation in postdoctoral training. For those pursuing postdoc training, it can mean postponing personal goals (family, financial) and uprooting one's life. These decisions also affect partners/ significant others: at minimum, they must agree to the financial sacrifice, be open to a geographical move, and accept possible changes in stability (e.g., moving away from family or support systems, disruptions in their own career stability). Importantly, despite sacrifices on the part of the trainee, there is rarely a commitment on the part of the institution. If your postdoctoral advisor leaves, you must either follow them (if they are staying in research), hope that someone nearby has the funding and expertise to support you, or make another geographical move. Finally, the NIH-recommended stipend levels are insultingly low, particularly considering that a qualification for postdoctoral fellowships is conferral of a doctoral degree. Of course scientists are opting for industry: they receive salaries that reward their hard work, recognize their expertise, and provide financial security; they get paid time off; they have affordable health insurance options; they get paid paternal leave; and they have job stability.

Existing NIH policies, programs, or resources

1. changes to the salary structure. Postdocs sacrifice substantial time and effort to get where they are. A request that they continue to sacrifice pay will surely continue to steer promising researchers away from this path.
2. a more nuanced understanding of training location. Training in a similar location should not be seen as a lack of rigorous and diverse training. Rather, the training opportunities offered, funding opportunities and successes, and products of research should speak to the value of the training. The expectation that a CV or Biosketch contain varied locales for Masters/PhD/Postdoc/Faculty positions was perhaps more important in prior decades, when cross-country collaborations, training, and presentations were not yet the norm.
3. job security. Barring no changes to the above, at minimum there needs to be some sort of commitment from the institution. If we are to uproot our lives and accept a barely living wage in high cost-of-living cities, don't allow the institution to accept zero responsibility when circumstances change.

Proven or promising external resources or approaches

Training programs, such as TL1 and T32, provide "redundancies" in mentorship (in a very good way). They offer varied training opportunities and a "safety net", of sorts, should a mentor leave or a project's funding mechanism end. They include structured training opportunities, so that "training" isn't synonymous with functioning as a glorified assistant to a faculty member, who dumps work rather than taking the time to groom future researchers. In training programs such as TL1 and T32s, there is accountability. Collaborative efforts on the parts of administrative teams overseeing the programs, faculty who organize them, and personnel participating within them all contribute to a more enriching experience.

Response 2994

Perspectives on the postdoc roles and responsibilities

It should be a time to either get additional training and mentorship while having protected time to do research to launch your own lab. However, I feel like it is more commonly used to get skilled workers to advance a PIs projects for a short time.

Fundamental issues and challenges

Stipends are typically too low. Particularly when a high volume of top institutions are located in high cost of living areas (Boston, NYC, San Francisco, Chicago). This not only makes doing a postdoc hard because you are scraping by, it also disenfranchises postdocs who can not make those ends meet (Those with children, overall lower economic status, those with health factors). Often postdocs are used as skilled labor as well but not paid accordingly.

Existing NIH policies, programs, or resources

Alternative pathways. Hiring more permanent scientists and less postdocs. Postdocs should be used for A. gaining additional training to aid in future career or B. establishing independent research directions for

future PIs. When postdocs are used as skilled labor for two years with no real direction for future careers it makes people become trapped in an endless postdoc cycle. Alternative longterm positions for scientists should be made.

Proven or promising external resources or approaches

No response

Response 2995

Perspectives on the postdoc roles and responsibilities

A postdoc position is a temporary position. In this role, you gain more knowledge and training to prepare you for your next step in your career.

Fundamental issues and challenges

I have 3 more degrees than my husband and he is making much more than I am with better benefits. It is not all about the money, but for the amount of work we do, it feels like we are not accurately compensated. Due to the high demands of the job and the low benefits, this can lead to burn out and poor mental health.

I am on a training grant which does not come with health insurance, which is one problem. Another problem is that no one explained that taxes aren't taken out automatically so we have to figure that out ourselves.

At times, there is no separation from your job and your home life. You are often on someone else's timeline and you have to be ready to complete work when they need you. There is a pressure to publish, give talks locally and nationally, provide service (score fellowships and symposia, do science communication, serve on committees), and writing fellowships. This is on top of actually running the experiments for your project. Postdocs also see what academia is like and on as a professor, your responsibilities grow to include teaching, mentoring, and managing a lab. There is not enough time in the day to do all these things so postdocs are constantly drowning in work, not producing quality work that they are proud of, and repeating this over and over. At times we wonder if we want to do this work for the rest of our career and many people don't want that. While we want to be passionate about our career, we don't want that to be the only important thing in our lives. We want to be able to disconnect and have time for ourselves.

Existing NIH policies, programs, or resources

In the "Resources" link, when I click on any of the tabs under "career guidance> Science career planning and opportunities", none of the links are working.

Proven or promising external resources or approaches

Your time as a postdoc is definitely influenced by the quality of your mentorship. When you are a PhD student, many people tell you to do your postdoc work with the top PI in your field. These people often turn out to be the worst mentors. This is a disconnect in the field, too. Scientists are usually praised for their research only where so many other things go into being a PI. You also have to think of how these PIs are able to generate so much data. Are they exploiting the people in their lab? There should be some accountability for these PIs and consequences for if they do not treat their trainees well. Many trainees are scared to say something because there think they will not be protected if they do.

Response 2996

Perspectives on the postdoc roles and responsibilities

A postdoc is a great training opportunity. However, this is a training experience we take on after getting a PhD, a time where most of us sacrifice a lot already. The fact that when I started my postdoc, which requires college + graduate degree, I could have made the same salary managing a gas station, which only required some college experience, was truly shocking and demoralizing. In this day and age you need to do a postdoc to get a faculty position at an R1 university which is fine, but that doesn't mean you should just be cheap labor for someone else before you "pay your dues" so to speak. As someone soon to

transition to an independent position, I will searhc for every avenue I can to better compensate my postdocs becasue they will be valuable members of my team and they deserve to be fairly paid.

Fundamental issues and challenges

Salary and support are the biggest issues in recruitment and retention. The academic postdoc will be extinct soon if the NIH does not increase budgets to allow for more salary support. We don't do this for the money per se, but if we suffer the stress of this life and aren't fairly compensated, we're insane not to leave for industry. Especially in cities like Boston, NYC, SF, etc, its ridiculous to expect people to live in these places on salaries that effectively put them at the relative poverty line.

Existing NIH policies, programs, or resources

F32s should be open to international postdocs. Also, once a trainee gets their own funding, PIs should be able to use some of those now freed up funds to increase the salary of the trainee. Reward them for their success!

Proven or promising external resources or approaches

No response

Response 2997

Perspectives on the postdoc roles and responsibilities

The postdoc role is important for training and gaining experience in your field, mostly to prepare a future faculty position. They are also the data generating engines of labs, and are responsible for advising students

Fundamental issues and challenges

Low salary. Poor and inconsistent benefits. Often overworked leading to poor work life balance. Industry jobs often don't require postdoc experience, and comparable private jobs can pay 2-3x more with better work/life separation

Existing NIH policies, programs, or resources

Increase stipends, expand funding programs, work with postdoc and mentor to ensure work expectations are reasonable

Proven or promising external resources or approaches

No response

Response 2998

Perspectives on the postdoc roles and responsibilities

I was a postdoc in an academic lab before my current position. I view the postdoc position as an early career scientific job. I was expected to have significant expertise to apply to my project and be able to conduct experiments independently. In addition, I authored manuscripts and gave presentations all work minimal input from my PI. For these reasons, I think it's patronizing and belittling to call postdocs "trainees" when they're expected to contribute at such a high level. Industry does not do this, the equivalent title is simply "research scientist".

Fundamental issues and challenges

The primary challenge is low pay. Related to this is the abysmal amount allowed for relocation reimbursement.

Existing NIH policies, programs, or resources

As only a small percentage of postdocs continue on to academic positions, I think having so much of the focus be on academic career paths is a missed opportunity. Programs to help postdocs transition to industry would be very valuable. There's some programs that exist for government careers, but these are also pretty limited.

Proven or promising external resources or approaches

Industry salaries start at around $75k, I think pay is the best place to start.

Response 2999

Perspectives on the postdoc roles and responsibilities

A postdoc is a senior trainee that is either developing their independent research program and gaining additional skills in mentoring and project management or they may be developing additional skills for transitions to other career paths than academia, all while conducting research in line with their mentors' goals. Unfortunately, they are not considered real employees by many universities and exist somewhere between student and technician—a lack of clarity that adds to the feeling you are in between—in a waiting room for a real job.

Fundamental issues and challenges

A postdoc feels like a turning point—you either get beaten down emotionally, physically, and cognitively and decide you don't want to do this anymore or you somehow persist, which still doesn't mean you'll have a career. There are massive limitations to your "viability" as a future scientist which makes any small speed bumps in work culture/support feel like mountains. You have limited time to secure funding, but are also supposed to round out your skillset by doing something new, which takes more time. Many factors are outside of your control—due more to luck than competence and skill. These factors determine whether you are able to make a name for yourself and research and ultimately make a career out of all of your hard work. It's a pressure-cooker, making the environment ripe with emotional distress, financial insecurity, and intellectual burnout. If you had a good chance of landing the job you are training for or make decent money while you make an attempt, that would help. Certainly being a faculty member is a continuation of these pressures, but there is little to no training on how to develop skills that let you persist in such an environment. It is harder for anyone with any sort of disadvantage—financial, health, not feeling like you belong, mental health struggles which are aggravated by the environment and scientific endeavor, lack of social support. Only those with the most privileged position in society could ever hope to survive a post-doctoral experience for what it is primarily meant to be—a training environment for a faculty position or other scientist roles. As a person who loves solving scientific mysteries and being challenged, if this position doesn't set me up for success and professional fulfillment, who is this position for?

Existing NIH policies, programs, or resources

Please, I do not understand the reason for the K99/R00 eligibility cap of 4 years post graduation. Post-docs are supposed to gain new skills to enhance their scientific toolkit and this policy directly prohibits that kind of professional development, instead reinforcing being single-minded and minimizing growth in many areas of professional development. There need to be more pathways to independence, not a one-size fits all mechanism. Especially when we, as academics have structured our work teams to be heavily biased toward graduate students—who are taken advantage of to get the needed work done—we need to support and encourage postdocs and staff scientist positions. These highly trained scientists help support earlier trainees, provide continuity of intellectual capital within labs, and serve as important coaches and mediators between PIs and graduate trainees and technicians. But instead, postdocs are expected to perform at the highest level or choose another career. Transitions to staff scientist positions can sometimes be viewed as a death sentence on the endeavor to become an independent scientist. Reducing pressure on this highly valuable population by providing fair compensation, recognition of value, and support/pathways to continue to contribute to PI research or move toward independence would go a LONG way toward making the postdoctoral position an attractive and viable option for doctoral awardees.

Proven or promising external resources or approaches

Turn toward organizational psychology and leadership practices. Companies and scientists have done a lot of work and invested a lot of time trying to figure out how to empower employees and get high performance from them. None of the research supports the notion that people in mental and emotional distress—perhaps those that just push through and work hard in the narrowest definition of the phrase—are the highest performers. Getting high quality, sustainable productivity and creating environments people WANT to work in requires treating them like whole people. Psychological safety and trust between team members and institutions are vital.

Response 3000

Perspectives on the postdoc roles and responsibilities

A postdoctoral scholar or postdoctoral fellow is a position that should enable the postdoc to reach independence and and gain technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.

Postdoctoral fellows should have the opportunity to develop new skills as well as explore career fields in which they may be interested in pursuing following their postdoctoral position.

Postdoctoral fellows should be given the opportunity to attend scientific conferences and professional and career development workshops or seminars to ready themselves for the next stage of their career.

Responsibilities and expectations of postdoctoral fellows should be discussed with their faculty mentors upon hire of the postdoc and may include mentorship agreements and individual development plans. A postdoc is a temporary position and does not carry the same responsibilities as a full-time staff or faculty position. Postdocs should have the opportunity to build their mentoring skills while also being mentored by their faculty/PI.

Fundamental issues and challenges

The biggest issue facing postdoctoral fellows is the compensation policies both at the NIH level based on stipend guidelines and inconsistencies across institutional policies. NIH stipend levels do not match other federal pay rates that are based on cost-of-living levels. Annual increases should also be aligned with annual inflation, location, and experience.

International postdocs have additional challenges with navigating visa paperwork as well as cultural changes moving into the U.S. academic setting. International postdocs may face challenges with their visa sponsorship based on relationships with their sponsoring faculty/PI. Considerations should be given to sponsorship that do not allow postdocs to be exploited by faculty. Partners/spouses additionally have difficulty in gaining work authorization which prohibits long term commitments by the postdocs if they are a single income family.

International postdocs also have less funding available due to citizenship restrictions for fellowships and training grants. This creates inequitable opportunities for postdoc positions for international postdocs.

Postdocs working in hostile work environments created by faculty unwilling to compromise the way they communicate or renegotiate expectations has led to postdocs leaving their assignment early. Additionally, postdocs that came to the university with the understanding that they would have the opportunity to work on specific research and then being given projects unrelated to their area of interest has led postdocs looking for other roles where they can focus on their specialty.

Existing NIH policies, programs, or resources

Postdoctoral fellow classifications continue to be a barrier of equitable training landscapes across the institution. Postdoctoral fellows on NIH training grants or fellowships are not provided with the same benefits as their peer postdocs on other NIH research grants, contracts, or institutional funding. If a postdoc is awarded this funding, they must give up benefits such as retirement. NIH should clearly provide support and state that postdocs on these funding mechanisms can be classified similarly to their peers allowing for equitable benefits. Many postdocs do not have the option of not going onto a training grant if they want to continue their position, although these awards do not provide the same benefits. Additionally, encouragement to supplement these awards should be communicated clearly and flexibility of the type supplement dollars should be available.

The NIH should expand family-friendly policies to allow for paid-parental leave and childcare subsidies similar to intramural postdocs. This allows postdocs who may put family planning on hold to continue to build their future.

The NIH should state clear practices of career and professional development to allow for postdoc fellows on NIH funding to have time set aside for development. By including it on grant-requirements, faculty/PIs must allow postdocs time away from research to continue to develop their skills.

The NIH should encourage mentor committees, similar to those of Ph.D. students to encourage intellectual growth of postdocs with faculty that they do not directly report to. This will allow additional career and professional development opportunities, training opportunities, and networking opportunities. This also provides additional mentorship to help navigate relationships between postdocs and their faculty/PI.

Proven or promising external resources or approaches

The National Postdoc Association (NPA) is a key advocate for the postdoctoral population. It provides institutions with resources to develop key programming for postdocs. It also provides guidance on setting postdoc policy.

Additional services provided by the NIH such as OITE has provided training, such as facilitation of resiliency training, that is helpful to postdoc offices to provide programming to our populations.

Open dialogues between institution postdoc offices, the NPA, and NIH will be invaluable in the future as we continue to encourage growth of postdoc populations and a diverse faculty landscape.

Response 3001

Perspectives on the postdoc roles and responsibilities

A postdoctoral research fellow is a trainee in residence pursuing advanced study beyond a doctorate or medical degree that contributes to the development of medical knowledge and other health sciences. The research fellow position is considered a short-term training position intended to lead to an independent research career in academia, industry, or government. A time-limited appointment offers the research fellow the opportunity to further training under the direction of a faculty mentor while at the same time protecting the fellow from indefinite tenure in a training position. The term of service should provide adequate time for a research fellow to transition into a full-time position with the appropriate salary and benefits commensurate with their education and research experience.

Fundamental issues and challenges

One of the biggest challenges impeding the recruitment, retention, and impacting the overall quality of life of postdoctoral research fellows at [redacted for anonymity] is the fact that NRSA postdoctoral salaries are not nearly sufficient to afford them a decent quality of life in the greater Boston area.

Uniform NIH stipends for postdoctoral trainees across the US do not consider the highly variable cost of living across the country. In the Northeast and the Boston area in particular, the minimum NRSA salaries are insufficient for a fellow to maintain a reasonable standard of living. The lack of flexibility on salary restricts [redacted for anonymity] ability to retain and attract postdoctoral fellows, all the more so given that the significant biotech and pharmaceutical presence in Boston makes the local market especially competitive.

Existing NIH policies, programs, or resources

The NIH should either substantially increase current NRSA stipends or adjust the stipends based on the geographic cost of living. While NRSA PGY stipends have increased, they have not adequately matched cost of living increases.

In addition to raising the NRSA stipend levels, NIH must simultaneously increase the size of each NIH award to accommodate the stipend increases. Moreover, the NIH should mandate that all NIH institutes accept non-modular budgets or significantly increase the award amount of the modular budget, which has stagnated for decades.

For [redacted for anonymity] to pay postdoctoral fellows at the local market rate, stipends at each PGY level must increase by 20% from the current NRSA levels. The NIH should therefore allow for at least a 20% increase to all R-grant budgets at the time of competing renewal for all institutes.

The NIH should liberalize the policy that restricts using alternative Federal funds to supplement trainees' salaries on any NIH training awards. The duration allowed on a training award should be lengthened to reflect the true time needed to be competitive in the current job market.

The NIH should decrease the administrative burden on new and especially competing renewals for training grants.

The time allowed on a training award should be lengthened to reflect the true time needed to be competitive in the current job market. The creation of transition awards (T to R and K to R) would help retain fellows in academia.

Given the impact of mentorship on the postdoctoral training experience, the NIH should mandate, on any federal grant envisioning postdoc training, an institutional document outlining the institutional support for postdocs. Additionally, the NIH should consider mandating secondary mentors for all postdoctoral fellows and creating an ombudsperson for postdoctoral fellows at NIH.

Lastly, to help track career progression, it would be useful if all fellows were given unique identifiers.

Proven or promising external resources or approaches

The [redacted for anonymity] serves as a center of excellence on career development of our diverse clinical and research faculty and trainees by sharing best practices on mentorship, well-being, and promotion. Among the several offices within the center, the Postdoctoral Division supports our trainees and the advancement of their careers through one-on-one meetings, CV reviews, mentorship, skill-building seminars, mentorship programs, and transition to independence.

Given the lack of uniformity around career mentoring for postdocs, which relies almost exclusively on the individual PI, the Postdoctoral Division at [redacted for anonymity] is an alternate resource for trainees to get advice on career development, academic promotion, and conflict resolution. The Director of the Postdoctoral Division reviews all requests that extend beyond 5 years of postdoctoral training.

We also mandated a secondary mentor requirement for postdocs to identify a secondary mentor and are encouraged to establish a mentoring network to obtain guidance on career development and engage in discussions of future professional goals.

The Postdoctoral Division and other CFD offices offer many programs and resources to support our research fellows during their training. Examples from the past year include:

- Two-day Postdoc Retreat for over 200 postdocs, centered around well-being and career development.
- Leadership Development Program for Researchers, to prepare postdocs and junior faculty for the challenges inherent in creating a successful research program.
- "Anne Klibanski Visiting Scholars Awards" to present as a "virtual" Visiting Professor at a national/international institution and receive focused mentorship and professional coaching.

CFD Writing Support:

- English for Speakers of Other Languages (twice/year)
- Writing/editing services for [redacted for anonymity] faculty and trainees by [redacted for anonymity] science writers (5 hours /year
- Stress Resiliency Program for Postdocs addresses the pressures of work-life balance

Response 3002

Perspectives on the postdoc roles and responsibilities

Essential to the scientific workforce and for faculty pipeline in academia

Fundamental issues and challenges

Poor funding prospects in academia is turning away the best and brightest. Even if we do increase postdoc pay, they see the abysmally low pay lines at NIH and choose to leave academia. NIH budget must be increased and the modular grant must be increased to keep up with inflation.

Existing NIH policies, programs, or resources

Increase postdoctoral award number and amounts so the best postdocs can get independent funding during their training period. Provide more postdoc to faculty transition awards. Increase the size of the modular R01. Increase paylines for funding. It's all about funding!

Proven or promising external resources or approaches

Listen to faculty who have been training and mentoring postdocs when we say that funding for research is the problem.

Response 3004

Perspectives on the postdoc roles and responsibilities

Postdocs are the drivers of biomedical bench science. With their youth, drive and willingness to forge new paths, I really think they are the source of new innovation; certainly they are responsible for putting the vast majority of ideas into tangible results. As the field of positions postdocs move into widens, we need to also think about how we can best support these different outcomes: Postdocs are able to do rigorous evidence-based work and how could this expertise be better integrated into public health and healthcare decisions? Others really want to continue to do great technical work and we lose out on this by having so few staff scientist positions in academic settings. We need to be flexible in postdoc timing: 2, 4, 6 year tracks might have different goals.

Fundamental issues and challenges

Chronic underfunding of public Universities has left many students in debt before they can begin a PhD, and PhD stipends are not keeping pace with coastal costs of living. At this pace, only the rich will be able to afford to be postdocs, and this is exactly the opposite of our goals to have a scientific community that is representative of the demographics of the US.

Existing NIH policies, programs, or resources

NIH stipends could be adjusted for regional cost of living, and include options for childcare expenses so that postdocs can live on the salary they earn.

Proven or promising external resources or approaches

I think people are looking to be part of things that are meaningful and advance the goals of society and community. If postdocs don’t see the next step after this period of training, I don’t think we’ll be able to recruit them based on the details of the job itself. Long hours and low-ish pay are only going to tolerated if there is a sense that this (short) period of deprivation will lead to something sustainable and meaningful.

Response 3005

Perspectives on the postdoc roles and responsibilities

they are a critical part in accomplishing academic science, they help to train PhD students, and are developing skills to eventually lead their own research laboratories. without them academic science would not work.

Fundamental issues and challenges

overwhelmingly the issue i see is that salaries are too low, thus un-competitive with other jobs like industry positions; even if the individual looking for a postdoctoral position is MORE interested in staying in and contributing to academic science.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3006

Perspectives on the postdoc roles and responsibilities

The academic postdoc should be a time for growth and independence in scientific thinking. The postdoc should take ownership of their project and lead the direction toward publication as well as getting funding for the project.

Fundamental issues and challenges

Financial reasons as well as the number of hours postdocs are expected to work inhibit recruitment and retention. Support such as childcare and flexible hours would improve the quality of life.

Existing NIH policies, programs, or resources

NIH programs that provide childcare and housing for postdocs would significantly aid postdoc retention.

Proven or promising external resources or approaches

No response

Response 3007

Perspectives on the postdoc roles and responsibilities

To me, the post doc is not a training position any more. Graduate students come in to grad school with the expertise post docs used to have 20-30 years ago. Yes, training happens during the post doc phase, but as a scientist, you have to always be learning.

The post doc to me is an arm of the PI. They do the hardest science the lab needs to do to get their desired funding and help train grad students. Post docs are experts and the role and pay should reflect that.

Fundamental issues and challenges

The pay is abysmal. That is it. I can make double if I just go to industry after grad school. The salary floor for post docs in the cheapest areas of the country should be 75,000 with regular increases with inflation year over year. That is the bare minimum. The pay is completely unacceptable for the level of expertise and the labor post docs contribute. I will have 11 pubs when I finish grad school and I'm going to leave academia because the pay for post docs is an absolute embarrasment. I could probably do well in academia and I enjoy many aspects of it, but why would I stay? I have to think about my family's future, not just how I love working in the lab. This economy doesn't allow for "chasing your passion" when you're going to make 50,000 with a PhD, it is crazy. I can't find a good reason to stay, it feels financially irresponsible. If we want to stay at the cutting edge of science in this country it has to change.

Existing NIH policies, programs, or resources

More money for post docs. Also some sort of pipeline system that guarantees a tenure track position at the end of an award. Like a K award that guarantees TT position depending on perfomance. We would keep way more good people in the academic space.

Proven or promising external resources or approaches

Unsure. Just get more funding and pay them more. Everything else is pretty much fine.

Response 3008

Perspectives on the postdoc roles and responsibilities

A postdoc is a critical period of advanced training when one can explore a new area or take real scientific risks in an area, to explore and develop as a scientist.

Fundamental issues and challenges

My postdocs spend a large amount of their time dealing with being forced to live on sub-living wages for this area. That dramatically affects both their ability to focus on research and to take the scientific risks required to develop to their true potential. This would be solved by higher salaries if the NIH funding existed for that. As it stands with current modular R01 and ESI MIRA/R35 amounts, the NIH is forcing postdocs into sub-par training.

Existing NIH policies, programs, or resources

NIH needs to up the modular budget and the 500k R01 budget without pre-approval. Particularly as most postdoc applicants are international, this is the primary way to pay them and we increasingly cannot.

Proven or promising external resources or approaches

A living wage is a proven approach to improve working environment, recruitment, and job satisfaction. Please enable us, your investigators, to pay it!

Response 3009

Perspectives on the postdoc roles and responsibilities

I viewed a postdoctoral fellowship as a chance to change my field of study (I went from microbiology/biochemistry to immunology). I felt I could benefit from additional time in a different research laboratory to learn new skills and get exposure to a different environment, as well as see and learn how a new lab/institution approaches scientific research. I also took a postdoc as time to help me determine the best career path for myself, as I left my PhD program unsure of what I'd like to do once I completed my graduate training. Postdocs in academic institutions are well positioned to receive guidance on how to best continue in academia, but after being in an academic postdoc for 3.5 years, I do not view these positions as being as helpful to those with non-academic aspirations.

I have heard from senior faculty members within academia, that if a postdoc takes longer than 3 years to complete their work they are a failure, and that any postdoc that takes longer is somebody who has no aspirations, drive, etc. Before going into my postdoc, I was informed by other postdocs that, compared to graduate school, postdocs can be lonely and isolating (see below, Quality of Life).

Fundamental issues and challenges

Issues impacting recruitment:

- While networking is ideal and usually the norm, it is hard to find out about available positions in labs or on T32s, there is no online tool or resource where this information is advertised and consolidated.
- There is no uniform application process to be a postdoc, it varies between lab or institution (e.g. some advertised positions ask for detailed cover letters).
- Not all graduate programs offer a chance to interact or talk to postdocs about their experiences.

Issues impacting retention:

- Poor pay compared to industry or other careers.
- Little resources to assist those that wish to start families (e.g. additional credits for dependents, time off can vary from lab to lab, etc.).
- Poor health insurance or no access to benefits provided within the institution (e.g. while I was on a T32, I was on a separate heath insurance plan that had higher deductibles and less coverage, was not eligible to invest in any retirement plans, and I had to do extra work to determine how much I owed in taxes).
- Postdocs are not viewed as employees or students by either the institution or local/federal government and thus often miss out on benefits provided. This creates issues both formally (taxes, pay, etc.) and informally (identity crisis within postdocs).

Issues with quality of life:

- See points above as major impacting factors.
- No required or supported mental health care for postdocs, this varies across institutions.
- Postdocs are lonely, as there are no shared required classes or activities that create the bonds graduate students can build, and postdocs are usually older and have families or outside responsibilities that make it hard to create connections outside of their immediate labs.

Existing NIH policies, programs, or resources

Ideas to improve recruitment/retention:

- Increase grant support on T32s, R01s, etc. so institutions can offer a competitive salary.
- Create a national database (similar mold as NIH Reporter) where interested graduate students can find postdoctoral positions in either labs and/or on T32 grants.
- Expand policies on T32s that require time for graduate students to meet current postdocs.
- Expand Loan Forgiveness Programs to accept PhD students from more backgrounds/research study areas.
- Clearly define the roles or position title postdocs are within an institution
- Streamline and simplify government websites to make it easier for postdocs to find materials for fellowships/K awards, or other support resources.

Proven or promising external resources or approaches

Offer support for institutions to create programs that enable postdocs to get exposure to alternative career paths (invited speaker series, salary-support internships, etc.)

Response 3010

Perspectives on the postdoc roles and responsibilities

I view my roles and responsibilities as a postdoc as being a focused researcher whose primarily directive is to make progress on the project my position is funded through. However, this role also includes other important tasks including but not limited to mentorship, grant writing and community service. This role comes with tremendous pressure as it feels that my ability to be competitive for a more secure position such as a faculty position is directly tied to my productivity as a postdoc. The transient and short term nature of the role as well as the limited financial security which come with being a postdoc make it difficult to fully focus on conducting good and innovative research. Compounding this issue, I only take on projects which I know will result in publications as I cannot afford to spend months working on high-risk projects which if unsuccessful will threaten my future opportunities for career progression. While I am passionate about research, the costs of delaying life milestones such as marriage and starting a family because of issues related to financial stress and instability are real and for me personally a significant source of despair.

Fundamental issues and challenges

There a two fundamental issues I am experiencing during my time as a postdoc, which center around issues of financial security and uncertain job prospects. Both my fiancÃ© and I postdocs in an NIH funded lab and while the pay is sufficient for our ability to afford rent and food we cannot see a path forward in

academia for being able to afford a permanent house and have children. Both of these issues severely reduce our quality and life and thus likewise hamper our ability to conduct quality research. The uncertainty of being able to secure a faculty position compounds this issue, leading us to seriously consider leaving academia for industry roles. These issues are severe enough that even though I am personal supported by a post-doctoral fellowship I am seriously considering leaving my fellowship early to take a role in industry. I would much prefer to stay in academia as else being equal, but science doesn't occur in a vacuum and I struggle to see a path forward within academia. The combined pressure created by the hyper competitive nature of the biomedical field and the volume of work hours required be to competitive coupled with the pressure of struggling to afford basic essentials for quailing of life are truly crushing.

Existing NIH policies, programs, or resources

In my view their are two policy modifications that the NIH could take which would improve the situation. These two modifications include expanding the pay and duration of training programs such as fellowships and pressuring Universities which receive significant NIH funding to better support postdocs. For expanded training opportunities the level of support is far too low, particularly in high-cost of living areas. While historically viewing postdocs as trainees would support the current level of funding, the reality is that outside of academia a researcher can easily double the salary that would come with an F32. While I acknowledge that the NIH is not responsible for industry wages the reality is that many postdocs including myself are finding it harder and harder to continue and that until there is better pay parity it's hard to see retention improving. For putting pressure on Universities to better support postdocs I believe that arrangements such as removing personal costs from overhead or other arrangements which would prioritize more competitive compensation would be a huge step forward to improving the situation. As an example I recently worked with my PI to put together a grant and overhead and salary plus benefits for one postdoc encompassed nearly half of the yearly budget. I believe that pressuring Universities to implement cost-sharing (or similar measures) of research personnel like postdocs would significantly improve the ability to recruit and retain postdocs. Ideally this would be done in partnership with Universities in a way that does not penalize PIs.

Proven or promising external resources or approaches

For approaches to improve the training ecosystem of postdocs my suggestion is implementing system of accountability that have some teeth. The power dynamics between trainees and PI is significant. Its been my observations that while most PI are kind and dedicated to supporting the development of their trainees abusive mentors are disturbingly common and are often well-funded and well-connected enough to be insulated from consequences. Specifically at the postdoc level you are entirely dependent on your PI for financial support (excluding fellowship support) and so many postdocs are highly exposed to abusive practices often without the recourse and protections which grad students have access to (committees and switching labs). As most postdocs have very little (if any) saving they cannot afford being out of work for long and thus can easily become trapped in abusive situations. This accountability gap is an important role that funding agencies can fill both by having mechanism of oversight which discourage abuse and when abuse does occur have the ability to hold individuals accountable. Ideally, this would include mechanisms to support trainees and insulate them from retaliation or job loss. In summary, the common thread that underlies the most pressing problems faced by postdocs center around the instability of the position. Academic trainees in general are highly exposed to the quality of life and security issues which face the US right now. As a postdoc myself believe that the only way to retain promising scientists is a significant overhaul of the systems which support trainees.

Response 3011

Perspectives on the postdoc roles and responsibilities

The role of postdoc is to provide training to become a professor or run a lab.

Fundamental issues and challenges

Postdocs are often treated more like scientists, but recruited with the lower pay and benefits of a postdoc.

Existing NIH policies, programs, or resources

More funding for scientists and differentiation of the two pathways.

Proven or promising external resources or approaches

No response

Response 3012

Perspectives on the postdoc roles and responsibilities

I view a post-doc as a researcher position that includes independently carrying out research projects as determined by the lab head, mentoring graduate students or other post-docs in the lab, communicating research in peer-reviewed publications and scientific conferences, and building new skills relevant to their research by attending workshops and classes.

Fundamental issues and challenges

The fundamental issue is pay and short term appointments. Postdocs should be paid commensurate with their experience, which only a few institutions require, and does not include the NIH. For example: https://www.hhmi.org/sites/default/files/hhmi-postdoctoral-associate-scale.pdf

Existing NIH policies, programs, or resources

Increase minimum pay.

Proven or promising external resources or approaches

https://www.hhmi.org/sites/default/files/hhmi-postdoctoral-associate-scale.pdf

Response 3013

Perspectives on the postdoc roles and responsibilities

A period of training after a successful graduate school training to learn and expand scientific skill set during a period of focused scientific investigation. May include development of professional networks, mentoring junior scientists/trainees, teaching, grant and financial management. Includes time to develop and apply for a faculty position.

Fundamental issues and challenges

Cost and competing salaries for similar levels of positions.

Existing NIH policies, programs, or resources

Cap the number of postdoctoral fellows an individual PI can train at the same time while receiving NIH funding for either party.

Proven or promising external resources or approaches

Create a postdoc to staff scientist grant in the same capacity as the F99/K00 and K99/R00.

Response 3014

Perspectives on the postdoc roles and responsibilities

The goal of the postdoc is to build and refine your skillset for the next career stage.

Fundamental issues and challenges

1. Benefits—The most significant issue with the salary and benefits of the postdoc is that postdocs are not offered anything in terms of a retirement benefit, even though they are in many cases considered employees of a university system. In my case, I did not start putting money into a retirement account until I was 32 because I had no access to an employer sponsored retirement program—not as a graduate student, and not as a postdoc. Assuming the average postdoc takes 5-6 years and a postdoc of 4 years, this is conservatively 9 years of lost potential. This needs to change.
2. Salary and work-life balance—There's no locality pay and it can't compete with private sector jobs. A typical postdoc conservatively works 50 hours a week. For a salary of $56k, this is about $22 an hour. This does not leave enough money to build retirement and savings, purchase a home, or start a family.

This is too low for many major metropolitan areas. Basic scientists are often expected to go in every weekend to run animals, conduct experiments with specific time points, feed cell cultures, etc. There is no work-life balance. Solutions: increase the modular budget for RPGs, as salaries are already diminishing the returns on RPGs to PIs. Indirect costs to universities can be upwards of 90%. These costs should be used to cover salary and full benefits (inc. retirement) of trainees. Certain percentages of indirects should be required to facilitate and/or subsidize the costs associated with trainees participating in certificate/degree programs in order to meet the needs of the biomedical research enterprise and enhance career opportunities for postdocs. Certificate programs that could be developed with partnerships include: lab management, non-profit management, regulatory affairs, project management, bioinformatics, qualitative/quantitative research, teaching, or programming.

Existing NIH policies, programs, or resources

1. The LRP—NIH created the L32 for individuals from disadvantaged backgrounds, but limited it to only those conducting clinical research. Why? I check 5/7 boxes for disadvantaged and my research as a postdoc would not have been eligible. As a result, I started my government career with almost $100k in student loan debt that had I been eligible for an LRP would have been wiped away when I was a postdoc. The L32 should be for any student from a disadvantaged background regardless of area of research.
2. K99/R00, F99/K00, T32s—All these programs only create positive bias and the rich get richer. These awards are not realistic opportunities for students from non-Tier 1 institutions. Students from R15 eligible schools stand virtually no chance. Most of these awards go to Tier 1 schools to trainees that didn't need them to succeed. Eliminating these golden tickets or using the programs to only allow non-Tier 1 trainees to get into Tier 1 programs are more meaningful solutions. Alternatively, the academic research enterprise could stop offering PhD slots to institutions that are not designated as Tier 1 or having a certain degree of funding in order to eliminate false hope and truly capture the best of the best from the best schools. Students and universities who get these awards come from heavily resourced personal and academic research environments. Students from R15 institutions proposing to do western blots or surveys can't compete with Tier 1 applicants proposing to do single cell transcriptomics via core facilities and complete a course in bioinformatics. So then what happens to all of the postdocs who went to non Tier 1 institutions? These students, who likely didn't come from privileged families to begin with, are stuck with too few options left at the end of training.

Proven or promising external resources or approaches

It is important that any LRP continue to pay the associated taxes as is currently the case. Many postdocs are not going to have an extra $5k-10k sitting around to pay the taxes. Further, if the focus is really on disadvantaged backgrounds, then these trainees are not going to have family resources to beg and borrow from in order to cover the taxes associated with lump sum payments.

Response 3015

Perspectives on the postdoc roles and responsibilities

Lead complex and ambitious projects, mentor students, help get data for grants

Fundamental issues and challenges

Salaries are too low. Paying a fair wage ($70k + benefits) takes up a huge fraction of an R01. Impossible to run a lab with postdocs and students with a single modular budget R01/R35.

Existing NIH policies, programs, or resources

Modular budgets (R35) should be 400k. Increased funding for postdoc fellowships, including immigrant/international postdocs.

Proven or promising external resources or approaches

Recent HHMI increase in postdoc stipends.

Response 3016

Perspectives on the postdoc roles and responsibilities

I view the role of the postdoc to be a bridge between graduate (mentored) research and independent (non-mentored) training. To develop the skills necessary to establish one's own line of research worth pursuing, skills that include grant writing, mentorship, teaching, networking, and research.

Fundamental issues and challenges

I am a graduate student a month away from finishing my PhD. I wanted more than anything to do a postdoc and remain in academia when coming into my PhD program. However, the barriers present within the current system make it impossible to pursue, which are two-fold: salary and abuse. Postdoc salaries simply are not enough and there is no way to justify the current standards. If academia wants to keep up, they must offer the same (if not better) compensation and benefits available to individuals who would leave for industry or outside jobs. It is unethical to continue to exploit the labor of graduate students and postdocs as has been the standard, often forcing them into poverty for the sake of "passion". The system itself is also horrendously abusive, even if the pay was higher. There is no accountability within the current system as it stands, with all of your career riding on the impression of a single (often) man. This simply cannot survive. As much as we'd like to think that one's papers and scientific output is the merit upon which one's worth should be measured, we know that that is simply not how the current system functions. Too many abusive, willfully negligent people are in positions of power who have no intentions of fostering the next generation of talent.

Existing NIH policies, programs, or resources

Minimum salaries must be $100,000+ for postdoctoral researchers. Full stop.

NIH should set up independent funding mechanisms in place at institutions such that no individual PI is responsible for individual postdocs--rather, they're jointly mentored when necessary or warranted (fostering collaboration) but sufficiently independent and responsible to one's self and the university.

Proven or promising external resources or approaches

https://cdn.ymaws.com/www.nationalpostdoc.org/resource/resmgr/docs/2023_postdoctoral_barriers_t.pdf

https://www.nature.com/articles/d41586-021-03041-0

https://www.nature.com/articles/d41586-021-03043-y

https://www.nature.com/articles/d41586-023-00332-6

Response 3017

Perspectives on the postdoc roles and responsibilities

As a postdoc, I drive projects forward on my own with very little input from my PI. I am expected to balance these multiple projects, mentor junior students, and write both papers and grants effectively. I do not view this as a trainee role in any way, shape, or form, nor do my expectations reflect a trainee status. However, I am frequently treated as "just a trainee." There are no differences in my program (or in my previous doctoral program) between the requirements for seminar presentations and attendance among graduate students and postdocs. There are also no training programs designed to enhance our job prospects in this increasingly competitive environment. I found myself thinking recently that I am essentially just starting graduate school over again, as I will have 4-5 years of driving a project with the expectation of forming and meeting with a committee and attending seminars, with nothing to help me reach the next level.

Fundamental issues and challenges

Chief among my issues is pay. We as postdocs have the highest degree attainable and are paid a fraction of what we are worth in industry. Benefits are another issue; since we are "trainees" in most environments, we are not given any sort of retirement benefits. My program offers a retirement account, but no employer matching which would be expected outside of academia. Going through graduate school and a postdoc sets us back a full decade on retirement savings, which helps explain why professors stay

on so long, preventing the next generation from obtaining a tenure track position. Increasing our pay and expanding the required benefits (or at least requiring institutions to compensate us commensurate with other employees) would go a long way to retaining postdocs.

Existing NIH policies, programs, or resources

Institutions rely on the NIH F32 minimum salary as a maximum in most places. NIH should provide annual cost of living adjustments that actually keep pace with inflation given how underpaid we are, and allow (or rather, require) scaling with cost of living for an area commensurate with other readily available cost of living adjustments such as through the military (DFAS; https://www.travel.dod.mil/Allowances/CONUS-Cost-of-Living-Allowance/CONUS-COLA-Rate-Lookup/). NIH should also ensure that institutions are working to minimize time spent as a postdoc. Some institutions like my current one only allow you to hold the title "postdoc" for up to 5 years, but after that you can retain your same position just as a "research associate" with no difference in pay or responsibilities. This is just a way of gaming the system to make their numbers look better than they actually are.

Proven or promising external resources or approaches

NIH should work on a set of required professional development topics, similar to currently required RCR training, that institutions must provide postdoctoral fellows focusing on job interviewing skills and the job search, negotiations, budgets, etc. to prepare us and actually train us to become PIs. If this is truly meant as a training phase, then provide us real, tangible skills to support our transition to tenure track faculty. Simply requiring us to present in annual seminars and journal clubs is not helping us and is lazy on the part of the institutions.

Response 3018

Perspectives on the postdoc roles and responsibilities

As a postdoctoral research fellow, I have been completely responsible for all aspects of my training. I have learned to fully advocate for my success and ensured that I have access to tools to assure the next phase of my career. Although this has been a mentoring role, there is minimal training or guidance that I have received. This leads me to believe that, at least in my case, postdoctoral researchers are already independent scientists but are paid A LOT less.

Fundamental issues and challenges

1. Low pay
2. requirement to consistently move
3. Toxic environments
4. no respect from peers.

Existing NIH policies, programs, or resources

1. PAY
2. Anonymous audits of NIH funded mentors

Proven or promising external resources or approaches

No response

Response 3019

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are crucial for academic research as they provide opportunities for recent PhD graduates to gain additional training, acquire new skills, and conduct independent research under the supervision of a senior mentor. The postdoctoral experience is considered a transitional period between graduate school and a permanent research position or academic faculty position.

Fundamental issues and challenges

Many postdoctoral trainees are paid low salaries, which do not reflect the level of education and expertise required for their position. This can make it difficult for them to afford living expenses, pay off student loans, and save for their future. Limited career advancement opportunities: The lack of clear career paths and job security can make it difficult for postdoctoral trainees to plan for their future and achieve their career goals. This can lead to frustration and burnout, and may contribute to high attrition rates.Limited mentorship and support: Many postdoctoral trainees lack adequate mentorship and support, which can make it difficult for them to navigate the complex academic research environment. This can lead to feelings of isolation and lack of direction, which can impact their productivity and overall well-being.

Lack of work-life balance: The demanding nature of academic research can make it difficult for postdoctoral trainees to maintain a healthy work-life balance. This can lead to stress, burnout, and mental health issues

Existing NIH policies, programs, or resources

Many postdoctoral trainees are paid low salaries, so salaries should be increased.

Proven or promising external resources or approaches

No response

Response 3020

Perspectives on the postdoc roles and responsibilities

I believe there are two types of people who look to do post-docs. Primarily, it is people who look to move to research-intensive academic jobs. I also see a second group of people who do a post-doc either because they are unsure of their future path, or they are looking to gain a specific skill before switching careers (particularly to gain experience with teaching or to gain experience in a specific technique relevant to industry). Depending on which category a person falls into, the roles of the post-doc are different. In the first category, the role of the post-doc is to establish their own project which can be taken with them while applying to faculty positions. For the second group, they are expected to stay for a shorter period of time, and their main goal is to acquire a specific skill set (while contributing to the research in the lab, much like a senior scientist, or technician would do).

Fundamental issues and challenges

I believe the biggest factor is the lack of benefits and low salary expected in most post-doc positions. The salary and benefits of these post-doc positions are vastly different than if alternative careers were pursued. I have noticed that many graduate students feel like post-doc are viewed as people who should crank out research and publications for a lab and are not necessarily seen as a trainee who is there to learn. At that point, it seems much more attractive to be a paid employee in industry for much more money and with better benefits.

Existing NIH policies, programs, or resources

I think the salary, benefits, and paid leave should be standardized.

Proven or promising external resources or approaches

Washington (the state), for example, is increasing its post-doc salary to be more competitive with alternative career options. I believe this would increase the recruitment and retention of post-docs.

Response 3021

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are important for most scientists interested in leading an academic lab in the future. It helps develop/refine independent ideas and provide the training necessary for running an independent lab.

Fundamental issues and challenges

Low salary

Poor future job prospects post training

Existing NIH policies, programs, or resources

Training grants for postdocs from foreign countries.

Proven or promising external resources or approaches

Postdoc salary should be comparable to salaries offered by industry. Increasing R01 grants for PIs will have a trickle down effect on postdoc salaries.

Response 3022

Perspectives on the postdoc roles and responsibilities

I am a first-generation Latino college graduate. In my experience, what an academic postdoctoral position was supposed to be did not match the reality of my situation. I was treated like a laboratory technician, constantly pushed to produce large amounts of data. At the same time, I was not mentored for non-academic careers (my main interest) and actively discouraged from non-academic opportunities. I did not receive very good mentoring in general, as I was not allowed to learn new techniques or skills. If I wanted to pursue interests that did not immediately produce data for established projects in the laboratory, I was told to do it outside of work hours or on weekends. My experience is why I no longer recommend academic postdocs to anyone. I view it extremely negatively, and given that my postdoctoral advisor refused to help me find a job in industry, I feel that my academic postdoc has ruined my chances at a career in science.

Fundamental issues and challenges

Pay is the biggest issue precluding recruitment, retention, and lowering overall quality of life. My mentor was very abusive and regularly threatened postdocs and staff scientists alike. However, she is very powerful and ingratiated in NIH circles, so there is nothing we could have done to stop her abusive ways.

Existing NIH policies, programs, or resources

Is there a way to report abusive PIs at the NIH? She would threaten to fire staff scientists because she didn't like their personal opinions, and bullies her lab into doing what she wants. Academia doesn't have a great track record of preventing or even disciplining PIs for sexual abuse, so I doubt there will be improvements in this regard.

Proven or promising external resources or approaches

I am legitimately traumatized from my experience. Near the end of my postdoctoral appointment, I was ready to hurt myself, so I sought counseling from my institution's postdoc services office. I survived my postdoctoral training, but that's all I can say. I have been unemployed for the past 9 months, and honestly believe it's because of the poor training I received as a postdoc. I don't know how much longer I can live with the shame of having chosen to do a postdoc just to ruin my career. More seminars on how postdocs can be their own mentors doesn't seem like a great fix. It is possible that I am an outlier, but who would be willing to admit all of this publicly?

Response 3023

Perspectives on the postdoc roles and responsibilities

Postdocs are everything in academia. I am the first line of support for graduate students and trainees. I read first drafts of everything the students write. I run my own studies while supporting all others. And while we hold such valuable roles we are neglected, underpaid and undervalued.

Fundamental issues and challenges

Pay is a major issue for PDs. It would be very impactful if NIH required faculty with NIH-funding to pay PDs the NIH minimums (if they write a PD salary into their R01 for example). Currently, that is only afforded to PDs that are privileged enough to obtain their own NIH funding. It should be an NIH-led initiative that helps support faculty in properly budgeting PD salaries across multi-year grants including likely cost of living increases which may be challenging to predict 5 years into the future. Secondly, the NIH PD minimums are being used at the university level as a MAXIMUM pay level. Universities do not

allow PIs to pay postdocs above the minimum. Perhaps a range for each year of experience would be more successful in practice.

There should be more support for DACA recipient scientists-they are currently ineligible for all NIH funding and that seems like a major failing in terms of diversity and equity.

Requiring PDs to move for faculty positions as can occur with K99 fellows is a problematic practice.

Existing NIH policies, programs, or resources

The LRP program is incredible. And is a huge reason for my retention in academia.

Proven or promising external resources or approaches

Most universities have a postdoc-led postdoc association which works at the local level to advocate for postdocs and create community within the university. It would be amazing if NIH supported these association by providing support to the postdoc leadership. I can imagine a training program where PD leadership could travel to NIH to learn about all the valuable resources available to PDs, to learn best practices for success, inclusion and advocacy while being connected to similar individuals across the country. I think it would be profoundly successful as those in the program would return to their university to disseminate all that info on the local level. I would love to share more about this vision. I can be reached [redacted for anonymity]

Response 3024

Perspectives on the postdoc roles and responsibilities

Performing high-quality and impactful science. Contributing to the laboratory environment, including informal or day-to-day mentoring.

Fundamental issues and challenges

Low salaries, limited parental leave, low status

Existing NIH policies, programs, or resources

Many universities are now setting minimum postdoc salaries that substantially exceed the NIH NRSA salary levels. This is necessary to provide an adequate salary for these highly-skilled individuals, especially in cities with high costs of living. However, it creates substantial funding challenges since NIH funds can often not be used to support the full cost of these individuals, resulting in a requirement for private or discretionary funds to support at least part of a postdoc's salary. This is not sustainable. The NIH should consider more flexibility funding for postdoc salaries and benefits.

Proven or promising external resources or approaches

HHMI policies, Singapore A*STAR program

Response 3025

Perspectives on the postdoc roles and responsibilities

In my view, a postdoctoral position should provide a training opportunity to facilitate a transition from graduate student to either independent investigator, an industry position, or other position that requires continued training in science. This means that there should be an OVERALL time limit. Postdocs should be limited to six years total, over all positions, with 1-2 year extensions granted on a case-by-case basis. The NIH should no longer be party to facilitating endless serial postdocs, as people go from one institution to the next. These postdoctoral fellows, usually foreign, are being exploited as cheap labor. The NIH should count total postdoctoral years, irrespective of institution or funding source. The NIH should also mandate career development opportunities.

Fundamental issues and challenges

Low salaries and poor benefits, combined with diminishing prospects for independent PI positions, have made postdoctoral fellowships increasingly unattractive. This must change if we are to encourage the best and the brightest to pursue careers in science. This is particularly an issues for postdocs from lower-

income and underrepresented backgrounds. Childcare benefits would also help. Please raise postdoc salaries and provide the necessary grant funds to support these raises.

Existing NIH policies, programs, or resources

1. Increase postdoc salaries and cover health insurance.
2. Place a 6-year limit on total postdoc years, with option to apply for 1-2 year extension. Stop the exploitation of foreign postdocs as cheap labor.
3. Expand the F32 program to increase number of fellowships.
4. Mandate career development for all postdocs supported by NIH grants.
5. Promote career scientist positions funded by NIH grants (in lieu of using postdocs as labor).

Proven or promising external resources or approaches

No response

Response 3026

Perspectives on the postdoc roles and responsibilities

Postdoctoral Research Fellows (postdocs) are integral to the overall success of academic institutions. They perform critical roles beyond their scientific research, including applying to funding sources and mentoring junior researchers. These activities are similar to the work done by established principal investigators (PIs). Therefore, postdocs should be considered early-career colleagues rather than 'trainees.' Postdocs are a major driving force for the scientific advancements of PIs and academic institutions through publishing papers, securing funding, and representing PIs' mentorship ability. Still, postdocs are a vulnerable group, prone to exploitation by PIs and institutions due to their historical positions in the academic hierarchy. The responsibilities of postdocs should not be solely limited to producing data and publications, but should also include holistic career development opportunities to develop the skills necessary for a successful future career in any field or opportunity. Successful mentorship of postdocs will reflect favorably on PIs and institutions, and garner additional interest from future, qualified postdocs. The immediate need for adequate mentoring and teaching opportunities to practice and hone relevant skills are equally important, as research scientists are also mentors and teachers. However, a glaring disparity exists between university-based postdocs and postdocs at other institutions, such as hospitals or governmental agencies, that place the latter group at a disadvantage when trying to secure mentoring and teaching opportunities. In summary, academic institutions need to update their entrenched view of postdocs as trainees of 'cheap labor'. They must recognize postdocs for bringing unique value to the academic community by contributing intellectual and technical knowledge, as well as critical thinking and oral and written communication skills. As early career researchers, postdocs should be financially and professionally supported. PIs and institutions must value postdocs' contribution and seek to foster their postdocs' continued intellectual and professional growth.

Fundamental issues and challenges

1. Low salaries compared to market value—NRSA guidelines for minimum pay do not consider the difference in cost of living (COL) between different cities, making financial stress worse for postdocs in high COL areas. Further, the annual PG-year increases ignore current inflation rates. Inadequate monetary compensation puts postdocs behind their industrial peers in financial and personal goals, thus adding more stress to postdocs' lives. Our institution recently conducted a postdoc survey, and, unsurprisingly, inadequate salaries were the predominant concern.
2. Postdocs being paid below the NIH PG-year scale—We found that many PIs disregard prior years of relevant, international postdoc experience. Due to vulnerable visa status, lack of institutional immigration support, **and challenges** of cultural integration and language fluency, international postdocs face difficulty self-advocating for the correct salary. Compounding this, international postdocs on external funding don't always receive the same benefits as national postdocs supported by NIH funds.
3. Limited employee benefits, including but not limited to, childcare, parental leave, matched retirement benefits, housing subsidies, and paid time off, further exacerbate the above issues.
4. Unclear guidelines for promotion—Career opportunities in academia are increasingly difficult to obtain due to the limited availability and high standards of prerequisite funding, previous peer-reviewed scholarship, and multiple mentoring and teaching experiences. This further limits the retention of highly skilled postdocs in academia, with many choosing to pursue alternative careers in the industry.
5. Power imbalance between PIs and postdocs—Lack of institutional and NIH oversight for postdocs' financial, emotional, mental, and physical well-being is problematic if left unchecked. Postdocs often take on administrative and managerial tasks that keep labs running smoothly but are unappreciated for these contributions. Continued dismissal of this unseen labor burdens postdocs' mental and physical well-being and can decrease their overall quality of life.

Existing NIH policies, programs, or resources

Firstly, the most significant change that NIH can make is adjusting its recommended NRSA scale to factor in adjustments based on location-specific costs of living (COL) (general schedule federal law for salary structure) and inflation. This is an extremely pressing issue due to the state of our current economy as well as considering that cities with the greatest concentration of NIH funding also tend to have higher COL. Also, as these scales are based on years of postdoctoral experience, the NIH should provide improved guidelines on how to correctly calculate previous postdoc experience when setting new starting salaries to include postdoc experience in other countries, industry, or other academic disciplines.

Secondly, the NIH should expand its guidelines to include a universal mentoring plan for postdocs focused on equipping them with the skills necessary to move ahead in the career of their choice, whether in academia or otherwise. This mentoring plan, along with its annual review, should be an explicit funding criterion for all grant applications that include postdoc salary support.

Thirdly, the NIH should address the limited eligibility of international postdocs who wish to obtain funding through the NIH Career Development (K) Awards or other NIH schemes. As the academic job market has become more competitive, the ability to demonstrate prior funding has become more critical for securing faculty positions. This puts highly-skilled, international scholars at a significant disadvantage when entering the academic job market, both in the US and abroad. Expanding the eligibility criteria for funding would also be beneficial to reduce salary disparities between intramural and extramural postdocs. Additionally, and considering the increasing time frame of postdoctoral experiences, expanding the K99 time limit beyond 4 years to 5 years would assist many postdocs in achieving equal opportunities to pursue funding that would benefit their career goals.

Proven or promising external resources or approaches

1. The Institute for Clinical and Translational Research at the University of Wisconsin-Madison offers "five different frameworks [of contracts] to help each mentor customize [their] own compact" with postdocs (https://ictr.wisc.edu/mentoring/mentoring-compactscontracts-examples/). They encourage using the documents "to structure regular conversations and help ensure follow-through." The NIH could use these as examples to establish a national standard for mentor-mentee contracts that would be more accessible to PIs and postdocs. This would align with the suggestion that mentoring plans, along with their annual review, should be an explicit funding criterion for all grant applications that include postdoc salary support. Pairing with this requirement, the NIH could provide guidelines and frameworks for such mentoring plans, like UW. Additionally, some PIs put mentoring statements on their websites regarding 'what you can expect from me and what I expect from you.' These web pages sometimes also include names and contact info of current and former lab members, explicitly encouraging future applicants to contact them to learn about the lab environment. The NIH could collect examples of best practices and promulgate them in its own mentoring guidelines.
2. PIs are struggling to recruit postdocs and it is expensive to advertise in journals or professional societies' websites. We recently learned of jobRxiv (https://jobrxiv.org/), which is a recruitment site for scientific jobs that aims to save labs and funders money. Their mission is "to make recruitment fairer: with jobRxiv, every candidate has access to every job, and all labs can find the best candidates, whatever their budget." This seems like an invaluable tool for recruiters and potential postdocs alike that would be deserving of financial support from or promotion by the NIH. As advertising options are currently very fragmented, all parties would benefit from an efficient, low-cost, and centralized online system for advertising and finding positions.

Response 3027

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions enable candidates to learn and acquire capabilities for becoming a mentor/faculty in academia. It is a period where our future careers are determined and directed.

Fundamental issues and challenges

International postdocs are recruited as J-1 visa holders, which makes postdocs' life complicated in many aspects like renewing their visa every year and especially applying for some of the grants that require the candidates to be a citizen of the US. So resolving either one of those issues would be much helpful. In addition, postdocs can be considered to be paid more given the amount of work **and responsibilities**.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Enhancing promotions from the position of postdoctoral fellow after three years of postdoc would definitely be an encouraging factor in our career pathways.

Response 3028

Perspectives on the postdoc roles and responsibilities

Postdocs are a critical source of scientific skills and knowledge for my lab. I view the postdoc training period as a valuable time for postdocs to acquire new scientific skills, gain experience in training and mentoring younger students, and develop their own research ideas. My group would not function without our amazing postdocs.

Fundamental issues and challenges

Low salaries and the limited spending power of current NIH budgets. Talented PhD scientists do not want to do a postdoc in part because they can make more in industry and are concerned about cost of housing, childcare, and general cost of living.

Existing NIH policies, programs, or resources

The NIH modular budget, and NIH budgets generally, should be increased to reflect inflation over the last almost 30 years. This would allow us to provide more financial support for postdocs. The NIH postdoc salary minimum should also be increased.

Proven or promising external resources or approaches

Efforts to help faculty attract more diverse postdoc cohorts would be particularly valuable (see Stanford PRISM program).

Response 3029

Perspectives on the postdoc roles and responsibilities

Academic postdoc positions are designed to train researchers to become an independent researcher and learn about careers they may be interested in. Academic postdocs are meant to be a temporary transitional position. Since it is a training position, time needs to be allotted for postdocs to participate in career and professional development which is not being allowed by many PIs.

Fundamental issues and challenges

Pay is a very limiting factor in recruitment and retention, especially when most academic postdocs eventually go into industry. While it would not be feasible to be competitive with industry salaries the way funding currently sits, academic salaries need to be much better to attract talented brilliant minds to academia. Additionally, there needs to be systems to prevent toxic work environments from happening that typically negatively affect the postdoc's career and the PI gets to keep repeating their actions over and over. As the system stands, PIs can create horrible toxic environments for postdocs to work in and postdocs are the ones who carry the brunt of the toxicity. Toxic examples can include unrealistic expectations (like working nonstop with no breaks in the week or vacation time ever), verbal abuse, gaslighting, threats to remove authorship, firing postdocs for having children, among so many others. These are all examples I have experienced or know postdocs who have experienced similar situations. This tends to go doubly so for postdocs on a Visa who feel even more trapped in their positions. Postdocs then have to find another position and the PI faces little to no consequences. Why should postdocs deal with these environments when they can be paid twice as much in industry and not have to deal with toxic systems that have no consequences for the leaders? It is getting the point that they know this is something they do not have to put up with so NIH needs to address these toxic systems and give consequences to the actions of toxic PIs.

Existing NIH policies, programs, or resources

Fellowship language is a big one here. The fellowships (ie T32, F32, etc) are worded in a way that is open for interpretation from the university or institution. This creates an equity issue with postdocs paid from PI's grants getting certain benefits (as employees) while postdocs that are on fellowships unable to get those benefits due to how the fellowships are written. Changing the language to state that they are employees (because they absolutely are), will allow many things to improve for them such as benefits and taxes taken out of their paychecks. Another thing that also needs to be made clear and supported is time for career and professional development for postdocs. Since it is classified as a training position, this is part of training and many PIs still do not support time away from research to do this. Most PhDs do not stay in academia and we need to support time training for and finding these positions to help the postdocs be successful. Making an allotment for postdocs to take so many hours a month to do career development outside of their research lab would help improve this support. Additionally, require the PIs to learn about careers outside of academic research so they can help and mentor their postdocs if or when they choose to go down different paths. So many PIs are shocked that their postdocs don't stay in academic research when the default is alternative pathways and not the other way around. Increased training in mentorship for PIs is needed as there is often little to none and it is usually done only by PIs who want to change for the better. Additionally, there needs to be non-postdoc positions created for postdocs who want to stay in academia but don't want to be PIs.

Proven or promising external resources or approaches

The National Postdoctoral Association has developed a number of fantastic resources created by committees of postdocs, postdoc office leaders, and other contributors. Communication with postdocs and

people who help postdocs on a regular basis would allow issues to be addressed in a timelier fashion and help prevent recruitment gaps in the future. That being said, the RFI about postdocs is greatly appreciated as there needs to be a shift to improve academic research environments especially those that include postdocs.

Response 3030

Perspectives on the postdoc roles and responsibilities

The roles of an academic postdoc is to perform academic research at an advanced pace with a focus on training fellow students and developing independent projects. A postdoc should also be given the opportunity to pursue professional development for future careers in academia including development in teaching and mentoring. Additionally, post-docs should be developing skills to develop independent scientific programs for future academic positions.

Fundamental issues and challenges

The most fundamental issue inhibiting recruitment and retention of postdoctoral trainees is salary. Postdoctoral trainees are highly trained and skilled in their fields, but they are currently paid extremely poorly in academic settings. Many universities use the NIH fellowship and training stipend levels as the guideposts, and these stipend levels are extremely low, especially for researchers living in HCOL areas. Therefore, many people who would be interested in pursuing postdoctoral training and subsequent academic careers simply leave the field due to the low pay. Postdoctoral trainees who do stay often sacrifice starting families, buying homes, and saving for retirement. This results in poor retention of top doctoral students in academia as postdocs. As of now, there is little to no incentive to stay as a postdoc due to the poor salary, poor training objectives, and poor outcomes for academic positions. In the long term, this also results in a less diverse faculty, as many faculty positions request postdoc training that many doctoral students cannot afford. Doctoral students who are part of non-traditional, first generation, disabled, and minority communities often cannot afford 2-3 more years of low pay as a postdoc, which takes them out of the academic track.

Existing NIH policies, programs, or resources

The resources online for writing grants are generally very helpful. However, the best resources I've encountered were in-person workshops put on by NIH staff at training meetings. If more of these were available perhaps on-site at large institutions or virtually, that would be very helpful. Often students and their mentors may not be fully aware of the different grant types open to postdocs or how to apply to these grants, so some more personal guidance could be helpful.

Proven or promising external resources or approaches

No response

Response 3031

Perspectives on the postdoc roles and responsibilities

While this role does include mentorship from an established PI where projects align with the PI's overarching research goals, Postdoctoral scientists largely work independently on their projects and are responsible for project management and any training they may require to conduct the research successfully. Additional responsibilities that I have personally undertaken include mentoring of more junior research staff and students, applying for and obtaining my own funding from government and private sources, presenting findings at international meetings and participating in conversations with the larger scientific community in my field, and preparing manuscripts for publication of my research. Each of these roles could be broken down further into a more detailed list of responsibilities.

Fundamental issues and challenges

Low pay, lack of benefits, and short term contracts heavily limit recruitment and retention initially. These caveats make the postdoc unattractive to PhDs who require stability, are caretakers, are starting families, or for other reasons cannot live with low pay and precarity. As postdocs, we recognize that the position does not compensate us at the level a professional with our qualifications and job expectations (see roles) should be compensated. We realize that the postdoc is generally viewed as a training position, yet more

and more we are relied upon to deliver high quality results independently at a low wage. This wage is generally determined by the NIH minimum salary scale, and does not compete with salaries for equivalent experience and responsibilities in industry. Additionally, toxic or abusive work environments are commonplace in academia and are often systemically enabled by academic institutions. When postdocs are empowered by the availability of other options, they will not stay in environments that preclude their success. Finally, a postdoc experience is generally viewed as only required for an academic faculty position. If faculty positions are scarce, accepting low pay and the high potential for toxic work environments makes working as a postdoc an incredibly risky choice. In short, the only things currently drawing PhDs to postdoc work are the freedoms of academic research, that positions are currently highly abundant (due to low retention) and the chance, even if incredibly small, to compete for a research faculty position.

Existing NIH policies, programs, or resources

NIH minimum salaries should be increased to be competitive with industry salaries for positions with similar responsibilities (e.g. "Scientist I" titled employees), and ideally should be modulated depending on cost of living indexes.

Programs that assist with family expenses should be created or expanded (e.g. grant programs that include stipends for subsidizing childcare expenses).

Proven or promising external resources or approaches

Look to what industry/non-academic positions provide and adjust policies in order to compete. This is where non-retained or "would be" postdocs are going.

Response 3032

Perspectives on the postdoc roles and responsibilities

As postdocs, we generate most of the data for projects. We maintain labs, we train junior researchers, we write papers.

Fundamental issues and challenges

How to maintain a life with $50k at ~30s year old while not even knowing how future looks like.

Existing NIH policies, programs, or resources

I wish postdocs were not hired as cheap labor. Maybe make postdocs program more organized. I have no solution.

Proven or promising external resources or approaches

Postdoc recruitment should be supervised by the department, not purely determined by the PI who has the funding. After all the funding is from governmental funding to the PI, supported by the institutions. So the institution should also have a organized system oversee the postdoc training.

Response 3033

Perspectives on the postdoc roles and responsibilities

Has a responsibility to communicate research & expertise to the public in an accessible way (ie in layman's terms and in a public, non-paywalled forum)

Fundamental issues and challenges

A perceived disconnect between academia and the "real world" ; lack of funding that supports cost of living ; lack of perceived efficacy of the work beyond closed academic circles; feeling disillusioned with academic siloes

Existing NIH policies, programs, or resources

Communication training should be a requirement of all NIH fellowships, training, and career development awards.

Proven or promising external resources or approaches

A proven science communication training that increases postdocs' motivation and skills is Wikipedia editing trainings through Wiki Education. The National Science Policy Network, which supports early career scientists, has invested in the trainings and seen effective results: https://wikiedu.org/blog/2022/01/03/wikipedia-as-a-vehicle-for-science-communication/

Such science communication work has also been recognized by The National Institute for Occupational Safety and Health (https://blogs.cdc.gov/niosh-science-blog/2019/01/24/wiki4/, the Harvard School of Public Health (https://www.hsph.harvard.edu/news/features/wikipedia-students-occupational-health/), Boston University School of Public Health (https://www.bu.edu/sph/?post_type=bu-article&p=196762), MedEdPublish (https://mededpublish.org/articles/9-109), the Journal of the Association of American Medical Colleges (journals.lww.com/academicmedicine/Citation/2017/02000/Why_Medical_Schools_Should_Embrace_Wikipedia__.22.aspx), and others.

Students gain proven communication and digital literacy skills, and feel an increased sense of motivation in their work and field (https://wikiedu.org/blog/2017/06/19/what-students-learn-from-contributing-to-wikipedia/), which can strengthen retention in their field. They also make a measurable difference for public knowledge (https://wikiedu.org/blog/2019/05/29/my-experience-editing-wikipedias-vaccination-page-during-medical-school/).

Wiki Education has open source curriculum and infrastructure that supports this work. And could be a valuable partner if NIH determines this kind of science communication training aligns with its goals.

Response 3034

Perspectives on the postdoc roles and responsibilities

Post-docs inhibit an essential space in the research enterprise at a critical career training period. I am/have trained 14 post-docs—4 have gone on to starting independent laboratory research programs, and all are pursuing science-related careers. Post-docs realize the research program in my group and contribute substantially to conceptual, technical, and educational responsibilities. They shape the rich intellectual environment in my group. I try to design projects collaboratively so that post-docs can use these to launch an independent career and become R01-funded investigators.

Fundamental issues and challenges

Low pay. General disillusionment with academic career ladder.

Existing NIH policies, programs, or resources

Increase NIH payscale for post-docs in conjunction with an increase in NIH modular budgets.

Proven or promising external resources or approaches

I think the emphasis should be on smaller groups with higher-paid postdocs (HHMI just instituted a 70K starting salary). I think that institutions and the NIH need to evaluate about the resulting pay gap. Re-thinking institutional indirect costs may be a way to accomplish this.

Response 3035

Perspectives on the postdoc roles and responsibilities

Post-doctoral trainees are central to progress in biomedical research which is tightly linked to the United States national interest in leading scientific investigation and innovation. Post-doctoral trainees are key engines of scientific discovery, whose work directly advances our knowledge of human biology and improves human health. We have observed shifts in the post-doctoral workforce prior to the beginning of the pandemic, and we have concerns that current funding structures have contributed to inequities that have made post-doctoral training less desirable for a rising generation of promising scientists.

As highlighted by the NIH Physician-Scientist Working Group Report, there has been a decline in the percentage of physician-scientists engaged in research from 4.5% in the 1980's to 1.5% by 2014 (PMID: 24297696). The transition from medical residency or fellowship training to post-doctoral research is often supported by a T32 award associated with reduced salary and benefits, including loss of employer

contributions to retirement accounts and dependent care support, as well as changes to health insurance and reduced parental leave. These decreases in benefits and salary occurs just as trainees begin to start and/or grow their families and peers are transitioning to roles with higher salary. Multiple trainees at our institution have chosen to forego research training for these reasons. In addition, medical school debt has risen, and individuals supported on T32s do not receive credits for years of service for the Public Service Loan Forgiveness Federal Student Aid Program, while their student loan interest continues to accumulate. This is a disincentive for physicians with high student loan debt to consider careers in research. T32s need to offer comparable benefits to what physician scientists have been receiving during their residency or fellowship training to decrease the disincentive in pursuing research training.

Fundamental issues and challenges

Accepting a prestigious NIH training fellowship (T32/F32) results in the loss of an employer-employee relationship. As a result, recipients must relinquish their status as benefits-eligible employees, which can include loss of access to health, dental, vision, disability and life insurance, and ineligibility for retirement plans and childcare support. Institutional policies and employment laws to support and protect postdoc employees may also not be applicable to postdoctoral fellows, further leaving them vulnerable. This current NIH policy therefore represents a major source of inequity, as it penalizes postdoctoral NIH trainees who contribute to the biomedical research workforce just as their postdoctoral associate peers do, but with fewer benefits and protections. In some cases, postdocs face the difficult decision to turn down their prestigious fellowship to avoid jeopardizing their family's wellbeing and financial security. Not all universities do have the unrestricted funds or the ability to manage a solution that navigates federal grants policy and employment regulations. The NIH should address this by enabling host institutions to maintain an employer-employee relationship with holders of NIH training fellowships.

When universities attempt to increase postdoctoral salaries to compete for talent, the NIH grant policy limits the financial sources that can be used to supplement stipends. This also makes it difficult for early-stage investigators to compete with more well-funded senior investigators and institutions, thus exacerbating the inequities both in the NIH-funded postdoctoral population, the faculty ranks, and amongst institutions. Programs that are able to offer higher salaries and more benefits are able to recruit highly competitive postdocs who would not be able to afford to take a position at the NIH stipend level but this also increases the inequities among postdoctoral trainees. Increasing the stipend levels offered by the NIH and providing cost of living adjustments will reduce the financial disadvantage that postdoc trainees face.

Existing NIH policies, programs, or resources

The majority of Yale postdocs (~65%) are not US citizens or permanent residents and thus represent the majority of the non-faculty biomedical workforce and the pipeline to future careers in biomedical research in the U.S. International postdocs are not eligible for most NIH training fellowships and career development awards, which places them at a disadvantage to their eligible peers. This compounds existing barriers to career development that visa holders face. These restrictions, coupled with other challenges academic immigrants must face, can represent disincentives to pursuing a postdoc in the US. Postdocs joining a new university in a new city/country often feel isolated. They are most often supported by NIH R01 grants and are therefore very dependent on a productive relationship with their primary faculty mentor for compensation, visa status, work authorization, and a letter of recommendation. The NIH should expand access for training fellowships and career development awards to visa holders to mitigate these issues and power imbalances.

NOT-OD-17-095 states that Postdoc Fellows supported by these mechanisms may spend up to 25% of their time on other employment, so long as those activities do not interfere with, or lengthen, the duration their NRSA training. However, Postdocs supported by research project grants or other NIH mechanisms, do not have the same opportunity to enhance their training experience. Postdocs, must certify 100% of their effort is on the grant that provides their compensation. This prevents postdoctoral associates from engaging in career and professional development activities. One solution is for the NIH to revise the policy on research effort certification for postdocs on RPGs to match the NRSA policy. The working group should review NIH grants policy on supplementing salaries for postdocs on research grants to allow flexibility to engage in other training experiences while they are still contributing to research projects.

Proven or promising external resources or approaches

For people seeking research careers in academia, government, or industry, postdoc years can be an opportunity to build independence, improve technical skills, and focus research interests. NIH fellowship opportunities, while promoting and supporting postdocs seeking an academic tenure track, don't offer opportunities for postdocs with non-academic pursuits.

The competitiveness of NIH fellowships, combined with their minimal benefits and below average salaries for doctorates, have disincentivized postdocs to submit applications. For example, data from Kirschstein-NRSA Post-Doctoral Fellowships (F32s) shows that the number of applications has decreased by 37% in the past 10 years, but the average success rate has remained at the same level of 27%. (https://report.nih.gov/nihdatabook/report/62).

The below average salary that postdocs receive, coupled with high cost of living in many major centers of postdoctoral training, culminates in financial stress, especially for postdocs who are not economically privileged. Postdocs from low socioeconomic and other underrepresented backgrounds are often more severely affected by these financial challenges, and those without a safety net can be forced to leave academia for alternative positions that offer a salary and benefits more commensurate with their expertise. This exacerbates issues of diversity and inclusion in academia.

Donna Ginther's work shows that completing an academic postdoc has a negative economic impact in biomedicine through loss of salary in the 15 years post-PhD (PMID:28072769.). The uncertainty, comparably low salary, and less robust benefits packages relative to other career paths disincentivize the biomedical research workforce from pursuing academic postdoctoral training. The increasing competition for faculty positions, and relative stagnation of NIH modular budgets, is further decreasing early career researchers from pursuing NIH-funded postdoctoral training. In an effort to decrease the disincentives that postdoctoral trainees face the NIH must address the below average salary, limited benefits and limited career opportunities for those not pursuing academic tenure.

Response 3036

Perspectives on the postdoc roles and responsibilities

As a crucial building block of academic research, postdocs drive new discoveries and inventions in our scientific field without which, research as we know will suffer unimaginable setbacks

Response 3037

Perspectives on the postdoc roles and responsibilities

Postdocs are one of the primary workforces of academic research and play a fundamental role in the functioning of research centers and institutions. The postdoc role is one that should position the individual for their professional goals which could be tenure track faculty or industry.

Postdocs share their expertise with colleagues and graduate students and overall contribute in various ways to the scholarly community. Under the mentorship of their PI, they are able to explore and implement new techniques, strategies, and methodologies in their labs and campuses. Importantly, postdocs represent their department or lab at conferences, talks and visits abroad. Postdocs also collaborate in writing grants and papers, designing research projects, presenting papers at conferences and keeping up with the literature. We are like junior PIs.

Postdocs have a higher degree of expertise and independence and we work with minimal supervision from PIs. The research groups have a hierarchical structure, where the PI is a type of CEO who designs the work strategies, lines of research and seeks funding, while postdocs and grad students carry out the research work. The grad students need a lot of supervision, which the PIs may not always have time for, and so in order for the research groups to grow the PIs need to delegate responsibilities and that's where the postdocs come in.

Fundamental issues and challenges

Firstly, postdoctoral fellow salaries have undergone minimal increases over the preceding years despite sharp increases in the average cost of living and national inflation rate. Postdoc stipends need to be significantly increased to accommodate the current cost of living, childcare and healthcare needs, and staunch the flow of postdocs exiting academia for higher salaries in the private sector.

Secondly, postdocs face an unclear path toward career stability and require more information and transparent data regarding their career options post-postdoc. The NIH can play an instrumental role by providing this information and providing platforms for postdocs to explore career options both in and out of academia. There should be a process of structural and institutional checks and balances in place to actively position postdocs to get jobs after the postdoc ends.

Thirdly, structural biases that prevent the career progression of URM and international postdocs should be examined and corrected to create more equitable academic spaces. It would be helpful to expand on initiatives related to diversity and inclusion.

Finally, numerous surveys have reported that high work stress environments contribute significantly to the poor mental health reported by many postdocs. The NIH should hold institutions accountable for fostering healthy and balanced work environments that are nurturing to early career scientists. This may include obtaining access to institutional climate surveys.

Existing NIH policies, programs, or resources

- Provide additional funding to institutions to support postdoc salaries and benefits, ensuring that postdocs receive adequate, employee-level compensation for their work, similar to other agencies' funding schemes. These should include relocation reimbursement, loan repayment programs, and paid parental leave and childcare subsidies.
- Establish a centralized system to provide postdocs with access to career development resources, such as workshops, seminars, research, and mentorship opportunities. Further, institutions that receive NIH funding should be required to provide postdocs with access to professional development opportunities, such as training in grant writing, public speaking, and leadership. NIH should provide additional support for postdocs who are transitioning to non-academic careers, such as offering workshops on job searching and networking. There should be a process of structural and institutional checks and balances in place to treat postdocs fairly and actively position postdocs to get jobs after the postdoc ends.
- NIH should mandate that all NIH-funded postdocs in the US develop an IDP and that PIs support and submit documentation of progress.
- Integrate into reportable grant requirements mentorship training programs for PIs and postdocs, providing them with the skills and knowledge needed to be effective mentors and mentees. Establish mentoring committees for postdocs at all institutions receiving NIH funding.
- NIH could establish a centralized database to track postdoc feedback, the experiences of BIPOC and LBGTQ+ postdocs, work place satisfaction, and career outcomes, enabling policymakers to better understand the effectiveness of postdoc training programs and the experiences of diverse postdoc communities.

By modifying, expanding, or improving existing NIH policies, programs, and resources, NIH can better support postdocs and promote diversity, equity, and inclusion in the research community. This can ultimately enhance the postdoctoral training ecosystem and provide postdocs with the resources they need to succeed in their careers, both within and outside of academia.

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

From my perspective, an academic post doc is an impossible standard without enough compensation. Post docs are expected to do a full PhD worth of research in 1/3 the time with 10% more salary while simultaneously expecting them to become PIs. It is not physically possible and not mentally worth it.

Existing NIH policies, programs, or resources

Post docs need a decent salary and a better work life balance.

Wikipedia is the 5th most visited website in the world, and its content has large, measurable effects on behavior. Research shows that Wikipedia content affects tourism, scientific literature, and even judges' legal rulings. That's why Wiki Education runs a program to help subject-matter experts take part in updating and correcting Wikipedia's content.

Participants in Wiki Education's virtual training courses report a strong feeling of pride in bringing high-quality medical or other scientific content to the public in a digestible, accessible way. Through the program, Wiki Education has supported graduate students, postdoctoral fellows, university faculty, and others.

The postdocs who have participated have expressed enthusiasm for outcomes like "supporting the science literacy and understanding in the general population." Wiki Education has the systems and Wikipedia expertise in place to help NIH give postdocs an outlet for developing their science communication skills while informing the general public about their area of expertise. Wikipedia can help researchers amplify research results to the world, and Wiki Education is set up to help them do this work.

Response 3040

Perspectives on the postdoc roles and responsibilities

The academic postdoc should be a term limited position that where a researcher with a doctoral degree can obtain additional training and mentorship before continuing into an independent role. Optimally, this role should be two years, with a possible third year extension for extenuating circumstances. Continuation in the same laboratory environment under the same supervision should only be allowable as a staff scientist or faculty position.

Currently, the academic postdoc is often extended beyond two years as a means of extracting inexpensive but highly skilled labor in the research enterprise. Frankly, the academic postdoc should simply cease to exist as a position distinct from a staff scientist or a non-tenured faculty position from an administrative perspective.

Fundamental issues and challenges

Postdoctoral reseachers, regardless of the source of funding, should be treated as regular employees by their institutions including all benefits rather than quasi-trainees or students. NIH awards, particularly the Ruth L. Kirschstein Institutional National Research Service Award T32 and F32 funding mechanisms, often result in the loss of pay and benefits.

Existing NIH policies, programs, or resources

Ruth L. Kirschstein Institutional National Research Service Award T32 and F32 should be restructured into a research grant from which the individual postdoctoral researcher could choose to draw part of their salary or commit towards independent research expenses. The NRSA should not be used as a mechanism to provide total compensation for a postdoctoral researcher nor should it be used as an effective upper bound for compensating postdoctoral reseachers.

Proven or promising external resources or approaches

Response 3041

Perspectives on the postdoc roles and responsibilities

Both NIH and NSF define the postdoc position as ".a temporary and defined period of mentored advanced training to enhance the professional skills and research independence needed to pursue his or her chosen career path."

We point out however, that postdocs have undergone extensive graduate training and been awarded their doctorate. They are, by definition, experts in their field. While SOME postdocs may receive evidence-based career development training and mentoring to leverage towards independence in their chosen career, most do not. The postdoc in practice currently is cheap labor, with "training" used as an excuse for low wages and varied access to benefits.

IF the NIH is committed to the postdoc as an evidence-based quality training transition from the PhD to more independent careers it must:

1. Exclusively make the postdoc a training position by increasing the number of NRSA awards and making them available to foreign postdocs
2. Ban graduate student and postdocs (NIH's funded "TRAINEE" pool) from being staffed on research grants
3. More clearly define the career development, mentoring, and management programming and interventions required by institutions to receive said updated NRSA awards

IF the NIH is committed to recognizing a postdoc's expertise and their rightful classification as an entry-level staff position, then it must:

1. Accurately define postdocs as workers and NOT trainees
2. Increase the salary, benefit, and childcare requirements on research grants that are funding postdoc labor
3. By extension, transition away from NRSA awards for people who have received their graduate training already (postdocs) and move towards funneling that money to higher starting postdoc and other staff scientist salaries

Either way, the NIH MUST be prepared to recognize that an increase in the quality of the postdoc position from its current state means a decrease in quantity and eventual transition away from postdocs in cheap and transient positions.

Fundamental issues and challenges

Postdocs often find themselves at the point of starting a family and may have accumulated a certain amount of debt due to student loans. Several key issues prevent a postdoc from staying and pursuing a career in academia:

Pay: The minimum pay for postdocs paid from NIH grants is $54,840. While this is above the MIT calculated living wage for a single person with no dependents, it is far less than the almost $80,000 living wage for a person with one dependent. Additionally, many postdocs are living and starting families in some of the regions that have the highest cost of living in the country, including major research hubs such as Boston, where the calculated living wage for a person with one dependent is almost $100,000. Accounting for the current rampant inflation rates and the ever-rising housing costs, the minimum pay for postdocs is exclusionary to individuals who have dependents, come from low-income backgrounds, or have a significant amount of accumulated student debt.

Benefits: Affording health insurance for a single person is a significant cost. Providing health insurance for dependents as a postdoc can be unmanageable, especially when wages are already low finances stretched thin.

Non-Economic Issues: Transient positions of one to two years, which depend on having to relocate possibly more than one person with little options for career advancement make the postdoc fundamentally broken. Additionally, the meritocracy that governs academia and the notion that every postdoc wants to be an academic scientist creates an environment that does not support a healthy work/life balance. The rampant bullying, harassment, and lack of commitment to equity in academic training centers compounds these issues.

Existing NIH policies, programs, or resources

NIH must acknowledge the role that it has played in the continued decline of the postdoc position as a feasible—or desirable—career step. Outdated funding mechanisms that do not allow for salaries that are competitive with those for similar positions in industry have and will continue to deter promising scientists from pursuing a postdoc. The classification of postdocs as trainees—which has been facilitated by the NIH—has allowed extramural entities to take at times extreme liberties with the pay and benefits they provide for postdoc positions. While not solely to blame, the NIH has both the power and influence to vastly improve working conditions for postdocs across the country.

It is clear that many of the issues that make the postdoc position unappealing revolve around pay and benefits. To the question "where will the money come from?" we point NIH to past initiatives that have since been abandoned that were intended to fix the many issues with how NIH awards grants. NASEM reports like Breaking Through, unpublished NIH working group reports, such as the NGRI working group, and other reports on the postdoc going as far back as the late 60's are also incredible resources that have gone largely unheeded. We suggest NIH do its research of the literature and gather information on which policies, recommended time and time again, have yet to be implemented. The NIH as an institution has a history of capitulating to the demands of well-funded institutions and its 'friends' in Congress as opposed to the needs of its constituents. The GSI, which would have significantly redistributed funds, diversified the pool of funded ECRs, AND benefited trainees, is one such example of a policy scrapped due to pressure from well-funded institutions with direct lines to those in power at NIH.

Proven or promising external resources or approaches

Across higher education the labor movement is growing. Through unionization, workers at every level of the academy from graduate students to postdocs to faculty have been able to win contracts that have

guaranteed them increased pay, better benefits (e.g. improved health insurance), and access to the holistic resources (e.g. childcare) that are needed to support the modern day academic workforce. We recommend that the NIH embrace and support this movement and look to it for guidance on what postdocs need to not just survive, but thrive in academia. For example, the recent contract ratified by UAW Local [redacted for anonymity], the union representing the postdocs and academic researchers of the [redacted for anonymity], guarantees that as of October 1st 2023, entry level postdocs (0-11 months of experience) will be paid $64,480 (almost $10,000 more than the NIH minimum) and will get a 3.5% raise each year. This contract also guarantees reimbursement for childcare costs and added protections for non-U.S. citizens working as postdocs.

In addition to unions, the NIH should work with the National Postdoctoral Association and other external organizations that have similar missions to improve the experience of early career researchers. HHMI has recently committed to pay postdoc a minimum salary of $70,000. Since the majority of postdocs are working in extramural settings, the NIH must work more closely with these employers to ensure that NIH policies around postdocs are being implemented as intended by NIH and not the employer's legal counsel. In this same vein, the NIH should work with extramural employers to develop programs like the one recently introduced at the Yale School of Medicine that facilitate the conversion of postdocs to tenure faculty.

Response 3043

Perspectives on the postdoc roles and responsibilities

A postdoc position is a "training" position typically and one that is designed to the help individuals become an independent researcher. Roles and responsibilities can vary due to the nature of the lab environment. Postdocs are learning to effectively operate a lab and perform cutting edge research in their field or area of interest. They are also learning how best to chart their career path and pursue funding and support. The lack of tenure-track faculty positions can make is seem like there are fewer opportunities available in academia.

Fundamental issues and challenges

Please see list below:

- Salary ranges: NIH stipend rates are too low. The NIH payscale is an average of cost of living across the entire country but in cities like NYC, San Francisco etc., the cost of living is significantly higher
- Pay scales are a major point of concern. Academic institutions are competing with industry which pays well above what a postdoc can make at most academic institutions.
- Stipends and tax issues favor potential recruits from privileged backgrounds, further discouraging applicants.
- Lack of subsidized child-care services and subsidized housing
- Postdocs have non-employee status
- Inconsistent recruitment methods, disregard or ignorance of effective inclusive recruitment methods

Existing NIH policies, programs, or resources

Please see list below:

- NIH should consider grant mechanisms to support postdocs who are more than 5 years in training.
- Allow employee status for F32 and T32 recipients.
- Increase NRSA pay scales stipends & align with regional cost of living
- Strengthen reporting requirements (including IDPs)
- Mandate mentor training
- Align funding dates with academic years
- Clarify and standardize career and training taxonomy so results can be tracked with greater accuracy.

Proven or promising external resources or approaches

Please see list below:

- Liaise with the NPA
- NIH should survey postdocs during training.
- Have focused communications with postdocs who are currently appointed to training grants.
- NIH institutes could share or support better (or national) recruitment to centralize efforts and bring more attention to smaller programs while diversifying larger/older programs
- Mentoring best practices need to be mandated and reported on

Response 3044

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Loan repayment options need to be greatly expanded for PhD scientists at the postdoc stage. This is both an issue that affects postdocs in general but especially women postdocs, postdoctoral women of color, and postdocs coming from underprivileged economic backgrounds. If we are to increase our efforts in recruiting and retaining a diverse population of scientists within the biomedical workforce, we need to work toward alleviating the pressures that disproportionately lead to the loss of these postdoc populations.

The American Association of University Women released a study showing 2/3 of all outstanding federal student loan debt is held by women. This gender divide is compounded over time with reduced ability to pay back outstanding loans due to family and childcare financial pressures disproportionately held by women, as well as the gender wage gap that women encounter during their careers. These issues are even worse for women of color.

The leaky pipeline is especially significant at the postdoc to faculty transition phase. If we are to retain postdocs through this especially weak point in the pipeline, we need to focus efforts on when financial pressures are the greatest on postdocs. Loan repayment options need to be available before scientists reach the faculty or staff scientist phase. Otherwise, many postdocs have already chosen to pursue other career paths to pursue as a result of financial pressures.

Additionally, time served in postdoctoral positions within academic universities and government institutions needs to count toward Loan Forgiveness Programs. This often does not count in cases where a postdoc is (again) not considered an employee, usually due to having received a fellowship.

Existing NIH policies, programs, or resources

Currently within the intramural environment, IRTA or CRTA postdoctoral fellows are considered completely ineligible for the Intramural Loan Repayment program due to their non-employee status. Only those postdocs who are classified as employees via Research Fellow status or Clinical Fellow Status are eligible. This is in contrast to the Extramural Loan Repayment Program, in which employee status is not required for program eligibility. This is because the Extramural Loan Repayment Program cites the intent to retain

scientists within the U.S. Biomedical workforce whereas the Intramural Loan Repayment Program cites the intent to retain scientists specifically within NIH. This is an issue where postdocs training at the NIH under CRTA or IRTA fellowships are at a specific disadvantage compared to those getting their postdoctoral training extramurally.

Response 3046

Perspectives on the postdoc roles and responsibilities

Postdoc is a post-graduate period where you obtain further skills that prepare you for the field of your choice.

Fundamental issues and challenges

The one hundred percent answer is pay and lack of benefits in comparison to industry. Though I have selected to be within a post doctoral position, family dynamic changes (i.e. I will soon have two children in daycare) will require me to obtain a job in industry, as my monthly salary will no longer cover the cost of child care. Though I am ultimately okay with this change in field, this is extremely limiting for people who desire to stay within academia while also starting a family. On this note, the lack of paid family leave (I feel fortunate to be able to obtain six-weeks family leave) and benefit limitations such as retirement is also not appealing for Postdoc positions.

Existing NIH policies, programs, or resources

I believe most Universities and institutions base many of their policies off of NIH standards. If the NIH set guidelines for appropriate pay levels, maternity and paternity leave, and other benefits (such as retirement) I feel that many universities would follow its example.

Proven or promising external resources or approaches

No response

Response 3047

Perspectives on the postdoc roles and responsibilities

I came to the US for a postdoc at [redacted for anonymity] on an international visa status. My intention was to gain professional experience, learn more skills and broaden my network to pursue a career in science. Postdoctoral training is an important part of training to ensure high quality of science—research and teaching—and to become a responsible part of our society.

Fundamental issues and challenges

I had a very bad experience with an abusive PI who used the visa status for putting on pressure on every international in the lab (almost everyone). He expected long working hours and results that meet his expectation. There was no room for scientific discussions or questions, no growth or collaborations. NIH funds were misused, grants were written by himself without any way of participation as a postdoc.

Existing NIH policies, programs, or resources

NIH should make sure that quality of research meets their standards. In our lab, results were interpreted using different statistical methods that were only applied after the experiments were conducted. Experiments should be planned ahead and statistical interpretation should be part of the grant application to prevent polishing results afterwards. There was no standard good practice, also animal well-being was not respected and therefore outcomes of animal experiments are questionable.

Proven or promising external resources or approaches

Labs that are not respecting work ethics or animal ethics produce questionable scientific outcome. NIH should communicate with IACUC to monitor reports. (In my bad experience with the lab I was discouraged to reach out to NIH since several lab members have reached out to both NIH and IACUC before and they said that nothing ever happened. This is not surprising to me if there is one report, but after several independent reports and over the course of several years, this is very surprising to me.)

Response 3048

Perspectives on the postdoc roles and responsibilities

To refine/optimize my personal research training program—techniques, grantsmanship, mentorship, research focus.

Fundamental issues and challenges

Funding/Salary as well as benefits within the university is the primary limitation. I have succeeded in winning two NIH T32 fellowships, an NIH F31 fellowship, and an NSF proposal all by the end of my PhD. I would love to continue pursuing research and become an independent researcher in academia. However, it is not financially feasible for me any more. I have spent 3 years of post-bacc training and 6 years in graduate school. In total, I have received over 13 years of education without a living wage. As a female scientist, delaying a family can only go on for so long. My current post-doctoral salary barely covers the cost of childcare and I am struggling tremendously to provide for my family. I cannot wait another 2-4 years to get a higher faculty position to earn a livable wage with a family and provide food for my children. Beyond the salary, the university treats post-doctoral staff lower than research assistants. We do not have access to the same benefits (worse insurance options) and no options to contribute to a 401K. The biggest hurdle is that even after 13 years of experience, and delaying earning potential and saving potential, I am still treated lower than an temporary research assistant. Despite my tremendous publishing record and success in receiving grants, it is not financially feasible to continue as a post-doc.

Existing NIH policies, programs, or resources

More money for salaries, maternity leave, childcare. Better insurance benefits, retirement packages. More secure job pathway. In most other professions, you can get promoted and have salary increases. As a post-doc it is very hard to be promoted and secure an academic job. While extended training is certainly as an aspect of doctoral training, many labs put post-docs in manager roles. As a a manager, I should be payed accordingly for my expertise and knowledge.

Proven or promising external resources or approaches

Feedback on mentorship-trainee relationship should be directional, with trainees being able to evaluate PIs and universities.

Response 3049

Perspectives on the postdoc roles and responsibilities

The postdoc is a time to gain additional expertise in a new research area and/or technique. The postdoc should also be a time where scientists are learning the necessary skills/training to launch an independent research career.

Fundamental issues and challenges

The combination of low salary relative to other possible career options for PhD scientists and unclear prospects for available future permanent academic jobs

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3050

Perspectives on the postdoc roles and responsibilities

The ASBMB strongly recommends that the roles **and responsibilities** of an academic postdoc emphasize the purpose of gaining additional research skills and mentorship to progress in the career pathway of an individual's choosing. As they are in mentored positions, postdocs should have protected time and equitable access to resources that advance their professional development in research and related careers, such as management (time, project, personnel, budget, administrative, etc.), grant writing, peer review, teaching, leadership, outreach, career exploration, and diversity, equity and inclusion training.

To ensure scholars and their advisers have a shared understanding of expectations for the postdoc's responsibilities, progression and goals, the NIH should require postdoctoral training plans that detail anticipated timelines for publications, grant submissions and other milestones, and agreed upon percent effort between professional development, mentored research, and independent research. The NIH should mandate updates be reported during annual progress reports to measure growth and make adjustments to accommodate new goals.

In addition, referring to postdocs as "trainees" can be weaponized to diminish their contributions and expertise to the research enterprise. The ASBMB strongly suggests that postdocs instead be called "scholars" or "fellows."

Lastly, postdoctoral positions are temporary positions for Ph.D. holders to obtain careers in academia, industry and other sectors. However, the value of pursuing a postdoc for nonacademic careers is not well quantified. Data should be collected and disseminated detailing the career outcomes of graduate students and postdocs (salary and position level) across all sectors, reporting the degree to which postdoc positions contribute to career progression in nonacademic sectors. This data would help recruit and retain postdocs who seek nonacademic careers.

Fundamental issues and challenges

Postdocs experience significant challenges in today's academic environment, including salaries below the living wage, unclear expectations and timelines for postdoctoral research, and inequitable support from institutions. Mitigating a few of these challenges would go a long way in increasing recruitment, retention and quality of life for postdoctoral researchers.

First, the inherent temporality of their positions often means postdocs are underpaid and lack necessary benefits, such as health insurance, childcare access and funds, retirement plans, etc., which are essential for long-term financial health. To recruit and, more importantly, retain postdocs, these barriers must be removed. It's vital for postdocs to have access to employee-level benefits that support and build financial stability.

Second, a systemic issue inhibiting postdoctoral recruitment and retention is the "trickle down" effect caused by the stifling competition and lack work-life balance in academic environments. Graduate students and postdocs observe their advisers and peers struggling and become increasingly unwilling to pay the

opportunity cost required to secure faculty positions that are outrageously competitive and have few perks in comparison to the challenges.

Third, postdocs often feel isolated. They are neither students, staffers nor faculty members and lack visibility in institutions and society. Additionally, postdocs often leave behind their support systems when relocating for positions, worsening mental health and work-life balance and limiting the participation of historically marginalized groups. The NIH should require postdoctoral offices at institutions and consider strategies to fund them.

Lastly, postdoc recruitment should become more comprehensive and transparent to increase the overall quality of the research enterprise and ensure inclusion. Recruiting postdocs is a challenging effort for many investigators; it relies heavily on networking, often disadvantaging students at lower resourced institutions. The NIH should incentivize and provide tools to conduct large postdoc recruitment events that are equitable and accessible to all.

Existing NIH policies, programs, or resources

While the NIH offers multiple resources that enhance postdoctoral training, the ASBMB recommends NIH play a more active role in setting policies that benefit postdocs, encourage institutions to cultivate positive work environments, and expand programs that retain postdocs in academia.

The NIH must lead institutions in encouraging policies that benefit postdocs, which in turn cultivates a positive work environment. First, the NIH must explicitly state that NIH-supported postdocs and fellows can be classified as employees. Otherwise, postdocs are at risk of losing employee benefits upon accepting an NIH fellowship. Second, postdoctoral support varies between institutions, departments and labs, enabling inequities. The NIH should be the arbiter of policies and resources that give all postdocs a sufficient level of support for success.

Family-friendly policies are key to building a positive work environment and retaining postdocs within the field. The NIH should expand paid family leave and intramural childcare subsidies program to all NIH-supported postdocs. Moreover, the NIH should increase the value the current childcare supplement for National Research Service Award fellows and expand it to allow use for caregiving expenses for eldercare, care for disabled spouses and/or dependent family members.

While mentoring is essential to postdoc professional and career development, principal investigators are not formally trained in mentoring. The NIH should require investigators to undergo mentorship training to be eligible to receive NIH funding, and require mentorship plans in research project grant applications.

Lastly, many postdocs want careers in academia but, due to the scarcity of faculty positions, are forced to choose other positions. To retain talent in academia, the NIH should expand programs such as the National Cancer Institute's R50 Research Specialist Award to all institutes to support more staff scientist positions for postdocs seeking to remain in academia without the responsibility of running an independent lab.

Proven or promising external resources or approaches

The ASBMB recommends the NIH expand requirements for mentoring across training programs, work collaboratively with institutional postdoctoral offices and encourage postdocs to obtain teaching or other certificates that help launch their careers. There are significant resources for postdoctoral training, but, given the demanding schedules to which postdocs must adhere, it can be difficult to find and fully utilize these resources. The NIH should make a concerted effort to communicate what external resources exist for postdocs, and the NIH should consider including some components of postdoctoral training programs such as IRACDA, MOSAIC and K99/R00 pathway programs that have demonstrated successes. The ASBMB also recommends the NIH consider expanding these programs so more people can benefit from them.

Additionally, the NIH should support postdoc development and success by providing the infrastructure to consolidate training, workshops, career exploration panels, etc. into a collective repository. The NIH should collect and maintain recorded programming, toolkits, and resources useful for postdocs from across the scientific community into a single accessible and searchable Web location. Currently, all institutes and centers do their own programming, which is costly and ineffective.

Lastly, the National Postdoctoral Association has a wealth of tools, knowledge and advice to help postdocs succeed. The ASBMB recommends the NIH support and disseminate these resources to the broader scientific community when appropriate.

Response 3051

Perspectives on the postdoc roles and responsibilities

I view the post doc position as additional training and mentoring in both scientific and career pursuits. However, it feels like post docs are used as skilled labor. We are underpaid and frequently overworked.

Fundamental issues and challenges

Post docs do not make enough money for the skills we bring to a lab. Grants are acquired using the hard work of post docs. Having a doctorate degree and over a decade of experience but being unable to buy a house is ridiculous. Not being able to start a retirement portfolio until I'm in my late 30s, also unnecessary.

Existing NIH policies, programs, or resources

Please change the budgets allocations and allow PIs to pay post docs more. We won't flee to industry if we know we can support ourselves and families with our salaries. Post docs need pod maternity and paternity leave. We need guaranteed moving costs to support the transition from under paid grad student with no savings to post doc in another city. We need to start hiking respectable retirement portfolios during our post doc tenure.

Proven or promising external resources or approaches

All components will be improved if pay and benefits go up.

Response 3052

Perspectives on the postdoc roles and responsibilities

An opportunity to lead a research project and develop the professional and personal skills needed to lead and manage a research group.

Fundamental issues and challenges

Money. My perspective is biased as a 1st generation immigrant/college student. I am working towards obtaining a PhD because of my interest and passion for science and always dreamed of leading a research group in an R01 institution. However, the thought of working 60-hour weeks for 4-8 years to compete for a few assistant professor positions while getting paid 40-60k/year, which I am supposed to use to live in one of the expensive cities where top research universities reside and stretch that money to support a family and my aging parents, is repulsive. Burdened by thousands in students loans, I am leaving academia, and research altogether, for a well-paying job in the finance sector as soon as my committee allows me to graduate. Whichever job I end up landing will probably not be as fulfilling as research, but I will sleep much better knowing my debts and bills are paid.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3053

Perspectives on the postdoc roles and responsibilities

To get training in biomedical research or teaching aimed at getting independent position within academia or industry. To conduct research, write papers and grants and to develope an independent research interest or expertise compared to expertise of PI.

Fundamental issues and challenges

Generally speaking postdoc is a cheap labor brought in to solve a specific problem for the PI and nothing else. Very few PIs have strategic training plan for their post docs, it's mostly focused on getting a publication or a grant and easily a staff or PhD student can fulfil these requirements for the PI. Postdoc

training should be well defined in advance with expectations and expected outcomes for trainee. Dedicated learning / milestone based approach and multi PI training format may help.

Existing NIH policies, programs, or resources

K99 eligibility for foreign nationals is the only funding source to independence. Other additional function opportunities should be opened to international trainees that are NIH based and more committing to their interest in continuing academic research.

Proven or promising external resources or approaches

American diabetes and American heart associations have more independent early inv funding.

Postdoc training shoud consist of industrial internships without visa restrictions

Response 3054

Perspectives on the postdoc roles and responsibilities

Postdocs are a massive workforce in biomedical sciences, however they are underrepresented in the media, in recognition for science, and for the training of undergraduate students, graduate researchers, and research technicians.

Fundamental issues and challenges

- Salary: too low for the expertise and reliance on this workforce, especially with the cost of living today.
- lack of future academic positions: with the increased competition for academic faculty positions, there are not enough spots for the current amount of grad students and postdocs. There needs to be additional outlets besides becoming a PI or going into industry. Scientist positions (with PhD and postdoc experience) should increase in demand to aid in this. (With a supportive salary and benefits). Less independent PIs who can mismanage funds/ projects/ students and more collaborative environments where scientists work together, through Research Scientist Positions rather than competitive PIs. Resources and data should be shared.
- the expectations of postdocs to succeed in academia these days is outrageous. The timeline to obtain a professorship is extending, the salary and time commitment (daily and career wise) have gone beyond what the limits should have been.
- there are tremendous differences between rich academic institutions and even high performing (top 20 NIH funded) public universities, this is not fair, doesn’t promote good science, and leads to waste in resources.
- poor environmental support, resources, especially for first-gen, women, and diversity postdocs. Abusive mentors should not be rewarded with more grant funding,
- administrators should not make 5x more than the scientists doing the actual work
- we need to change the rhetoric in which we address “trainees” with, these are adults, who are trying to have families and homes while working in labs.
- promote permanent positions at universities, instead of early career researchers having to move constantly to build a career in the sciences.

Existing NIH policies, programs, or resources

- salary such as HHMI announced increases, while its still low, this increase is necessary
- retention programs
- alternative career opportunities (non-PI based, Research Scientists, Educators, etc) for postdocs and graduate students, with less of an emphasis of administrators without any scientific knowledge.
- diversity programs but with more emphasis on sharing the wealth of popular prominent labs and institutions, that promote permanent positions
- relocation assistance, childcare, housing and healthcare benefits
- aim for less # of incoming PhD students and instead focus on the quality of students training to promote a better workforce of postdocs and researchers

Proven or promising external resources or approaches

More concrete universal training,

Better job satisfaction,

Less temporary positions and solutions,

Response 3055

Perspectives on the postdoc roles and responsibilities

Post-doctoral positions are a time in which a researcher should develop their own scientific identity. They should be treated with respect and collaborate with others on projects that are of mutual interest. A post-doc should work on projects for the PI, but should also have their own projects that they control. This would better prepare post-docs for their future careers, regardless of where they will be employed (e.g., academia, government, industry).

Fundamental issues and challenges

The main issue for quality of life for post-docs, from my point of view, is the low-pay and job insecurity. After going through graduate school (those stipends are too low as well), post-docs are not able to properly save money and plan for their future, while taking care of themselves and their families in daily life.

Existing NIH policies, programs, or resources

NIH policy should require institutions to have more support for post-docs. There should be a minimum set of requirements that institutions must meet to be able to have an NIH grant that supports post-docs. These include such things as paid parental leave and some type of retirement contribution.

Proven or promising external resources or approaches

NIH should refer to how the DOE's National Laboratories treat their post-docs. It is a better quality of life and provides post-docs with more freedom, thus leading to more scientific advances.

Response 3056

Perspectives on the postdoc roles and responsibilities

As a former postdoc, the position meant excelling in research so that it will provide you opportunities to get a faculty position in one of the leading academic institutes

Fundamental issues and challenges

I have tried in the past to get a postdoc by publishing it on our university website and through Indeed few years ago. Received very few responses, most were entirely irrelevant (e.g., different domains). The only one that would have been considered had his Visa ending soon. This meant high risk for an early-stage investigator, including investing money in their visa application, which may or may not go through in a reasonable time frame and it was eventually dropped.

Nowadays, the recruitment is not possible by the lack of funding. I can totally understand why someone would not want to be a postdoc if they happen to see an assistant professor fails to obtain funding from the NIH for ~25 proposals over ~6 years, with significant portion of the critique directed not at the proposal but at the single fact that the early stage faculty is, well, early stage.

Existing NIH policies, programs, or resources

Postdocs already receive relatively low salary (which is hard to increase because the faculty have limited funding). In my opinion, that would have been less critical if the postdoc have better certainty that they could go on to lead a successful academic career. Unfortunately, the combination of low income now + murky future is the rate limiting factor in continuing.

What the NIH needs to do is improve the entire funding cycle. If early career investigators would be more successful in securing funding, they will be able to hire postdocs, especially in this stage when their are full of enthusiasm, which in turn will go on to be faculty. From my perspective, it's not the program

officers but the panels who are hesitant to support early investigators (some express that explicitly, some implicitly) and until that is changed, I am afraid the direction will remain downward.

As a side note—the promotion NIH gives to ESI status is insufficient as long as the review panel scrutinizes this status too much (As one reviewer wrote: why is the investigator proposing an R01 before securing a smaller grant?).

Proven or promising external resources or approaches

No response

Response 3057

Perspectives on the postdoc roles and responsibilities

I believe the role of a postdoc is outlined by 3 temporally categorized phases:

1. an early-phase (0-2 years of experience),
2. an intermediate phase (3-5 years of experience), and 3) a transition phase (>5 years of experience).

The early phase is marked by learning new techniques and/or new systems, networking/ presenting data, and publishing a first article or two (most likely as co-author through collaboration). Therefore, scientists in the early phase are responsible for 'hitting the ground running' and do what they can to contribute to projects in the lab while they develop their skills, develop novel/fundable questions, and lay the groundwork for their near-future first-author publications and grant applications. The intermediate phase is marked by focused work on producing one or two major first-author research articles, managing new lab staff and students, and initiating independent funding plans made during the early phase. Finally, the transition phase is comprised of the same roles **and responsibilities** of the intermediate phase postdoc, however, they are actively pursuing a faculty position to start their independent research group. While these phases are not numerically delineated by the NIH, the guidelines presented here are adapted from those published by the NIH in the 'Postdocs' Guide to Gaining Independence.

Fundamental issues and challenges

Financial Burden

In the state of Maine (where I am a postdoctoral scientist), the average cost of living is currently $45,272/year (https://www.sofi.com/cost-of-living-in-maine/), which is the lowest in comparison to all other states in New England. After taxes, the estimated "take-home pay" for one who makes the base NIH postdoctoral salary ($54,835/year) is $43,500 (https://smartasset.com/taxes/maine-tax-calculator#drcFnqJiMv). This suggests that one who lives to the average Maine standard will lose $1772/year just to manage basic needs. Additionally, one who lives in Massachusetts, the northeastern hub of biomedical research, is likely to have an even larger deficit. Therefore, a significant bump in NIH standard salary is likely the most important change to make to improve the quality of life for this essential workforce of biomedical researchers.

Existing NIH policies, programs, or resources

One way to reduce the burden of student loan repayment is to develop a policy with the Department of Education (which receives student loan payments post-consolidation) that reduces payment amounts for academic trainees and/or provides accelerated access to the Public Service Loan Forgiveness program (https://studentaid.gov/manage-loans/forgiveness-cancellation/public-service)—reduce the number of payments from 120 to 60 (10 years to 5 years respectively).

Require that NIH-funded PIs provide annual training mechanisms at no charge for postdocs to maintain appropriate ethics training requirements, workshops for postdoctoral grant writing, project development, time management, mentorship—ideally from both sides, and publishing/reviewing. Additionally, funded postdoctoral fellows could also participate like the "Leading Edge Symposium" group that recently published in Cell (Bayin et al. 2023). Here, more senior postdocs could host development workshops as part of their training.

The variability in grant type eligibility for the same funding mechanism between different ICs should be removed. All ICs should enforce the same eligibility requirements across a singular funding mechanism.

Availability of postdoctoral funding is critical to academic postdoctoral development. Additionally, when postdoctoral fellows are funded by the NIH they may lose critical support, including access to health insurance and other employee benefits at their institutions. Thus the "prestige" of acquiring funding is overshadowed by the potential loss of compensation that is already at a significant low. One solution to combat financial burden is to provide the appropriate funding within the fellowship or to require that institutions maintain employee status and thus the postdoctoral fellow remains eligible for health insurance.

Response 3058

Perspectives on the postdoc roles and responsibilities

I view my pos-doc position as a next step. Long term I would like to become a PI and this is necessary for that. That being said, I am not optimistic about the future of academia, so I am increasingly open to transitioning to industry. However, since academia does not really let industry people back into academia (which is a problem) I felt that staying in an academia position at this point left my options open.

Fundamental issues and challenges

While evaluating my options and talking with others who were making similar decisions, I noticed two major areas that have changed in recent years. Insufficient compensation is pushing people away from academia, and new research options in industry are pulling people there.

The most obvious difference between academic and industry is compensation. When comparing options, my pay (including bonuses, stock, etc.) was easily twice as high in industry than academia. This is obviously a big factor. Relatedly, work-life balance appeared much better in in industry (I can't compare based on personal experience since I have not worked an industry job). Industry did not have the expectation of working weekends or outside of 8-5 hours. My academic job did not officially require extra hours either but they used phrases like "what it takes to get the experiments done" that imply that extra hours will be part of an academic post-doc. This is fine for me, however, it is an important difference and a major consideration for others (especially those with families).

Differences in compensation and work-life balance are not a new difference between academia and industry. However, in the post-covid era these aspects of jobs have become a more important consideration. Academia needs to adjust to the post-covid era or it will continue to lose people.

In my opinion, insufficient compensation in academia has been balanced out by more exciting research. Historically industry has focused on late-stage drug refinement research; this research is boring for driven researchers who enjoy basic and discovery-based projects. However, industry is clearly investing a lot of money in this type of early-stage research that has historically been done by academia.

These two factors make industry incredibly appealing. Basically, you can do fun and cool science while getting paid more and maintaining a healthy work-life balance.

Existing NIH policies, programs, or resources

In my opinion, academia cannot directly compete with industry. Industry has more money, faster timelines, and fully trained people. Therefore, academia should focus on areas where it has a competitive advantage. First, academia should increase its focus on training. NIH could easily encourage this by adjusting the weight of its funding vehicles. NIH should move money out of Research (R-family) grants and more money to Training (T-family) grants and Fellowship (F-family) grants. This would maintain the same total amount of money spent on research but would put increased emphasis on training. Critically, I believe that this would help drive a cultural shift in academia. PIs who wanted money would have to actively recruit trainees (and the F-grants that they bring), this would force PIs to create a culture that was more attractive to work in (such as better work-life balance). This cultural shift would help keep people in academia.

Academia should also focus on early and high-risk projects which industry may be unwilling to invest in. This may be tricky for NIH to implement, however I adjusting jhow the grant process works may improve things. Smaller grants with a fast turn-around (instead of large R01s or R21s) will make it easier to start and fund high-risk projects especially in new labs where there is not extra money.

Another issue is that academia tends to exclude industry people from returning to academia (largely due to hiring practices requiring publications). This is a huge loss for academia since we lose out on the skills that people learn in industry. NIH should create/fund a grant designed for transitions back into academia (like a K award). This would allow universities to hire and fund these type of people.

Proven or promising external resources or approaches

In general, I think academia faces a significant crisis. Without a deep and major cultural shift, academia will continue to lose talented people to industry because those people can do exciting research with better pay and a healthier culture. NIH cannot change academic culture alone, however, changing how it funds research to encourage a healthier and training-centric culture will help make academia an acceptable place to work. Basically, NIH needs to force some painful cultural shifts.

Response 3059

Perspectives on the postdoc roles and responsibilities

I held an academic postdoc position from August 2017—December 2022, and started my independent faculty position about 3 months ago. The postdoc was a key stage for me to develop independent projects, obtain independent funding, and establish myself in multiple fields of study for my future independent career. I applied for 9 grants over the years and was lucky to secure NRSA F32 support (which was then extended 3 extra months due to the COVID-19 pandemic). My 3 first-author publications show a reasonable rate of productivity that was slightly hindered by pandemic-related disruptions to lab work during a majority of 2020. The largest effect of the pandemic on my time as a postdoc was conference and networking disruptions, which essentially ceased entirely for the key mid-late stage where I would have liked to present our work in-person at multiple different meetings for career development. I independently reviewed 10 manuscripts over the years, and this was largely due to my postdoc mentors or junior faculty colleague connections suggesting my name in place of theirs, which is a very informal but essential training process. In summary, the postdoc position is an apprenticeship for independence as junior faculty in research, service, and grantsmanship.

Fundamental issues and challenges

Unfortunately, the number one challenge here is financial. The ONLY reason I was able to persist in the academic pipeline as a woman in science and to search for a tenure track job is that my partner is very successful in a tech job and provides nearly all financial support for our family. In a 5 year + 5 month postdoc, the ENTIRETY of retirement savings contributed by my institution was a meager $4,173 USD due to the F32 fellowship support. To be approaching your mid-30’s with only $4k in retirement savings is unsustainable for the academic labor market. My fellowship salary of $48.8k—$56.7k was reasonably okay for a mid-cost-of-living region in the US but would not have contributed enough to support us in a city and/or if we had decided to start a family during the postdoc stage. Most importantly, the financial constraints of being a postdoc will lead to continued biases in race, gender, and socio-economic status at the junior faculty level. Extreme uncertainties about geographic location at the tenure track job search stage together with poor financial savings has made the academic path less and less appealing for the current and next generation. Hearing concerns and gripes from mid—and late-career scientists at conferences about the funding landscape and administrative burdens of being a PI is further discouraging to aspiring academic postdocs.

A second concern for postdoc scholars is lack of funding opportunities and long-term citizenship options for excellent international senior graduate students and postdocs. I fear that the US will lose its place as a top tier research country if we cannot create effective programs to recruit and retain international talent.

Lastly, in terms of service, formal organization is lacking around training postdocs to be effective and constructive manuscript reviewers (and future grant proposal reviewers).

Existing NIH policies, programs, or resources

A pay raise would help retain postdocs in academia and maintain (somewhat) a competition with industry positions. However, this would require NIH grant budgets to increase so that the same sized lab can be supported. If there is any legal way to allow fellows to continue to get retirement savings matches from their institutions while receiving stipend support , this would also help the financial security of the academic career path option.

Proven or promising external resources or approaches

No response

Response 3060

Perspectives on the postdoc roles and responsibilities

Transitional training position. A stepping stone to gain more independence in science.

Fundamental issues and challenges

Postdoc pay is one big obstacle. Expectations in terms of working ours and productivity are variable and can be overwhelming. Quality of life is compromised having to work many weekends. The temporary nature of postdoc position and the fact they're treated as trainees and not employees.

Visiting Fellows have their own set of challenges including special visa implications resulting from working in government that affect their ability to obtain industry jobs in the future.

Existing NIH policies, programs, or resources

Improve pay. Better work life balance, which would be more effective if there are policies and training to guarantee its implementation

Proven or promising external resources or approaches

No response

Response 3061

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellowships remain one of the most important interventions to provide further training and to retain early investigators in a research field. Postdoctoral fellowships allow an early investigator to conduct research with the mentorship of an established investigator. Often, postdoctoral fellows are the critical workforce needed to initiate and develop new research ideas. For the field of nephrology, research still lags other specialties and most of the care delivered for kidney diseases is not supported by level 1 evidence. Preclinical science is needed to determine how the kidney functions and how disease develops. Declines in research in kidney diseases holds strong and negative impact on healthcare expenditures for the future, most significantly for Medicare. By 2030, over 1 million individuals in the U.S. may have kidney failure and healthcare expenditures for an expanding population requiring dialysis is not sustainable. Research is needed to determine more efficient methods of identifying kidney disease early and develop personalized interventions that account for genetic background and its interaction with environmental factors.

Fundamental issues and challenges

Adequate funding remains a major impediment for recruitment and retention of postdoctoral fellows in kidney diseases research. Kidney health research requires diversity among investigators because kidney failure disproportionately affects persons with non-White race and with Hispanic ethnicity and with low income. The investigators studying kidney health and diseases should better reflect the population at risk for kidney diseases. Salary for postdoctoral fellows is inadequate, especially for individuals with large student loans and/or living in areas with higher-than-average housing costs. Postdoctoral fellows also need mentors with established research funding. To ensure that we have an adequate pool of nephrology researchers in the future, funding is needed to ensure the opportunity for investigators to develop and sustain research in the field of kidney health and diseases.

When postdoctoral fellows apply for a fellowship, the reviews they receive are often not instructive for a successful resubmission of their application. If NIH cannot provide more granularity on the committee's evaluation, then NIH should consider additional assistance for grant writing. Specific for postdoctoral fellowships, a critical step for a research career, NIH could develop a partnership whereby fellowship applications could be reviewed by a committee prior to submission. Currently, early researchers benefit from working with professional grant writers, but most early investigators cannot afford such services. The use of professional grant writers then exacerbates disparities in research funding.

Existing NIH policies, programs, or resources

The current structure of pooling resources from multiple institutions within a geographic area to create interdisciplinary training programs for pre-and postdoctoral Kidney, Urology and Hematology trainees helps to recruit and retain early investigators from a larger number of institutions. However, without adequate support at each involved institution, recruitment will lag. NIH should ensure that such collaborative agreements between institutions provide adequate support for faculty leadership at all participating institutions. Collaborations should include the freedom to design training that fits the existing strengths of the institutions and not be forced into a specific structure. For example, collaborations that include kidney, urologic and hematologic researchers within a given geographic area mitigates incentives for kidney, urologic or hematologic researchers to work with or learn from other researchers within their own field that are outside a geographic area. The collaborative agreements may work better if researchers could have workshops and professional development with other nephrology researchers instead of being forced to work with the entire KUH research group within a geographic region. For example, a postdoctoral fellow in polycystic kidney disease could have a fellowship whereby he/she has journal clubs and meetings with a large group of researchers in cystic kidney disease in the U.S., Canada and even outside North America. The way the collaboration is currently set, fellows are participating in journal club and professional development with other investigators who may be at same level of training, but they are in a completely different area of research.

Proven or promising external resources or approaches

Only a small fraction of postdoctoral fellowships in KUH are successfully funded. NIH should do more to work with applicants and their mentors to improve their applications for a resubmission. NIH, especially NIDDK, could develop quarterly grant writing workshops or committees that review applications prior to submission. NIH should also help develop more programs that focus on undergraduates and graduate students to promote research.

Response 3062

Perspectives on the postdoc roles and responsibilities

Post-docs are the life-blood of my mid-size lab. We have been highly productive and extremely "cost-effective" publishing in impactful journals being funded by 1-2 R01 grants over the last several years. Post-docs steer the science, they bring in new perspectives and together with me, train graduate and undergraduate students in the lab. My lab would not function without them.

Fundamental issues and challenges

The low pay, the lack of retirement benefits and poor health quality benefits at a time when these highly skilled professionals are starting families.

Existing NIH policies, programs, or resources

Increase the NIH modular budget so that we can pay post-docs a living wage and be competitive with private foundations (HHMI) in keeping our labs and science afloat.

Proven or promising external resources or approaches

No response

Response 3063

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are among the most valuable members of the scientific enterprise. They train students and technicians, and in most cases are able to carry their own independent projects.

Fundamental issues and challenges

It is difficult to recruit and retain them because with limited NIH funding, one cannot offer a competitive salary. Small Labs, like mine, struggle to to have more than one Postdoc because the budget can barely cover their salaries and benefits.

Existing NIH policies, programs, or resources

Increase the minimum salarie and increase the budget.

Proven or promising external resources or approaches

No response

Response 3064

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

SALARY. The NIH guidelines for minimum salary are taken as the only salary that institutions can offer. I was in "negotiations" with 2 academic institutions for postdoc positions, neither would negotiate because they "follow the NIH/NRSA guidelines for postdoc salaries". The intent of setting a minimum is good, but institutions will not/do not want to pay more than the minimum. I turned down one of my offers because they wanted me to relocate but with student loan payments, housing costs, health insurance, etc I wasn't going to be able to afford basic necessities like groceries. I am only able to afford the postdoc I accepted because

1. my institution allowed me to work remote
2. I can live with my parents.

These are luxuries/privilege's that many potential postdocs are not afforded. As far as retention, again SALARY. There is a $500 difference between year 0 and year 1 on the minimum postdoc salary guidelines. Do you really think that $500 BEFORE TAX is a fair valuation of the additional skills that a postdoc has received with an additional year of training? On a personal level, choosing to stay in a low salary postdoc means delaying starting families, buying homes, and financial stability for additional years. There is no incentive to stay in these positions when working for industry or even for the government that sets the minimums means tens of thousands of dollars more per year. I'm not doing research for the money but I would like to be able to support myself somewhat comfortably after years of instability that I've already endured thanks to extremely low PhD student salaries. It's a slap in the face to be told that I can't even negotiate my salary when I have 8 years of graduate level research training.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3065

Perspectives on the postdoc roles and responsibilities

Postdoctoral positions are semi-independent research roles often involving self-directed projects and direct supervision of PhD and/or undergraduate students. They are also opportunities for researchers to continue to hone research skills and learn new methodologies. It is therefore important to provide adequate

training and infrastructure in the research methodologies and subject matter that interest postdocs and that align with the NIH mission to advance understanding of human health and disease.

We have heard directly from PhD students interested in using nonanimal, human-specific approaches that they have found many barriers to training. Trainees have expressed difficulty in accessing and employing these methodologies in their research due to existing bias towards animal-based methods. We attribute this, in part, to the NIH's overall reliance on animal-based research approaches, which has created a workforce heavily biased in its expertise. Despite the relevance of nonanimal approaches to human disease pathology and to PIs' research goals, the lack of expertise with nonanimal methods of lab leadership may result in little-to-no support for trainees (e.g., when accessing human data and samples, setting up clinical collaborations, or establishing protocols for methods that are not widely used). By comparison, the ease of ordering animals and obtaining approvals for widely used protocols can become more appealing and career trajectories can change entirely.

The NIH should work to reduce these barriers for students, postdocs, and early-career researchers interested in using nonanimal, human-specific approaches. Indeed, there is a separate and timely ACD Working Group currently charged with identifying how and where to invest in the development and use of novel alternative methods to advance biomedical research; but the Working Group on Re-envisioning NIH-Supported Postdoctoral Training has an overlapping goal: identifying how to support the next generation of scientists to advance ethical, effective, human-centered biomedical research.

Fundamental issues and challenges

The decline in postdoctoral researchers is fundamentally tied to the NIH's continued investment in training, infrastructure, and funding for outdated methodology and research approaches. Determinants of health expand well beyond biological, yet NIH priorities remain locked onto this narrow understanding of health, to the detriment of patients and researchers. A shift toward a more innovative, human-centered research ecosystem that can address our most pressing health needs is gravely needed.

The [redacted for anonymity] aims to partly address the gap in nonanimal research training through our Early-Career Researchers Advancing 21st Century Science (ERA21) program. ERA21 engages students, postdocs, and early-career researchers interested in nonanimal, human-specific methods, providing hands-on training via our biennial Summer School on Innovative Approaches in Science as well as a monthly newsletter with relevant publications, events, and funding and employment opportunities. In our experience, the next generation of researchers is eager for training and funding for nonanimal approaches and, similar to younger generations among the general public, are more likely to oppose animal use for scientific research than more senior researchers.

The misalignment of postdocs' personal values and aspirations for independent research, coupled with other pressures like insufficient pay, obligations to perform lagging experiments that are needed for PIs' grant renewals, and the struggle to conform to using methodology that they find ethically questionable, scientifically inadequate, and limited in translatability, creates an enormous emotional and mental toll and results in reduced quality of life and training satisfaction. The NIH should therefore offer and fund more concentrated training opportunities like summer schools and determine other ways of centrally disseminating and supporting skills training in nonanimal methods (see below). The shift toward human-specific approaches is already taking place in industry. Without such opportunities and support in the form of competitive pay, the academic decline will only worsen.

Existing NIH policies, programs, or resources

Biomedical PhD students, postdocs, and early-career researchers need training, funding, and infrastructure for nonanimal, human-specific research approaches. They should be able to explore clinical data, access human biospecimens, and operate experimental systems like tissue chips or organoids with competence. The National Center for Advancing Translational Sciences (NCATS) Clinical and Translational Science Awards program's Institutional Career Development Awards (KL2) could be expanded to provide broader support for senior postdocs and early-career researchers. The NCATS Tissue Chip program and the Interagency Center for the Evaluation of Alternative Toxicological Methods are examples where the NIH could add or expand opportunities for students, postdocs, and early-career researchers interested in human-specific approaches, especially T32 institutional training mechanisms. NIMHD could also expand opportunities for students, postdocs, and early-career researchers, especially in areas assessed as future priorities upon mapping the research portfolio on the NIMHD research framework

(doi.org/10.2105/AJPH.2018.304883) such as environmental, community, and societal-level determinants of health.

Biomedical PhD students and postdocs must also be well-versed in the ethical, social, and legal implications of their research—not as an afterthought, but as a central component of study design, analysis, and reporting. We recommend that

1. at least one full year (two semesters or three quarters) of rigorous ethics coursework and
2. at least one full course covering health disparities, social determinants of health, and social science methods should be required in doctoral and postdoctoral training programs.

Lastly, biomedical PhD students and postdocs must be competitively compensated (comparable to nonacademic peers) and afforded the right to collectively bargain without intervention or fear of repercussions from faculty. The NIH should therefore require grantees to remain neutral when student and postdoc workers are forming unions or collectively bargaining. Because unions protect workers, these measures would help ensure that the future of biomedical research is more inclusive of presently and historically social disadvantaged groups.

Proven or promising external resources or approaches

Several foreign and domestic government agencies have programs dedicated to training scientists and students on human-specific, nonanimal approaches that the NIH could use as frameworks for its own training programs.

The US Environmental Protection Agency is committed to working on the development and application of New Approach Methodologies (NAMs) to avoid the use of vertebrate animals in testing. As part of the agency's commitment, it offers numerous NAMs trainings and makes these trainings publicly available in the agency's catalog of training materials and resources. The agency also hosts the Computational Toxicology Communities of Practice, which is composed of hundreds of stakeholders from public and private sector organizations with a common interest who meet monthly. A similar training program and opportunity to engage the public at the NIH could improve the training ecosystem and foster interest among students and early-career scientists, especially those from outside of the NIH's typical network.

The European Commission's Joint Research Centre and its European Union Reference Laboratory for Alternatives to Animal Testing host a biennial Summer School on Non-animal Approaches in Science. In May 2023, the fourth iteration of the program will take place at the Joint Research Centre in Ispra, Italy. The program is geared towards students and early-career scientists a strong interest in nonanimal approaches working in relevant fields of research and application. The NIH could offer a similar program or partner with organizations like the Physicians Committee to jointly host a training program to engage early-career researchers.

Response 3066

Perspectives on the postdoc roles and responsibilities

Postdoctoral research is key to training to become an independent and professional scientist in the academic world. The US is renowned for its high-quality postdoctoral training, hence, as an international scholar, I agreed to move my family and I to the US to pursue a career in academia. Postdoctoral researchers are adults who studied substantially to become highly specialized individuals and their role is both to learn from the PI and the environment as well as to train the future generation of scientists. Their responsibility is to deliver high-quality of science—both in research and teaching/mentoring—and contribute to the progression of science in the scientific community as well as in the general public community.

Fundamental issues and challenges

There are many issues that come along with being an immigrant postdoctoral researcher in the US.

1. VISA is given for only 1 year by year which makes it impossible to make family plans.
2. Family members like spouses are not allowed to work and they need to spend $500 every time to request permission from the US government to work and wait many months before receiving a "yes, you are legally allowed to work in the US". This is extremely painful if you consider you have to repeat this procedure every time you renew your visa, hence every year. What job is okay with the spouse

working only a few months per year while you wait for your paperwork to come back to work and contribute to society in a legal manner?

3. There are many abusive PIs in academia who take advantage of this broken system to threaten and blackmail postdocs to work insane hours or to provide them with fake results or to perform scientific misconduct in an exchange for contract renewal. If the contract is not renewed, the postdoc and her/his family get deported in 30 days, which is an insane big amount of stress. We should save our energy for science, not basic human rights. We are not kids coming to study in the US, we are adults with families who aspire to become professors and expect equal human rights that do not depend on the passport of birth. I'm speaking out of a personal experience where I landed in an abusive lab, where the PI was threatening us to do experiments on animals without analgesics pending contract renewal. I had the luck to be rescued from another lab. All my colleagues instead left for an industry career because no lab rescued them.

Existing NIH policies, programs, or resources

NIH should not fund the abusive lab or the abusive PIs. It should remove their grant money. NIH should talk to individual universities and assess their grievances, and complains and make sure these labs do not have access to animal work anymore and do not have access to funding. So many papers funded by the NIH are performed in abusive environments, doing animal cruelty, and the science is not reproducible. Science that is not reproducible is not science and shouldn't be funded in the first place. I would also increase the years of VISA for international postdocs so they have time to look for another lab if things do not work out, exactly as US citizens can. All my US postdoctoral colleagues could change labs at no cost, with no consequences, while all international postdocs were stuck in abusive labs with no way out. The university protects the abusive PIs because they bring money from the NIH. If NIH do not fund in the first place abusive labs, then there would be a change for the better in academia.

Proven or promising external resources or approaches

Provide postdocs with two mentors, increase their salary and VISA, and protect them against an abusive environment. Please give them a way to report issues without retaliation.

Response 3067

Perspectives on the postdoc roles and responsibilities

The academic postdoc has become an unending holding pattern for scientists and creates a revolving population of insecure and poorly compensated professional workforce. Support for postdocs should be phased out of research grants and only provided as individual fellowships. Grants should support permanent research staff who are full employees, with all the benefits and appropriate salary compensation.

Fundamental issues and challenges

Postdoctoral trainees need a non-PI academic career ladder, i.e. research scientist position.

Existing NIH policies, programs, or resources

Support for postdocs should be phased out of research grants and only provided as individual fellowships. Grants should support permanent research staff who are full employees, with all the benefits and appropriate salary compensation. In order to support permanent research scientists, the R01 module should be increased to at least $350k/year direct, and tied to inflation.

Proven or promising external resources or approaches

Response 3068

Perspectives on the postdoc roles and responsibilities

It's a nice opportunity to receive additional training (or new training) on items that I didn't receive any/enough training on during my doctoral program, such as writing a K grant, mentoring students, leading a research team, and applying for and interviewing for faculty jobs.

Fundamental issues and challenges

The pay is not enough. I receive the annual NIH stipend as of Sept 2022, which was $53,760. This comes out to $25.85 per hour. This is literally what I made as a data collector DURING MY PHD PROGRAM! This is honestly insulting. We should be making AT LEAST $75,000.

Additionally, the NIH should encourage institutions to allow remote work for postdocs. It's totally unrealistic and toxic to expect that we should uproot our families just to take a temporary 2-3 year job, and then have to uproot them again whenever we finish. (Especially for a job that pays $25.85 an hour!)

Existing NIH policies, programs, or resources

Our salaries need to be adjusted for inflation and cost of living throughout the year. All faculty and staff at my institution received a 2% cost of living increase in January 2023. However, I was told that I could not receive a cost of living adjustment to my salary because NIH does not allow for raises outside their pay scale. So everyone got cost of living pay increases except for the postdocs, who probably need it the most!

Proven or promising external resources or approaches

Please pay us more. We cannot support ourselves and our families on the current postdoc stipends.

Response 3069

Perspectives on the postdoc roles and responsibilities

It gives me a great opportunity to use my research and academic skills and pursue my research interests in biomedical science for better diagnostics and therapeutics. It also acts as a bridge to establishing myself as an individual scientist

Fundamental issues and challenges

The apparent issue that I noticed is that Postdocs have been used as research slaves with very much underpaid salaries. They are not getting the right recognition as they should get. For some of them, it acts like a dead end, and makes very hard for them to either continue in academia or change into an industry.

Existing NIH policies, programs, or resources

Current NIH Postdoc payscales are very much underpaid, and it has to be significantly increased. It is very inappropriate to have different payscales for a Postdoc at different research institutes, and there should be the same payscales throughout the country based on his/her experience. An average postdoc is married with a child at this stage of their career and it is highly unfortunate and humiliating for them to hardly survive with these salaries.

Proven or promising external resources or approaches

The person at the level of Postdoc in his/her career has the right momentum and maturity to design and drive the research. They are the people behind most of the discoveries around the world. Their work should be valued and appreciated accordingly. I believe having a national pay scale with consideration to HRA (House Rent Allowance) based on the cities they live is a promising approach.

Response 3070

Perspectives on the postdoc roles and responsibilities

We are writing these responses as a postdoctoral association at a large state-sponsored research-intensive institution. We are a postdoc-led organization responding on behalf of the postdoctoral scientists (including postdoctoral research associates, fellows, and analogous titles) at our institution. We have incorporated their perspectives here to ensure they are shared as part of our organizational response. We have also encouraged individual responses. Overall, the roles **and responsibilities** of the academic postdoc are unclear and poorly understood by those around us. Often, we find that administrators do not know what a postdoc is and therefore what they do. For example, we are often confused for students since not all of us receive benefits from the university (such as in the case of fellows, referred to here as designated campus colleagues). Many postdocs often find it difficult to balance their own research and career interests (requiring professional development), while managing their supervisor/PI's expectations. This leads to a

disconnect and unrealistic expectations, which negatively impacts both the postdoc and the academic research enterprise as a whole. Ideally, there would be a mechanism in place for ensuring that a mentor does not take advantage of the postdoc and instead mentors that trainee towards their long-term career goals. Additionally, we have heard from mentors that they face institutional barriers to supporting postdocs under their supervision (e.g., university or state policies on employment and benefits) and must go above and beyond to "make their postdocs whole" and retain talent. Overall, we have heard recommendations that roles **and responsibilities** should be clearly defined in offer letters and contract language and that postdoc supervision and mentorship should include additional checks and balances (for example, a mentorship committee).

Fundamental issues and challenges

Quality of life and recruitment is highly dependent on a mentor's reputation and the benefits provided (or not) by the institution. We often hear from our fellow postdocs that a competitive salary, moving expense assistance, health insurance, immigration assistance, and retirement benefits would make their lives a lot easier. For recipients of prestigious fellowships, some are left shocked and disappointed by the reality that these awards will negatively impact the financial and physical well-being of their family due to loss of regular salary (instead dispersed as a lump sum, with no withholding, leading to a "tax bomb" and complicated filing) and loss of employee benefits. Even for postdocs that are employees, the benefits are not adequate and do not include matching retirement at our institution. As it stands, becoming an academic postdoc is often an unsound financial decision, and for some an impossible choice that limits us from recruiting and retaining the best possible scientists and future leaders. Some postdocs have had to really consider whether their family could financially support themselves in this position, compared to going into a non-academic position (such as industry or government). This perpetuates the current inequalities in academia. Additional challenges include unclear career progression and timelines.

Existing NIH policies, programs, or resources

The most important thing that the NIH could do today would be to change the wording in the agreement of the F32 award. As it stands, as per the administration at our institution, they are NOT allowed to hire postdoc fellows as "employees" and instead are considered "Designated Campus Colleges" . DCC's do not have access to basic benefits such as health insurance, dental insurance, qualified tuition reduction, etc. This negatively impacts the quality of life of postdocs and likely negatively impacts their work and therefore NIH's end-goal of helping facilitate an adequate training program for postdocs and ensuring a successful pipeline of highly qualified personnel to keep the academic research enterprise thriving. We recommend that the NIH must mandate (as NIH does for other sponsoring requirements) that institutions provide a minimum salary (with built-in increases per inflation and cost of living adjustment), comprehensive benefits, and matching retirement plans. Some postdocs feel that they do not have any leverage, therefore they are hopeful that the NIH can require minimums. The NIH should permit postdocs to be employees or otherwise require institutions to support their postdocs to be eligible for federal funding, the same way they require institutions to have policies and structures in place for ethical human and animal research. Otherwise, as a former postdoc has stated: "not requiring a minimum salary and benefits for postdocs, supplied by the institution, is admitting that postdocs are effectively slaves to the system" . We also heard that "the university will only do the bare minimum required to fulfill requirements" , so we recommend that reasonable minimums be established for organizations with leverage. International postdocs, which make up >50% of the postdoc community, are especially vulnerable to being taken advantage of and accepting poor compensation and lack of benefits due to stringent visa requirements.

Proven or promising external resources or approaches

Currently, at our institution, we find that training options specific to the uniqueness of the postdocs role work best. For example, the Center for the Integration of Research, Teaching and Learning (CIRTL) network created a specific teaching training program that accommodates the need for postdocs to work on their research projects, while also getting experience through a co-teaching partnership. We also have found that a productive working relationship between our postdoc-led association and the Postdoctoral Affairs office, including cooperatively planned events and orientations, has been beneficial to connecting postdocs, enriching their professional development, and advocating for change. To help international postdocs, some organizations like the American Cancer Society have expanded the eligibility of their postdoctoral fellowships to non-citizens, and it would be beneficial for the NIH to consider expanding their F and K award opportunities to non-citizens (beyond the K99/R00). Given that the majority of academic

postdocs in the USA are non-citizens it seems prudent to support their training. We have also heard recommendations to include more small grant awards ($25,000 to $50,000) that would be specific to postdocs to help generate preliminary data toward a K99/R00 or transitioning toward independence. Additionally, expanding alternate career path options for postdocs, such as staff scientist supplement support has been recommended, although some postdocs fear that making these tied to a pre-existing R01 "only makes the rich richer" rather than supporting the full breadth of scientific creativity and potential that exists in our community.

Response 3071

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity], representing more than 7,500 U.S and international basic and biomedical researchers, appreciates the opportunity to comment on the current challenges facing postdoctoral candidates and their positions within the academic system. The national focus on this issue has illustrated that there is a need for open dialogue and careful consideration on whether the current postdoctoral training system needs to undergo some degree of reform for future generations of researchers given the substantial impact of the scientific enterprise on the U.S. economy. Through the [redacted for anonymity] a panel session was organized at the 67th Annual Meeting in February of 2023 and included members at various career stages and a representative from the National Institutes of Health (NIH). The following responses to the RFI questions reflect the input we received from participants in that session alongside the collective expertise of the members of the PAC. We appreciate the opportunity to participate in this discussion and share our recommendations for the future of postdoctoral training.

Fundamental issues and challenges

Principal Investigators (PIs) have cited a shortage of qualified candidates for postdoctoral positions as a significant challenge currently facing research labs in the past few years. Simultaneously, postdoctoral candidates have identified a number of issues with the current training system deterring them from pursuing a career in academic research. Specifically, they cited inadequate salaries (especially in large/expensive cities), uncertain future job prospects, and insufficiently supported leave policies (including maternity/paternity leave).

The U.S. has always been a draw for international students and scientists interested in learning and participating in cutting edge research initiatives. To date, more than half of the postdoctoral workforce is made of up international researchers who choose to study here and lend their expertise to the U.S. research enterprise. International students contributed nearly $33.8 billion and supported more than 335,423 jobs in the U.S. economy during the 2021-202 academic year, not including the scientific research that their academic work supports and the economic and research discoveries they contribute to during their time in the U.S. Significant concerns have been raised about the ongoing delays in obtaining and renewing visas for students and researchers who have earned a place at an academic institution or been previously approved for entry. These continued delays in turn cause research initiatives to operate at less than their full capacity while they await graduate and postdoctoral researchers to arrive in the country.

Existing NIH policies, programs, or resources

One proposed solution to address the issue of compensation would be to increase the National Research Service Award (NRSA) postdoctoral stipend levels. While some private academic institutions simply use the NRSA recommendation as a baseline and can offer more competitive pay to recruit top candidates, the majority of academic institutions set their biomedical research postdoctoral pay scales based on the NRSA recommendation. Increasing the stipend to levels more commensurate to cost-of-living in large cities will ensure adequate financial support for postdoctoral candidates pursuing a career in academia. We recognize that increasing postdoctoral salaries will require increased funding for individual NIH grants, and indeed to NIH overall, in order to compensate for an adjusted NRSA baseline and prevent a decrease in the number of grants supported by NIH.

If a reduction of postdoctoral researchers in academia becomes normalized, measures will need to be implemented to prevent a loss in extramural research productivity. Currently, trainees that include postdoctoral and graduate students, are the primary workforce for NIH-supported research. One solution to this possible problem is to encourage and support consistent NIH funding for staff scientists in academic research. While these positions will also require more funding support, staff scientists provide a high level

of productivity and increased consistency due to the position being career-based, rather than just a temporary training position. We should also consider setting stricter time limits to the length a trainee can be funded as a postdoc (e.g. 4 years) through the NIH. Shorter postdoctoral training times would also serve to discourage the current system of using postdocs as long-term workers which has contributed to the above-noted issues.

Proven or promising external resources or approaches

[redacted for anonymity] supports the creation of new pathways for international postdoctoral training candidates coming to the US by streamlining the visa process. In order for the U.S. to remain the global leader in scientific research, we must be able to recruit the best and brightest from around the world. While not directly under the purview of NIH, policy changes to make it easier for biomedical researchers to study, train and conduct research funded through NIH grants to receive and renew work visas would most greatly improve the number of international candidates for postdoctoral positions.

The ongoing national and Society dialogue on how we look at and support postdoctoral training shows that there is a significant need for change in our academic training system. There are many options for systemic policy change to improve the postdoctoral training ecosystem at the academic research institution level. It should be noted that in addition to the efforts of the NIH, there would need to be corresponding buy-in by the various academic research institutions given their diversity. For example, institutions with the financial capabilities should be encouraged to supplement postdoctoral salaries using institutional funds wherever possible. Furthermore, universities can decrease the challenge of securing faculty positions for accomplished and motivated postdoctoral candidates by developing postdoctoral-to-faculty bridge programs, as exemplified by the the University of California's President's Postdoctoral Fellowship Program. Thirdly, improving international scholar offices to provide more resources and support for international trainees will further increase international postdoc retention and recruitment.

Response 3072

Perspectives on the postdoc roles and responsibilities

Ideally, academic postdoctoral research is meant to be a transitional period for early-career scientists to develop new technical and professional skills under the guidance of a mentor or mentoring team for the purpose of gaining independence in their chosen career paths. Postdocs are highly-qualified scientists pursuing intentional, time-limited training to bridge their graduate training and career independence. Strong mentoring support, coupled with career development training, is key for success during the postdoctoral scholarship period.

However, in reality, many postdocs find themselves in precarious positions in which they are treated as cheap staff scientists because they are highly qualified (more advanced than a "trainee"), while also stuck in ill-defined training environments that are lacking in support, mentorship, clear expectations, and freedom to grow and gain skills to prepare them for independence. A lack of standardized hiring practices, titling, appointments, and agreement on what postdoctoral training actually is causes confusion about who is serving as a postdoc, leading to a lack of targeted resources for postdocs and their faculty mentors, and exacerbating the isolation, and possibly exploitation, that postdocs may experience.

In addition, it is important to recognize that the workforce has changed and that most postdocs will not continue in an academic tenure-track career path but will pursue any of a number of career paths in a variety of competitive sectors. Better education and preparation about postdoctoral training is required at the graduate level, in order to divert people away from taking unnecessary postdoctoral positions. However, simultaneously due to a current shortage of doctoral-trained scientists pursuing postdoctoral positions, the workload is becoming overwhelming for those who do choose postdoc paths, leading to work-life balance issues coupled with low pay compared to expectations.

Fundamental issues and challenges

A fundamental issue challenging postdocs in academic research is a lack of standardized compensation and benefits. All postdocs deserve equitable, standardized benefits and adequate pay at an institution regardless of their source of funding. While paid on the NRSA scale, postdocs with F32 and T32 fellowships are unable to access employee benefits, such as subsidized employee health insurance and retirement benefits, afforded to postdocs who are funded by other NIH mechanisms. On the other hand, currently, there is no requirement for NIH RPG budgets to adhere to any standardized salary scale for postdocs. NIH

should consider revising the policy that disallows F32—and T32-funded postdocs to be appointed as employees, while also adopting a revised NRSA salary scale for all NIH-funded postdocs, coupled with a cost-of-living adjustment for high-cost areas, and annual increases.

More accountability is needed for NIH-funded PIs who train postdocs. All PIs should undergo formalized mentor training before being allowed to train postdocs, and mechanisms for reporting bullying and abuse should be strengthened by NIH and also be required at the institutional level. All NIH grants that will fund a postdoc should include a detailed mentorship and training plan, similar to NSF, along with a requirement for IDPs and yearly evaluations. NIH should consider issuing an update to NOT-OD-15-008, clarifying the amount of time that is allowable to be spent in professional development training for all NIH-funded postdocs, to discourage PIs from disallowing their postdocs to take time to participate in professional and career development activities. Finally, yearly progress reporting should include feedback reports of PIs from postdocs, and successful (or not successful) mentoring needs to be reflected in these evaluations of the PI.

Existing NIH policies, programs, or resources

If NIH is unable to solve the postdoc employment and benefit issue that comes hand-in-hand with T32 and F32 postdoctoral fellowships as described in point 2, I recommend transitioning away from these mechanisms for postdoctoral training and moving toward expanded K mechanisms for both institutional and individual postdoctoral training, especially expanding mechanisms like the K99/R00, in which international postdocs are eligible. I would also like to highlight the excellence of the IRACDA K12 institutional training program in preparing postdocs for teaching and research careers and recommend that NIH expand the IRACDA program as well as replicate it for the purpose of training postdocs for other career sectors. I also recognize the utility of the NCI R50 program for Research Scientists and recommend expansion of this mechanism, as many postdocs, especially international postdocs, wish to stay in academia and transition to advanced staff scientist or research assistant professor positions. Finally, I recommend that NIH allocate more individual funding for early-career tenure-track faculty, including via the R01 mechanism. Increased funding for junior faculty will increase the attractiveness of an academic career path and encourage more postdocs to enter academic tenure-track faculty positions while improving retention of new faculty.

As a postdoctoral office director, I would like to recognize the excellence of the NIH Office of Intramural Training and Education for its outstanding opportunities for training for intramurally-funded postdocs, and extend my appreciation to OITE for their outreach to and inclusion of extramural institutions in their virtual programming. I recommend that NIH create a center for extramural workforce development, which includes expanded career and professional training opportunities for extramural postdocs, as well as a centralized place to track outcomes of extramurally-funded postdocs.

Proven or promising external resources or approaches

To enhance the postdoctoral training ecosystem, there are several external resources and approaches that NIH could explore. First, NIH should adopt the recommendations from the AAMC Appropriate Treatment of Research Trainees (AToRT) and CIMER mentor training curriculum for PIs who will be supervising NIH-funded postdocs. Next, NIH should continue to invest in postdoctoral cohort training programs, such as IRACDA and MOSAIC. A number of institutions have developed successful postdoc to faculty transition cohort programs, including my own institution, with the purpose of retaining outstanding scholars in academe while diversifying faculty ranks. NIH should consider developing an institutional postdoc to faculty transition training grant funding mechanism.

Finally, individual institutions and organizations are left to develop their own training and resources for postdocs, which is inefficient. NIH should develop a centralized hub linking resources that are available from NPA, PDHub, Postdoc Academy, professional societies, and individual institutions that have developed outstanding resources for postdocs, such as UC San Francisco. In addition, there is need for funding for institutions to develop training programs for postdocs, which could be organized and disseminated via the centralized hub. For example, I would like to recognize the excellence of the Burroughs Wellcome Fund Career Guidance for Trainees Grant, a small-grant mechanism through which innovative programs, like the Leadership and Management in Action Program (L-MAP) developed at Washington University in St. Louis, have been successfully developed, disseminated, and implemented at other institutions, including my own. I would also like to recognize the NSF Alliances for Graduate Education and the Professoriate (AGEP) program focusing on funding for multi-institutional collaborations. Finally, I would recommend reimagining and reinvesting in NIH BEST to fund model training programs at the institutional-level, which could then

be shared with other institutions. Resources developed with NIH funding could organized and disseminated in the centralized hub.

Response 3073

Perspectives on the postdoc roles and responsibilities

Postdoctoral researchers are the lifeblood of the biomedical research enterprise. This rings true at [redacted for anonymity] where our postdoctoral scholars conduct cutting edge research, develop innovative technologies and methods, and actively participate in many of the institute's large-scale collaborative projects and initiatives, all to enable breakthrough discoveries and enhance our understanding of human disease. In addition, postdocs are fostering the next generation of scientists, mentoring junior researchers at the beginning of their scientific careers, whether through teaching undergraduates, mentoring graduate students in their labs, or overseeing research technicians assigned to their projects. Postdocs play a crucial role in the nation's biomedical research ecosystem and their contribution is unmatched. They are not just another component of the system but an essential element that cannot be substituted.

This is why we are grateful that the National Institutes of Health is taking a look at re-envisioning the experience of postdoctoral researchers and that we have been given the opportunity to provide comments and thoughts on the role and how we can best support it.

Postdoctoral training is intended to be a temporary period of advanced scientific training to prepare young scientists for independence, and as such, postdocs should have freedom to explore various career pathways and professional development opportunities while receiving guidance and encouragement from their mentors as they begin to pursue their own research questions. At [redacted for anonymity] we offer many opportunities beyond the bench including public engagement, communication, and science policy skills development. We view the NIH to be the standard bearer for setting the accepted practices and policies to enhance the training of biomedical postdoctoral researchers. In this capacity, the NIH is well-positioned to establish guidelines and mandates that encourage activities to foster a culture of inclusivity, mentorship, and professional development, as the role is intended.

Fundamental issues and challenges

We acknowledge that this stage of a researcher's career is meant for acquiring advanced scientific training in preparation of an independent career. To succeed in this endeavor, postdocs need the freedom and flexibility to explore their curiosities and devote their energy to their science. Often, external pressures get in the way. Postdocs frequently must relocate to high-cost-of-living areas for their positions and the moves can be expensive, sometimes putting postdoctoral research beyond the reach of many without secondary support, usually young families, those from lower socioeconomic backgrounds, and international scholars. At [redacted for anonymity], we have traditionally used the NIH's National Research Service Award salary levels to benchmark postdoctoral salaries. Beginning in 2022, we added 10% to each NRSA level to set our minimums to account for Greater Boston's higher cost of living.

Postdoctoral training frequently coincides with significant life events such as marriage and starting a family. In addition, the cost of childcare can be prohibitive to many young families. We've tried to thoughtfully address this at [redacted for anonymity] by instituting programs such as the Childcare Financial Assistance program which can reimburse various childcare expenses. NIH has made strides with the creation of the childcare subsidy for NRSA-supported fellows and we advocate that this type of program be expanded to postdocs supported by other PI sponsored grants.

Existing NIH policies, programs, or resources

[Redacted for anonymity] is also home to a robust community of professional scientists who are deeply involved in leading and executing a range of core scientific projects across the Institute. These staff scientists are not faculty but are long-tenured researchers who may lead project teams and initiatives. Many of these researchers began their careers as postdocs at [redacted for anonymity], providing a viable and rewarding professional pathway for young scientists. The NIH should explore expanding programs for staff scientists in academic labs to encourage postdocs to remain in academia while also providing clear guidance on the differences between the two roles. Expanding funding mechanisms like the K01 and K02 Research Scientist Development Award provide postdocs with a stepping stone pathway as tenure-track faculty position opportunities remain limited.

Proven or promising external resources or approaches

No response

Response 3074

Perspectives on the postdoc roles and responsibilities

As a postdoc, and an active member (former President) of [redacted for anonymity] postdoc association, I see the postdoc primarily as the first post-graduate job for those wishing to continue on the academic track. However, it is important to remember that some postdocs (especially international postdocs who often face visa limits to getting jobs in industry) are aiming to gain additional experience before applying to industry or other jobs.

While the postdoc position is often thought of as a training position, and postdocs are referred to as "trainees" , in my experience, postdocs do not receive any more (or less) training than anyone in a new job: if I had pursued an industry job instead of a postdoc, I expect I would need as much, if not more, training. My graduate school classmates took positions in fields as diverse as science journalism, consulting, and venture capital. These peers were not hired as "trainees" , despite the fact that, in comparison, our graduate training provided less direct training these positions than it does for the postdoc position. The postdoc should thus be no different than any other job: it is merely the first post-PhD step on the academic job path, not a special training position.

It is also important to note that the postdoc is often thought of as a temporary position, contributing to its classification as "training" . However, many postdocs, especially biomedical postdocs, remain in their jobs for 4-6 years, which is longer than most people in a similar age group stay in their jobs. Thus, this postdoc position is a job like any other job and should be treated as such.

Fundamental issues and challenges

1. Compensation and benefits. The main issue with the postdoc position is that it is treated as a short-term training position rather than a job (see above), which is used as an excuse for poor compensation and benefits. If we want to have a diverse postdoc population—and, more generally, a diverse biomedical field—we must make the compensation and benefits of the postdoc position high enough such that no graduating PhD feels that, given their option of career paths, they are unable to afford to choose the postdoc position. A few of the specific downsides of choosing a postdoc position over other positions that are treated more like a regular job:
    a) Salary: The NIH-NRSA salary scale, which is adopted by many universities as a minimum salary policy, is inadequate to support postdocs in high cost of living areas. Furthermore, salary source and benefits can change multiple times over the course of a postdoc as fellowship funding source changes.
    b) Child care: many postdocs, especially women, leave the postdoc position due to lack of affordable childcare.
    c) Retirement: Postdocs are, more often than not, not offered employer-matched retirement contributions (despite the fact that they're often in their 30s, at an age where they should be saving for retirement).
    d) Health insurance: Some postdocs are not guaranteed employer-sponsored health insurance and must pay for it out of pocket.
2. Harassment, bullying and discrimination. Most postdocs are in a unique position where they are hired directly by a faculty member who has almost complete control over both their job and their career future. This system creates an environment in which it is very difficult for postdocs to get any recourse against bullying, harassment, or discrimination—especially in the case where their faculty mentor is involved—without completely overturning their professional lives.

Existing NIH policies, programs, or resources

In place of the current NIH NRSA scale, the NIH should adopt the General Schedule (specifically level 11—the minimum salary level offered to new PhDs) system for setting postdoc salaries. This scale is already used by the federal government to set salaries paid by tax-payer money, which in theory should be similar to postdoc salaries paid directly or indirectly by the NIH. Importantly, this scale is adjusted for cost of

living and includes a yearly increase for years of experience. The NIH should also require that any postdoc paid by NIH funds is paid at least the minimum salary on that scale. The NIH should also require that any postdoc in a lab that receives NIH funding has employer-sponsored health insurance and employer-matched retirement contributions regardless of the postdoc's fellowship status (i.e., require that NIH-funded PIs cover these things). The modular R01 budget should be increased to account for these expansions in pay.

Furthermore, funding mechanisms for postdocs should enable more independence from their faculty mentors. (e.g., some grants such as the R34 allow postdocs to be the PI, but as it's not the norm, they often still need extensive faculty and university support). There are currently few NIH funding mechanisms that are open to postdocs that enable them to receive substantial research support (i.e., support beyond just stipend funding and small research allowances). This contributes to postdocs heavy reliance on their faculty mentors both practically and intellectually. The K99 and F32 mechanisms could also be altered to have less emphasis on "training" in a specific lab, more funding for research, and thus less reliance on faculty mentors.

Proven or promising external resources or approaches

The Harvard FAS postdoc association conducts an annual survey of our postdocs. We collect and analyze data about our postdoc population and provide suggestions for improvements to the postdoc experience. I hope you will check out our survey reports here: https://postdoc.fas.harvard.edu/PDA/reports

Response 3075

Perspectives on the postdoc roles and responsibilities

To me, the postdoc position is a temporary advanced training period. It is a helpful time in the apprenticeship model of science and I value the protected time to gain independence and skills.

- NIH postdoc positions should facilitate research independence and promote development of technical and non-technical skills. All postdocs should have access to professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills.
- Postdocs should work in an environment that fosters new skills and expertise, encourages creativity, and allows flexibility to explore new research areas to maximize personal and professional growth.
- Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

Fundamental issues and challenges

- Compensation
- The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areaswith defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.
- Insufficient DEIA
- Academia contains remnants of structural biases and institutional barriers that hinder the success of scholars from historically-marginalized groups still today. Postdocs from historically-marginalized groups and international postdocs face increased structural and implicit barriers including: lack of inclusion, reduced resources, implicit bias, and loss of community, while often managing increased familial commitments and additional financial responsibilities. Examining and acting on these power imbalances is key to creating a more inclusive and safe environment.
- Environment
- Postdocs often cite high instances of isolation and poor mental health. NIH should hold institutions accountable for fostering inclusive and supportive training environments, including expanding the current requirement for institutional commitment to preventing discrimination and harassment to include provisions for mental health and wellbeing support.
- NIH should require a percentage of indirects on all NIH grants supporting postdocs to provide postdoctoral offices with increased resources to foster stronger postdoctoral communities with healthier, sustainable cultures.

Existing NIH policies, programs, or resources

The most significant improvement that is required, based on my personal experiences as a postdoc at a large, public, R1 university and as the recipient of an NIH F32 grant, is better coordination between NIH and universities to handle the HR side of fellowships. I had to go on "educational leave" to be funded through my F32, and be treated as a contractor by the university to receive health benefits, but still lost access to retirement benefits during my fellowship. This kind of disincentive to receiving extramural funding is a glaring sign of a broken system.

- Postdocs need equitable benefits
- Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. (Other implications, such as tax, do not stem from NIH.) Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible.
- NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds.
- NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.
- To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be especially cost-prohibitive for researchers from low socioeconomic backgrounds, those with increased familial commitments and internationals.

Proven or promising external resources or approaches

- NPA Resources
- The NPA has a wealth of resources developed by committees consisting of

postdocs, PDO leaders, and other contributors. By combining the lived experiences of postdoc training from multiple perspectives, NPA resources provide well-balanced and comprehensive tools, knowledge and advice. The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

- Consolidate professional development resources
- Currently, institutions and NIH IC's each develop their own professional

development resources, leading to inequity while inefficient in time and money. NIH should provide a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. In anincreasingly virtual environment, a well-maintained comprehensive hub should be searchable and accessible to enhance a postdoc's personal, scientific, and professional development. This would complement federal commitments toward open science by increasing not only the availability and access of federally-funded research but also its community resources.

- Engage with key stakeholders
- We encourage NIH to work closely with institutions that host postdocs and NPA

on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change.

I sincerely thank NIH for the platform to share my feedback and experiences as an NIH funded postdoc. I applaud the many efforts NIH has already undertaken to improve the scientific training culture and urge NIH to continue and improve these efforts. I am particularly pleased that the IRACDA program exists to facilitate teacher-scientist training.

Response 3076

Perspectives on the postdoc roles and responsibilities

As a postdoctoral fellow (as part of a T32 training program), my time was devoted to a combination of professional development and career building research leadership opportunities. Postdoctoral fellow time should be protected for these activities. I have tried to facilitate the same for any postdoctoral fellows that I supervise or work with. Unfortunately, there has been quite a practice—in some academic spaces—of treating postdoctoral fellows more like research assistants and without as much attention to their career growth and without cultivating their agency in their research and career development. Additionally, particularly for those underrepresented in research, many postdocs begin to receive a lot of teaching and service requests. While some level of experience in these areas is helpful and may give a sense of the types of commitments and time management required in next career stages, these should not comprise a large part of the postdoctoral fellow role (unless the role was created for that purpose and that was explicitly and transparently communicated upfront). In my field, postdoctoral fellowships are typically 2 years to sometimes 3 years in duration. The postdoctoral fellowship also tends to serve as a bridge between doctoral (PhD, DrPH, or equivalent) training and a more independent position (Assistant Professor or equivalent role). The postdoctoral fellowship is also typically a mentored role. Historically, this may have involved a single mentor, but I've seen greater expectation for postdoctoral fellows to have multiple mentors, and seen this reflected in actual practice. In some cases there is continuity between doctoral program mentors and postdoctoral fellowship mentors—especially if there is new opportunity for growth, learning and increasing independence/leadership. However, many postdoctoral fellows benefit from a change in environment, or at least projects and teams.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

- allowing variation in the postdoc timeframe for the K99/R00. This option isn't as attractive as it could be given that it can extends postdoctoral fellowships quite significantly by the time a trainee is well poised to apply
- providing PI or MPI status to awardees of NIH diversity supplement funding (so that they are seen as independent or increasingly so)
- expectation that mentors of NIH training awards be only NIH superstars (received a whole lot of NIH funding)—this is particularly limiting to the diversity of trainees and mentors (and may facilitate/reinforce some mentorship malpractice)

Response 3077

Perspectives on the postdoc roles and responsibilities

As clinical neuropsychologists, we view the role of an academic postdoc in our field as a position that provides advanced training for individuals who are interested in pursuing the study of brain-behavior relationships with an emphasis on research and academic productivity. This typically refers to positions on training grants (e.g., NRSA and T32 grants), but it also includes positions funded by faculty on non-training grants.

Fundamental issues and challenges

- Lack of flexibility in time allocation: Many trainees in our field are interested in balancing advanced research training with clinical training that is consistent with requirements for board certification in clinical neuropsychology (i.e., "at least 50% of postdoctoral training must be in the provision of clinical neuropsychological services that are supervised by a clinical neuropsychologist" during a two year fellowship). Clinical research activities can count, but the time-allocation guidelines for NIH-funded fellowships make meeting this requirement difficult and deters individuals interested in board certification from pursuing academic postdocs.
- Visa restrictions are limiting: J1 visa applications are common for international trainees. However, many grantees are subject to the two-year home country residence requirement. This stipulation effectively places a "hold" on postdoctoral fellow experiences.
- Payback requirement: The NRSA payback requirement, unique to academic fellowships, is a significant potential burden/deterrent for many individuals. Trainees cannot guarantee that a position that meets their professional goals will be available, and a position that meets this requirement is hard to obtain in academic medical centers immediately post-fellowship without grant funding. It is recommended that this requirement be re-evaluated.
- Low stipend: The NIH postdoctoral stipend is below the cost of living in many metropolitan areas, leading many trainees to forego postdoctoral training in pursuit of more financial stability.
- Potential lack of continuity in funding: The T32 funding cycle means that trainees who enter a postdoc during a renewal year may only receive one year of funding, making it an impractical option for individuals seeking a 2-year training program.
- Lack of oversight/quality of control: Additional monitoring of training standards, including insuring that promised support and mentorship is provided, is needed. An external, independent review is one option that would reduce the pressure on the trainee to identify and report issues with the training program.

Existing NIH policies, programs, or resources

- Increased flexibility in the training plan to allow clinician-researchers to integrate more clinical training into NIH funded research fellowships in order to promote the development of the next generation of clinically-focused researchers. Alternatively, development of a specific postdoctoral training grant option for clinician-researchers that allows for clinical training compatible with the requirements for board certification in their field would be of significant benefit.
- Modification of NRSA payback requirement to reduce burden on trainees.
- Develop funding mechanism to support individuals whose postdoctoral training is affected by mentor's loss of funding (e.g., T32 isn't renewed as anticipated).
- Expand NIH Loan Repayment Program so it is available to a larger number of individuals and thus serves as an additional financial incentive for individuals who forego higher salaries available in clinical positions to pursue research training and ultimately research careers.
- Increase costs allowed for travel and training-related expenses on training grants. In particular, funding that supplements the stipend should aim to comprehensively cover out-of-pocket costs that currently contribute to increased debt incurred during fellowship. This includes, but is not limited to, budget allocated for relocation costs, conference travel, poster printing, statistical software, professional memberships, and other training opportunities. We believe that none of these costs should be expected to come out of the postdoctoral fellow's stipend.

Proven or promising external resources or approaches

- Add a locality adjustment for the stipend, such as that used in the VA system (i.e., General Schedule (GS) Locality Pay Tables) or allow individual universities to match salaries paid to other fellows.
- Provide incentives to individuals who complete academic fellowships such as:
- Develop unique funding opportunities limited to individuals who are or have completed NIH postdoctoral fellowships, and in particular clinical psychologists. There are special funding mechanisms designed to keep physicians in academic medicine, but there is nothing comparable we are aware of for our field.
- Unique training and/or networking experiences that can only be accessed by individuals who participating in academic fellowships; as an example the VA holds an annual meeting for Career Development Award (CDA) recipients that is attended by all of the program officers and provides an excellent opportunity to engage with the leaders of VA Research and Development and peers throughout the country.

Response 3078

Perspectives on the postdoc roles and responsibilities

Being a postdoc feels like a middle management position. We are not ultimate decision makers but we do have some independence and mentoring roles. In my postdoc position, I am the day-to-day mentor to two graduate students. This important responsibility is on top of the many lab management type roles I fulfill, as well as my own research and training. It often feels like postdocs wear many hats—and that this is not always acknowledged or valued by institutions or funding agencies. Postdocs are highly trained and effective scientists; we are adept at not only experimental work but also at management and administrative roles as well. It often feels like we're the behind the scenes scaffolding that holds the faculty and graduate students together.

Fundamental issues and challenges

To put it bluntly: the pay. I am only one of the few members of my graduate school cohort who are in an academic postdoc. Most are in industry—either biotech, pharma, or consulting—simply because the pay is better. I am able to work within the NIH postdoc payscale because my spouse has a well paying non-science corporate job. Her income basically subsidizes my choice to stay in academia. Academia strives to increase diversity among scientists, but we are not providing the pay necessary to recruit individuals who are living on a single income or may be from economically disadvantaged backgrounds. The issue is even more dire for postdocs who are attempting to support children or other members of their family. And this isn't even to mention the immense financial stress of student loans, which many postdocs also need to

contend with! Of course there are other issues within academia like the toxic culture of overwork and discrimination, but the core issue is pay.

Existing NIH policies, programs, or resources

Increase the postdoc salary minimums and increase research grant budgets to allow faculty to pay their postdocs more. It is difficult to fully embrace training and the academic pathway when financially insecure. Everything starts with pay.

Proven or promising external resources or approaches

In my opinion, the training ecosystem does well. F and K grants are fantastic ways to formalize training plans and future research goals. To get more scientists in the door and choose the academic career path pay must be increased. The current pay scales are not sustainable.

Response 3079

Perspectives on the postdoc roles and responsibilities

Historically, the postdoctoral role has been focused on the idea of preparation for a tenure-track position. This is no longer true. Many postdocs ultimately move towards careers as staff scientists, where they are still at the bench, but do not independently lead a lab. There are similarities between this role and the traditional tenure-track assistant professor, in terms of needing to lead and manage a project at a high level, learn about financial and project management, and gain new scientific skills. However, there are major differences too, especially in terms of learning specific arts of self promotion and communication that are usually NOT the role of the staff scientist. Classically, NIH support for postdoc training has asked the question "how does this training teach you to get an R01?" , and has not asked "how does this train you to be a rigorous research-supporter?" That concept should shift.

The other thing to consider that is changing is duration. Postdocs should not be permanent positions, but we need to recognize that as science gets more complex, a reasonable postdoc (i.e., learns enough to make a publishable unit) is 3 years at a minimum and often longer. It is not reasonable to expect 2 years of focused training to be sufficient, because many modern approaches would require a year to learn competently, a year to use to generate data, and a year to navigate publication (which is necessary to prove that one actually does know/possess a technique).

Fundamental issues and challenges

Current generation postdocs are older, more likely to have caregiver responsibilities, and more likely to have personal medical problems. This is a natural consequence of

a) grad programs often preferring candidates who have experience post college and

b) attempts to diversify the academy. Historically, structural/systemic factors have excluded people from academia if they lacked family wealth and strong support networks, factors that are highly correlated with race, ethnicity, and national background.

Recent attempts to explicitly promote and admit, e.g., BIPOC scientists, have not yet considered that this means that we have more scientists who have more complex needs and less ability to be solely work-focused.

At the same time, academic centers are in areas facing housing and transportation challenges, with rapidly escalating costs of living. This makes a standard postdoc economically unviable without additional resources, e.g. the aforementioned family wealth or a clinical degree enabling extra income.

As times to publication become longer and papers more complex (particularly in our field of Neuroscience), this also means postdocs are being asked to take on extended periods of uncertainty before they know their career prospects. That uncertainty itself often makes careers outside research look more promising.

Existing NIH policies, programs, or resources

We should change: pay, hiring practices, and in the longer run, the philosophy underpinning training programs.

First and foremost, we need to reevaluate the NRSA scale. The ideal standard for such a reevaluation would be a single salary scale that is livable in any high-cost city AND is indexed to inflation. That is, it should be a standard assumption of Federal programs (which will trickle down to R01-like grants) that a postdoc should in fact come with a living wage. This is critical to address the diversity problems just mentioned.

The benefit of such a change is that postdocs could afford to take jobs in the high-cost cities/R1 institutions that might best suit their training needs. The other benefit is that some postdocs might choose to take jobs in lower-cost cities as a way of improving their quality of life, which could benefit academically strong but less famous/prestigious institutions in these 'less desirable' places. Regardless of where postdocs choose to work, they would be able to more directly focus on their research and training. (The increased productivity from lack of financial stressors would also be a benefit to their PIs.)

The corollary is that NIH would need to correspondingly increase the $500k prior authorization cap. NIH has not raised the cap for more than 25 years, despite increasing the salary caps for investigators. This has weakened the purchasing power of grants by nearly half since 1998, and it is unsustainable. We recognize programmatic concerns that raising the cap limits the ability to fund as many grants, and may exacerbate the inequality biased towards "super labs" . To address at least the first concern, increases could be phased in over time, or could be first targeted towards labs without multiple R-equivalent grants.

[A further response is coming with the second half of this]

Proven or promising external resources or approaches

Two core concepts above are the creation and maintenance of a living wage, and providing more support for postdoctoral trainees who also have family obligations. These are, in fact, proven resources/approaches. Specifically, we know that PhD graduates are less frequently choosing to become postdocs, and we can reasonably assume that the majority of them are also not choosing unemployment or non-science careers. Rather, the majority are taking roles within industry—which by definition is required to provide economically competitive pay, and in many states, either required or strongly encouraged to provide paid family leave and benefits. We need to recognize that academia is in fact in competition with industry for talent, and that we are losing talent because we are not competing.

Improving the training of postdoc mentors is also likely to be helpful—in the current postdoc shortage, a trainee will be more likely to pick a mentor who is clearly attuned to the needs of a postdoc at levels beyond just the science (i.e., someone who establishes a supportive lab environment, demonstrates open and supportive communication, and is sensitive to work/life balance). These are likely features of successful and well-established mentors, but some junior and established investigators will need training in how to get there. Supporting laboratory leadership and mentorship training (particularly for minoritized/diverse trainees) would accelerate this.

Response 3080

Perspectives on the postdoc roles and responsibilities

[this is a continuation of a prior response]

Fundamental issues and challenges

[this is a continuation of a prior response]

Existing NIH policies, programs, or resources

There are numerous axes that likely should change: pay, hiring practices, and in the longer run, the philosophy underpinning training programs.

[continued from prior repsonse]

Third, in the longer run, could a program be designed to prepare trainees to become both staff scientists and team scientists? The K pathways are designed to help postdocs train, but they entirely focus on independent, tenure-track positions. We recommend exploration (e.g., convening design workshops, seeking best practices) of the creation of a K pathway designed to help a trainee gain project-management skills while working on a specific R01-attached research project. Graduates of such a program would be attractive lab employees—it is hard to find trained managers and mid-level lab leaders.

Fourth, family leave needs to be explicitly considered on NIH grants for other than the PI. In the institutions of our Liaison Committee members, we are seeing an increasing number of postdocs who need to take child-related or medical-related FMLA-like leave. If a PI takes such leave, it is allowable to seek supplemental funds for the grant to either extend it or to cover additional costs related to child care. We need to achieve the same for postdocs and other technical personnel on grants. The assumption currently is that some other staff member can simply "substitute" for the lab member who is out on leave. That is not valid in an era of rapidly advancing biomedical techniques. Postdocs are not fungible resources, and should not be assumed as such.

Proven or promising external resources or approaches

Two core concepts above are the creation and maintenance of a living wage, and providing more support for postdoctoral trainees who also have family obligations. These are, in fact, proven resources/approaches. Specifically, we know that PhD graduates are less frequently choosing to become postdocs, and we can reasonably assume that the majority of them are also not choosing unemployment or non-science careers. Rather, the majority are taking roles within industry—which by definition is required to provide economically competitive pay, and in many states, either required or strongly encouraged to provide paid family leave and benefits. We need to recognize that academia is in fact in competition with industry for talent, and that we are losing talent because we are not competing.

Improving the training of postdoc mentors is also likely to be helpful—in the current postdoc shortage, a trainee will be more likely to pick a mentor who is clearly attuned to the needs of a postdoc at levels beyond just the science (i.e., someone who establishes a supportive lab environment, demonstrates open and supportive communication, and is sensitive to work/life balance). These are likely features of successful and well-established mentors, but some junior and established investigators will need training in how to get there. Supporting laboratory leadership and mentorship training (particularly for minoritized/diverse trainees) would accelerate this.

Response 3081

Perspectives on the postdoc roles and responsibilities

Academic post-doctoral researchers (post-docs) are in a transitional role, serving as a senior trainees but in many ways also as junior colleagues. This dual perception creates challenges where some post-docs are treated not as trainees pursuing their own independent goals but instead are perceived as temporary staff scientists who are easily released and replaced at the end of the grant period. This puts them in a marginalized role which can lead to an environment which is abusive, unprofessional and lacking in inclusivity and equity. While the role of post-docs was seen as a way for individuals to obtain further specialization and mentoring on their way to independence as an investigator, in some disciplines it has instead led to precarious employment as researchers compete for tenure track positions following decades of extremely high competitiveness.

Further, we recognize that the hiring landscape has changed and there is a significant need to shift the perception of post-docs as primarily looking for academic positions at large research institutions. For many of these trainees, a faculty position may no longer be a goal due to the significant opportunities in other sectors and roles. As a result there is a need for institutions to modify their education and support of these trainees to meet their career aspirations.

While there have been advances in the post doctoral oversight continues to be challenges and disparate between institutions. The availability and maturity of structured support such as post-doctoral offices and associations on campus varies significantly among institutions. Even identifying post-doctoral trainees at universities can be challenging as their hiring processes are often not centrally overseen and the individuals may hold a number of titles within a university, making it difficult to connect and ensure they are provided with connections to university support mechanisms.

Fundamental issues and challenges

There is inconsistent messaging about the value of academic post-doctoral training, particularly in a competitive hiring market, which is further occluded by institutional variance in hiring practices for NIH funded post-docs and salary and benefits issues.

We recommend moving to standardize the salary offerings so that all positions meet the NRSA standard, however, we recognize that this is likely to financially impact lesser resourced programs without a

concurrent change in budget allowances. We also want to point out the unsustainability of the lack of benefits provided in the NRSA and similar programs, particularly family leave and child care assistance. We encourage the NIH to work with Congress to modify programs in order to ensure that health insurance and retirement benefits are provided to these trainees.

Another challenge is vagueness around dedicated time for professional development for post-docs and transparent metrics for success, which leads to significant variance between institutions and investigators. We recommend that NIH develop standardized guidance such as is in the NRSA F32/T32 grants and guidance on metrics of success with requirements including formalized feedback for trainees.

There is a lack of required mentoring training for investigators which leads to disparities. While we recognize that training alone will not address all potential problems between investigators and post-docs, a consistent baseline would provide more clarity of expectations to all parties and provide a mechanism by which NIH could assess investigators in meeting their mentoring obligations.

Post-docs report significant challenges in reporting bullying and abuse. We encourage the NIH to require the establishment of institutional ombudsperson programs with confidential methods for reporting misconduct. We recommend the development and maintenance of trainee feedback in yearly progress reporting submitted separately of the documents provided by the investigator. This is especially critical for T32 programs, with their specific goal of providing training.

Existing NIH policies, programs, or resources

We recommend adding a requirement for a professional development and training plan for any grants with post-doc positions, similarly to the NSF. This could build upon the IDP program, which has been seen by some investigators as only an administrative task.

The Office of Intramural Training and Education (OITE) is an excellent program for supporting intramural postdocs, and has been doing excellent work outreaching to extramural institutions. We encourage the expansion and replication of this program for extramurally-funded postdocs, through the development of a center at NIH which could provide unified resources for trainees and investigators, mentoring support, and centralized tracking outcomes. By standardizing and centralizing this information, it would provide significant information both to institutions to understand the career paths pursued by their post-docs and would provide PhD students information about paths taken by those from specific programs and institutions. Centralized writing training, supplemented with local support, could significantly assist trainees as they draft their early career grants.

We recommend the revision of the K99/R00 program. There is inconsistent awareness of the program availability and eligibility across trainees, investigators, and institutions. Also, as many post-docs need to go through the grant application twice, they may be eliminated due to time limitations.

We support the expansion of cohort-based training programs such as the T32 programs and the IRACDA and MOSAIC programs as they provide more comprehensive mentorship and advocacy. We also recommend the expansion of eligibility of these programs to international postdocs.

We suggest building upon awards that support the transition of post-docs to staff scientist and Research Assistant Professor Positions. We recognize the excellence of the NCI Research Specialist Award (R50) and recommend mirroring this program in other ICs.

Proven or promising external resources or approaches

A successful program at the University of Illinois Chicago is the Bridge to Faculty program. This program competitively hires candidates into a two year post-doc program with targeted mentoring and a cohort support network. At the end of the two years, participants are transitioned to tenure track lines. The focus of this program has been to increase diverse faculty at this minority serving institution, which 11 participants thus far have successfully completed, with 17 more anticipated to make the transition to faculty in Fall 2023. Institutional doctoral to faculty career training grant could be implemented at other institutions.

We highly recommend the CIMER mentoring training program, developed at the University of Wisconsin. Additionally, there are excellent mentoring programs at the Rackham School and the Karolinska Institute. Adoption of programs like these nationally could support consistent mentoring understandings across investigators and disciplines.

There are a number of institutions that have exemplar post-doctoral trainee support programs including Vanderbilt University, the University of California San Francisco, and Stanford. They have varying specialities surrounding training and support and the metrics captured but have strengths which should be sought and replicated.

We encourage the adoption by NIH of the AAMC Guidance on Research Trainees (AToRT). This resource describes the issues with inappropriate treatment of research trainees. It also outlines clear characteristics that mentors should have, including encouragement, communication, self-improvement, professionalism (respect and integrity) and equity. The AToRT includes guidelines for how mistreatment should be resolved at the institutional level.

Finally, we recommend that NIH collaborate to consolidate external resources developed across disciplines into a centralized hub. This could be in partnership with the National Post-Doc Association and include the resources developed by the BEST programs, Graduate Career Consortium, Postdoc Academy, PDHub, OITE, and individual institutions that have been exemplars.

Response 3082

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] is a professional organization representing professionals at over 185 institutions and/or organizations, and 74% of our members serve postdocs. The 2012 Biomedical Research Workforce Working Group Report and the NIH's Broadening Experience in Scientific Training (BEST) grant spurred much investment and innovation in career and professional development (CPD) for graduate students and postdocs. Many [redacted for anonymity] members led development of the BEST programs and other innovative career and professional development programs. As a function of our jobs, we are intrinsically dedicated to supporting postdocs in achieving their career and professional development goals and advancing postdocs' careers. We view the postdoc as a "temporary and intentional training" period that includes protected time for career and professional development toward academic success during the postdoc and for preparation for diverse future careers in the scientific workforce.

While it may pose a challenge for the biomedical research enterprise, we do not see a decrease in the number of PhDs pursuing postdoctoral research positions as a problem in and of itself. That decrease may result from increased clarity about employment options, a sense of greater agency among early career scientists, and an increased demand for a highly-trained scientific workforce.

Fundamental issues and challenges

As postdoc affairs staff and career and professional development advisors to postdocs, we are keenly aware of the unique challenges academic postdocs face, as well as institutional challenges in recruitment and retention. Multiple CPD challenges affect recruitment, retention, and quality of life for postdocs, including uncertainty about the career benefit of postdoctoral training, salary discrepancies between postdoc and industry positions, limited support for exploration and pursuit of diverse careers, and more.

Often career and professional development professionals serve as a touchpoint when issues beyond career preparation arise (e.g. well-being, termination of position, workplace misconduct). In fact, the National Postdoctoral Association's 2023 Postdoctoral Barriers to Success found that 81.7% of postdoc survey respondents are negatively affected by a lack of career and professional development opportunities. Therefore, a lack of value and visibility around career and professional development negatively affects postdoc experience, well-being, and future professional preparedness.

Existing NIH policies, programs, or resources

Career and professional development opportunities are a significant selling point for institutions and mutually reinforce the research endeavors of postdocs. Specifically, they enable skill building for professional success and exposure to diverse careers.

First, we recommend funding postdoc career and professional development programs and offices through training/research grants: the impact of career and professional development advising and programs is under-appreciated and not sufficiently supported. To address that, we recommend allocating a percentage of indirect costs on all NIH grants that support postdocs to contribute toward institutional support for postdoc and career and professional development offices and staff. Establishing a ratio of staff to postdocs

served as a best practice (such as 1 FTE career advisor for 250 postdocs) would ensure that postdocs are educated and empowered in their career planning.

Second, we recommend establishing a minimum percentage of postdoc time (e.g., 15% of effort) to be devoted to career and professional development activities and providing tools to assist institutions to adhere to these requirements and incentivize compliance beyond Individual Development Plans (e.g., require ongoing career and professional development, in order for postdocs to be eligible to be paid by an NIH grant).

Proven or promising external resources or approaches

A proven strategy is data transparency around postdoc experience and career outcomes (e.g., Coalition for Next Generation Life Sciences) that influences recruitment, retention and academic success. We recommend systematic and consistent reporting on postdoc experience (e.g., number and length of postdocs) and career outcomes funded by NIH through a national database, administered and funded at the federal level. Further, all research grant applications that support postdocs should require information on postdoc length and career outcomes of former and current postdocs mentored by PIs. Making postdoc career outcomes an integral component of grant evaluations and faculty tenure processes will contribute to maintaining the training ethos of postdoc positions, as a step toward a successful career transition.

Response 3083

Perspectives on the postdoc roles and responsibilities

To me, a postdoc position means I am more independent as a researcher and learning how to become an investigator, but still have the guidence from an experienced mentor. The postdoc takes on more responsibilities and how to be a leader. But a postdoc is also viewed as a placed holder until you know what next steps you are going to take in your career. Some people do not know whether they want to continue to do academia or a different pathway like industry, and a postdoc helps to give a different perspective and new experiences which either fuel your designer to be an independent investigator in academia or decide to go into industry.

Fundamental issues and challenges

One of the biggest issues inhibiting recruitment, retention, and quality of life is the postdoctoral salary, especially for those who live in expensive cities. As a postdoc in Boston, MA, the minimum NIH postdoctoral salary is way too low to have a good, comfortable quality of life because of the cost of living. We cannot afford to live on our own, or have to make significant scrafices to afford to live in this city. It also does not allow us to even save money for our future. This low salary also specifically inhibits recruitment and retention because the starting salary of an industry job is so much higher than a postdoc salary no matter what part of the country you are in. I personally have known people who either dropped out of PhD programs or left their postdoc early to go into industry for a higher salary.

Existing NIH policies, programs, or resources

I am currently on a T32 program, and while I know the institution that receives the T32 is supposed to have their own career development activies, maybe the NIH should have special career development activies as well. The NIH could have webinars or even a yearly symposium that all T32 trainees could attend to give resources like for getting grants, applying for jobs, or how to be a good mentor.

Proven or promising external resources or approaches

There are many organizations and postdoctoral societies at institutions that try to have career development resources and webinars for postdocs, but one of the things they are trying to figure out and address is also recruitment, retention, and job satisfaction. And in may opinion, no one as come up with a good answer. I can say me personally, as a postdoc, on of the biggest problems with recruiting new postdocs is the low salary, which that also ties in to job satisfaction as well. If you are struggling to survive, no matter how much you enjoy the actually work, you are going to have less motivation to work or stay at that job because you are stressed about finances. I think part of the problem to retention also has to do with the availablity of academic jobs and difficulty of getting funding. If there are more people trying to get jobs than there are jobs available, they have no other option than to find a job outside of academia or moving to another country. If it is difficult to get grants, then people who get labs cannot afford to keep it running.

Response 3084

Perspectives on the postdoc roles and responsibilities

An opportunity to expand one's training before becoming an independent investigator. I think the current system incentivizes long post-docs, often more than 5 years. This doesn't benefit the post-docs, many of whom are ready for independence soon after PhD.

Fundamental issues and challenges

The lack of TT job opportunities results in increasingly long post-docs in order to become competitive. This leave us with little pay, little long-term stability, and little intellectual independence for far too long.

Existing NIH policies, programs, or resources

No years-since PhD limit on K99 and no years-since PhD limit on Early status investigator

Improved Post-doc salary/benefits payline following the examples of St Jude/HHMI

Proven or promising external resources or approaches

Increasing the salary of post-docs significantly would have positive trickle-down effects, including shortening the duration of post-docs.

Response 3085

Perspectives on the postdoc roles and responsibilities

For several decades, the NIH has generously funded numerous post-doctoral fellows in general internal medicine, who have made and continue to make a tremendous positive impact on U.S. health care policy, population health, and patient care. To further support the pipeline of primary care—and hospital medicine-oriented researchers and leaders in academic general medicine, the [redacted for anonymity] has proposed several recommendations for improving NIH-funded post-doctoral fellowships.

Fundamental issues and challenges

1. Current funds for post-doctoral training grants are insufficient, particularly for general internists due to a relative paucity of clinical revenue to supplement research training. Moreover, HRSA T32 stipends are around $56K per year, ACGME rates are around $85K per year and rapidly rising. It is easier to fund PhDs at the $56K. Furthermore, master's degree programs are much more expensive than the stipends given for coursework in T32s; the coursework is essential for MDs to get the skills necessary for the research while PhDs may only need a few courses to supplement what they learned during their PhD. Without additional financial support, the pipeline of general internal medicine (hospitalists and primary care) physician researchers will decline. As HRSA wants to prioritize more primary care—and hospital medicine-oriented researchers, NIH should partner with HRSA to increase funding to address the unique needs of internists who require buy outs of clinical time and funds to support MPH tuition, which are currently inadequate, and fellowships often must rely on foundation awards to supplement this.
2. General internists may have unique needs that differ from subspecialty physician scientists. General internists more frequently engage in clinical and population health research (e.g., Stage T3-T4 translational research—efficacy, effectiveness, dissemination and implementation) rather than basic or translational science. For example, as opposed to lab space, health services researchers need resources to collect or purchase data, and resources to support substantial time for analysts, statistical consulting, research assistance, and project management.

Existing NIH policies, programs, or resources

To support diversity, equity, and inclusion, NIH should enhance promotion of and/or expand financial support for programs that provide provisions for child and elder care and student loan repayment. NIH should also enhance provisions for child and elder care as well as family health insurance supplements for post-docs.

Proven or promising external resources or approaches

1. Directors and mentors of post-doctoral training programs also need training (e.g., communication and team management skills), perhaps NIH can consider incorporating resources to support the training of directors and mentors. If the fellowship directors lack training on how to best support their trainees, then the trainees will lose learning opportunities.
2. Because awards are made to institutions, NIH can do more to understand how institutions are utilizing indirect costs to support postdoctoral training. Currently, NIH has 8% indirect rate caps for post-doctoral awards, however, increasing this indirect amount and then requiring greater institutional support of post-doctoral fellows in tandem could be another mechanism for NIH to consider.
3. NIH should acknowledge the growing field of implementation science and recognize that many implementation scientists often have one foot in research and another foot in health system operations (e.g., 50% clinical, 50% research) and may not fit the mold of a traditional 80/20 clinician investigator. By forcing implementation scientists to choose one path or the other, NIH may be losing talented innovators. Perhaps NIH can consider developing post-doctoral awards that cover health-system embedded implementation scientists to pursue research-informed quality and equity improvement interventions within learning health systems.

Response 3086

Perspectives on the postdoc roles and responsibilities

To my mind, there are two main objectives of a postdoc position. First, a postdoc position is intended to broaden or enhance the research subject expertise of the postdoctoral scholar. This may be learning a new set of models or techniques to address an existing interest, or application of one's knowledge to a new research question or new field entirely. If the goal is to remain in academia, then by the end of their postdoc years, a scholar should have carved out an area of investigation that will be uniquely their own. If going to industry, the goal should be to have a set of well-honed technical skill and ability to design experiments independently. Secondly, the postdoc position should provide mentorship and an opportunity to learn management skills. For a postdoc moving on to an academic role, this would consist of supervision of students, writing of grants, and, as applicable, opportunities to teach and learn about administration. For postdocs heading to industry, this would be supervision of others, budgeting, and project management skills.

Fundamental issues and challenges

By far the most pressing issue facing postdocs is that of compensation. There is a national conversation about the need for higher wages for postdocs, and this is an excellent first step. However, just a higher salary is not enough. Postdocs are by their nature temporary hires, with their time bridging their graduate work and their independent careers. However, this has resulted in them being afterthoughts when it comes to employment policies. For instance, my institution treated those postdocs on their mentors' grants as employees, with full employee health and related benefits. Once I received an extramural fellowship of my own, I was no longer considered an employee, meaning I lost my health, vision, and dental coverage and had to figure out my tax withholding on my own. The tax situation was complicated by having to constantly convince tax preparers and software that I was not, in fact, self-employed. While my institution has apparently worked to correct this inequity in the intervening years, many more institutions have similar policies.

A second issue is the lack of training in some areas, particularly for postdocs who wish to stay in academia. I knew I wanted to teach in addition to doing research, but it was up to me to find a certification program in college level teaching, and being in a medical school meant I could not easily find any actual students I was allowed to teach. I also received no formal training in how to manage lab personnel or to budget my funds, despite being expected to do both from day one in my next role as an independent investigator. I was taught to write grants and manage conflicts and harassment, but beyond that I was left to figure it out.

Existing NIH policies, programs, or resources

A potential option to encourage universities and other NIH-funded institutions to provide equitable compensation for all postdocs is to make NIH funding contingent on those institutions following guidelines on postdoc pay AND BENEFITS. Similarly, training plans are already part of postdoctoral fellowship

applications, but language could be added to the RFAs specifying that training in teaching, mentorship, and/or management and budgeting should be a part of those plans where applicable for the fellows' goals.

Proven or promising external resources or approaches

My external Fellowship was awarded by the American Cancer Society. While all of the following policies were not necessarily in place when I was a Fellow, the ACS has certainly set a good example in the policies they have for their awardees. These include newly increased stipend amounts, allowance for purchase of insurance or other benefits for the fellow, and parental leave for fellows which includes an extension of the fellowship time window.

Response 3087

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is to lead projects under the supervision of a PI. Postdocs have been my second, and often times most accessible and hands-on, mentor at every stage of my academic career. Postdocs are PIs in training. They are professionals with unique skills for their given discipline and research interest. They lend these skills to the labs their join and bring innovation.

Fundamental issues and challenges

Money. And money again. I am 31 years old and I will be a postdoc in two months. At the current NIH rate, I will only be able to do a postdoc for one year. And that is a year of great sacrifice that I will be making. My personal life has been on hold since I have started graduate school and I can no longer put off my responsibilities of taking care of my parents and starting a family. My parents were refugees and do not have the generational wealth that others enjoy to build up retirement savings. I am their retirement plan. The one year of postdoc I will do is a selfish endeavor so that I can't look back and say I didn't try. But with $56,000, I cannot pay for a nurse to help take care of my dad who has Lewy Body dementia, I cannot pay for a wedding for my fiancÃ©, I cannot buy a house for my future family to live in, and I cannot even start a family and pay for childcare on this low salary, while living in the DC area. With my skills, I could be making $150,000 in industry. I do not want that. I would rather have half of that and stay in academia. But a postdoc salary equivalent to the average amount someone fresh out of undergrad with a bachelors (i.e. what my friends were making 10 years ago) does not give me the financial security to live as an adult with dignity, after all my years of training and education. I hope I have made it clear that this is a diversity and inclusivity issues.

Existing NIH policies, programs, or resources

The effort limits on grants is an issue. I have never known a post to only work on a single project. Often times postdocs taken on administrative and mentoring responsibilities within a lab, which is labor that is unpaid. It is my understanding that with the F training grants 100% effort has to go towards that grant. That removes an chance of a lab paying extra for their postdocs. It makes the NIH rate or minimum, the effective maximum a postdoc can get. This is also a major issue at the institutional level. I have a K00, but the [redacted for anonymity] has a rule that postdocs cannot get more than the NIH minimum, even though my K grant is for 75% effort. In my instance, my PI has an RO1 with a postdoc line that she wanted to pay my remaining 25% effort. The university has blocked this. In addition, the NIH can increase the NIH rates for postdocs. Additional funds for childcare is appreciated, but the NIH needs to pay more. It should not be harder to pay a postdoc more than it is to buy new computers for an entire lab every couple of years. Additional funds should be available to postdocs in areas with a high cost of living, such as the DC metro area, NYC, and California. I don't know how this is possible, but some kind of retirement plan for graduate workers and postdocs would be great. I have had a couple of small plans for previous postbac positions. But the constant moving around from makes it impossible to save for retirement, when many places require a minimum number of years for the benefits to be "fully vested", such as 10 years for the [redacted for anonymity] pension system.

Proven or promising external resources or approaches

No response

Response 3088

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellowships should lead to research independence in technical and non-technical skills. To this end, postdocs should have access to training in management and leadership, teaching, science communication, grant-writing, experimental techniques, career exploration, and other transferable skills. NIH could promote this by making these expectations clear to mentors, some of whom focus too narrowly on technical skills.

Fundamental issues and challenges

In an economy coupling high inflation and low unemployment, lack of competitive pay and benefits is an impediment to postdoc recruitment and retention. The NPA 2023 Postdoctoral Barriers to Success report found that low salary has a negative impact on 95% of postdocs' professional and/or personal lives. The NIH could increase its stipends to postdocs on training and fellowships grants to match GS-10 federal salaries (minimum $62,898). Similarly, the NIH could promote minimum salary requirements for all NIH-supported postdocs to provide a living wage adjusted annually for inflation and location.

In addition to salary, international postdocs struggle with short contracts that create immigration problems. NIH should encourage contract lengths commensurate with the postdoc training period, fair termination notices, and ties to institutions, not PIs. NIH should also promote policies such as vacation accrual rollover for international travel needs, and subsidized costs for visas and dependent insurance. Finally, NIH should prohibit part-time postdoc positions that are designed to avoid the costs of employee benefits.

Existing NIH policies, programs, or resources

Surprisingly, postdocs often lose employee benefits when accepting an NIH Fellowship (e.g., T32 or F32 position). This striking inequity is due to NIH policy language that most university legal counsels interpret as precluding employee status in addition to preventing the use of federal funds to pay for most employment benefits (NIH policy on allowable costs to training grants, section 11). NIH should require that all postdocs receive employee-level benefits as a requirement, similar to some NASA and NSF requirements, and allow institutions to use federal funds to cover these costs.

In further support, NIH could expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. Similarly, the NIH could provide NIH-funded postdocs with moving allowances. These expenses disproportionately burden those from low socioeconomic backgrounds or coming from abroad.

Finally, NIH should collect survey data on postdoc satisfaction on an annual or biennial basis to facilitate policy adjustments to postdoc concerns. These data should provide key insights and allow postdocs to provide honest, anonymous feedback without retaliation.

Proven or promising external resources or approaches

The NIH ACD Working Group should make use of resources such as NPA Recommended Postdoctoral Policies and Practices, the triennial NPA Institutional Policy Survey, and other documents in the NPA Resource Library.

Currently, NIH ICs each develop their own professional development resources, leading to inequity, inefficiency, and confusion. NIH should develop a centralized hub linked to publicly available resources from NPA, PDHub, OITE, professional societies, and individual ICs/universities. This should be searchable and accessible to enhance professional development and an awareness of critical policies.

[Redacted for anonymity] wants to sincerely thank the NIH for a platform to voice our priorities for postdoc training. We applaud NIH's successful policies and programs that have made American postdoc training an international standard. We look forward to working with NIH to continue improving the working conditions for these valued early career scientists.

Response 3089

Perspectives on the postdoc roles and responsibilities

Role: Trainee/mentee for their next high-level scientific role, future leadership in science. Responsibilities

1. Generate high quality and quantity of papers
2. Help write grants
3. Lab mentor/trainer of more junior lab folks.

Fundamental issues and challenges

Finding high-quality candidates/recruiting is impossible these days. Why?

1. Postdocs don't want to become academic PIs and follow our path. Why would they? Postdocs see our stress, the pressure and struggle to fund our whole enterprise on grants against ridiculously impossible odds in study section.
2. They can make a better salary elsewhere (i.e. industry).

These 2 factors affect recruitment, retention and overall QOL.

Existing NIH policies, programs, or resources

1. increase R01 funding levels to be able to pay postdocs more.
2. increase paylines to retain more PIs, and less stressed-out PIs, in academic research, so post-docs want to continue their training and become PIs themselves.

Proven or promising external resources or approaches

No response

Response 3090

Perspectives on the postdoc roles and responsibilities

To me, the postdoc is an opportunity to expand my skillset and knowledge while preparing for a career as an independent scientist/professor. I chose my position because it provided an opportunity to explore a new area of science and learn a new model organism. During my postdoc, I plan to also gain additional experience mentoring students and teaching at an undergraduate level (as part of the IRACDA program) to prepare me for the next stage of my career. After my postdoc, I hope to attain a position as a professor at a primarily undergraduate institution, where I will run a small lab while also devoting a significant portion of time to teaching and mentoring.

The responsibilities of a postdoc include managing independent and collaborative research projects at a level of independence beyond that of a graduate student, while also mentoring/training undergraduates, research assistants, and/or graduate students in the lab. The postdoc should acquire skills necessary to complete their research project, reach out to collaborators when necessary, and generate ideas for their own project. They should also begin to plan their independent research program that they will take with them when they leave the lab, which will be distinct from their postdoctoral PI's research. More work on this independent research program should begin by the end of the postdoctoral position, to establish the foundation for their future lab.

Fundamental issues and challenges

The biggest problem inhibiting recruitment, retention, and overall quality of life for postdocs is money. Postdoctoral positions are incredibly underpaid for the level of training that they require. I am a postdoc at [redacted for anonymity] and [redacted for anonymity], one of the most expensive cities in the US. My salary (which started at $55k) barely covers my basic living expenses. I applied for subsidized university housing (which is still quite expensive) as soon as I could, but there were no openings. I ended up living with roommates for the first 5 months of my postdoc, and then finally found an off-campus studio apartment that I could (barely) afford at $2000/month, which is standard or even cheap for studios in [redacted for anonymity]. I did not even initially qualify for this apartment, as the requirement was to make 3X the rent, and thus I was required to pay an even higher security deposit than normal. Luckily I

had enough in savings, but this was a tremendous financial burden. Requirements like this are common, so most postdocs do not qualify for the majority of apartments in high cost-of-living cities. I find that I worry much more about money now than I did even during my PhD in New York City, because I at least had guaranteed subsidized housing for the duration of my PhD. I cannot even fathom how parents are affording their expenses as postdocs, as childcare for one child at [redacted for anonymity] costs about 70% of our income.

The low pay of postdoctoral positions is a tremendous barrier not only to recruiting talent to the scientific workforce but also to diversity and equity in academia. People who have student loans, medical, or family expenses cannot afford to work for such low pay and are forced to find employment elsewhere.

Existing NIH policies, programs, or resources

To be completely honest, there is no substitute for higher pay. Financial and/or housing instability are major stressors which make it difficult for people to achieve their full potential, and bar people from pursuing these careers in the first place. In recent years, there has been a significant increase in training programs and career workshops for graduate students and postdocs, which I think have been moderately useful but ultimately have little impact on trainees' decisions to pursue a career in academia.

One issue that I did not mention above but is also a major barrier to postdoc satisfaction and success is toxic work environments. In general, academia has not been successful in addressing bullying and harassment in the workplace. In addition, many PIs are not well-trained in mentoring and are primarily concerned with research output. PIs at R1 universities are chosen for their positions almost solely based on research productivity and other factors are not highly rewarded. Requiring PIs to undergo more extensive training in mentorship and maintaining healthy lab environments could potentially improve the postdoctoral training ecosystem. Requiring a more extensive evaluation of mentoring history for faculty positions could also be beneficial.

Although some diversity NIH grants already exist, expanding these grants could help to increase diversity in academic research. In particular, it would also be helpful to extend the timelines to apply for K99, F32, and similar grants, as it puts a lot of pressure on postdocs to get publications out quickly which may not always be possible or in the control of the postdoc. Additionally, expanding support for postdocs to receive critical training in teaching and mentoring (such as through the IRACDA grant) would help postdocs to be better prepared for faculty positions.

Proven or promising external resources or approaches

HHMI recently announced that they are increasing the minimum postdoc salary in HHMI-funded labs to $70k. NIH should increase their minimum to the same. NIH should also make it easier for labs to attain supplemental funding to keep up with salary increases after a grant has already been initiated. At [redacted for anonymity], the postdoc union successfully negotiated a higher salary. Unfortunately, many PIs opposed this effort because they would have to pay the increased salary out of existing grants that had been obtained when postdoc salaries were lower. Many PIs were talking about laying off postdocs because they would not be able to afford to keep all of them after the pay increase. This put postdocs and PIs at odds with each other and created unnecessary conflict, despite most PIs agreeing in principle that postdocs deserved higher pay.

I also think that requiring more formal evaluations throughout the postdoc would be helpful. Many companies have regular "360 degree" evaluations in which bosses evaluate their employees, and the employees also evaluate the boss. In academia, it's common to work for many years without receiving any formal evaluation or having an opportunity to give your mentor feedback about what you would like them to improve. This can lead to general job dissatisfaction, or a feeling of being lost or overlooked in your position. Requiring these types of formal evaluations could improve postdoc job satisfaction.

Finally, I think there should be more training required for alternate careers outside academia after postdoc. The truth is that there are simply not enough faculty positions for every postdoc to obtain one, so we need to be more realistic about the options that exist and help postdocs prepare for a position that will ultimately be a good fit for them.

Response 3091

Perspectives on the postdoc roles and responsibilities

to me it means, where you learn to manage high-risk projects, gain extreme expertise in one area, write grants, train (and manage) other scientists (grad/technicians)

Fundamental issues and challenges

low salary, non-existent family and fertility treatment benefits, unrealistic expectations on timeline for grants/papers, unacceptable publishing standards / measures, NON-EXISTENT faculty positions. the last one being the most detrimental factor. there is ZERO transparency in the faculty job process. it is heart breaking, unfair, and completely pushes people away.

Existing NIH policies, programs, or resources

K99 timeline has to change or the expectations for what are needed to get a K99 need to change. PIs have to go through training at NIH about how to manage a lab, train people. NIH should increase postdoc salary or provide additional support for higher-cost of living places like NYC, Boston, San Francisco, San Diego which are hubs for American and international postdocs from all backgrounds. Distributing the money to all labs so that lab sizes need to be smaller is a good idea in principle if carried out carefully but still it is not sustainable with the amount of money NIH is offering with grants right now. The NIH idea of small labs with the amount of money they are offering suggests a lab of 5-6 people which cannot be competitive in any way realistically.

Proven or promising external resources or approaches

academic vs non academic jobs are completely different. there are some hiring models and working environment changes that some companies have incorporated but they are not realistic for academia. but more transparent job market process, mentoring style set at UF Scripps (for junior faculty), and providing more positions are every job cycle by reducing the space and allocation for >85 year-old PI labs would be a great start!

Response 3092

Perspectives on the postdoc roles and responsibilities

I view postdocs as highly skilled and valuable employees, whose expertise and experience should be applied for the advancement of science. At the same time to progress and keep oneself up to date with global science postdocs should be given the opportunity to take courses, workshops, attend conferences and symposium and receive guidance for professional development.

Fundamental issues and challenges

1. Lack of financial help at the beginning of tenure: Visa fees, relocation fees, no moving in expenses adds a high financial burden on the incoming postdocs
2. Short visa duration add renewal headache: J1 Visa is subjected to DS so why not grant for full 5 years, because in case of no employment continuity anyway the candidate has to return to home county. At least with valid visa candidate can travel internationally with peace of mind.
3. No job security
4. Lack of Academic position opportunities hampers the interest and retention of postdocs
5. Low salaries hampers the possibility to stay in academic
6. Include paid parental leave and child care subsidiaries
7. Leave distribution should be similar across board, some institutes give leaves as soon as you join, some institutes have accrual of leaves. Accrual of leaves makes it very difficult to travel and leads to loss of pay incases of travel

Existing NIH policies, programs, or resources

1. The most important is the options for funding. Expand training grants opportunities for non-US citizens

Only NIH grant that is available to non-US citizens is K99/R00, which is very competitive and has a deadline of 4 years in postdoc. What happens if a postdoc changes lab? then precious years to work for the grant is lost!

2. Recommended salaries to be made mandatory and also automatically increase annually as per the pay scale , so that it is followed diligently in institutions across USA
3. Better, transparent and supporting work environment. Form a committee to listen to postdocs complaints and guide them better related to authorship issues, professional development, job search opportunities

Proven or promising external resources or approaches

NIH should align with the National postdoc association and also take in consideration the postdoc association at various institutes to get a feedback and ideas from them to make postdoctoral research experience fulfilling, satisfying and not filled fear of lack of money, job insecurities, visa insecurities. Postdoctoral years should be spend in advancing science and solving healthcare issues and not in these fears and fights.

I would like to express my sincere thanks and gratitude to NIH for giving the opportunity to share ideas, a platform to speak our minds and forming a working committee group to positively reshape the postdoctoral experience.

Response 3093

Perspectives on the postdoc roles and responsibilities

- Definition of a Postdoctoral Fellow: Following previous AAMC and NPA definitions, a Postdoctoral Fellow is an individual holding a Ph.D. or M.D., or equivalent degree who is temporarily appointed primarily to receive advanced research training under the guidance of a mentor holding a faculty appointment. In addition to research training, other training areas include grant writing, executive training, and mentoring.
- Time Limit as a Postdoctoral Fellow: The time as a Postdoctoral Fellow position should be limited with a focus on developing targeted research skills, mentoring skills, and professional skills. To promote career advancement, we recommend that NIH establish a specified time limit for the Postdoctoral Fellow position. That defined window for training as a Postdoctoral Fellow should start when the advanced degree is obtained rather than the time invested at a particular institution. However, there should also be limited exceptions such those with unemployment, health, or family issues.
- Mentored Training: For Postdoctoral Fellows to succeed in their next career phase as a research scientist, a trained mentor is needed. The mentor should be one who promotes development of new research skills, independent thinking, professional and executive training, and career exploration.
- Diversity of Postdoctoral Fellows: A pool of new investigators from diverse backgrounds starts with a diverse pool of Postdoctoral Fellows that includes trainees from different ethnic, educational backgrounds, financial resources, and countries. Approaches should include strategies that attract and cultivate Postdoctoral Fellows from diverse backgrounds, including international fellows.

Fundamental issues and challenges

- Postdoctoral Fellow Compensation: At [redacted for anonymity], Postdocs are classified as mentored trainees with no CV review but compensation is strictly based on the NRSA Table. This policy provides equity and ensures that outstanding and promising trainees funded through the T32/F32/K99 mechanisms do not have a pay cut. The NRSA Table provides a living wage for a single person in [redacted for anonymity], a $75,000 living wage is needed if there is also a child. This is an important driver for Postdocs with children or other family-related expenses. Women and those from under-represented groups particularly cannot afford the potential pay loss for a job with a poor career trajectory, poor benefits, long hours, poor work/life balance, and the continued stress these issues present. Secondly, a mentor sponsoring an international Postdoc in obtaining a H1B visa has to pay the prevailing wage of $72,000 for a trainee with 0-5 years of experience. This is a different equity issue when the highest compensation for other Postdoctoral Fellows is $61,500. The third common issue is pay for the highly competitive fields bioinformatics and artificial intelligence.
- T32/F32/K99 Postdoc Compensation: In addition to healthcare benefits, [redacted for anonymity] offers Postdocs flexible spending accounts for childcare, life insurance, and matching retirement funds. For T32/F32/K99 trainees, mentors provide an account for healthcare benefits but the [redacted for anonymity] matching benefits only applies to the ~$300 for healthcare benefits. By losing retirement benefits and Social Security deposits, many nationally competitive Postdocs turn down the offer.
- Others Struggling for Grants Decreases Enthusiasm: Career choices are highly influenced by their working research environment. Research faculty continuously write grants to stay operational and give up work/life balance to write another grant. The observant Postdoc questions if they can remain competitive throughout their career or give up that level of work/life balance.

Existing NIH policies, programs, or resources

- Raise the NRSA Stipend Scale: The increases in the NRSA Table have not matched the cost of living wage. Raising the NRSA Stipends would encourage nationally competitive Postdocs to seriously consider an academic research career. Some institutions strictly adhere to the NRSA Table for Postdoc compensation and others use the Table to establish a minimum level. Thus, raising the NRSA Table would improve compensation for a significant fraction of Postdocs.
- T32/F32/K99 Compensation: These training mechanisms should remain prestigious and policies should be established to ensure the recipient does not lose compensation or benefits available to other Postdocs at that institution.
- Train the Trainer: Mentors should promote development of new research skills, independent thinking, professional and executive training, and career exploration. NIH should encourage this by providing guidelines for expectations and requiring Postdoc mentors submit an outline how those guidelines are being addressed in their Annual Progress Report. Guidelines could include a specified number of hours required for the Postdoctoral Trainee to attend Professional Development Workshops and a specified time since degree completion to qualify for the position of Postdoctoral Fellow.
- Promote Diversity: New approaches that attract, encourage, and promote Postdocs from different ethnic, educational backgrounds, financial resources, and countries are seriously needed. As the PI of an NIGMS IRACDA K12 Program, this cohort model successfully promotes community building, peer-to-peer mentoring, networking opportunities, and career development within [redacted for anonymity], our partner institutions and nationally. International scholars (50% of [redacted for anonymity] Postdocs) also need new approaches that continue to attract those interested in a biomedical research career.
- Promote Exploration of Career Choices: While our Postdoc entry survey suggests ~75% want an academic research career for an academic position. A program like the previous BEST Program would help provide resources and opportunities for Postdocs to explore multiple career options.

Proven or promising external resources or approaches

- Cohort-based Postdoc Programs: Cohort-based programs such as the IRACDA, MOSAIC, and BEST have successfully promoted community building, peer-to-peer mentoring, networking opportunities, and career development for Postdocs from diverse backgrounds. Expansion of these cohort-based programs would not only provide opportunities to expand the diversity of the junior biomedical research workforce but also provide access to additional career and professional development opportunities.
- Support of Early-Stage Investigators: Success as an Ealy-Stage Investigator has become pivotal in securing an entry level research faculty position. This unintended consequence of this successful program puts greater emphasis on monitoring the paylines of this group, supporting career development programs, and identifying those at risk for losing their grant support.
- Appropriate Treatment of Research Trainees: [redacted for anonymity] Postdoc Working Group, a subcommittee of the AAMC Group on Research, Education, and Training (GREAT), a taskforce developed the Appropriate Treatment of Research Trainees (AToRT). This guide serves as an excellent resource that provides guidance in strategies that promote inclusive and supportive training environments for graduate students and Postdocs. Recommendations by NIH to adopt these policies will help provide the appropriate framework for institutions to identify and discipline investigators not providing a supportive environment.

Response 3094

Perspectives on the postdoc roles and responsibilities

As a graduate student contemplating the postdoc route, I perceive the academic postdoc as a critical, yet challenging stage in a researcher's career. This phase serves as a transition from graduate training to independent positions in academia or industry, enabling the development of specialized skills and the pursuit of innovative research.

In my view, the roles and responsibilities of a postdoc include conducting independent research, publishing findings, and contributing to grant writing. Additionally, postdocs often mentor students and engage in teaching activities, which can be both rewarding and demanding.

Despite the opportunities that postdoctoral positions offer, I am aware of the challenges they present, such as the pressure to publish, financial concerns, and job insecurity due to short-term contracts. As I weigh my options, I seek to strike a balance between the potential benefits of the postdoc experience and the personal and professional stability I desire in my career.

Fundamental issues and challenges

I can't help but notice several **Fundamental issues and challenges** that inhibit the recruitment, retention, and overall quality of life for postdoctoral trainees in academic research.

Financial concerns: Postdoc salaries often fall short when compared to industry positions, making it difficult for trainees to manage student loan debt and meet other financial obligations. This disparity can deter talented individuals from pursuing academic research careers.

Job insecurity: Short-term contracts and the uncertainty of obtaining a permanent position in academia can make the postdoc experience stressful and lead to a lack of job satisfaction.

Work-life balance: The pressure to publish, secure funding, and meet other expectations often results in long working hours, leaving little room for personal life and self-care. This imbalance can contribute to burnout and negatively impact mental health.

Limited career development support: Insufficient mentorship and professional development opportunities can hinder postdocs from reaching their full potential and make them question the long-term benefits of staying in academia.

Competitive job market: The scarcity of tenure-track positions and the increasing number of highly qualified postdocs create fierce competition, further exacerbating job insecurity and dissatisfaction.

Existing NIH policies, programs, or resources

Postdoc salaries: NIH stipend levels lag behind industry standards. Reevaluating and increasing these could draw and keep talented postdocs in academic research.

Loan repayment help: Broadening the NIH Loan Repayment Programs (LRP) to cover more postdocs or offer extra repayment choices would lessen financial burdens and make academia more enticing.

Targeted grant opportunities: Additional funding aimed at early-stage researchers like postdocs would enhance their ability to secure grants and transition to independent research roles.

Enhanced mentorship: The NIH should foster programs prioritizing mentorship and career development, arming postdocs with essential skills to succeed in academia and other sectors.

Mental health support: NIH-funded institutions need encouragement to allocate resources for mental health, promoting a healthier work-life balance, and addressing burnout among postdocs.

Job stability: Supporting longer postdoc contracts could alleviate job insecurity, allowing researchers to focus on their work without the constant worry of finding their next position.

Proven or promising external resources or approaches

Industry partnerships: Collaborating with the biotech and pharmaceutical industries could provide postdocs with exposure to alternative career paths and valuable practical experiences, making the academic route more appealing.

Professional development programs: Adopting successful models from institutions like the National Postdoctoral Association (NPA) can help improve training, mentoring, and overall job satisfaction for postdocs by offering workshops, networking events, and career guidance.

Remote and flexible work options: Encouraging remote work and flexible hours can improve work-life balance and attract a diverse pool of candidates, including those who may face geographical or personal constraints.

Interdisciplinary research initiatives: Fostering interdisciplinary collaborations can broaden postdocs' perspectives, strengthen their research skills, and increase job satisfaction by exposing them to new ideas and methodologies.

Mental health support: Drawing inspiration from universities with robust mental health and wellness programs could help NIH-funded institutions create a supportive environment that addresses stress and burnout among postdocs.

Postdoc advocacy groups: Establishing or expanding postdoc advocacy groups can empower postdocs to voice their concerns and work collectively to improve their working conditions, training, and career prospects.

Response 3095

Perspectives on the postdoc roles and responsibilities

I elected to pursue a postdoc position in 2012 as I was finishing graduate school. To me, the position meant:

1. opportunity to learn new techniques, and immerse myself in a new but related area of research,
2. opportunity for additional development relating to a science career such as mentoring others and grant writing, and
3. required preparation for an academic career, which I was heavily considering. I held a postdoc position from 2014-2019 and began a tenure track faculty position in early 2021 (with a staff scientist role in my postdoc lab bridging the gap).

I obtained an R01 in 2022, and have been attempting to recruit a postdoc since November, 2022. In my current role, I would like to provide an opportunity for someone become acquainted with my field through helping complete the experiments I have put forth in my R01, and importantly, also support them in pursuing interesting side projects to develop something they have ownership over, and could use to launch their own independent line of research.

Fundamental issues and challenges

Issue 1: The F32 program has numerous problems:

1. Fellowship stipends are not "earned income" thus fellows are not "employed" by their university. They pay taxes health insurance benefits as imputed income. Health insurance premiums have become immensely expensive, so a postdoc supporting a family may owe taxes on upwards of $20,000 of imputed income.
2. F32 fellows are ineligible to contribute to retirement programs, placing them financially behind peers working traditional jobs.
3. While stipend levels have improved, the stipends are still insufficient for high COL cities, considering postdocs relocate for these positions and may support families.
4. Personally, I trepidatious on accepting my F32 award due to the payback agreement--I did not want to leave my position early, but I would not have been able to stay if there were interruptions in my spouse's income.
5. PIs with NIH funds are prohibited from increasing the salary support of F32 fellows, but PIs with other types of funding are able to do this. This results in inequity within departments and universities.

Issue 2, recruiting international scholars: In five months of advertising, I have only received one qualified (and excellent) applicant. They had to reject my offer, as it was unsafe for them to leave the US in order to apply for a J1 visa from China due to COVID lockdown policies during that time. I regret that I had no other mechanism in which to hire them. Fixing issues imposed by visas would require cooperation of multiple governmental agencies, but this was the deciding factor that cost me an excellent postdoc in a time when recruitment is already strained. Promising graduate students from countries experiencing instability would be discouraged from taking a postdoc position due rules obtaining and fulfilling a J1.

Existing NIH policies, programs, or resources

In my view, F32s can only be undertaken by postdocs with external financial support and without financial dependents. This harms/discourages postdocs who are from economically disadvantaged backgrounds or who have children. I realize some of this falls under the purview of the IRS, but that should not preclude an award mechanism from functioning differently than it currently does (e.g., change the F32 from a scholarship for a non-degree-earning individual to earned income.)

Remove the rule limiting PIs from paying F32 fellows additional stipend support from NIH funds. This will be necessary as other institutions (e.g., University of California, HHMI) have higher postdoc salaries than the NIH F32 salary.

The K99/R00 should not be tied to 4 years from graduation date. Many external factors influence a postdoc's ability to begin a project and achieve meaningful results and publications in order to compete for the K99 (e.g., time for relocation or family reasons). This timeline also discourages ambitious, long-range projects in favor of fast or predictable results. It also overlaps the practical support time for the F32.

The modular R01 budget is becoming insufficient to support the staff required to complete the research due to increasing postdoc salaries. It is also difficult to afford and retain career technicians and staff scientists.

Response 3096

Perspectives on the postdoc roles and responsibilities

When I just started I saw the postdoc experience as something that can enrich me professionally, open me to new fields and new techniques, and serve as a path to hopefully open my own lab. Personally, I also saw it as an opportunity to be exposed to a new culture (I am not originally from the US, but got a green card during my time as a postdoc). I've been in my postdoc lab for over 5 years, and the lab is great, but honestly I am not so sure why I'm still doing this. I am a parent and I feel like I need to choose between my kids and my academic career.

Fundamental issues and challenges

Low salaries are a major problem.

Difficulties in combining the requirements of lab work along with being a parent that actually wants to spend time with my kids.

Feeling of isolation when working on a project in solitude may be hard for some.

Existing NIH policies, programs, or resources

Expanding the eligibility window of grants like K99 (further than the addition of two cycles due to the pandemic). Maybe allowing more revisions.

It would be so helpful if the turnaround of time-sensitive awards (like K99 that has a 4 year eligibility window) was quicker. currently it takes about 10 months from submission to decision. If turnaround was quicker then it would be possible to revise the application and resubmit quicker, helping to secure funding and gain some much needed confidence that we are on the right track.

Generally, allocating more funds to K level awards so that more talented postdocs may get them and survive the transition to independence.

Proven or promising external resources or approaches

consider establish funding mechanisms that will aim at funding a technician for postdocs. This would be a great way for postdocs to practice in writing a small grant, and will help them tremendously in advancing with their work, while keeping a healthier work-life balance.

Response 3097

Perspectives on the postdoc roles and responsibilities

The NPA and NIH jointly developed the definition of a postdoc. NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism. "Trainee" is seen as diminutive by many, and should be avoided, while "scholar" or "fellow" is more appropriate. Postdocs are usually intent on entering different positions after a defined period of time unlike permanent staff. Establishing clear expectations at the offer of appointment for both postdocs and their PI's regarding their role and how it differs from staff scientists will alleviate misunderstandings.

Fundamental issues and challenges

The NPA 2023 Postdoctoral Barriers to Success report indicates that salary has a negative impact on 95% of postdocs' professional and/or personal lives. Higher postdoctoral salaries will assist those who wish to contribute to academic research and innovation, but struggle to support themselves and their families, especially in high cost areas. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Using "Rest of U.S." locality levels, the 2023 NIH minimum award would be $62,898, with higher amounts in areas with defined cost-of-living levels. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.

For myself personally, I am concerned that the NIH "minimum" salary schedule for postdocs is treated as a "maximum" salary schedule by my institution, except in the case of extreme circumstances. As such, my PI's hands are tied by administration policy that is based on NIH guidelines, even though he would like to be able to pay me a more livable salary from available funding. For me, this means delaying motherhood until after my postdoc due to the high cost of childcare in my area, a challenging choice to make. If I am unable to secure a better-paying position within a few years, I will have to choose either between risking a potentially complicated geriatric pregnancy or leaving my institute/academia in general, although I love my lab and would otherwise choose to stay. I currently make ends meet by supplementing my income with additional work beyond my full-time postdoctoral efforts.

Existing NIH policies, programs, or resources

Postdocs deserve equitable benefits regardless of funding source. NIH should issue written guidance explaining that the mere fact of a postdoc receiving an NIH grant or fellowship does not prevent the host

institution from categorizing such postdoc as an employee. (Other implications, such as tax, do not stem from NIH.) Currently, postdocs can lose employee benefits when accepting an NIH fellowship, making these prestigious awards less feasible. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs. In addition, NIH could allow PIs to supplement fellowships from their NIH RPG funds. NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies. The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

Proven or promising external resources or approaches

I sincerely thank NIH for the platform to share our vision for postdoctoral training in the biomedical sciences. I applaud NIH's policies and programs that have progressed postdoc training to date, including offering OITE resources to external audiences, promoting DEIA through COSWD and UNITE, tailored training programs like MOSAIC and IRACDA, and supporting reentry and reintegration supplements for scientists with career gaps.

Response 3098

Perspectives on the postdoc roles and responsibilities

The role of a postdoc is to implement the scientific training they gained during their doctorate to begin their journey to an independent researcher. Ideally, new and complimentary research techniques are learned during their postdoc to broaden the sort of questions they can ask in their own lab. Time should be spent by the postdoc and their supervisor on filling gaps in expertise to set them up for their independent career such as grant writing, mentoring, teaching. Postdocs should work on a project that they are able to take with them to start their own lab. Postdocs should help mentor and teach lab members, especially in experimental techniques, as this will be vital for their own lab.

Fundamental issues and challenges

There is no greater issue or challenge to postdocs than compensation. Having already sacrificed a great deal of earnings potential in pursuing their PhD, postdocs are then kept at depressed wages. These early years, during people's 20's and 30's, are vital for retirement savings. Yet, PhD students and postdocs rarely get access to tax advantaged retirement accounts. Even those who do have access, the point in largely moot as wages are depressed and retirement savings are unthinkable. During my postdoc I gained and lost access to my university's 403(b) plan depending on my funding source. Prestigious fellowships costs me tens-of-thousands of dollars in lost retirement savings. This brings the broader issue of how universities and institutes treat postdocs as employees or not, seemingly when convenient for them. The postdoc period is stressful enough, but worrying about a lapse in health insurance due to being awarded a fellowship is absurd.

Universities and even PI's seem to be completely out of touch with market rates a doctorate level of training demands in industry. Compensation discrepancies are only further exacerbated by differences in geographic location. It is a disgusting disservice to science trainees that the NIH does not provide cost of living adjustments to the NRSA postdoc salary scale.

Many people think about starting families around the time of their postdoc. However, at current compensation levels this is nearly impossible, especially in HCOL cities. The $2,500 childcare supplement is frankly a slap in the face and shows just how out of touch the NIH is with the current cost of childcare.

For all that the NIH attempts to do for DEI, compensation could be the single greatest tool to raise up those of underrepresented groups. Instead, these groups are given the opportunity to hamstring their abilities to gain generational wealth and meaningful upward mobility.

Existing NIH policies, programs, or resources

Increase NRSA pay scales to be competitive with industry. Tie NRSA salary to inflation. Provide cost of living adjustments to NRSA salaries. The NRSA scale is always the pathetic fallback universities exploit to also not pay their non-NIH funded post-docs a depressed wage. Increasing the NRSA scale would have a massive impact on postdocs across the country. Provide meaningful childcare support in terms of

supplements that will actually make an impact, around $15,000. Provide a retirement saving vehicle and supplement retirement savings plans.

Proven or promising external resources or approaches

Literally just pay us competitively. We obviously already want to do follow this career path, having already completed a PhD and choose to continue our training as a postodc. I cannot make it more clear that the NIH just needs to pay better.

Response 3099

Perspectives on the postdoc roles and responsibilities

It should not be viewed as a training program. Postdocs should not be treated like a cheaper temporary alternative to permanent full time scientist.

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

Increase the salary for postdocs starting from $75000 considering the inflation and responsibilities for providing for the family.

Proven or promising external resources or approaches

No response

Response 3100

Perspectives on the postdoc roles and responsibilities

Through my 5+ years as a postdoc in two different labs, I have found that the responsibilities of being a postdoc in the biomedical sciences are very similar to those of being a doctoral student. With the support and mentorship of their advisors, both are expected to drive forward their own scientific research projects and learn all the background information and techniques required to do so. For doctoral students, their research project is a way of training them how to do science and design lines of inquiry, while most postdocs already know how to do this. However, in my experience, postdoctoral training differs from doctoral training not just in what skills it can provide training in, but also the fraction of trainees who actually require that training and in the efficacy of that training process. For postdocs who wish to pursue careers as independent investigators, their research project is a way of building expertise in a new field and building a scientific foundation for their new lab, but according to McConnell et al. 2018 eLIFE, among postdocs in the US (the majority of whom are in the life sciences), only 50-60% aim to pursue careers in academic research. For postdocs with other career aims (e.g., industry, teaching, etc.), further experience doing scientific research provides little to no career-relevant training, meaning that their roles and responsibilities as a postdoc are far more similar to a research job than to a training position. Thus, I think it is important that we reckon honestly with how heterogeneous the postdoc population is in what they actually need and get out of postdoc positions, allowing us to shape postdoctoral experiences in a more practical manner.

Fundamental issues and challenges

The primary issues I see with postdoctoral positions are shortcomings in support and training. Doctoral and postdoctoral training are both highly dependent on the mentor-mentee relationship. Because faculty are not trained in how to mentor and are not held to any standards for the quality of their mentorship, the level of support that trainees receive is highly variable from lab to lab. When mentorship from an advisor falls short, trainees are forced seek out other sources of training on their own, which is an extremely fraught process given that trainees rarely fully understand what skills they need to learn before they themselves have learned them. While this issue is not unique to postdoctoral training, postdoc differs from doctoral training in that there is no formalized program to scaffold the process. The support structures of doctoral programs such as coursework and thesis committees—which can sometimes help to mitigate gaps in advisor mentorship—are absent in postdoctoral training. Additionally, postdocs who wish to pursue careers as faculty must learn skills that are not taught through the day-to-day pursuit of doing science

(e.g., managing people, managing lab finances), meaning that some simply lack these skills or are forced to organize their own training in these skills. These challenges are made even more daunting by the time limits that postdocs are subject to. Nearly all postdoctoral fellowships deem postdocs ineligible if they are more than a certain number of years removed from getting their doctorate. This means that any postdocs who experience bumps or delays in their training (e.g., poor mentorship, being scooped) will have more difficulties in achieving their career goals through no fault of their own. These flaws in the postdoc experience increase stress, decrease overall quality of life, and can even drive prospective postdocs away from academia entirely.

Existing NIH policies, programs, or resources

Poor mentorship—I think is one of the largest issues plaguing academia, causing problems for all trainees. In my mind, fixing this issue would require a two-pronged approach. Firstly, current and prospective faculty should receive formal training in how to mentor effectively and sensitively. This type of training could become a prerequisite both for receiving NIH funding and for using it to pay postdocs. For current faculty, mentorship training could be treated much like education in responsible conduct of research; they would be required to receive this training and to update it regularly in order to receive NIH funding. Additionally, for postdocs who seek to become faculty, the NIH could stipulate that advisors of these postdocs can only pay them using NIH funds if they submit a plan for how the postdoc will be formally trained in how to mentor. The second facet to solving mentorship issues in science is for faculty mentors to be held accountable for the quality of their mentorship. This could be done through requiring regular (e.g., yearly) evaluations of an investigator's mentorship from their trainees, and these evaluations could, again, be made part of the criteria used to evaluate investigators for NIH funding. Admittedly, given the sometimes-complicated power dynamics that exist between mentors and mentees, ensuring that the mentorship evaluations are honest may prove to be a difficult and nuanced task. However, if we are to truly hold faculty accountable for their mentorship—one of the primary responsibilities they are entrusted with—I believe that trainees themselves will be the most accurate judges of this. There are fixes for several other postdoc problems that I think the NIH should make, including either lengthening or completely abolishing eligibility timelines for postdoctoral fellowships, but I do not have space here to discuss these at length.

Proven or promising external resources or approaches

While I do not have a detailed familiarity with training in how to mentor, I think it is important to remember that this is not something that we as scientists will need to make up on our own. For example, there are entire schools dedicated to teaching management skills. While management and mentorship aren't quite the same thing, I think there is enough overlap between the two to make it clear that we are not the first to try to figure out how to effectively mentor others.

Pay!

Response 3102

Perspectives on the postdoc roles and responsibilities

The academic postdoc, more often than not, represents the major workhorse of American research. While it was historically meant to represent a training position on the route to becoming an independent PI, the reality of the current academic climate is that there are not nearly enough academic/faculty jobs to

support the number of postdoctoral trainees. When it was truly a training position and the odds of getting a faculty position were high, it made sense that the salaries and benefits/status given to postdocs were quite low--as this was typically a very temporary situation. However, postdoc position lengths have now been extended to well beyond 4+ years, often without the guarantee of a faculty position on the other side. Thus, while I still view continued training to be a major component of a postdoctoral position, the reality is that postdocs offer a lot more value to their labs and to institutions than this would suggest. They perform the majority of the country's research, they mentor younger scientists, they help manage labs, they produce publications, they contribute to the generation of intellectual property for institutions, and they forge collaborations. All of these responsibilities often take place for 4 years or more, making postdocs very valuable employees and drivers of American science.

Fundamental issues and challenges

The biggest issues facing postdoctoral trainees include low salary (particularly in high cost-of-living areas) coupled with institution's resistance to view and treat postdoctoral trainees as true employees. Postdocs are consistently on temporary contracts that must be renewed, instead of being hired as long-term employees. This precarious situation undoubtedly contributes to postdocs being exploited by their heads of lab, as their employment status is constantly hanging over their heads. This is especially true of international postdocs and scholars, who feel even more pressure about their performance and output given that it directly impacts their ability to stay in the country. Moreover, the low salary offered to postdocs is made that much worse by the added issue that postdoctoral trainees cannot contribute to retirement accounts or start 401Ks at any point during their training at all/most institutions. So not only are trainees falling behind their peers in terms of salary/net worth over the course of their late 20s and 30s, they are also losing years of potential retirement contributions. Given that there are so few permanent academic jobs available following a postdoctoral position, the disadvantages associated with the position can no longer be explained away by emphasizing that it's solely a 'training' position. Postdocs are employees and professional researchers, and their salaries and status within their institutions must reflect this moving forward. Also, given that alternative career paths often offer an income of at least double, it's hard for many postdocs to justify staying in the position. A higher salary and treatment as true employees would almost certainly improve recruitment, retention, and overall quality of life for postdocs.

Existing NIH policies, programs, or resources

The NIH minimum salary policy for postdocs must be raised to a level that actually reflects the extensive training and expertise that postdocs provide to institutions and to the American research enterprise more broadly. The current salary minimum does not signal that postdocs are valued. A starting salary of at least $60,000 would be a good start. In addition, the most logical adjustment to the NIH salary policy would also include regional salary minimums that account for cost-of-living. The same salary in one region would need to be significantly higher to support a meaningful quality of life in an expensive region like New York City. I also think it would go very far if the NIH mandated that postdocs must be treated and categorized as full-fledged employees of the institutions they work at. This means that postdocs can no longer be put on vague tax forms that end up becoming a confusing, added burden to deal with, and it also means that postdocs must be eligible for the same 401Ks and retirement programs that are offered to other employees. At some institutions, postdocs must pay health insurance out of their own salary (while other employees do not), and this is a massive added financial burden being placed on them on top of a lower salary. Ideally, postdoc contracts would also no longer be only 1-2 years in length moving forward.

Proven or promising external resources or approaches

HHMI just this week raised the starting salary of postdocs to $70,000, and just overall offers a lot of benefits to postdocs that are in line with what it offers its other employees. Much of how HHMI treats its postdocs could be modeled by the NIH.

Response 3103

Perspectives on the postdoc roles and responsibilities

I believe the standard view of a postdoc is someone who is expected to crank out data, publications, and funded grants, while training others in the lab.

Fundamental issues and challenges

The most glaring issue with postdoctoral training is the lack of applicability of the training activities to the career for which they are training. It focuses on generation of data and is ridiculously lacking in skills required to be a PI, including management, reviewing grants and papers, service, interpersonal effectiveness, interactions with administrators, how tenure works, networking with other postdocs and junior scientists, and budgeting.

Postdocs' identities as humans suffers from unrealistic expectations and a lack of support, including lack of career development opportunities (or lack of support from their mentor to participate in these), mental health awareness, and sense of community. Additionally, the salary is not commensurate with the high level of expertise and demanding work ethic. All of these issues lead to people not wanting to become a PI, as they feel ill-prepared, or not wanting to become a postdoc, as the conditions are widely known to be less-than-favorable.

Existing NIH policies, programs, or resources

Higher salaries

Proven or promising external resources or approaches

National Postdoc Association

Response 3104

Perspectives on the postdoc roles and responsibilities

An academic postdoc gains technical and theoretical experience under the mentorship and supervision of a more experienced academic, to gain credentials and qualifications for an independent research career. An academic postdoc may also assist in supervising more junior colleagues (e.g. undergraduate or graduate students) to gain experience in teaching and mentorship.

Fundamental issues and challenges

Salary and benefits, including family leaves with pay, especially in locations with high cost of living; competition from other academic institutions that either offer higher salaries or are in locations with lower costs of living; lack of a core postdoctoral pool in a PI's lab to stimulate intellectual growth and productivity of individual postdocs.

Existing NIH policies, programs, or resources

NIH postdoctoral pay scales should increase, but caps for PIs' R01 budgets need to increase. For example, the number of modules to be requested before detailed Budget Justification should increase, or be in proportion to the number of postdoctoral fellows (and years experience) that will be supported by the R01.

Proven or promising external resources or approaches

Make available funding mechanisms from the NIH to support institution-based postdoctoral workshops on career development, or proposal preparation, or invitations for outside seminar speakers.

Response 3105

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] agrees with the NIH definition of the academic postdoc which is "an individual with a doctoral degree who is engaged in a temporary period of mentored research and/or scholarly training for the purpose of acquiring the professional skills needed to pursue a career path of their choosing." As an organization, [redacted for anonymity] is very focused on supporting postdocs in their pursuit of a career path of their choosing. We believe postdocs should be focused on independent projects that feature their peak creativity and inventiveness so they can pursue their own career with groundbreaking research.

The postdoc position should allow for bold blue-sky ideas and provide the opportunity for early career researchers to take chances. In order to support the transition to independence professional development, mentoring, and networking should be incorporated into the position. Postdocs should also be able to manage their own research funds to pursue their work and understand the administrative pieces of the

job. This is a stepping stone to the next career and postdocs should be prepared for those opportunities in the position versus focusing only on the goals of their mentor.

Fundamental issues and challenges

- The Apprenticeship Model: Many postdoc positions continue to follow the apprenticeship model which means the postdoc could largely be focused on fulfilling the goals of the lab instead of their goals to become an independent researcher. Many postdocs, especially those funded by the mentor's grant, feel pressure to focus on their mentor's priorities instead of their own research interests due to the power dynamics created in the lab. Without the scientific freedom that could come from postdocs having their own funds awarded directly to them, scientific creativity can be limited. As a result, many postdocs are stuck in their positions longer than required because they have focused on the goals of the lab instead of their individual growth.
- Barriers for International Researchers: A large pool of postdocs are international researchers. Many are discouraged from coming to the US for their postdoc due to immigration and funding challenges. Currently, many foreign postdocs are limited to the K99/R00 mechanism for supporting their transition from an academic postdoc to an independent researcher. This limits their opportunities to secure jobs as independent researchers and pushes postdocs to return to their home country even when it's not desired. In addition, due to immigration policies, it is difficult for this pool of talent to stay in the country and have a good quality of life.
- Lack of Funding Opportunities to Transition into Independent Roles: Many postdocs that would like to become independent researchers are discouraged due to low paylines and success rates at the NIH. Researchers have a less than 20% chance of receiving independent research funding from the NIH. This makes it very difficult to transition out of the postdoc position. Additional funds are needed to support these researchers at this critical stage.

Existing NIH policies, programs, or resources

Expansion of the funds dedicated to early career researchers to support the transition of postdocs to independent positions. NIH should set a goal to invest at least 10% of its overall budget to young researchers, specifically postdocs.

Enhance bridge funding to support young investigators at key transitions in careers (e.g. the transition between postdoctoral researcher to early career faculty). NIH could target funding increases to the High Priority, Short-Team Project Award program (R56). This program typically funds one or two years of high-priority new or competing renewal R01 applications and are awarded to projects that fall near the payline of the IC. This program could be targeted to specifically support early career researchers at critical points in their careers such as the final years of their postdoctoral fellowship or during the years prior to receiving their first large independent funding opportunity. ICs could be required to set aside a certain percentage of their R56 funding pool for investigators with early-stage investigator status.

Double annual funding for existing award programs like the Maximizing Investigators' Research Award (MIRA) and the Stephen Katz Early-Stage Investigator Research Project Grant. NIH should encourage more ICs to support the MIRA program, which was pioneered by NIGMS.

Double annual funding for the Common Fund's High-Risk High-Reward programs, with a focus on those for early career investigators, the Director's New Innovator Award and the Director's Early Independence Award.

Increase funding for career development awards (K awards) that provide protected time for research and maximize independent funding opportunities for early career investigators.

Require all ICs to have Early Stage Investigator policies that increases the paylines and success rates for those researchers to increase the opportunity for postdocs to receive their first RPG award.

Proven or promising external resources or approaches

NIH should look to philanthropy as a promising external resource to enhance the postdoctoral training ecosystem. The cost of doing research is constantly growing despite the limited funding increases available from the government. In 2016, Philanthropists provided 44% of research funding at US universities and non-profit research institutions according to a post from the Science Philanthropy Alliance (https://sciencephilanthropyalliance.org/philanthropy-a-critical-player-in-supporting-scientific-research-alliance-blog/). Modest donations and small awards add up and the NIH should think about ways public

and private partnerships can be formed to support postdocs and overcome compensation hurdles that limit the quality of life for postdocs. Through The Foundation for the NIH, NIH uses private-public partnerships to advance research in critical areas through the Accelerating Medicines Partnership Program. This model could be used to create partnerships with philanthropists, biotech, and pharma to provide another opportunity for postdocs to receive independent research funding that will help catapult them to the next stage of their careers. The challenges and issues we see for postdocs are extreme and the NIH must address these issues with the same urgency as we address some of our largest global health challenges.

Response 3106

Perspectives on the postdoc roles and responsibilities

- Broadly defined, the goal of a postdoctoral fellowship is an independent career, whether in academia or not. If the end goal is broad, then the training and mentoring needs to be broader.
- The roles **and responsibilities** for postdoctoral fellows vary greatly across academic disciplines, with funding, whether from a training grant or other award, often dictating the type of work that is assigned. The leads to variability in terms of resources, skill training, and community building.
- There is tension between a postdoctoral fellowship being a time to learn and explore and running experiments for mentor Roles as a lab manager or mentor for graduate students can be particularly variable. Trainees should expect to develop skills in proposal development, writing grants, and mentoring younger people.
- Mentors have the responsibility for training and helping to transition to independent research and/or faculty careers. This can result in tension between mentoring/training and supervising.
- There is a need to define the commitment to the postdoctoral training period for both the trainee and the mentor.
- Postdoctoral fellowships could be defined by time. After five years, it is appropriate to have a different title and show career growth.
- Postdoctoral appointment length should vary depending on the ultimate career path. It is not clear that postdocs aiming to enter industry positions benefit from 5 years of postdoc training.

Fundamental issues and challenges

Recruitment

- Recruitment of postdoctoral fellows is impacted by low salaries compared to industry and cost of living, especially considering the life stage of postdocs due to prolonged graduate training. Given that the difference between postdocs salaries and PhD student salaries is narrowing, postdoctoral fellowships are less desirable. Going forward, salaries should be adjusted for the cost of living relative to inflation.
- The lack of relocation packages makes it difficult to recruit postdocs from across the country and internationally.
- Job descriptions should outline responsibilities, duties and a mentoring plan.
- Depending on university policy, postdoctoral fellows might be recruited through limited advertising on list serves, or through a general listing on a human resources web page. These mixed approaches could result in limiting the pool of applicants.

Retention

- Lack of clarity for the length of the postdoc position which also leads to job insecurity.
- Loss of funding can negatively impact the job security and career goals of postdocs.
- Postdocs often leave due to a poor fit with a mentor, and lack of aligning expectations in advance. Communication with the mentor is essential from the recruitment stage to ongoing communication about reaching individual postdoc goals and project milestones. Setting expectations to the length of the position not only in terms of funding but also skills learned, and mentorship provided.
- Postdocs are vulnerable to power imbalances, especially if they are also international postdocs who are dependent on their mentor for visa renewal and in many cases a recommendation letter for obtaining permanent residency.
- A private office can increase productivity and reduce interruptions.

Quality of life

- Expectations for spending evenings and weekends in the lab can become onerous.
- While postdocs may have official vacation time, like any professional employee, they are not always able to utilize it.
- Abusive relationships, toxic work environment, and mental health challenges are all impacting postdocs and affecting quality of life.

Existing NIH policies, programs, or resources

- NIH programs (K01, K99, etc.) should be presented on a pathway so that trainees have a clear understanding of eligibility requirements and how to build an independent career with those awards. If the pathway shows flags (e.g. an individual with a K01 cannot also apply for an R01) that would help with understanding how to sequence the awards. The implications of choosing one grant mechanism over another should be clear prior to application, so that a postdoctoral fellow does not become ineligible for other training opportunities.
- Awards for non-US citizens and permanent residents would be helpful in recruiting postdoctoral fellows.
- It is challenging to quickly understand what one can do with each program. Information that quickly explains eligibility across a range of awards, as well as whether the award can be moved to a different institution would be helpful.
- Effort reporting has added a layer of complexity for postdoctoral fellows supported on R01 grants, since mentoring/training is not explicitly called out in those grant mechanisms.
- Postdoctoral programs that support academic/industry partnerships would be helpful.

Proven or promising external resources or approaches

- Cohort hiring is a promising model that helps with community building for postdocs and ensures departmental resources are in place to support trainees. [redacted for anonymity] College of Nursing and Health Professions used a cohort recruitment model in 2019. Ten postdocs were hired within a few months and the program invested resources in postdoc orientation and instituted weekly meetings to support skill and community development.
- Typically, postdoc appointments are designed to train postdocs to leave and enter independent positions elsewhere. However, some universities are prioritizing a long-term commitment and treating postdocs as a pipeline to faculty. [redacted for anonymity] has excellent examples in the College of Medicine and the College of Arts and Sciences. Our experience shows that faculty converted from postdocs are highly successful, due to efforts to fully integrate them into the department, with a focus on building an independent career.
- Some institutions are focused on diversifying the faculty pipeline by offering DEI postdoc fellowships that are internally funded through the Provost Office or Research Office. These awards not only offer competitive salary and mentoring they also offer seed money for research to create preliminary results for independent grant submissions.
- Industry postdoc programs serve as an excellent employee screening tool.
- More awareness for all the K award types.
- Formal grant writing workshops for early career scientists. A cohort model with hands on mentoring, perhaps expanding the National Research Mentoring Network grant writing model would be helpful.
- More policies are needed regarding work environment such as the new NIH policy on sexual and other harassment.
- Competitive salaries, particularly in fields like epidemiology where trainees have strong analytical skills in biostatistics and informatics and thus are attractive to industry, are needed to compete from strong candidates. Some universities are already addressing this by going above suggested NIH salaries.

Response 3107

Perspectives on the postdoc roles and responsibilities

Speaking about myself as a postdoc, postdocs in my training labs, and postdocs in my own lab, I emphatically believe that postdocs are in a training role. I do not buy the academic twitter narrative that "postdocs are highly trained professionals". They are highly specialized *researchers*, and often have a lot to learn when it comes to professionalism. The postdoc is a time to learn those professional practices and also to test whether a person who really loved their PhD research is able/interested in applying research skills to new questions and to develop a scientific identity. A postdoc should be brief and serve the needs of getting the next job.

Fundamental issues and challenges

PhDs and postdocs are taking longer, and many postdocs today are at more advanced life stages (partnered, parents). I do not think the long-term solution is to make the postdoc job (pay, duration) suitable to sustain a family, but to incentivize briefer timelines so this overlap doesn't occur.

Existing NIH policies, programs, or resources

I would love a supplement for recruiting postdocs specifically. Timelines for fellowships are very long, and postdocs shouldn't be. A fast-track to be able to take on a new postdoc at any time while a grant is active even if not previously budgeted for would be very helpful. They could then apply for fellowships.

Grant support for long-term research positions off the tenure track would also be helpful.

Higher salary

Response 3109

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

- While the increase in pay from graduate school is significant, the salary/stipend of postdocs is not high enough to continue attracting academic-oriented scholars. When taking their talents to other industries, scholars receive larger paychecks as well as training, which is more appealing, especially for those with student loan debt.
- Postdocs are spearheading a huge amount of the research conducted at institutions; however, academia pays very little attention to them. There is a general sense of postdocs paying their dues before being allowed to even consider becoming a professor. If they exist at all, postdoctoral offices generally have only a few staff members and minimal budgets to oversee a huge portion of the early career scientists at an institution.
- Many institutions do not consider postdocs as part of their alumni community, so there is no tracking of outcomes after completion of the postdoc. Additionally, while training grants may want their trainees to continue in academic research, no career path should be considered a failure should a trainee choose it over academic research. The lack of tracking exacerbates the lack of university support and adds to the sense of transience that many postdocs feel.
- While the form and style of mentorship is unique to each relationship, mentorship is a skill that can be trained and honed like any other skill. Yet very few postdocs and even fewer faculty mentors receive mentorship training. It is extremely rare for a postdoc to have an opportunity to reflect on the mentorship they are receiving and have that reflection actually lead to positive change. As mentoring achievements are not part of tenure, promotion, or grant awarding, faculty who create poor (and even toxic) environments for their postdocs go into successful careers while using the data and experience of the researchers they mistreat.

Existing NIH policies, programs, or resources

- The NIH Maximizing Opportunities for Scientific and Academic Independent Careers (MOSAIC) program is an excellent example of cohort-based postdoctoral training. The program also focuses on institutional accountability and promotes mentoring through career advancement and professional development as well as the tracking of postdoc outcomes. This model should be expanded and adapted to other types of awards.
- Similarly, the model used for the NIH Institutional Research and Academic Career Development Awards (IRACDA) program should be replicated for introducing postdocs into a chosen non-faculty career and other job markets adequate to their level of training and expertise.
- NIH needs to clarify what is referred to with "relevant research experience." On the NRSA announcements, NIH specifies that relevant postdoctoral experience "may include research experience (including industrial), teaching assistantship, internship, residency, clinical duties, or other time spent in a health-related field beyond that of the qualifying doctoral degree." This list, however, is not present in other awards, so PIs keep scholars (notably, international researchers) in postdoctoral appointments for longer periods of time.
- At the same time, NIH must emphasize protected time for professional development by clarifying effort-related language, which currently attributes 100% of effort for research in the postdoctoral experience of several awards. Postdocs' 100% effort should be for research, training, career or professional development, and other scholarly pursuits as defined by the hosting institution.
- Finally, NIH should be very strict in setting postdoc working hours at 40 hours/week or less and penalize those PIs who force their postdocs to work more than that. In fact, by establishing that T grants allow participants to work outside of their grant time for up to 10 hours, NIH is literally endorsing a 50 hours/week work time and sending the message that this is okay for our researchers.

Proven or promising external resources or approaches

Postdoc development—NIH must increase salaries and stipends for postdoctoral researchers. Institutions follow NIH minimum compensation guidelines, so the impact of the changes at the NIH will be tremendous across the country. Simultaneously, dedicated time for professional development must be considered as part of effort. This will include academic preparation, career exploration, skill development, immigration education, and financial education.

Partnerships to improve postdoc experience—As a leader in science and medicine, the NIH should partner with other government agencies and leaders to address relevant issues to the postdoctoral experience such as (re-)establishing an age of retirement for tenured professors nationwide as well as a path to permanent residence and even citizenship for advance-degree scholars who have been contributing to the development of the American scientific enterprise for a defined number of years.

Funding and tracking—NIH must create mechanisms that fund postdoctoral affairs offices to provide programming for the exploration of various career tracks in the biomedical workforce. Some examples are the NSF Accelerating Research Translation (ART) program, Burroughs Wellcome Fund Career Guidance for Trainees, or the NSF Innovations in Graduate Education (although this one does not fund postdoctoral education). At the same time, the NIH could capitalize on its prestige and influence and urge other federal agencies, professional societies, and national organizations to partner to create and fund mechanisms to track postdoc motivations into the appointment, factors influencing postdoc career decisions, and postdoc training outcomes at the national level.

Response 3110

Perspectives on the postdoc roles and responsibilities

The postdoc is critical for furthering scientific endeavors in basic translational research as they are well trained and require less upstart time to learn new skills than graduate students, can progress projects faster towards logical endpoints for dissemination.

Fundamental issues and challenges

Many postdocs are unwilling to move to locations that are not coastal big cities to pursue scientific careers.

Salaries for postdocs compared to industry options are significantly lower. Increasing salaries for postdocs would help to address this issue. However, in order to address this, current grant funding of already existing budgets that have postdocs need to be increased to account for rises in salary, whereas future budgets can be increased during the submission process. Furthermore, there would need to be a push to increase faculty salaries in many cases, as there are several places where faculty salary would be very close to postdoc salary with significant upward movement in postdoc salary.

Existing NIH policies, programs, or resources

Provide supplemental funding for additional reasons for postdoc hires or give automatic supplements to postdocs with child care costs (perhaps 3-5k/year) as a pseudo raise for those with the largest challenge staying in a lower salary position.

Raise modular budgets (including existing budgets) to account for increased costs associated with raising the salary of postdocs

Provide more avenues for permanent staff positions (e.g., grants aimed towards research/staff scientist positions) to encourage postdocs at higher salary bands to stay in the position for a career. A stable 'senior' postdoc workforce that is adequately paid and happy to maintain this scientific role will do wonders towards pushing science forward as they will need less learning for each lab versus regular turnover of new people.

Proven or promising external resources or approaches

N/A

Response 3111

Perspectives on the postdoc roles and responsibilities

The NIH should advocate for bringing the postdoc position back to its primary and intended purpose, that of career training and preparation, which should include not just research training, but also comprehensive training in skills for professional success across domains such as:

1. Scholarly and Professional Communication
2. Professionalism and Career Preparation
3. Leadership and Management
4. Ethics and EDI
5. Health and Wellness.

All postdoc positions should include dedicated time to participate in career and professional development workshops and trainings in all of these areas, not just those for advancement of their research skills or knowledge, and funding to support their participation in all such programs. We should also broaden our understanding of the purpose and utility of postdoc training as not just useful for academic faculty careers, but for a diverse array of careers both inside and outside of academia.

With the explicit understanding that one of the primary purposes of a postdoc is for training and development, all postdoc positions should be required to have learning objective and goals for the appointment, that cover not just research or technical skill development, but development of skills for professional success, such as communication (interpersonal, grant writing, etc.), working with diverse teams/individuals, effective and culturally aware mentoring, leadership, management, and other skills necessary for success across the variety of careers available to postdocs. Postdocs also play a key role in the mentorship structure within academia, and specific training for them to navigate those mentoring relationships, both as a mentee and as a mentor, should be supported both through funding and dedicated time to participate.

Fundamental issues and challenges

The key to this is to bring the postdoc position back to its primary and intended purpose, that of career training and preparation, which should include not just research training, but also training in skills for professional success, such as communication (interpersonal, grant writing, etc.), working with diverse teams/individuals, effective and culturally aware mentoring, leadership, management, and other skills

necessary for success across the variety of careers available to postdocs both inside and outside of academia but that are not currently being prioritized within the current postdoc training framework. Additionally all postdoc appointments should include dedicated, paid time to participate in these non-research related professional development workshops and activities and funding to support participation in such programs.

Recruitment adds, job postings, and job descriptions for postdocs should list learning opportunities available in the position instead of just desired skills and qualification for the role, again to bring postdoc positions back to their intended purpose of building experience and skills for future career success. The required skills for postdoc positions should be limited to those necessary as prerequisits for learning the research area or techniques in the lab, but should not require postdocs to come in with a thorough knowledge of either the research area or the techniques utilized. Instead, it should be structures as a learning opportunity where the most important prerequisite is the applicants desire to learn and documented success in learning previously. Upon hiring, an explicit training and professional development plan should be setup that meets the goals and needs of the individual postdoc based on their desired learning outcomes and career goals. These training plans should be updated at least annually during the postdoc's tenure.

Existing NIH policies, programs, or resources

Allow for costs for postdoc training and professional development activities to be charged to research grants (such as R's) if postdocs are being funded on these mechanisms. This should support not just research training activities (such as learning new techniques) but other professional development activities to build career skills, such as courses in leadership and management, mentoring, working with diverse teams, communication, and other skills desirable across the variety of careers available to postdocs both inside and outside of academia.

Similarly, allow for costs for mentor training for faculty to be charged to research grants on which postdocs are also being funded. If faculty are using trainee labor toward achieving their research goals, they should be required to document and demonstrate their competence as mentors and be required to compete and attend trainings to support this expertise. Renewal and awarding of research grants should take into consideration training/professional development plans for both the PIs and for the postdocs in the areas described above and provide adequate funds to cover those training and professional development costs

Also provide funding to train postdocs in mentorship practices, both to help them to be better mentors to graduate and undergraduate students, but to prepare them to take on these roles as future faculty members. This will help to build a pipeline of mentors trained in equitable, culturally sensitive mentorship practices for the future.

To support these training efforts, the NIH should require that a specific portion of the institutional indirect costs go towards funding staffing and operational costs for a postdoc professional development office with at least 1 full time FTE for every 500 postdocs specifically dedicated for 100% effort towards support for postdocs professional development.

Response 3112

Perspectives on the postdoc roles and responsibilities

A postdoc is just grad school but with the expectation that you're work will lead to publication fast than a grad student would publish. Nothing seems to change. No skills are learned that blow you away. Many PI only want established people in the field and are unwilling to train.

Fundamental issues and challenges

Mainly money. If I don't get paid right, I'll literally drag my feet. There are no metrics to achieving promotion. No real way to supplement salary. Whether I publish 4 or 0 papers I get paid the same given the "years PD experience" . Makes no sense.

Existing NIH policies, programs, or resources

More early career oriented programs to win money.

Proven or promising external resources or approaches

Just pay people more. 75k minimum and clear benchmarks to achieve for promotion. There NEEDS to be a way to transition from postdoc to permanent position at institutions

Response 3113

Perspectives on the postdoc roles and responsibilities

I thought that it would be an opportunity to work with a different PI and to work on a different scientific topic. Also I had a chance to apply some techniques that I learned as a grad student to different problems. I thought I would get a different perspective on research and a chance to transition to a more independent position. By independent I mean intellectually independent from my advisors, not that they couldn't still provide mentorship if they were able to do so.

Fundamental issues and challenges

In the late 1980s I interviewed in-person with four lab leaders in three different states for a postdoctoral position. Two of the labs were led by M.D. professors and two by Ph.D. associate professors. For at least one of the interviews I gave a research talk with slides to the hosting department. One reason I picked my first postdoctoral lab was because my thesis advisor had given me the PI's NIH grant proposal to read. I don't remember when I disclosed this to the PI but I did. I remember being told that was unethical. I thought that meant I was unethical. When I arrived, the PI wanted me to apply for my own funding. People who were funded by the PI's NIH grant were still working in the lab. I realized that I had no publications and no health insurance. It never occurred to me to discuss health insurance prior to doing postdoctoral research. I bought a catastrophic policy privately. The PI funded me from a departmental NCI training grant. I think that I attended two out-of-state meetings, one was in Toronto Canada; but I didn't present any results. I had one phone conversation with my thesis advisor who said I could return to his lab. I wasn't comfortable sharing various concerns. I didn't realize that I had to "pay back" the NIH training grant time but eventually concluded that I needed to find another postdoctoral position.

The second postdoctoral position was in a different state. I wrote annual reports to the PI's "managers" and gave a poster presentation at a meeting. My immediate response to the end-of-funding/completing NIH payback requirements was to apply to advertised positions that I found in journals. After 5.7 years of graduate education and 7 years of postdoctoral research I had two first-author publications.

Existing NIH policies, programs, or resources

I haven't read most of the information in the links given above. I found out around 2017 via the internet that the PI's NIH grant that funded me ended about 1.5 years into the second postdoc. I assume that private funding sources were used to allow me to work in the lab until the end of my payback requirement. Later the PI did write and submit a manuscript that wasn't accepted. The strains, the records of strains that I constructed using molecular biology, and my lab notebooks are all inaccessible to me and maybe discarded.

Someone could have explained to me that NIH had a 5-year cutoff for postdoc eligibility and a 5-year limit on data retention. I understand that policies regarding retention and handling of data are being modified and improved from the time I was a postdoc. NIH should work with postdoctoral labor unions in my opinion, especially to avoid a totally top-down system. DEI isn't served by linking opportunity and success to funding sources, especially private funding sources. The NIH benefit floor appears to be too low. I don't know if NIH salaries have followed the Consumer Price Index or something else.

Proven or promising external resources or approaches

I have tried unsuccessfully to use the IDP (individual development plan) (from AAAS) The IDP from the American Chemical Society seemed a little more applicable but still not very helpful. I joined and unjoined a smaller, more specialized scientific society. I subscribed to NRMN (National Research Mentoring Network). In both of these organizations I found that the programs are directed to younger and/or more recent Ph.D.s. They also appear to be directed towards obtaining funding from the United States government, at least initially. I listened to the Science of Mentoring podcasts produced by the National

Academy of Sciences. I was hired by a younger Ph.D. for a part-time adjunct instructor position in time for the COVID pandemic. I don’t want to use social media although sometimes I find it informative.

The listening webinars associated with this RFI were helpful in possibly explaining the differences in postdoctoral work benefits due to funding sources and locations.

Response 3114

Perspectives on the postdoc roles and responsibilities

The postdoc role is a time when academic researchers are very skilled but do not run an independent laboratory. The period is used to showcase the talent of the scientist for faculty applications and start a research trajectory that will be further investigated once the postdoc start to run a lab. The 5-6 year expected length of a postdoc today is a recent change and therefore the role of postdocs has changed. Today, postdocs are seen more as the main workers to advance the science of the PIs laboratory, rather than short term trainees. Essentially the postdoc has turned into a second PhD period.

Fundamental issues and challenges

Low postdoc salaries are the underlying cause of low postdoc recruitment and retention. PhD level job applicants can make 2-4 times as much money in an industry role. For most people, it does not make financial sense to do a postdoc. This is especially true of people who have children and people who are disadvantaged in society due to factors including race, gender, and socio-economic class. The best suggestion I have heard is to use the Federal Government GS-11scale to determine postdoc salaries. This would take into account the cost of living locally which the current NIH minimums do not.

A second major issue that reduces quality of life as well as the desire to do a postdoc is the poor job outlook following the postdoc period. Faculty positions are very hard to get and investing 5 years to something so uncertain is not an attractive option for many people. The low number of faculty positions also increases competition between postdocs, requiring more output to be competitive. As a result, postdoc stress and work—life balance is very poor, however, long work hours are the only way to advance in the career path.

Response 3115

Perspectives on the postdoc roles and responsibilities

Already submitted.

Fundamental issues and challenges

Already submitted.

Existing NIH policies, programs, or resources

- NIH position about fellows' employee status—The NIH has not been clear about whether its fellows can be employees. The language used in the policies is open to multiple interpretations. Most institutions have decided to act on the safe side by considering NIH fellows as non-employees in most institutions. This has been creating disastrous consequences affecting the living and working conditions for fellows, as their health benefits may be more expensive than those of their employee-status peers, they may not be able to make contributions to a tax-deferred retirement, they may no longer be paying into Social Security (FICA) or Medicare, they may no longer have FMLA benefits, and their time as a fellow is not eligible for the Public Service Loan Forgiveness Program. This generates unjustified stress during a critical stage in the researcher's career. Also, with the average age of postdoctoral appointees constantly increasing across the country, it also creates difficulties for family planning, wellness, and financial stability.
- Need to include international scholars in NIH mechanisms—Postdocs on temporary visas constitute more than 50% of the postdoctoral population in the U.S., and the number is growing due to the increasing awareness of career pathways requiring little or no postdoctoral training among graduate students, particularly those of domestic backgrounds. In this context, the postdoctoral community will benefit from the expansion of NIH awards' eligibility criteria to include international scholars, who pay federal taxes as well as state and local taxes where required. Currently, only the K99/R00 mechanism (except for MOSAIC) accepts U.S. non-citizens. Keep in mind that this is an award for transition to independence, which means that applicants should provide evidence of academic accomplishments. With scarce funding opportunities, international scholars are at a disadvantage in their research careers in comparison with domestic scholars.

Proven or promising external resources or approaches

Existing NIH policies, programs, or resources

New NIH mechanisms for workforce development—Although the NIH integrates career, professional, and workforce development into T, F, and R mechanisms, it barely provides mechanisms that fund the activities of postdoctoral offices and specialized practitioners in the field of career and professional development for early-career scientists. Grants and opportunities similar to the Broadening Experiences in Scientific Training (BEST) awards with emphasis on advancing postdocs should be available every year to broaden postdocs' knowledge and exploration of diverse career options. It has been shown that participation in professional development does not increase time to degree or manuscript output (Brandt et al 2021), NIH-funded training programs will most likely enhance faculty/department buy-in, create institutional long-term commitment, and encourage other funding agencies to support these initiatives.

Proven or promising external resources or approaches

Already submitted.

Response 3117

Perspectives on the postdoc roles and responsibilities

The postdoc position for me personally is a space to establish my scientific confidence and learn to ask good and meaningful questions. This is further relevant as I experienced emotionally abusive and racist mentoring during graduate school which was severely traumatic. In this context, the postdoc position is a great opportunity to develop my skills further and identify my path forward. I also perceive it as an opportunity that will help me develop my mentoring skills and implement these so that I would be more

prepared if I went down the tenure track path. I am also utilizing this opportunity to further my advocacy efforts towards making academia more inclusive and equitable.

Fundamental issues and challenges

The ambigious status of postdoc positions makes receiving training and independence confusing and tricky. The "trainee" aspect is often the reasoning to offer much less pay than postdocs could be earning in industry jobs, often nearly 2-3 times less than industry. This, in addition to years of extremely lower pay during graduate school (I earned 3 times my graduate stipend before grad school, and I may not make even that much as a postdoc for the first 10 years per NIH scale), makes the entire trajectory rather frustrating and absolutely exploitative. In addition, there are no clear policies for receiving training opportunities, which really concentrates even more power in the hands of PIs.

Existing NIH policies, programs, or resources

- require institutions to cover relocation costs for postdocs as making cross-country/continent moves in your late 20s/early 30s, often with a family, is non-trivial financially and every other way, but can at least be made manageable with a relocation compensation
- establish % salary that can be used towards conferences, training workshops, visiting collaborating labs etc. to cover the "training component"
- increase the NIH minimum which is almost always used as the "maximum" salary for postdocs. Starting at $50k after a PhD, including in places with significantly high costs of living is unacceptable
- honestly, unless a respectable salary and compensation is offered, the expectation that the postdoctoral training ecosystem could become less exploitative is not reasonable and ill-founded. Many of us choose to remain in this position and be exploited because we have worked so hard to be allowed to do science, but sadly this shouldn't have been the price we had to pay and nor should this be the reason to stay.

Proven or promising external resources or approaches

- financial compensation seems to be a significant predictor for people moving to industry, and for many us wanting to make the switch
- the current system, combined with the absymal financial compensation, is not suitable for disabled scientists and there are no easy ways to discuss this for fear of jeopardizing our standing and for fear of our competence being questioned (this was my experience during graduate school in that asking for accommodations for my mental health led to a punitive response from the office of disability at [redacted for anonymity] and made things worse)
- offering training opportunities and structured workshops + requiring it for postdocs on NIH grants, to help us prepare for the path forward, either in academia or industry, would be very beneficial and mandating some of it will make it easier to carve out time and support to pursue these
- some advice on requiring a kind of training committee for postdocs would be helpful as many of us could benefit from a structured mentoring arrangement
- please include postdocs on study sections etc. or offer such training to us!

Response 3118

Perspectives on the postdoc roles and responsibilities

A postdoc's role is to gain experience in all aspects of science (experimentally, the leading project, writing papers/grants, teaching) from mentors, while simultaneously performing science related to that lab. As one is in that lab they gain experience in all these aspects from their mentors so that they might fill out any missing gaps of experience/knowledge not gained during their graduate training. The overall goal is to gain the necessary skills, likely being shown by publication records, that prepare them for an independent research career.

Fundamental issues and challenges

Financial, both in salary and grant opportunities. I am not sure how addressable the quality of life is and it seems subjective, likely something to be achieved at the more local level (i.e. university/institution).

However, the financial aspect should be set as a standard by the major supporting governance overseeing that. As such, any university/institution performing NIH-funded research should abide by NIH rules, of course. The NIH not setting standards of finances is one way that postdocs are being neglected by the NIH. Often the salaries of postdocs are set in comparison to national averages that are dictated by funding governments like the NIH. I believe this is a fundamental issue. In my situation, the deciding factor as to whether or not I stay in academia will be financial, as I know am a second-year postdoc still paying off student loans—unable to overcome the enormous interest and debt from this. My CV is good and likely will have a good chance if I can stay long enough in research. However, time is running out before I have to get a job that pays me enough to pay off student loans. This should not be the case. My career determinants should be based off of my work and not financial burden due to inadequate pay. I am not alone in this and have many friends in similar situations. I might add that the NIH offers no help to someone in my situation. The loan repayment for MD/PhD, makes sense. But to have that program before having a program for PhD's alone, who will be delayed in making as much as an MD/PhD seems a glaring oversight.

Existing NIH policies, programs, or resources

There should be a loan repayment program for PhD's, not just MD/PhDs. The idea that we need to keep MD/PhD's around but not PhD is appalling. Yes, MD/PhDs are likely to hold large debt, but so is the average American, including PhD. This problem is already pervasive among PhD's performing NIH-related research, yet it seems to not be on the radar of the NIH. If it was started next year, such a program would be years behind. Yet the problem will only escalate, choking out future PhDs whose undergraduate debts will accumulate during grad school and postdoc fellowships—only those lucky enough to survive financially long enough will be able to stay in science, not because of the rigor of their work.

The second is clear, change the standards of postdoc salary. This will aid immediately those with student loans, as discussed above, but will also match the rightful amount of salary that should have been adjusted for continual inflation, yet has not been adjusted for many years. I think simply paying postdocs a salary adjusted for inflation to that of all others in the scientific ecosystem is nonsensical that it is hard to believe it has to be pushed for.

Proven or promising external resources or approaches

Perhaps allowing for less lengthy grants for early postdocs. F32 is 3 years and K99 is needed by end of year 4. This gives very little time to apply for a grant that runs quickly into the K99 application. Such a grant then seems to not make sense for the normal pathway of a postdoc. Perhaps limiting 1-2 years of funding would be more apt and allow for more people to be funded.

Second, adding funding for those who do multiple postdocs or do a 1-2 year intermediate postdoc. I don't like it any more than anyone else that more and more training is needed to gain a faculty job, but this is how it is. The NIH should help with this—lessening timeline of K99 and providing grants for those who do a second postdoc or short secondary postdoc to increase their skillset and resume. Such funding would support very diverse research backgrounds, something the NIH is supportive of. Such postdocs will bridge fields with experience and provide niche areas of research once they reach faculty positions.

Response 3119

Perspectives on the postdoc roles and responsibilities

Postdocs are generally a temporary training stage in academia on the way to becoming a tenure-track faculty member. Postdocs gain more training opportunities that can help with their research and professional development. These positions are also important prerequisites for applying for other positions in academia.

Fundamental issues and challenges

Many issues currently plague postdoctoral trainees in academic research. First and foremost, pay and benefits are simply not competitive, especially in recent years and in high-cost-of-living areas. Salaries need to be raised significantly! Benefits also need to be evaluated and NIH should do more to ensure consistency and equality of benefits across institutions, as postdocs are often excluded from important benefits like health insurance and retirement. Training for postdocs in research and professional development is also haphazardly available and is normally poor relative to undergraduate/graduate education, which significantly detracts from the purpose of this career stage. In general, while individual

PIs may value postdocs a lot and offer great support and training (although this is far from universal), institutions appear to offer little regard for their postdoc community members. In my experience, postdocs are forgotten because we are not officially students, but at the same time, many universities get away with classifying postdocs as students and trainees when it suits them, resulting in situations where honest efforts at improving situations are met with the response "our hands are tied because you are a student/trainee" or the opposite, depending on seemingly on whether the action required significantly impacts the bottom line. I could go on, but I think the bottom line is that across almost all levels, postdocs are underappreciated and underpaid relative to the tangible benefits they provide on campuses across the country. And as a result, many are unhappy and until this changes, academia will continue having trouble recruiting and retaining postdocs. There are also significant equality issues with the current approach and if NIH and other institutions are truly behind DEI efforts, many changes are needed for the postdoc career stage.

Existing NIH policies, programs, or resources

As a postdoc, I do not have time to familiarize myself with a bunch of existing NIH policies, programs, or resources. I suspect most postdocs and academics in general would say the same thing, which makes me wonder how useful these policies, programs, or resourcesare. The most tangible way that NIH can help postdocs is by significantly improving funding for them and ensuring that training and academic environments are setup in a way that values these important members of the academic community. This starts with raising modular grant amounts so that PIs can better support postdocs. Until this and other actions are taken on this front, other modifications or improvements will hold little weight.

Proven or promising external resources or approaches

I do not have any obvious examples I can provide here. I think this underscores the fact that very few entities (NIH, NSF, universities, etc.) are properly handling postdoctoral training. I believe NIH and others should critically evaluate whether small changes to existing programs will really solve many problems, or whether more substantial changes or a "start from scratch" mentality may be more valuable and lead to better outcomes.

Response 3120

Perspectives on the postdoc roles and responsibilities

It could expand the area of science and knowledge with depth in a new environment. It could be an opportunity to learn new people and mentorship for their future.

Fundamental issues and challenges

funding

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3121

Perspectives on the postdoc roles and responsibilities

I think postdoctoral training is to practice on building their own research programs by deep dive on research from experimental details to writing proposal to get grants.

Fundamental issues and challenges

It should be not contracted yearly. Rather it should be treated as an industrial jobs. At this time of career many postdocs start to have a family and current year to year contract with low salary put lots of stress.

Existing NIH policies, programs, or resources

Salary needs to be increased along with benefits. Covering childcare and support is definitely needed.

Proven or promising external resources or approaches

Every institution has hire postdocs as research scientists not as temporary positions.

Response 3122

Perspectives on the postdoc roles and responsibilities

The postdoctoral role SHOULD be a place where after leaving graduate school, a person can acquire a final round of training in a field and/or a technique they did not have time and/or access to during their doctoral studies. Unfortunately, far too often it's "try to get out as much work as desperately as I can to be eligible for one of the shrinking number of faculty opportunities that exist". The responsibilities SHOULD include learning such new scientific directions competently, contributing to a positive work environment, and contributing to the knowledge base of the research group (through papers, mentoring, etc).

Fundamental issues and challenges

Postdocs are not paid enough, especially in high cost-of-living areas. PIs who would otherwise like to pay their postdocs more don't get a "cost-of-living-adjustment" for their grants, and thus have to possibly materially hurt the quality and/or quantity of their scientific output in order to pay postdocs a living wage, so many simply do not.

Many PIs see postdoctoral appointments not as "here is a person I will train", but "here is cheap labor to do work in my lab". It is rare for PIs to receive any formal training in management or mentoring at all, and there are no incentives for PIs to serve as high-quality mentors. Abuse or mistreatment of postdocs is allowed in many places to run rampant, especially for visa-dependent postdocs who can't risk angering a PI if they want to stay in the US, or postdocs who have to PAY BACK THEIR STIPEND IF THEY LEAVE (seriously, NIH, this is horrifying, why do you do this).

Finally, due to dwindling faculty opportunities and limited opportunities for staff scientists and/or technical specialists to gain their own funding, there are very few opportunities for postdocs to stay in academia even if they WANT to. This leads to postdocs remaining in ostensibly "trainee" positions far longer than they are actually trainees.

Existing NIH policies, programs, or resources

- Expand the R50 mechanism A LOT, creating more permanent science positions to alleviate the scarcity issues that force postdocs to stay in bad situations.
- Stop making people pay back their training grants if they leave. This promotes abuse.
- Actually make the training sections of research grants serious parts of it. Not just "I trained such and such person, they learned X" in 3 sentences. Spot check some fraction of the RPPR "training opportunity" responses with the trainees, making it more likely the PIs will actually take them seriously and do what they say they are doing.
- Make the NRSA stipends legally-enforceable minimums, and mandatorily adjust them for cost-of-living. In order to make this not a penalty for PIs in high cost-of-living areas, move from a "pure direct cost" model of funding to a "efforts plus supplies" model of funding. This would work like this—in a grant, you specify 1 grad student FTE, 1.5 postdoc FTEs, and 0.1 PI salary FTEs, and use the NRSA stipend numbers in converting this to "direct costs" to make comparisons across grants equal. If awarded, the fraction of the grant that is salary dependent is then granted at the stipend levels for the area where the research will be performed.

Proven or promising external resources or approaches

- Have serious repercussions for PIs who abuse postdocs, and reporting mechanisms that allow them to. In the same way we have special visa classes for crime victims, visa extensions could be given to postdocs under abusive PIs so that they don't have to choose between "staying and being abused" or "leaving the country". Make a PI code of conduct with respect to trainees a requirement of an institution receiving federal grant money. Make a training commitment a requirement of an institution receiving federal grant money. Make proof of trainee abuse a permanent lifetime ban on federal grants.
- Create and/or expand efforts to offer postdoctoral training with specialized curricula aimed at creating technical specialists with the deeply-needed technical skills the research community needs. In microscopy we have a couple of excellent examples of this, one aimed at creating microscopy specialists (https://microfellows.hms.harvard.edu/) and one at bioimage analysis specialists (https://cimini-lab.broadinstitute.org/training-program), there may be others in other communities as well.
- Mandate to grant-receiving organizations that postdocs are employees and as such should be allowed to have full benefits no matter their funding source, and allowing them to unionize if they so wish. No one should lose their health insurance for getting an external fellowship.

Response 3123

Perspectives on the postdoc roles and responsibilities

Academic postdocs fill a vital role for many laboratories and are a key part of a robust biomedical research workforce. Due to their advanced training, postdocs allow principal investigators to accomplish more research at a more advanced level than if supported by pre-doctoral staff or those not on a PhD track. Postdocs directly contribute to science that is more complex and more likely to be successful.

Fundamental issues and challenges

Scientists are choosing to forgo or leave careers in academics for various reasons, including:

Finding a Position: While applying for a PhD program is often a formalized and predictable process, the process for finding an academic postdoc position is often disjointed and informal. This is often a barrier for potential applicants, as those looking for positions often must rely on network connections and word of mouth to identify potential positions.

Salary: Recently graduated PhDs can receive a much higher salary working in industry than in an academic setting, which puts academia at a financial disadvantage to industry in terms of recruitment. Additionally, some institutions consider postdocs as students, while other consider them staff.

Life transitions: Many postdocs are at a stage of life when they are choosing to start or grow their families. Taking parental and family leave can often conflict with the goals of working as a postdoc, such as the pressure of gaining additional research experience and transitioning to independence.

Differing Requirements Between Institutions: The roles and requirements of a postdoc differ between institutions, with some institutions setting forth requirements that serve as barriers and deterrents to interested applicants. For instance, some institutions require postdocs to have grant funding awarded prior to a position being offered. This practice limits postdoc training opportunities for many promising scientists.

Existing NIH policies, programs, or resources

Finding a postdoc position: NIH should consider working with and providing technical assistance to grantees, institutions, and stakeholder organizations to develop a more streamlined process for postdocs to identify open academic positions and facilitate application.

Salary: While NIH has taken steps to increase salaries in Training (T) Grants, barriers remain for principal investigators seeking to bring a postdoc onto their research team. For example, paying a postdoc a competitive salary often leaves less funding available in an overall Research Project Grant (R01) to conduct critical research. NIH should consider how to increase or supplement postdoc salaries while maintaining the overall grant funding necessary to perform critical research.

Mentoring: Postdoc training is a critical time for young investigators to develop the skills and resources for a sustainable career in academic research, and this training is most effective with robust and dedicated mentorship opportunities. NIH should explore ways to promote mentorship in its existing grants and programming.

Networking/Career Growth: NIH should consider providing dedicated travel support to junior investigators to attend conferences to learn and network. Further, NIH and other relevant stakeholders should investigate opportunities to provide postdocs with externships to introduce and prepare them for their next position in academia, industry, teaching, or other fields.

Parental and Family Leave: Many postdocs are at a stage in life when they are choosing to start or grow their families. Taking parental or other necessary family leave shortens the critical window of time for young scientists to develop their skills and transition to independence. For example, taking a 4-month parental leave shortens a 2-year postdoc position by nearly 20 percent. NIH should consider ways to provide additional support for postdocs who take parental or family leave during this time, including supporting additional time and implementing programming/mentorship opportunities directly related to supporting young investigators.

Proven or promising external resources or approaches

No response

Response 3124

Perspectives on the postdoc roles and responsibilities

Postdocs should be considered as full-time working scientists in a lab, because they are. Usage of the word "trainee" is not appropriate considering the terminal degrees, work experience and skills they have and bring to any lab they work—even if they change research fields or require training for specific methods etc. Postdocs are responsible for everything in the lab like a contractor that PI hires to complete the project at hand, they are required to work and take responsibility like it is their own lab/project which indeed is not true. Personally, I can say that I work in a rather small lab, and I work like 3 people because I am responsible for 2 projects that belongs to my PI, but I am responsible for everything, I have no training opportunities rather I am expected to train junior postdocs and techs. Therefore, I think postdoc positions should have a more strict structure that is almost if not exactly the same across institutions. The responsibilities should be strictly defined, work hours and training plans should be defined. And these have to be inspected regularly by the institution or NIH (preferrably by NIH because NIH is the ultimate responsible institution for the funding and the institution has a conflict of interest in this situation). When international postdocs are involved -like me—situation gets even worse. Considering our vulnerable situation, we cannot say no to abuse and harrassment, because there is no mechanism that protects us from losing our jobs/careers/statuses. This is the main problem in academic postdoc system, which I think NIH can change significantly. Because it has a lot of components from security of those people (visa issues and human rights) to reliability of the science done in the US and NIH is the biggest funder.

Fundamental issues and challenges

- lack of protective and regulatory measures for abuse and harassment (sexual harassment, mobbing and bullying) that ultimately leads to bad science and loss of talent in academia. (this is the main problem in academia, as I know personally and from the experiences of a lot of people I talked to throughout the US institutions). Abuse and harassment have to be stopped at all means.
- lack of structure in the postdoc positions that defines job duties
- Lack of training plans for the next step in staying in academia.
- lack of proper funding mechanisms especially for international postdocs.
- lack of funding for early career researchers.
- lack of benefits for most postdocs because they are not treated as employees.
- short visa lengths that limit freedom of the postdocs to visit their home countries and make them stuck in an unsecure environment. Should they do science or deal with visa renewals and try to make plan B's for next year?
- not competitive salaries.

Existing NIH policies, programs, or resources

My personal opinion is NIH should be more involved in inspections of labs that receives NIH funding. A postdoc funding, should have a clear training plan for the next career step in academia and that should be included in the grant proposal and maybe even reviewed by the grant committees. If the PI is not able to provide it, they should not be able to hire postdocs. To determine this NIH should be auditing, and talking to not only the PI, but also the other lab members about the projects, maybe via surveys etc. Because if you only talk to PI you never know about the misconduct going on. The PIs should be audited on their responsibilities. And one more critical thing, early career researchers should be funded more than established/senior researchers. Those people are valuable for science, but considering their ages and the scientific and technological pace we have in the world, most of the time they are not able to provide adequate mentoring (having more postdocs) or cannot keep up with the changes in cultural improvements.

Proven or promising external resources or approaches

PIs should receive a training on project management, team management, mentoring, budget and time management. Like in the industrial settings, evaluations should be done bi-directionally. PI evaluates the postdoc and the postdoc evaluates the PI. And NIH should be more involved in these evaluation processes. To be honest, I am seeing a lot of PIs have no idea about how to run a lab or a project, hence they are not fit to train people to do it. So they use bullying and harassment to keep control on everything and that results in bad science and waste of taxpayer's money.

To be more aware of the problems international postdocs face, NIH should recruit more international people or maybe international postdoc representatives

Thank you for the opportunity to share my ideas with you, and I really appreciate NIH's efforts and intentions in improving postdoc experience. I believe these inputs will result in good outcomes and I will not have to give up on my childhood dreams of being and academician.

Response 3125

Perspectives on the postdoc roles and responsibilities

A postdoctoral position to me is a means to diversify one's science portfolio for two purposes:

1. Either towards independent investigation (academic route)
2. Technique learning towards another application (industry/other route)

Many PhD graduates have requisite skills for entry positions in industry in my opinion and taking on a postdoc positions comes with considerable lost wages. I advise all graduate students to think about this carefully before jumping into a postdoc position.

Postdocs should be incredibly short positions. I advise that people know their exit plan before they start. Postdocs should be independent scientists that have a plan to receive dedicated training to accomplish their career goals. This can mean different things for different people based on these goals; training/mentoring others, teaching classes, developing a technology, learning a new field. etc. Postdocs should have iterative feedback on professional development, in addition to scientific training, with PI on at least a quarterly basis to keep them on track to leave.

However, I've observed few academic labs treat postdoc positions this way and instead recruit highly trained PhD level laborers for extended positions (>3 years) at the currently acceptable low wage. Postdocs also end up doing a lot of the managerial work of a lab, which may not be on-pathway for a postdocs career development.

Fundamental issues and challenges

As stated above, few academic labs treat postdoc positions as short duration/training focused and rather as an additional PhD. The symbiosis of academia here is skewed along a power differential, where principle investigators stand to receive more labor/data/papers from postdocs than training conferred. This skewed symbiosis is also apparent in the longer duration for PhD completion in many programs. Additionally, the large salary difference for PhD holding scientists as a postdoc versus any other competitive position is staggering. I've observed many median age PhD graduate looking forward to stable salary commiserate with experience and a workplace without stark power differentials to do things like, start a family, promote/maintain sound mental health, work with active managers/in teams, and to allow work to take

less part in their lives. Most of these talented scientists ultimately decide not to pursue a postdoc because most positions do not offer any of the aforementioned.

Other issues, most postdocs apply for extramural funding but NIH funding processes typically take at least one full year (from application submission to award received) which is hampers the ability of postdocs to keep their positions training focused and short.

Academic principle investigators (PIs) are rarely good managers and PhD graduates typically see good management from friends who leave academia.

The large power differential that exists between postdoc and PIs can make doing a postdoc absolutely miserable at worst and generally ok at best.

Existing NIH policies, programs, or resources

The NIH-F32 inclusion of child-care costs is a wonderful step in the right direction towards actively facilitating people to fulfill their non-work selves while doing excellent science. However, $2500/yr is laughably low and out of tune with the current economic state of the country. Currently, at the [redacted for anonymity], it costs $2600/MONTH for a single child to attend day care. With the F32 taking care of one month of this, the remainder the postdoc would be responsible for is $29,000 which is about half of the current NIH salary. Child-care costs are not this expensive everywhere, but even with the F32 intervention in place, the prospects of having a child while a postdoc are incredibly dim. Higher salary and higher child-care offsets would enable more people to choose postdoctoral training. Additionally, this mechanism is only afforded to postdocs that are awarded an F32 grant while a majority are not awarded this funding. Moreover, it typically requires 1 year from the time of application to notification of award leaving many to have to wait a long time to even see if they have this funding available to them. We need shorter review/acceptance of grants to allow training to happen on an meaningfully short timeline. Finally, having a child-care policy for any NIH-funding receiving institution would go a long way.

The biggest policy change of all should be that postdocs be paid commiserate with their experience.

Additionally, there should be more mechanisms to fund early investigators prior to tenure-track position. Fellows positions have been increasing and these are a wonderful means for talented scientists to gain independence quickly.

Lastly, there should be a policy to transition postdocs who have completed their predefined training into non-trainee research scientist positions (with higher pay).

Larger NIH budgets to support changes.

Proven or promising external resources or approaches

Private institutions and industry pay higher salary for postdocs, do this.

Require PIs to undergo inclusive mentoring and managing training. I’ve done this training as part of my transition toward a tenure-track research/teaching professor and it makes a big difference.

Formalize pre-determined training plans for postdoc positions and a plan to transition to research scientist. Include desired postdoc length on job postings and take data on whether institutions/labs have been able to meet these pre-determined timelines.

Promote secondary mentors for postdocs that do not have a vested stake in the science.

Promote institutions to develop professional training courses and formalize this into postdoc positions.

Response 3126

Perspectives on the postdoc roles and responsibilities

I see it as a stepping stone to a permanent role in either academia or industry. Though I would have preferred it to be a more permanent and stable position, given a PhD student spends close to 10 years being financially unstable.

I also view the postdoc as an opportunity to publish more papers and develop new skills.

Fundamental issues and challenges

Low pay is a major factor, cost of living has been going up salaries of postdoc has not increased. It is not a permanent position, and with a low pay it diminishes the postdoc's quality of life. Many postdocs are in their late 20s or early thirties, a time when people get married or have kids. As a postdoc with low pay, being always considered as a "temp" worker it is not possible to pursue the many other meaningful objectives of life. As an international postdoc, I find it is very frustrating that all institutions in the US do not provide Green Card sponsorship to postdocs, makes us feel like workers who can be disposed off and not worth much. Lastly like all professions Postdocs are overworked but more importantly criminally underpaid.

Existing NIH policies, programs, or resources

I dont have clue of what to say here as I was not aware these resources, neither my Postdoc mentor or PhD advisor told me anything. Everyone looks out for themselves , long gone are the days where your PhD Advisor or Postdoc Advisor was invested in your professional growth.

Proven or promising external resources or approaches

To restate the key points

1. Increase pay to meet the rising cost of living.
2. Green Card support for international postdoc.
3. Institutions should make an effort to absorbing postdocs as permanent employees instead of getting hard work done at cheap pay.
4. Create funding programs for international postdocs and raise awareness of these programs, especially the existing ones.

Response 3127

Perspectives on the postdoc roles and responsibilities

As a postdoctoral fellow, I often find it hard to manage my different "hats." I often hear I need to prioritize my own projects or my own professional development, but that is often mismatched with the fact that my PI needs someone to help them with their project and maintaining their lab. I often take on the roles of a lab manager/technician because I can learn a new skill from that new role, but it comes at the cost of my own research project. I find the power my mentor has over me inhibits me from speaking up for myself and saying no to new tasks. It is very difficult to say no to someone who writes your letter of support. Even though my contract says I am legally obligated to work only 40 hours per week, I feel that if I don't at least work 45-50 hours a week, my mentor will be disappointed with my progress. This negatively affects my quality of life, as I find my mental health deteriorates (e.g., always worried about impressing my mentor) and have less time to spend on hobbies or with loved ones. I love working in the academic research setting, which often means I willingly work extra hours to finish an exciting experiment but feel this shouldn't be a requirement but instead a choice the postdoc can make on their own. I hope that the NIH can set clearer guidelines for mentors and postdocs in terms of working hours, research output, lab management, etc. Additionally, if there was a mechanism in place to track mentor/mentee expectations in award applications/reviews that might lead to a better respect of workers' rights.

Fundamental issues and challenges

One reason I chose this institute over another is due to better benefits. At my current employer, my husband is able to go back to school for a fraction of the cost. This helped offset the low salary I am paid as a postdoc, vs. what I could earn in other fields with a PhD. It is still very challenging to know that I do not qualify for retirement benefits at my institute, which is so critical as I might be in this role for ~5 years. That is a lot of time without help saving for retirement, especially after being in school most of my life. Recently I applied for the F32 award, yet I was afraid to be awarded the fellowship because it would mean I would lose my dental and health insurance benefits. Because my husband is a student, this would be a horribly stressful decision for our family. I don't think any postdoc should have to weigh the cost of paying a high premium on Marketplace vs. risking going without health insurance and therefore good quality health care. I wouldn't be surprised if this factor pushes many candidates away from academia.

Existing NIH policies, programs, or resources

The most important change NIH could make is to change the language in the F32 contracts that currently prevents institutions from hiring postdocs as employees. This change would allow postdocs to ultimately receive benefits, likely improving outcomes related to our well-being. As mentioned above, being awarded the prestigious F32 should not come at the cost of good quality health care. I want to progress towards an independent career in academia, but I am not sure it is worth the cost of my family's health. Given how much funding NIH allocates to public health, it surprises me that this language still persists. I think other funding sources (e.g., NSF) would follow suit if NIH made the change to allow F32 fellows to become employees of an institution. Additionally, the F32 is an excellent source of funding for salary and travel funds, but in order to submit a competitive K99/R00 application you must have a substantial amount of preliminary data. The NIH could help by creating smaller grant funds (~$25,000) for postdoctoral fellows to specifically obtain pilot data for their future independent careers. This might also lead to better working conditions for the postdoc, as they would not by completely reliant on the PI's funding and therefore have a greater say in their experimental tasks.

Proven or promising external resources or approaches

A program that works well for postdocs at my institution is a specifically designed year-long fellowship affiliated with our campus CIRTL network. They designed the program to accommodate the high research demands postdocs are under, while still learning teaching pedagogy and gaining teaching experience by co-teaching one semester. This program has helped me focus on my own professional development while not fully compromising my research progress. Additionally, I find that having benefits and being treated like any staff member at my institution would make me feel my best at work.

Response 3128

Perspectives on the postdoc roles and responsibilities

It gives me a platform to build up my research knowledge and get expertise in the relevant area

Fundamental issues and challenges

Salary is very low.

Existing NIH policies, programs, or resources

Salary—follow the government pay scale that includes cost-of-living i.e. GS-11 scale (see federalpay.org/gs/calculator). NIH needs to be a leader in this space, as institutions follow its lead.

Proven or promising external resources or approaches

No response

Response 3130

Perspectives on the postdoc roles and responsibilities

This response has been prepared by a subset of the [redacted for anonymity]. The [redacted for anonymity] supports the position that the quality of scientific research is a direct result of the quality of the workforce and that employer-sponsored childcare and related support systems are critical to attract and maintain a highly efficient and diverse workforce. Voting members of the [redacted for anonymity] are current [redacted for anonymity] federal employees, and several are former postdocs.

An academic postdoc is a temporary, mentored research position that includes significant training (particularly in the first 2 years of any postdoctoral position). A postdoc should receive training/mentoring in:

1. Technical research skills (techniques, research design) that complement the postdoc's existing skill set
2. Grant and manuscript writing
3. Lab management and mentoring
4. Professional development skills including networking, time management, leadership skills, and work-life balance.

Fundamental issues and challenges

Childcare costs vary widely across the country. The US Department of Labor estimates 2022 center-based infant care had a median annual cost of $8,310 in low-population counties and $17,171 in high population counties (2). Many U.S. counties have median, center-based, infant care costs well over $20,000/year with costs in Arlington County, Virginia exceeding $27,000 in 2022. These costs have a direct impact on workforce participation: a 10% decrease in the cost of childcare leads to a 0.5 to 2.5% increase in maternal employment, and the effect is even stronger for mothers with lower incomes (1).

Most postdocs are between 30 and 34 years old and many experience challenges maintaining work/life balance. Postdocs report pressure to conceal pregnancies, not request accommodations, and not utilize family leave (3). To foster a diverse and inclusive postdoctoral workforce, NIH should financially support postdocs' childcare needs and continue to encourage institutional policies (e.g., leave, telework, meetings between 10am and 4pm) to support postdocs with caregiving responsibilities.

1. US Department of Commerce, NIST, CHIPS for America Fact Sheet
2. US Department of Labor National Database of Childcare Prices
3. McConnell et al., (2018) Research: United States National Postdoc Survey results and the interaction of gender, career choice and mentor impact. eLife

Existing NIH policies, programs, or resources

NIH has several family-friendly policies for recipient institutions to help foster family-friendly environments for the NIH-supported workforce (1).

The [redacted for anonymity] is supportive of these policies and considers them to be a good start. However, we would also note that these policies are complex and have gaps in coverage. For instance, the childcare cost support only applies to NRSA-supported fellows. NIH intramural postdocs and postdocs supported on other NIH awards (i.e., R01s) are not eligible for these same benefits. NIH, via NOT-OD-21-074 and NOT-OD-21-177, has recently provided up to $2,500 in annual childcare costs for NRSA trainees. The complexities of this policy led NIH to publish a 2000 word, 25 item, FAQ. The [redacted for anonymity] would contend that the current approach is overly complex and carries hidden administrative costs. Furthermore, there is a childcare subsidy program for NIH federal employees and NIH fellows deserve similar support, which would also help with recruitment and retainment efforts.

The [redacted for anonymity] suggests that NIH work to reduce the complexity of the current policies and to make the policies uniformly supportive of parents across all categories of postdocs.

1 NIH Family-Friendly Initiatives https://grants.nih.gov/grants/policy/nih-family-friendly-initiative.htm

Proven or promising external resources or approaches

The [redacted for anonymity] supports continuing analyses of the impact of family friendly policies on extramural and intramural postdocs.

The [redacted for anonymity] endorses many policies to improve the recruitment, training, working environment, mentoring, and job satisfaction of postdocs. Some of these policies are in place at NIH, but not required in the broader academic environment. The [redacted for anonymity] continues to encourage NIH to endorse and/or require these policies.

- Paid leave for birth/adoption of a child.
- Flexible working hours, options for telework, dependent care leave, and other flexibilites.
- Meetings during core hours (10am-4pm) to allow for parents to maintain their schedules while being full participants in the lab.
- Organize parental support groups so parents can share resources and best practices within their local academic environment or location.
- Mental health support for postdocs.
- Career development trainings should include sessions on maintaining work-life balance.
- Training for PI/Mentors on the importance of supporting trainee work/life balance.
- Childcare cost support, including supplemental income. This could be weighted by local childcare pricing.
- Institutionally supported childcare facilities with availability for postdocs and other trainees.
- Use of exit surveys to determine the impact of family friendly policies on postdocs.

Response 3131

Perspectives on the postdoc roles and responsibilities

Postdoctoral position is a training process where the graduate student is allowed to work independently with little guidance/support from the PI or other senior lab members towards the goal of the project(s). As per my understanding, this position is a path to a future academic career openings in reputed institutions. Postdoc position gives us a knowledge about how the grants should be written and what are the challenges PI/Co-PI face during the overall process. Having an output in the form of good high impact publication(s) is a primary objective of every fellow which helps in acquiring a suitable position in future.

Fundamental issues and challenges

Nowadays, the cost of living is really high, and by looking at the basic salary structure of a postdoc, it is very difficult to survive financially.

Existing NIH policies, programs, or resources

The salary structure should be revised appropriately by taking into consideration all important factors from students point of view.

Proven or promising external resources or approaches

Response 3132

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Low salary that does not reflect current cost of living and the substantial amount of training a postdoc has receive before starting a postdoc.

Existing NIH policies, programs, or resources

Significantly increase the NRSA stipend scale. It is taken by institutions as a salary ceiling for postdocs.

Proven or promising external resources or approaches

No response

Response 3133

Perspectives on the postdoc roles and responsibilities

I don't believe that trainee is an accurate term for a postdoc beyond the first few months. There is a difference between trainee and mentee, and postdocs are no more trainees than any person in any new job. This description misrepresents the nature of their experience; the reality is they are experts in their fields. Consider "Young Investigator" . Additionally, many PIs are hiring cheap and highly skilled labor, not "trainees" .

Postdocs are more mature than graduate students, with an increasing number of life responsibilities: becoming parents, desire for housing, retirement etc. Postdoc comes with financial sacrifice and reduced benefits, and great risk. The reduced compensation is reasonable only as long as it is paired with corresponding experience that sets up a successful career transition which can result in significant opportunity cost. Benefits like retirement and childcare support are more important for those with lack of generational wealth. Faculty positions (i.e. the ostensible end goal of a postdoc) is increasingly only achievable for people who can afford to stay in these underpaid positions for so long (or trapped by visa circumstance), rather than being truly meritocratic. Benefit policies are also wildly inconsistent across institutions.

Fundamental issues and challenges

1. Increased stipends will improve recruitment and retention. Simple. Salary is the defining issue. Concerns about saving for housing, retirement etc. reach a critical threshold and squeezes many postdocs out of academia. There needs to be an agreed upon base, accounting for local cost of living. With stipulated minimums on R grants and annual increases and benefits. Consider "family supplements" and "international supplements" to financially support those with additional financial burdens. Increased and equal maternal/paternal benefits/time off (to avoid gender bias), with extensions to grants. Private institutions are raising their salaries at rates that public institutions cannot match, creating a disturbing inequity across institutions.
2. Lack of grant/funding opportunities. Especially for internationals (who represent the majority of postdocs).
3. Lack of benefits. Definition of postdocs as temporary employees restricts their benefit entitlements within universities.
4. Lack of structure to assist postdocs in preparation for their post-postdoc careers. An experience that also formally allows (with % of time) for career exploration, industry skill development, personal and soft skills.
5. High-stress environments with poor acceptance of work-life balance. There is a culture of trickle-down misery. For long-term sustainability, this younger generation needs to be exposed to and value work-life balance. Acknowledging postdoc burnout, NIH could stipulate 20 days' paid vacation per year and vacation accruals; this would significantly improve quality of life and force institutions to amend their postdoc policies.
6. Enormous amounts of data that are unreasonable to obtain in the span a short postdoc.
7. Variable quality in mentorship. NIH could outline expectations for universal postdoc experience—20 days' vacation, at least one professional development/conference event per year, 1 grant per year, community engagement, 10% of time reserved for development away from the bench.

Existing NIH policies, programs, or resources

Add structure to mentorship. As it stands, success is far too dependent on interpersonal relationships with precarious (and overstretched) PI/mentors, with virtually no oversight or accountability. Consider mentorship committees and postdoc cohorts. This would be particularly beneficial for international fellows

who have to navigate many hurdles and are busy acclimating to the US system; these simply won't have the confidence to seek additional mentorship. Formalize IDPs and require that they be submitted to NIH with progress reports, which would at least force some interaction between mentor/PI.

Restructure NIH grant opportunities to create smaller-scale, pilot-style, grants to support postdocs' hypotheses, production of preliminary data, growth, and independence. Open more grants to internationals and replace F-32s with additional Ks. International supplements, similar to diversity supplements could help offset inequity and would provide grant/cv opportunities for internationals. All postdocs should be required to submit grants to ensure they receive grant writing experience. Provide formal education/training for internationals about the US grant system and review processes.

Formalize "Postdoc to PI" training modules, to be run through institutions (similar to RCR) that have a threshold number of postdocs (with virtual NIH trainings for smaller institutions). E.g., in mentorship, grant writing, lab management, budgeting, staffing etc. Allocate money to postdoc offices to implement such training. A major deficit in the academic model is that faculty are acting as managers without ever receiving meaningful management training. Creation of strong, professional online hubs that prevent duplication of resources across universities.

Overall culture of postdoc dissatisfaction will remain if NIH guidelines are not implemented at institutional level. It might even metastasize if two classes of postdocs emerge—one on 60k+ NIH salaries and others on meagre institutional minimums.

Proven or promising external resources or approaches

Most postdocs don't stay in academia; this is a fact. The postdoc experience/training needs to evolve to accept this and realistically prepare postdocs for post-postdoc careers. If we can shift the perception that a postdoc is only for an academic career, and provide much stronger support for alternative career training, this will reduce the anxiety many postdocs share about planning their next steps and encourage more entrants.

Structure experience into multi-track postdocs. All postdocs spend one year as "trainee" , with defined exposure to academic and non-academic careers. Following this, choice of either an "industry track" or "young investigator track" (and potentially "teaching/communication" track) postdocs. With modules and expectations clearly outlined for each. Make very clear to PIs that there is an expectation that they should support extracurricular activities.

Establish postdoc cohorts. Postdocs on-boarded in quarterly increments could belong to a "cohort" within departments for co-mentorship and peer support to reduce sense of isolation.

Creation of a late-stage funding phase to help postdocs transition. Creation of formal, respected, staff scientist roles. Recognize that many postdocs would continue to do science in academic settings, off tenure track, if such roles existed and were financially supported. If postdoctoral researchers play a vital role in scientific research in the US, create a permanent workforce of academic researchers at this level.

Value of a postdoc is unclear. Compel universities to track postdoc outcomes, with development of common language for descriptions. Provide better support for Internships, startups, commercialization opportunities and allow for practical workforce development.

Lobby hard to ease burden of visas on internationals. US prides itself on innovation and should make efforts to retain the highly skilled talent that has been poached from abroad. Loan repayment program. Broadening the LRP program could be an enticing way to encourage graduate students to enter postdocs.

Response 3134

Perspectives on the postdoc roles and responsibilities

[redacted for anonymity], with input from faculty and postdocs.

Postdocs are the backbone in academic research communities. Having talented postdocs to lead projects and perform quality lab tasks are a critical factor for productive research and discovery. However, currently, it is difficult for our faculty members at [redacted for anonymity] to find postdocs who fulfill the minimum requirement of a postdoc. Most need extensive training to become useful and independent researchers.

The NPA and NIH jointly developed the definition of a postdoc. [redacted for anonymity] uses that definition in our postdoc policy. The training and preparation for their next career step needs to include both scientific/technical skills and professional development transferable skills, e.g. grant writing, science communication, management, leadership, teaching, and career exploration.

The NPA's 2023 Postdoctoral Barriers to Success reported most postdocs (81.7%) are negatively affected by a lack of professional development opportunities. All institutions need to provide training in the professional development transferable skills. NIH should provide tools and funding to assist academic institutions in providing this training. A percentage of indirects on all NIH grants that support postdocs could go to fund career and professional development programs and offices. Postdocs on any type of NIH grant should have protected time (~15% effort) to devote to their professional development. The NIH could require postdocs to have a certain number of professional development activities annually, similar to CMEs, to stay on an NIH grant. Postdocs should have funds to attend at least one scientific or professional development conference annually. The requirement of protected time and annual professional development will assist postdocs, mentors, and postdoc office leaders in creating a climate for success.

To keep equity among all postdocs, the NIH should adhere to a consistent universal definition of a "postdoc" regardless of funding mechanism.

Fundamental issues and challenges

Postdocs should be offered a competitive salary commensurate with local cost of living and with local competing non-academic employers. While not necessarily needing to match industry salaries due to the additional benefits of professional development available in an academic environment, one [redacted for anonymity] faculty member suggested determining the average industry starting salary for PhD recipients and then subtract $20-30k to offset costs of the "training" done in academia.

To provide a competitive salary, the budgets for NIH training and research grants need to be increased. The NIH has increased postdoc salaries annually, but the standard budgets for R01 grants haven't been increased for two decades. As a result, PIs can hire fewer postdocs.

NIH should require a percentage of indirects on all NIH grants supporting postdocs to provide postdoctoral offices (or offices with similar oversight) with increased resources to foster stronger postdoctoral communities with healthier, sustainable cultures.

International postdocs comprise 50-75% of the postdoc population in the US. At [redacted for anonymity], the postdoc population is 70% international. International postdocs face unique challenges; the NPA's 2023 Postdoctoral Barriers to Success report shows 86% were negatively impacted by cultural transitions into the U.S. NIH should work with the State Department and USCIS to accelerate and simplify the visa and immigration process for these world-class, early-career researchers.

The NIH should track postdoc career outcomes through a national database, coordinated and funded at the federal level. It should be publicly available and should link to faculty grants. Tracking outcomes is resource-intensive and most institutions lack these resources.

Many PIs lack formal mentorship training. Likewise, many postdocs lack understanding of how to succeed as mentees. To address this gap, NIH should institute reportable grant requirements for mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding.

Existing NIH policies, programs, or resources

The NIH has raised annually the NRSA postdoc pay scale, which is used by many institutions as their salary minimums. However, the standard budgets for grants like R01s haven't been increased for two decades. The NRSA salary scales need to be increased more and the postdoc salaries on research grants need to be increased accordingly. An increase in postdoc salaries along with an increase in research grant funding for postdocs was the top recommendation by [redacted for anonymity] postdocs and faculty members.

Many postdocs also have added financial burdens, such as undergraduate student loans that do not qualify for deferment while a postdoc. Increased salaries will help to allay that burden. One postdoc also mentioned having better accessibility to the NIH loan repayment plan. They suggested that it needed better advertising and a less extensive application process.

With the majority of postdocs in their childbearing years, parental leave is a much needed benefit. The current policy needs to be reviewed with an eye toward increasing the NIH NRSA stipend support for maternity leave to 10-12 weeks as well as allowing for a more inclusive parental leave.

The majority of the US postdoctoral workforce is international. However, there are fewer funding opportunities for international postdocs. NIH should allow non-citizens to apply for F grants or create a similar funding opportunity for them. This will help with funding the postdoc in their current laboratory, but will also allow the postdoc to practice grant writing and show their fundability when applying for faculty positions.

NIH has recently shortened the cumulative years allowed for NRSA postdoc support. Given the increasingly complex and interdisciplinary nature of research, one [redacted for anonymity] faculty member recommended to increase this limit to permit additional training and completion of published studies.

Proven or promising external resources or approaches

Seven institutions in Philadelphia set aside their individual needs to host a virtual postdoctoral recruitment event called the Philadelphia Postdoctoral Preview Event, www.Philadelphiapostdocs.com. This successful recruitment event with over 100 prospective postdocs brought the postdoc office administrators closer together to share other programming and opportunities throughout the year for the benefit of their postdocs.

The Postdoc Academy, https://www.postdocacademy.org/, is providing a cohort-based, online curriculum to teach postdocs how to be successful in their positions that can be supplemented with in-person local discussion groups.

NIH's OITE has been providing highly valuable, virtual programming on resiliency and mental health wellness, https://www.training.nih.gov/, both intramurally and extramurally to students, postdocs, faculty, staff, and administrators. More of this programming is needed at every institution.

I would like to thank the NIH for the platform to share a re-imagined vision for postdoctoral training in the biomedical sciences. I applaud NIH's policies and programs that have progressed postdoc training to date.

Response 3135

Perspectives on the postdoc roles and responsibilities

My understanding is that postdoc positions were first created several decades ago as the number of scientists graduating with PhDs increased, but the number of open faculty positions remained stagnant. These overflow of recent graduates needed something to do, and the postdoc was invented. In theory, the role of a postdoc is to acquire additional skills and improve your CV before applying for faculty positions. In practice, postdocs often take on the role of senior scientists in a lab. They do most of the hands-on training of graduate students and they are typically the first author for most of the manuscripts in the lab. In most labs, postdocs are the most experienced scientists who are actually "doing science." The PI or additional faculty in the lab might have more experience, but they often take on more managerial roles. In my opinion, postdocs are some of the most essential workers in the lab, and can often produce science most efficiently. I do not agree with the notion that a postdoc is a "training position."

In recent years, I've seen industry companies advertise "postdoctoral researcher" positions. My understanding of these industry positions is that they are a good entry-level role for folks graduating with a PhD. I imagine that the industry postdocs have a similar workload and job description as academic postdocs, though industry postdocs often have substantially larger salaries.

Fundamental issues and challenges

1. The salary of an academic postdoc is too low, especially compared to industry roles.
2. Low PhD stipends leave recent graduates financially strained. While they might like the idea of an academic postdoc, they have fallen so far behind their peers financially during their PhD that a low-paying postdoc seems untenable.
3. Many postdocs are hoping to pursue future faculty positions. I know several postdocs who left academia because they either couldn't get a faculty job or assumed they wouldn't be able to get a faculty job when they finished their postdoc.
4. There are not many opportunities to stay in academia after the postdoc without pursuing a tenure-track faculty position. I believe many postdocs would be excited to continue working under their current PI as a research professor, senior/staff scientist, etc. but there is not a clear funding mechanism for this in academia. This sort of position seems to be more common in industry.
5. I've often been advised to move across the country every time I take a new step in my academic career (e.g. graduating a PhD and finding a postdoc.) I've spent my entire career in Boston because my family and friends are here—I wouldn't be able to do science well without this valuable support system. But I'm often told that I'm missing out on valuable experience by not uplifting my life every 2-4 years and moving across the country. I'd like to see more opportunities for scientists to find geographic stability in academia.

Existing NIH policies, programs, or resources

1. Allow PIs to supplement postdoc salaries using their other federal grants (e.g. use an R01 to supplement a postdoc's NRSA funding.)
2. Increase the NRSA stipend minima, which is the standard by which most labs set postdoc pay
3. Vary the NRSA stipend regionally to account for cost of living differences (e.g. New York postdocs require higher pay than Kansas City postdocs). Many other federal agencies adjust salaries/pay scales for cost of living by zip code
4. Consider eliminating the postdoctoral NRSA (F32) program altogether and reallocate the funding towards higher-paying K awards for postdocs. After all, postdocs are not trainees in a majority of cases and should not be forced to compete for low-paying fellowships.
5. Consider expanding opportunities like the K99/R00 which provides postdocs with funding to pursue a faculty position. In general, consider expanding opportunities for PhD students and postdocs to pursue faculty positions.
6. Consider funding mechanisms for a "senior/staff scientist" role. Not every postdoc wants to become a PI or a tenure-track professor. However, research professor positions are hard to come by, and postdoc positions are typically limited to 5 years. Institutions might consider allowing folks to remain a postdoc indefinitely, or create new roles such as "Instructor" or "Staff Scientist" that allow postdocs to get promoted within the same institution and increase their salary.
7. The NIH should do more to encourage institutions to promote within. Postdocs shouldn't be forced to move halfway across the country to find a faculty position.

Proven or promising external resources or approaches

1. Increased salaries have helped industry companies recruit and retain top scientists
2. Most other government agencies adjust their pay scales by geographic location/cost of living.
3. Several research hospitals and universities ([redacted for anonymity]) have created "Instructor" positions. These often give postdocs a "ladder" to climb where they can be promoted at their current institution and increase their salary while they are still working towards attaining a faculty position.
4. K awards are very popular among postdocs as a way to make a higher salary than the NRSA standard. Consider expanding funding K awards and eliminating the NRSA mechanism. Postdocs are not "trainees"

Response 3136

Perspectives on the postdoc roles and responsibilities

The postdoc position is a time to establish independence on the way to apply for academic PI positions. However, it was also the next step after graduate school for many who are still unsure of their career path or an unfortunate position for those that want to stay in academia but not run a lab since there are few staff scientist positions.

Fundamental issues and challenges

Poor salary, no benefits at many places, not considered employees by many universities, high student loans. Academics cannot compete with compensation that industry can. I am going to loose a very talented postdoc to industry because she cannot afford to live in a decent apartment that doesn't have numerous leaks in the ceiling. The cost of living has increased significantly and postdoc compensation has not kept up. No retirement means they are significantly behind their peers when planning for the future. Add family obligations (cost, time) and being a postdoc is not a position in which many people wish to invest.

Existing NIH policies, programs, or resources

Higher postdoc salary guidelines, more money for R01s to pay for postdocs, the ability to supplement postdoc salary or benefits, rules to indicate postdocs are employees. Everything comes down to compensation. Expand LRP awards for postdocs.

Proven or promising external resources or approaches

HHMI increased minimum postdoc salary to 70K. LRP awards can help offset lower salary by paying student loans (I received one and it helped immensely. It is one of the reasons I am still in academia).

Response 3137

Perspectives on the postdoc roles and responsibilities

Postdocs are working professionals, in Ph.D. required positions, not trainees. Postdocs are given similar expectations to that of entry-level researchers in industrial positions that require Ph.D.s, and are expected to hit the ground running.

Fundamental issues and challenges

Starting as a postdoc often requires a cross-country move, and paying multiple months of rent up front. When I moved to boston, I had to pay four months rent up front which was 8000 dollars. This is a huge barrier for members of historically marginalized groups, and anyone who doesn't have wealth. Also, doing a postdoc almost always means making them choose between prioritizing their job or their family. When I moved to Boston, there wasn't a way that my wife could leave her industry position to follow me for a 2 year temporary position that paid under the low-income level for the region. To spend time with her, I have to do an extra four hour drive at the end and beginning of each week. Postdoc parents also struggle a lot, and often don't have subsidized child care, or access to affordable family health plans.

Existing NIH policies, programs, or resources

Add a cost of living adjustment based on the GS-11 scale which is already used for other similar governmental scientist positions, require that universities provide 16 weeks maternity/paternity leave to accept NIH funds, recognize that having to worry about whether you can afford to eat next month severely decreases the ability of a postdoc to do their job and thus, NIH funds would actually be better spent if postdocs were paid a livable wage. I won a major, national dissertation award when I graduated from grad school—but my experience in my postdoc has had me strongly considering leaving academia.

Proven or promising external resources or approaches

No response

Response 3138

Perspectives on the postdoc roles and responsibilities

Postdocs are highly trained, highly skilled scientists that drive the bulk of scientific research worldwide. They are critical independent contributors to their labs by leveraging their expertise and perspectives from their PhD training to rapidly start and progress on independent projects. Ideally they gain additional technical, scientific, and management training during this time from their postdoc adviser and colleagues, enabling them to start their own labs successfully, but in reality this training is often self-driven.

Fundamental issues and challenges

Salary. The "trainee" title is used in practice as an excuse to underpay postdocs. Many institutions use the NIH salary minimum as a maximum, or put restrictions in place preventing PIs from easily paying more than the minimum. The NIH salary minimum is well below a sustainable living wage in most cities. Salaries do not keep pace with inflation, housing costs, or childcare costs. Postdoc fellowships occur at a time in life when many are trying to start families and save for their future, a burden felt especially strongly by women. The lack of pay is the primary reason for the mass exodus of postdocs to industry positions where they can receive a comfortable salary, benefits, and promotion opportunities.

Volatile benefits:

1. Some universities punish trainees for winning fellowships by reducing the trainee's salary to the value of the award, rather than continuing to pay them at previous levels, or by removing healthcare or retirement benefits. Some universities take the institutional allowance and put it towards university expenses like health insurance without input from the trainee.
2. Benefits are further restricted through the "trainee" status. As simultaneous students and employees, postdocs denied benefits like childcare and retirement benefits granted to other staff employees their age.

Lack of training and mentorship. Postdocs are called trainees but simultaneously expected to be independent, and therefore receive less help and mentorship from their advisor than as a student, even if they've switched fields or are learning new techniques. Further, a postdoc's success and livelihood relies almost entirely on their advisor, with little to no oversight of this dynamic if it becomes toxic.

Existing NIH policies, programs, or resources

Replace the postdoc title with a staff scientist position, providing appropriate pay and benefits. Salary would grow with experience, starting higher than current postdoctoral salary levels ($70k minimum) and with the opportunity to seek promotion. This role is still compatible with training. The staff scientist role would provide a career option for scientists who wish to remain in academia without running their own lab. These scientists would become pillars of their lab's knowledge and output, accompanied with the credit attribution to recognize their independent contributions, including co-PI title on grant applications and corresponding authorship on papers.

Increase salary minimums to be location-based to account for cost-of-living differences. This would require an increase in the size of the modular budget, which has lagged far behind inflation. The NIH could further limit the total funds or grants that can be held by a single lab in order to make larger modular budgets more widely available.

Protect existing pay by adding requirements to NIH postdoc fellowships that if funded, the university cannot reduce the trainee's salary or existing benefits, and the university must reserve the institutional allowance for research costs at the discretion of the trainee.

Compile training resources to supplement what is provided by individual PIs. Create a platform to disseminate workshops and courses on grant writing, mentorship, teaching, budget management, hiring, etc.

Return the K99 eligibility window to 5 or 6 years. The growing duration of postdoc appointments cannot be solved by applying arbitrary deadlines and increased financial pressure to postdocs. The current eligibility window punishes postdocs for pursuing creative or risky scientific projects. Further the removal of the K99 extension for the COVID-19 pandemic particularly punished postdocs who were the most vulnerable and at the earliest stages of data collection when the pandemic hit.

Proven or promising external resources or approaches

No response

Response 3139

Perspectives on the postdoc roles and responsibilities

A postdoctoral position should prepare postdocs to move to a permanent position, either by moving to a research position in industry or to a Faculty job. A postdoc should be able to lead their own research project, participate in the training of undergrads and grad students, and learn how to apply for funding, while still receiving training and mentoring from a PI.

Fundamental issues and challenges

The cost of living in the USA has risen considerably, especially in areas such as the Bay Area, where the cost of rent, food, transportation, and medical care exceeds the salary of postdocs. This is a greater burden for postdocs with children who also have to pay for childcare. Many postdocs end up in debt, and some even leave academia due to the financial burden. International postdocs face even more challenges as their visas may prohibit their spouses from working, and they have to support their families with a single salary. Single postdocs often have to live in unsafe conditions and far away from campus. These conditions can affect their performance, leading to fewer opportunities and grants, and ultimately ending their academic careers. The situation is even worse for postdocs from underprivileged backgrounds, and the ones who succeed are those with generational wealth or high-earning partners.

Faculty members often cite the minimum NIH salary as a reason not to increase postdoc salaries, claiming that their grants do not allow for it. NIH should increase the postdoc minimum salary, and make it dependent on geographical location, with regular updates to keep up with inflation. It is disheartening to think that success as a PI depends on exploiting the people working for them.

Postdocs are not asking for luxuries, just a salary that covers basic needs such as food, shelter, and transportation. Retention of postdocs may be affected due to the low likelihood of getting a tenure-track job, leading to feelings of hopelessness. It may be necessary to rethink how science is conducted in the country, perhaps by creating more staff scientist positions or alternative paths to the tenure track.

Existing NIH policies, programs, or resources

For international postdocs, there are not many opportunities available to complete postdoc training. The only program I am aware of is the K99 fellowship. However, a successful K99 applicant is one that could already be going to the job market. For international postdocs, it can be difficult to figure out how the system works, and when they finally figure it out, it could be too late to complete a successful application. If PIs recruit international postdocs, they should provide them with all the tools necessary to succeed. Another limitation is unplanned live events, like sickness or having to take care of relatives. There should be clear guidelines about how to deal with such situations when dealing with eligibility to apply for grants.

Proven or promising external resources or approaches

No response

Response 3140

Perspectives on the postdoc roles and responsibilities

The National Postdoctoral Association (NPA) defines a postdoctoral scholar (or fellow) as "an individual holding a doctoral degree who is engaged in a temporary period of mentored research and/or scholarly training for the purpose of acquiring the professional skills needed to pursue a career path of his or her choosing" . The postdoctoral period is meant to be a short-term opportunity (no more than three to five years) for biomedical researchers to gain valuable research experience in preparation for their chosen field of study, as well as develop their communication, leadership, and additional professional skills in preparation for a more permanent position in research-related careers or science-related non-research careers in various sectors, including academia, the private sector, government and the nonprofit sector. Though this phase is still a mentored experience, the postdoctoral phase also allows individuals the chance to demonstrate that they can operate as independent researchers with minimal supervision from their advisor, whose main role is to provide adequate training and mentoring in preparation for the next step of

their postdoctoral fellow's career. This training period offers postdoctoral fellows opportunities to broaden their scientific skills and make new connections, preparing them for their next career stage and putting them in the best position to succeed.

Fundamental issues and challenges

Postdoctoral fellows are the backbone of biomedical research [redacted for anonymity] playing an essential role in research and discovery as they prepare to launch their own careers. However, despite their critical impact on biomedical research and that performing a postdoctoral fellowship is a near-requisite step of many career paths, the postdoctoral fellowship can be a challenging time for young scientists. This can be attributed to many competing priorities and conflicts:

- Low stipends (makes it difficult to support themselves or family)
- Lack of benefits (health care, retirement, leave)
- Competing research priorities (their own vs. their mentor)
- Skill acquisition needed for the next stage of career vs. research priorities
- Publication pressures (need to publish in high-impact journals, meeting large data requirements)
- Visa issues for visiting fellows
- Mental health issues such as anxiety and depression due to poor mentoring, unbalanced power dynamics, and hostile work environments.

Many of these issues disproportionately affect women, people of color, LGTBQA+ scientists, and scientists with disabilities. For example, low stipends often force women to choose between their careers and starting or raising a family. Scientists of color and LGTBQA+ scientists, who may already be impacted by low mental health, can have that exacerbated by a lack of inclusion in labs.

Existing NIH policies, programs, or resources

The NIH IRP is well-equipped to handle many challenges. After a recent examination of the costs of living for NIH postdocs, the NIH IRP has taken steps to increase stipends significantly to match the NCI pay scale. As many top research institutions are within some of the more expensive areas of the U.S., NIH Extramural in partnership with universities could enact policies that would raise postdoctoral stipends, perhaps through location pay.

The NIH OITE and the IC training offices provide resources for career planning. They also provide provided specializing training on a variety of skill sets needed for career success. Training offices leverage alumni contacts working in fields related to their scientific mission to provide valuable networks. The NIH should reflect on funding career education for all postdoctoral fellows in order to provide an experience that can mirror what is available at the NIH IRP. In terms of opportunities for postdoctoral fellows to learn skills outside of their labs, the NIH IRP provides a national model.

The OITE provide wellness services, including mental health counseling. OITE also provides resilience training to assist fellows in building their mental health. In particular, their "Becoming a Resilient Scientist" (BRS) workshop series has equipped intramural postdoctoral fellows with the critical skills needed to cope with adversity in both their lives, covering such topics as self-advocacy, dealing with imposter fears, and helping to maximize their mentoring relationships. Evaluation of the program showed that participants that attended most of the BRS sessions showed a significant increase in resilience, as measured by a validated resilience scale. This in turn led to significant increases on fellows' ability to deal with stressful situations and reductions in depression and perceived stress.

Proven or promising external resources or approaches

Coordinated postdoctoral programs can offer additional support to postdoctoral fellows in the areas of mentorship, training navigation, and others. For example, the NCI's Intramural Continuing Umbrella of Research Experiences (iCURE) program supports mentored research experiences for qualified scientists from diverse backgrounds in the multidisciplinary research environment of the NCI. ICURE is an extension of the highly successful NCI CRCHD Continuing Umbrella of Research Experiences (CURE) program which supports career progress of its scholars towards research independence, as well as fosters and sustains diversity in the biomedical research pipeline. ICURE supports the recruited postdocs within the program and programs that supplement the postdoctoral experience for postdocs within the research environment.

Programs that address gaps or needs in the training of these individuals have also been found to be beneficial, such as the Sallie Rosen Kaplan (SRK) Postdoctoral Fellowship for Women Scientist and the Transition to Industry Fellowship (T2I) Fellowship.

Response 3141

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

I think the fact that postdocs aren't considered full employees and therefore don't receive full benefits is a bit absurd to me and being considered a "lesser class" of employee I think definitely plays into people being unwilling to take postdoc positions. Furthermore, it's almost like postdocs get punished for getting outside funding, as you immediately loose any employee benefits that you had to begin with. When I received my T32 grant as a postdoc, I lost access to university health insurance, which was not something I was informed would happen and was not handled well by the T32 program. Also, because I do not fall neatly into an employment category like student or faculty partially because of my funding, I also lost access to university software packages like microsoft office. The fact the postdocs are often overlooked when it comes to changes in university or NIH policy and that there is no oversight for universities to uphold policies for postdocs is also a big concern. At my institution, postdocs are only recently (as in within the next couple months) being given maternal leave after having a child. Also, even though the NIH has stipulations for what postdocs should be paid, many institutions do not follow these guidelines and pay their postdocs much less. All of these things give the appearance that the NIH and academia in general do not care how postdocs are treated and that our position is not valued and viewed as substandard compared to the other employees at the university.

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

No response

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

NIH could consider funding more positions, such as research staff, that are designed to follow postdoctoral positions. This could both provide opportunities for postdocs to move to, and also enable the research to continue with a smaller number of postdocs.

Response 3143

Perspectives on the postdoc roles and responsibilities

The postdoctoral position allows me to discover my independent research direction by obtaining new research and increasing my publishing skills. More importantly, it is to manage a group of scientists to meet this goal and mentor younger scientists. Additionally, significant time must be spent writing grants and fellowships to develop critical skills for the independent investigator position. Developing meaningful collaborations is essential to the academic postdoc.

Fundamental issues and challenges

Often postdocs must relocate to a different institution. This is detrimental to underrepresented groups as most do not have the funds to move and thus do not continue to the postdoc level, especially since the postdoc contracts are initially short-term. Do not penalize postdocs applying for grants or fellowships because of this.

There is a severe lack of minority representation at the postdoc level, which leads to a lack of diverse faculty. One way to combat this is to provide equitable compensation for the postdocs. A minimum of 70k with the cost of living increases, following in the steps of HHMI, will address this issue and lead to better recruitment and retention.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Follow the HHMI postdoctoral pay scale.

Response 3144

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] would like to provide feedback to NIH in response to RFI (NOT-OD-23-084). [redacted for anonymity] is a private, stand-alone health sciences university that currently retains approximately 150 postdoctoral researchers [redacted for anonymity]. We are the largest private research institution in [redacted for anonymity] and also the second-largest NIH funding recipient in the state. [redacted for anonymity] ranks in the top third of all US medical schools in NIH research support (Blue Ridge Rankings). Our comments below were generated via input from our Assistant Dean of Postdoctoral Education, Dean of the School of Graduate Studies, Associate Provost for Research, several of our NIH-funded PIs, and postdocs, of course.

Perspectives on the postdoc roles and responsibilities of the academic postdoc (e.g., what the postdoctoral position means to you, how you view it).

The academic postdoctoral position is a valuable opportunity for training, mentorship, and career development. The postdoctoral position allows individuals to gain hands-on experience in their field, develop new research skills, and prepare for future career opportunities. Additionally, the postdoctoral position provides a unique opportunity for mentorship, allowing postdoctoral trainees to receive guidance on their research, career development, and networking opportunities.

To address these challenges, NIH could consider expanding support for postdocs, such as increasing funding (both in form of more fellowships & increased stipends) and providing more comprehensive benefits. Additionally, NIH could establish policies to promote work-life balance and a more inclusive research environment, such as providing more flexible work schedules or requiring diversity-focused training and mentorship programs. We also believe that a mentorship plan for postdocs supported by R-series grants should be explicitly required in proposals. By supporting the success and well-being of postdoctoral trainees, NIH can help ensure that the academic research workforce remains vibrant, diverse, and inclusive. More details on these recommendations are included below.

Fundamental issues and challenges

The academic postdoc position presents several challenges that can inhibit the success and well-being of postdocs. For example, postdocs often experience limited job security, long working hours, and low pay, which can make it difficult to balance their research responsibilities with their personal lives. Postdocs are often so focused on research deliverables that they neglect the non-laboratory auxiliary training (teaching skills, industry/business acumen, networking, etc.) needed to be competitive for future career opportunities. Additionally, postdocs from underrepresented backgrounds may face additional challenges, such as limited access to mentorship and professional development opportunities or a lack of representation in the research workforce. Furthermore, postdocs are often mentored insufficiently, as though they are graduate students. This is most often true when the principal investigator is more junior.

- Limited job security: One major challenge is the limited job security and uncertainty of the postdoctoral position, which can make it difficult for postdocs to plan for their future and make long-term career decisions. This issue is compounded by the fact that the number of available academic research positions is often limited, making it difficult for postdocs to transition to permanent academic or industry positions. The K99/R00 mechanism is well-suited to help overcome and directly addresses the difficulty in transitioning to academic positions. We believe a targeted and sizable expansion of the K99/R00 program is warranted. In addition, the NIH should consider creating a similar mechanism for transition to industry positions that are research-focused.
- Long hours & low pay: Another major challenge is the long working hours and relatively low pay that are characteristic of many postdoctoral positions. This can make it difficult for postdocs to balance their research responsibilities with their personal lives, which can lead to burnout, high levels of stress, and (increasingly) PhD graduates turning away from postdoctoral training.

Existing NIH policies, programs, or resources

Additionally, some postdocs may experience inadequate mentorship or lack access to professional development opportunities, which can inhibit their ability to grow as researchers and prepare for future career opportunities. To remedy this situation, the NIH should consider a requirement that postdocs funded by any NIH grant mechanism (beyond only T & F awards) be funded at the minimum indicated in the NRSA stipend levels. Furthermore, NIH should establish policies to prevent overwork or burnout and allow for flexible work schedules.

- Auxiliary training needs: To be competitive for limited academic/industry positions after completing their training, postdocs must have time to pursue skill-building activities outside the laboratory. Examples include teaching opportunities, familiarity with the business environment, networking in their field, professional development workshops, and possibly even shadowing or information interviews. Very few postdocs are given the time to explore these options and, as a result, become unprepared and are discouraged about their job prospects. When R-series grant proposals include a budget to support postdocs, the NIH should require PIs to submit a scorable 1-2 page document outlining a specific Postdoc Mentoring Plan. The National Science Foundation has been using this mechanism to great effect for quite some time and this scoreable feature is often the focus of discussion on grant review panels. Two options come to mind for how this could be funded:

1. the NIH could implement a policy whereby R-series grants allow for 5-10% postdoc effort to pursue these training needs outside the lab, and/or
2. the NIH could allow for administrative supplements to cover these costs, when needed.

- Mentoring issues: Faculty mentors are often far better prepared for advising graduate students than they are for advising postdocs. The Postdoc Mentoring Plan mentioned above can provide an excellent opportunity to ensure that PIs understand the needs of postdocs.

Proven or promising external resources or approaches

However, the NIH might also consider requiring first-time R-series awardees to engage in mentorship training prior to award activation. Such training could focus on the specific needs of postdocs, as differentiated from graduate students; and also some form of sensitivity training for mentors that will help postdocs from underrepresented backgrounds. This could be accomplished through an online course module or even local in-person training run by the home institution.

As mentioned above, we recommend the following improvements to existing NIH policies and programs:

- Expand the K99/R00 mechanism to help postdocs transition to academic positions
- Require institutions that receive NIH funding to insure that all postdocs be supported at NRSA stipend levels
- Promote diversity in the ecosystem by explicitly including this in mentorship training
- Further promote diversity by expanding the Diversity Supplement program (PAR-21-071) for postdoctoral fellows
- Expand the F32-Diversity fellowships (PAR-21-217) & K99/R00-Diversity awards (PAR-21-220), which are both currently limited to translational research in Alzheimer’s Disease, to include all fields of study

We recommend the following new approaches to enhance postdoctoral training:

- Require mentorship training for all first-time R-series awardees in proposals that budget support for at least one postdoc
- Require a 1-2 page Postdoc Mentoring Plan (follow the NSF model) for any proposal that includes budget support for at least one postdoc
- Implement new policies to prevent overwork or burnout and allow for flexible work schedules

Our institution greatly appreciates the efforts that NIH has made to solicit comments from the postdoctoral training community. We hope that these comments [redacted for anonymity] will help the NIH Advisory Committee Working Group to implement a range of strategies to help improve the working environment and training for postdocs. Please feel free to reach out to me for any clarifications or additional feedback at [redacted for anonymity]

[redacted for anonymity]

Response 3145

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is meant to provide the scholar with appropriate training, tools, and exposure to facilitate research independence or skills required to succeed in non-research careers. Given the lack of permanent positions in academia after a postdoc, NIH should broaden the definition of postdoc positions and a postdoc looking for opportunities outside scientific research should be supported equally. All postdocs should have access to professional training in management including budgeting, grant writing, leadership, and administration. For postdocs interested in science communications, science policy, medical writing, and other potential career trajectories appropriate opportunities should be made available. As a global early-career scientist community, we advocate that these opportunities should also be open for international scholars. This is possible by broadening the scope of job duties **and responsibilities** for postdocs and including an optional internship as part of the program so it doesn't hinder with maintaining international scholar visa status. Postdocs should be allotted protected time and funds to attend at least one scientific or professional development conference annually to explore new scientific innovations, share knowledge and perspectives, and grow their network. Additionally, NIH should establish a recommended range of postdoc time to be devoted to service, mentoring, and professional development activities. This will help all the stakeholders: postdocs, PI's, mentors, and postdoc offices (PDOs) leaders in creating a guideline for success that is tailored to individual needs. Additionally, the NIH should develop mechanism to hold academic institutions accountable in adhering to these requirements and incentivize compliance. Lastly, it should be mandated to have annual performance reviews between postdocs and PIs to establish clear expectations, yearly goals, and evaluate progress quantitatively to avoid miscommunications.

Fundamental issues and challenges

Compensation and Benefits: While the minimum salary requirements has increased over the past years, it isn't enough to provide a decent quality of life to support postdocs and their families. This becomes an important concern, especially in high-cost-of-living areas, that are often the hubs for scientific innovation. In addition, the benefits offered to postdocs differ based on the sources of the grants which creates uncertainty amongst postdocs and having differential access to health insurance, and retirement benefits for similar job responsibilities. The NIH should increase the stipends to a minimum $65,000 with an annual increase based on performance, inflation, merit, and location. NIH should also recommend a minimum scale for adjust for differences in location with higher cost-of-living. The NIH should also set mandates that irrespective of the funding sources, postdocs have access to same employment benefits through academic institutions.

Lack of representation from diverse communities: Postdocs from underserved communities and international postdocs face systemic and implicit barriers including lack of inclusion, increased micro-aggressions, lack of community leading to increased isolation affecting their mental health tremendously. The NIH should continue to invest in DEI initiatives and mandate DEI training for all stakeholders including PIs, Department Chairs, and PDOs. In addition, NIH should establish rubrics to measure outcome of the DEI initiatives and ensure accountability.

Lack of permanent opportunities in academia after postdocs: Job security and stability are another issue and challenge after postdoctoral training. With a burst in the number of academic postdocs and decreased number of academic jobs, career opportunities in academic institutions are dwindling forcing graduate students to look into non-academic careers.

Competitive environment: The increasing competitiveness, emphasis on publishing or perishing, and pressure to publish in a high impact-factor journal creates an environment that's challenging to navigate and deteriorates mental health.

Existing NIH policies, programs, or resources

Policies

Universal access to benefits

Postdocs should have access to universal and equitable benefits regardless of the funding sources. Currently, upon acceptance of NIH fellowships, some postdocs can lose employee benefits as they no longer are employed by the university. NIH should expand the family-friendly policies including paid parental leave, childcare subsidies to postdocs supported by NIH grants.

Programs

The four-year timeline for applying to fellowships such as K99 acts as a gatekeeper for p[ostdocs from underserved backgrounds. A postdoc should not be excluded from consideration for such a consequential award simply because they had a break or took upon a challenging research project. In addition to this, the K22 should be more supported as an alternative for senior postdocs that did not receive an F32-style fellowship. Similarly, the 5 year timeline for the K22 should be effectively abolished. It goes without saying that the career delays many contemporary postdocs have faced due to the pandemic.

Increase in funding programs for international postdocs

The NIH should increase the number of funding opportunities available for international postdocs. Currently, K99/R00 is the only program International aree eligible to apply for, while they constitute ~50% of the workforce. In addition, NIH should include provisions such as visa application help/subsidies, accommodate for delays in visa stamping and allow vacation accrual to allow travel for international postdocs to see families.

Programs to incentivize establishing/increasing permanent position in universities

To retain diverse talent, NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs

Evidence-based outcomes and Accountability

Conduction annual surveys on postdoc satisfaction and collecting real-time data will position NIH to analyze if policy changes were effective and adjust policy accordingly.

Proven or promising external resources or approaches

This response is consolidated by a few representatives of The [redacted for anonymity] program. The program was set up by the [redacted for anonymity] to help channel and support the passion of early-career researchers (ECRs) in driving change towards open science, greater integrity, and equity in the wider scientific enterprise.

Mentoring resources

The NIH should set up a nationwide online mentor database that postdocs can access. This will allow postdocs to search for mentors based on their specific goals and needs.

National Postdoctoral Association resources

The NIH Working Group should refer to the following resources in particular: NPA Recommended Postdoctoral Policies and Practices (updated version released Q3 2023), the triennial NPA Institutional Policy Surveys from the last decade (2023 released Q3 2023), and more specific pieces within the NPA Resource Library.

Canadian Association of Postdoctoral Scholars: https://www.caps-acsp.ca/en/

Link to data surveys conducted

https://elifesciences.org/articles/40189,

Future of Research survey: https://pubmed.ncbi.nlm.nih.gov/29946421/

Lastly, we would like to thank NIH for providing this opportunity to share our vision for improving postdoctoral experience and satisfaction. Numerous NIH programs such as MOSIAC, IRACDA, and UNITE have moved the needle in the right direction and proved effective in promoting DEI in STEM. We hope that these recommendations will help NIH spearhead much-needed change in the postdoctoral training experience.

Response 3146

Perspectives on the postdoc roles and responsibilities

The academic post-doctoral (postdoc) position is critical for growing the biomedical research workforce. As one [redacted for anonymity] member described it: "The postdoc experience pushes young investigators to get outside their comfort zone and identify a research niche. Postdocs are actively choosing to make research a long-term career goal, and this time is critical to develop the skills and resources for a sustainable career in academic research."

[redacted for anonymity] is concerned that the number of researchers with a focus on women's health across the lifespan continues to decrease and these losses in the research workforce, particularly women and women of color, will only continue to grow without action. Therefore, [redacted for anonymity] supports the NIH's efforts to improve the postdoc training experience and grow and retain investigators across research career stages.

Many postdocs are at the stage of life when they are beginning or growing their families. Taking parental, family, or other leave can often conflict with the goals of the postdoc experience, including gaining additional research experience and delaying the transition to independence. It is important to note that women are more likely than men to take on childcare and other family responsibilities. Women are also more likely to research issues that pertain specifically to women's health. Therefore, [redacted for anonymity] is concerned that there is currently little support in the system to ensure that these obstacles do not hamper career advancement for women who are underrepresented in science and further widen the gender gap in highly-trained PhD scientists.

We feel that the roles and requirements of a postdoc differ between institutions. For instance, some require postdocs to have been awarded grant funding, which limits post-doc training opportunities for many promising scientists.

Fundamental issues and challenges

Finding a Position: While the application process for PhD programs is a somewhat formalized process, establishing an academic postdoc position tends to be a disjointed/informal process. Those looking for positions often rely on network connections and word of mouth to identify positions. A [redacted for anonymity] member described the process as "chaotic," which makes the process unattractive to researchers.

Salary: Recent PhD graduates can receive a much higher salary working in industry than in the academic setting. One [redacted for anonymity] member reported that PIs have no choice but to give postdocs a low salary (i.e., what is posted by the NIH) with NIH-funded T grants Additionally, some institutions consider postdocs students, while others consider them staff. This difference impacts both postdoc salaries, students are not taxed, and the amount of overall grant funding that is dedicated to salaries. Benefits also vary based on status. Moreover, NIH training grants do not provide PIs with a budget sufficient to cover tuition or costs of coursework. This is ultimately a deterrent for faculty PIs who do not have access to other funds to pay for tuition and other learning opportunities.

Transition to Independence: A significant barrier to recruiting and retaining academic postdocs are the real and perceived barriers to transitioning to independence. Being awarded an R grant is extremely challenging for those pursuing an academic research career due to low paylines, which hinder promising young scientists from entering or remaining in the field. A member of [redacted for anonymity] said, "This is the hard fact: postdoc fellows don't see the light at the end of the tunnel to stay motivated and work in an academic setting."

Existing NIH policies, programs, or resources

Finding a postdoc position: NIH should work with grantees, institutions, and stakeholder organizations to develop a more streamlined process for postdocs to identify open academic positions and facilitate application.

Salary: While NIH has taken steps to increase salaries in some awards, difficulties remain for principal investigators bringing a postdoc onto their research team. For example, paying a postdoc the higher salary they require and deserve leaves less funding in an overall R01 award to conduct critical research. NIH should consider how to increase or supplement postdoc salaries while maintaining the overall grant funding necessary to perform critical research. In addition, NIH can take steps to increase academic postdoc salaries and make this a more attractive career path for promising scientists. Without these improvements and efforts to retain scientists, we will stifle research and scientific advances.

Transition to Independence: NIH should expand and create additional paths and awards to fund early career investigators, including K and R awards. Additionally, as we transition away from the COVID-19 pandemic, NIH should consider how to increase postdoc opportunities for MDs to pursue that allow for greater flexibility, such as research-based careers. Additionally, the NIH should foster support for individuals who are not only leaving graduate school, but for those who are considering transitioning back into the academic and scientific workforce.

[redacted for anonymity] recommends that NIH consider enhancing the postdoc training experience by supporting re-entry training and re-tooling with a specific mentor or mentor team. As an example, ORWH is currently supporting research supplements to promote re-training and re-tooling into health-related research careers. It is envisioned that the supplement scholar will be engaged in career development at a laboratory, institution, or organization different from their current place of employment with the goal of supporting the scholar's transition to independence in a multitude of career options.

Proven or promising external resources or approaches

Mentoring: As noted earlier in the comments, postdoc training is a critical time for young investigators to develop the skills and resources for a sustainable career in academic research. Gaining these skills is not possible without robust and dedicated mentorship. To distinguish quality mentorship as a benefit of an academic postdoc versus industry, NIH should investigate all its options to promote mentorship in its existing grants and programming, including creating more dedicated time and resources both mentors and mentees. One [redacted for anonymity] member suggested, "We need to do a better job of defining and disseminating what the advantages/benefits are of a postdoc. The concept may be abstract for many graduate students who think it is going to be more of the same thing."

Networking/Career Growth: To further encourage academic tracks for postdocs, NIH should consider providing dedicated travel support to early career investigators to attend conferences to learn and network. Further, NIH and stakeholders should investigate opportunities to provide postdocs with externships to introduce and prepare them for their next position in academia, industry, teaching, or other fields.

Parental and Family Leave: As noted earlier, many postdocs are at the stage in life when they are beginning or growing their families, particularly women who are balancing their work with childcare and other responsibilities. Taking parental or other necessary family leave shortens this critical time for young scientists to grow their skills and transition to independence. NIH should consider supporting postdocs who take parental or family leave during this time, including providing additional time and implementing programming/mentorship opportunities directly related to supporting young investigators. Further, they should consider how to account for loss in productivity for individual grants if a member of the research team takes leave. This is a crucial step for protecting women in the biomedical workforce.

Response 3147

Perspectives on the postdoc roles and responsibilities

A postdoc is someone who has earned a PhD and is seeking additional experience in pursuing independent research for a defined, temporary time period. PIs do not see postdocs in this fashion. Postdocs are often seen as inexpensive labor used to collect data for grants that will advance the career of a PI. Postdocs are referred to as "trainees" , which dismisses and devalues the knowledge and expertise of a PhD scientist.

Postdoctoral positions should be used to facilitate research independence while developing technical and nontechnical skills and have career exploration built into the professional development experience. This is a valuable time in a person's career to build skills that can be used for whatever career path a postdoc pursues. Professional development should be seen as a responsibility and should be normalized by PIs, not as an optional supplement.

Fundamental issues and challenges

The lack of pay is a fundamental challenge for all postdocs but especially for the postdocs living in cities with a higher cost of living. The NIH should increase its stipends to postdocs on NIH training and fellowships grants to match the GS-10 federal pay schedule including locality pay for the year of award. Year 0 postdocs should receive stipends equivalent to GS-10 Step 1, with annual increases equal to the next GS-10 Step. Similarly, the NIH should promote minimum salary requirements for all NIH-supported postdocs that provide a living wage adjusted annually for inflation, location, tenure and merit.

While DEI is an important and essential for the success of STEM researchers, NIH's definition of "underrepresented minority" does not support inclusivity of ethnic minorities. Asians are treated as one giant monolith which does not acknowledge the cultural and socioeconomic differences between different Asian ethnicities. Southeast Asians are underrepresented, but because Asians are treated as a whole, the underrepresentation is hidden. There needs to be a disaggregation of data to define and determine what groups are underrepresented.

Existing NIH policies, programs, or resources

Currently, postdocs can lose employee benefits when accepting an NIH fellowship or position on a training grant. Postdocs deserve equitable benefits. NIH should issue written guidance explaining that receiving an NIH grant or fellowship does not prevent the host institution from categorizing such postdoc as an employee. NIH should require all postdocs receive employee-level benefits as a requirement of NIH training/fellowship grants, similar to some NASA and NSF requirements, and provide funding to institutions to assist with these costs.

To increase equity, NIH should provide NIH-funded postdocs with moving allowances. Moving costs can be especially cost-prohibitive for researchers from low socioeconomic backgrounds.

NIH should expand its family-friendly policies to all NIH-supported postdocs, including paid parental leave and childcare subsidies.

Proven or promising external resources or approaches

NIH should develop a hub for professional development resources to be stored and shared. There are a lot of efforts out there that get repeated due to the lack of coordination of efforts. Bringing those resources together would make professional development for postdocs even stronger.

Thank you for the opportunity to submit comments and ideas.

Response 3148

Perspectives on the postdoc roles and responsibilities

I believe that an academic postdoc should be a defined period of intentional training to move someone along in their career. What they are learning can be very broadly defined (e.g., new research experience, new techniques, management skills, teaching, grantsmanship, communication, etc.), but the experience should be about acquiring new skills that prepare them for a career. If there is not new skill building, then the individual should move into a regular position. Furthermore, an academic postdoc should not just be used to acquire enough accomplishments (e.g., papers, grants) to be competitive for an academic position. If it's not new learning, but simply doing more of what's already known, the individual should be in a regular position. If medical residents can learn all they need to in 3-5 years, then academic postdocs should be able to do the same in a similar timeframe.

Fundamental issues and challenges

Finances: This likely will be a primary point of conversation and also the most difficult item for the NIH to address. That said, the financial burden posed to many postdocs has made continuing in this position prohibitive. I recently worked with an outstanding postdoc interested in a faculty career who was forced to

leave her postdoc because she could not afford rent and childcare on postdoc pay. Although difficult, finances and cost of living will need to be addressed in some way.

Mentorship: Many institutions have made great strides in building more effective mentoring practices among graduate faculty. Many of our biomedical postdocs conduct their training in labs with faculty who are not part of graduate programs, however. Aside from T32 appointments, and many times even within T32 grants, the lack of enforcement of postdoc mentoring best practices makes the overall postdoc experience highly variable and rife for abuse. Postdocs supported on non-NRSA mechanisms are far too frequently still seen as a cost-effective means to complete research projects, and not as an investment in the future of academic research.

Uncertainty: I believe one final challenge is the uncertainty about how postdoc training is moving someone forward in their careers. Without set expectations around length of training, what training will occur, and clear career outcomes, postdocs are asked to enter into a nebulous void of an uncertain future that in practice, may last upwards of 10 years. Consequently, the value of the postdoc is unclear and can appear largely undesirable.

Existing NIH policies, programs, or resources

Use models like IRACDA to focus on additional career options, e.g., pathways to industry, which could help build public/private partnerships and allow postdocs to gain industry experience while still focusing on academic research. This type of approach also could be paired with pathways to academic staff scientist positions, that do not carry the expectation of becoming the PI in a tenure-track role.

Rather than the K99/R00 mechanism that extends the postdoc phase, transition that award to an early faculty scientist award, such that the awardee would have a more competitive salary and full university faculty benefits. The K99/R00 awards add on additional years to what is already a long training period, and moving awardees to independent positions sooner would help make academic positions more desirable. Additionally, create more early career awards for non-TT faculty roles, so individuals can amass accomplishments in independent positions rather than remaining as postdocs longer than necessary.

Proven or promising external resources or approaches

1. Clarify NRSA language to allow institutions to provide equitable benefits to all postdocs regardless of funding source.
2. Set regionally adjusted cost of living NRSA rates.
3. Set consistent postdoc training expectations, regardless of funding source (i.e., NRSAs and R01s).
4. Before approving a postdoc's appointment to a research grant, require the postdoc and PI to submit some form of a career and training plan, potentially even uploading it to ERA commons and require annual updates.
5. Require evidence of commitment to mentoring from all faculty who want to support a postdoc. Administer mentoring evaluations to NIH supported postdocs to gauge the quality of their experience; factor those evaluations into the PIs eligibility to continue receiving funding.
6. Set consistent salary/stipend amounts for all postdocs and require following experience levels.
7. Place absolute limits on total time allowable in postdoctoral positions. This could prevent perma-docking; oftentimes postdocs do multiple postdocs not because they need more training, but because they just need more history of grants and pubs. That can happen by other potential academic junior scientist positions.

Response 3149

Perspectives on the postdoc roles and responsibilities

In order to respond to this RFI, the [redacted for anonymity] postdoc association sent out an extensive survey to its postdoc community (close to 500 postdocs). Although the majority of the postdocs were satisfied in general (based on a 5-level likert scale), one-third of them were dissatisfied. And while the largest population indicated that they felt the postdoc position is probably well defined, the second largest indicated that it was definitely not the case. This is in stark contrast with the results when postdocs were asked if they felt that their own personal responsibilities and expectations were clear to them.

A large majority of respondents were less likely or unsure about staying in academia after their postdoctoral experience. When asked about possible improvements they would like to see, either from the NIH or [redacted for anonymity], among other things, postdocs suggested that the "trainee" title be dropped, often citing what they found to be a patronizing title which allows for predatory practices, or that actual training responsibilities (either by their PI or institutions) be regulated and/or surveyed. Most postdocs appeared satisfied with their training, but there was a clear correlation with how satisfied they were with their training and their likelihood to stay in academia. When surveying the population that appeared to be more likely to stay in academia, 75% of postdocs were satisfied with their training, with most postdocs citing self-interest, followed by PI/Institution support/training as their main motivations to stay in the academic pathway.

These results imply that the postdoc role requires a more clear definition regarding its currently-accepted status as trainee. Historically, postdocs were on a leadership pathway towards a faculty position; a clear direction with supervision and training administered by their PI. Currently, lack of vacancies and structured training have eroded that concept.

Fundamental issues and challenges

More than 50% of surveyed postdocs said that compared to when they started the postdoc, they are now less likely to stay in academia

The main reasons are the following: discontent with salary, the precarity of an academic position, lack of support from PIs/institution, work/life balance issues, dissatisfaction with academia, lack of DEI, the existence of better opportunities elsewhere such as industry, and immigration issues.

Overall, postdocs don't feel that the NIH provides sufficient funding opportunities

The largest issue inhibiting retention of postdocs is proper financial compensation for their work. While postdocs are generally satisfied with their workload, working hours, time off and benefits, their salary shows a stark contrast with almost 85% of them not satisfied. A part of our survey allowed postdocs to share recommendations about possible improvements to the postdoc position, either from the NIH or [redacted for anonymity]; increase in salary was the most common answer. When asked for reasons as to why they are less likely to stay in academia after their postdoc experience, the following answers were the most common: Salary, precarity of an academic position, lack of support either from the PI or the institution, work/life balance issues and dissatisfaction with academia. Other less common answers were discrimination, better opportunities elsewhere such as industry and visa issues.

While the postdoc body clearly views their immediate situation as a consequential barrier to staying in academia, it is quite clear that many also do not wish to remain because of the poor prospects an academic career seems to evoke. As indicated above, the precarity of academic positions and work/life balance issues are some of the most common barriers for retention, and surveyed participants often cite many issues plaguing the PI position, such as "publish or perish" mentality, the "grant treadmill" , constant administrative duties and poor preparation for a managing position.

Existing NIH policies, programs, or resources

Respondents heavily support an increment of NIH base salary for postdocs, with adjustments made for cost-of-living within geographical areas of work.

More access to career-advancing funding, and opening these rewards to international postdocs

More regulation on postdoctoral traineeship

Non-surprisingly, most postdocs request that the NIH increments the base salary of postdocs, with a common argument of adjusting postdoc salaries based on local cost of life. The second most common request was for the NIH to make awards more easily accessible to international postdocs, which make up the majority of the postdoc body. The majority of respondents were dissatisfied with the funding provided by the NIH for career development, and incrementing these funds appeared as the third most common answer for recommendations for the NIH. Finally, respondents request more regulation on training, with common suggestions being to train PIs on personnel management/training, to require other senior academics to provide counseling/mentorship to postdocs and/or to create a framework to provide training in a more structured fashion.

Other recommendations which the postdoc association would like to point out included: streamlining visa applications/help with visa issues, mandated time off, more "family-friendly" policies (such as introduction

of mandatory parental time off) and better protection from harassment/discrimination/predatory PIs. Common recommendations from other parts of the survey also indicate that making the actual PI position more attractive and available by facilitating grant access/award money, reducing administrative burden on PIs, as well as changing "success" metrics to be more on par with actual research and not the number of papers published, would make pursuing an academic career more attractive.

Proven or promising external resources or approaches

Our recommendations would be to:

Observe the current state of academia in other regions were this postdoc drain is not happening, such as Europe.

The creation of more permanent and readily available positions within academic research such as Researcher.

Fomenting and streamlining more industry partnerships with the clear objective of leading to an industry job for postdocs.

Development of more centralized career development tools within the NIH, and an increment in communication/distribution from the NIH to the postdoctoral body, such as through their postdoctoral associations or the National Postdoc Association (NPA).

Response 3150

Perspectives on the postdoc roles and responsibilities

Training role with the chance to become independent if that is needed. But also the flexibility to stay in research and not pursue tenure track if that is not the career goal.

Fundamental issues and challenges

Poor compensation structure and no protection against harassment or abuse.

Existing NIH policies, programs, or resources

I have no exposure to any NIH postdoctoral programs and haven't encountered any in my 6+ years as a postdoc

Proven or promising external resources or approaches

Direct annual reviews that have transparency to NIH, mentoring reviews from trainee to supervisor.

Response 3151

Perspectives on the postdoc roles and responsibilities

The postdoc is a temporary position in academia where an experienced and qualified researcher carries out research labor under the guise of being a "trainee" . They are, in effect, "gig-economy" staff scientists.

U.S. biomedical academia is heavily dependent on postdocs to carry out the bulk of its research labor. This labor is needed to sustain the careers and finances of faculty, the finances of research institutions, and to justify funding NIH with taxpayer money to advance research into human disease. Any diminution in their workload or number will affect how productive faculty, institutions and NIH appear to those who pay them.

Postdocs are trainees when it suits PIs, universities and funding agencies, and are staff when it suits these organizations. Most postdoc advocacy in recent decades has focused on clawing back the benefits for postdocs that come with those designations.The need for postdocs to unionize and redress the power imbalance is self-evident.

"Post-postdocs" should also be included in this definition. Due to efforts to restrict the length of time that people are perceived to be in postdoc positions, many institutions have required postdocs to transition into roles with new titles after 5 years. Some postdocs receive better compensation and benefits; but for some, the only change they notice is a change in their title. Regardless, for most their function does not change: they are still in a position providing labor for someone else. This diminishes the responsibility and prestige of true staff scientist roles, which are fewer in number.

Most current faculty became faculty because their postdoc was the point at which they were most successful and so the status quo is heavily defended by survivorship bias.

Fundamental issues and challenges

In 1969, the NRC report "The Invisible University" showed that most faculty had not needed a postdoc, and 1/3 of "postdocs" at the time were actually faculty on sabbatical. Postdocs were not necessary for faculty positions in the past. They are now deemed required for "training". Such "shifting goalposts" are a clear sign to postdocs of the hypocrisy of their elders.

Across race, gender and ethnicity, the defining factor in people deciding to stay in academia is an alignment with one's values, as shown a decade ago by Gibbs and Griffin. It's worth reflecting on this and the struggle to do—and be recognized for—more outward-facing, work, or educational activities. NIH suggests that part of the reason black researchers are receiving less funding is affected by their interest in clinical research into population—and community-level interventions, which are less likely to be funded. Conversely, supporting the IRACDA program has been a great success story of NIH's diversity efforts by giving value and support—and ultimately a reason to stay in academia—to people who are interested in teaching.

Many academics perpetuate a culture of martyrdom, whereby they insist that they have had a very hard time, and have suffered greatly, in their noble cause for science. It is therefore expected that one should suffer for academia, and the more suffering one can claim, the more worthy one is of academic success. This "suffering" is very subjective, and conveniently ignores both survivorship bias and the shifting goalposts over time for who secures a faculty position. Plenty of people experienced just as many hardships during their academic training, and left academia because there aren't enough faculty positions for all the smart people who could fill them, and they didn't have the luck or pedigree of those who did.

Existing NIH policies, programs, or resources

Adapting from a recommendation made to NIH in 2018: NIH should increase the Ruth L. Kirschstein National Research Service Award (NRSA) starting salary for new postdoctoral researchers to $63,300 (in 2023 dollars), with annual adjustments for inflation and for cost-of-living increases tied to the Personal Consumption Expenditure Index. The NIH can make use of the General Schedule to determine regional adjustments. This would bring postdoc compensation policies into line with NIH's Interest in Diversity Notice that has a substantial focus on financially-disadvantaged groups.

NIH and its various institutions have the ability to open any and all career development (K) awards to foreign researchers. Similarly, NIH can work with the Department of Health and Human Services to amend the code of Federal regulations to allow foreigners onto NRSA training mechanisms.

NIH can follow the lead of federal agencies such as NASA and ensure that all NRSA award recipients receive benefits, and refuse to give awards to universities who strip postdocs of these benefits.

Numerous comments have surfaced that the postdoc is like medical residency. It isn't, but NIH could make the postdoc like residency: cap the time funded for training; cap the number of postdocs it funds; and ensure postdocs are practically guaranteed a faculty job at the end. The postdoc and residency will therefore be more comparable.

NIH should bring in its work on peer-review and research evaluation to ask what, in a defined time period, are reasonable expectations and accurate articulations of success for a postdoc. This would divorce the length of the postdoc from factors that are outwith their control—for example, the growing inefficiency of scientific magazine publishers, or rodent breeding cycles.

Proven or promising external resources or approaches

A Congressionally-mandated report developed recommendations around this exact issue, which were given to NIH in 2018. The report can be found at: https://nap.nationalacademies.org/catalog/25008/the-next-generation-of-biomedical-and-behavioral-sciences-researchers-breaking

Industry seems to be capitalizing on taking the postdoc model, but providing them training, appropriate benefits, and compensation. This might be worth a try.

Numerous institutions and funding organizations are realizing the necessity of raising postdoc salaries. NIH is in danger of being behind, whereas it was at the forefront of this effort in 2016.

DORA is looking into ways to diversify research evaluation. Postdoc length is being affected purely by a focus on publishing articles in magazines, there is a clear need to establish other ways to evaluate the postdoc. In particular, graduate students, and increasingly undergraduate students, are being evaluated in terms of journal publications, so NIH needs to justify why the taxpayer is funding yet another period of "training" that appears to just be more research labor with no discernable training outcomes.

Funding agencies in countries such as the UK have mandates to allow trainees time to leave the lab for professional development training. NIH could include such a mandate, or at the very least reduce paperwork that acts as a barrier to trainees getting training. For example, such policies from the UK's Medical Research Council (and at the University of Cambridge) allowed me to undertake pedagogical training during my PhD, and obtain an education credential and membership of the Higher Education Academy. When I was a postdoc at [redacted for anonymity], to accept a teaching fellowship position at [redacted for anonymity] my PI had to fill out paperwork to explain to NIH why I, as a "trainee" on an RPG, wouldn't be spending all my time at the bench.

Response 3152

Perspectives on the postdoc roles and responsibilities

1) It is a position seen as a default next step for PhDs even though MOST don't need it for the careers they will go into and sacrifice time and money by doing it.

SOURCES: https://rdcu.be/c6FXp and https://www.science.org/doi/full/10.1126/science.aar4638 and https://www.ncbi.nlm.nih.gov/books/NBK268777/ and https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8809557/ and https://elifesciences.org/articles/48774

Fundamental issues and challenges

NIH should PLEASE PLEASE PLEASE create a national tracking database for Postdocs to track career outcomes so national and institutional data is publicly available at one source. Right now we have a patch work solution with things like: https://nglscoalition.org/ and without good data we can't make good decisions.

Existing NIH policies, programs, or resources

1. From an equity standpoint, there should be an extensive expansion of OITE services for extramurally funded Postdocs as right now Postdocs at NIH have MUCH more access to professional and career development than many Postdocs, especially those at smaller institutions with a 1 FTE or less or NO Postdoc office. Alternatively, NIH should require that institutions that get grant funding for postdocs have a 1 FTE career and professional coach per 100 Postdocs (this ratio requirement could allow combining Postdocs and Pre-docs for 1:100 trainee ratio).
2. Also for equity, extramurally funded Postdocs should be paid using the GS salary scale system (with geographic adjustments) used to pay intramural NIH Postdocs.
3. Expand programs like IRACDA with PROTECTED time for professional development skills that prepare Postdocs for non-academic and non-research careers (IRACDA focuses on teaching, perhaps have a tracks in public policy, science communication, entrepreneurship, intellectual property/tech transfer, consulting, etc.)
4. Childcare stipends should match actual costs of childcare or at least what is defined as "affordable" if we want folks with children to choose postdocs (child care is about $11,000 a year for ONE child) $2500 is NOT sufficient for most. According to the U.S. Department of Health and Human Services (HHS), child care is considered affordable when it costs families no more than 7% of their household income." Stats from: https://www.care.com/c/how-much-does-child-care-cost/ This stipend could be income-based vs available to all in case some Postdoc is married to someone with more means. Could also vary by geographical location.

Proven or promising external resources or approaches

1. Postdocs should ONLY be employed on training grants, F32s, and K99s. Faculty-focus grants (R, etc.) should only allow hiring research scientists/techs. This gives agency to Postdocs who are currently in a huge power mismatch, especially Postdocs on visas, and would requires PIs to hire staff scientists and compete for extra staff in the form of Postdocs with own funding by being good mentors. Current faculty have a disincentive to mentor Postdocs and help them move into their own careers as they lose well trained and low-cost labor by doing so.
2. We need more Postdoc (2 to 3 years) to faculty bridge programs at the SAME institutions (unlike K99/R00) so PhDs don't have to keep moving all around the county.
3. All Postdocs should be required to have a mentoring team of at least 2 other faculty (not just their PI) who meets with Postdoc at least twice a year as a group (quarterly would be even better) to look at a required IDP and create a plan to help Postdoc gain skills and competencies needed for next steps.
4. Mechanisms like the K99 need to be changed so that they are more supportive of Postdocs staying at Postdoc institution as Postdocs with spouses and kids are way less likely to want to uproot their families (same for diverse Postdocs who move to Postdoc institution to be near extended family) and move again and if you want a more diverse scientific workforce you need to create policies that are family and married people friendly.

Response 3153

Perspectives on the postdoc roles and responsibilities

The postdoctoral stage—typically consisting of one to two transient stays in research groups in the hope of securing a more permanent position—is a relatively recent compulsory step to sustain a stable career in academia.

Indeed, Cantwell et al (Expanding Research Capacity at United States Universities: a Study of Academic Research and Development Investment from 1990-2005, Higher Education Quarterly, 2012, DOI: 10.1111/j.1468-2273.2012.00522.x) found that the number of postdocs grew faster than the number of faculty members over the period 1990-2005. The authors also found that "federal R&D expenditures were also strongly associated with post-docs numbers and, to a lesser extent, non-faculty researchers, indicating an association between federal support for R&D and the growing contingency research staff. [.] Faculty salary, a proxy measure of university prestige, was a significant predictor only for post-docs. [.] It is likely that high prestige faculty members employ relatively large numbers of post-docs in order to increase their levels of research production".

This mirrors my experience. Postdocs are fully trained researchers that can produce research autonomously and even train graduate students while being barely more expensive than students. Postdocs drive research—often, the PI only offers light supervision, either because they have a large research group or because they are away taking care of other ventures (e.g. startup).

In addition, postdocs are under a lot of pressure as they have to compete to secure one of the—scarcer and scarcer—permanent positions, nowadays meaning almost exclusively tenure-track positions. For this, they need to not only maintain a healthy research program, but also apply for funding. In a nutshell, they do the job of an assistant professor, but without the associated benefits. I personally believe that this is not a period of so-called 'training'; instead, I believe that it is a period of exploitation.

Fundamental issues and challenges

From my experience in neuroscience, postdocs face increasing challenges as the duration of postdoc positions lengthens due to limited faculty openings and expanding peer review and publication pipelines. The extended period of hard work and short-term contracts often comes with significant personal sacrifices, such as difficulties maintaining a support system and relationship stress. In addition, while the postdoctoral period often extends well into their thirties, postdocs often have a hard time starting a family—because of geographic instability, financial hardship, heavy workload, expected backlash during job interviews, and/or direct pressure from the employer (which is still relatively common in my experience).

Foreign postdocs, who make up an increasingly large proportion of postdoctoral workers in the US, experience amplified challenges. They often face short-term visas and stressful renewal processes, while working in the US is considered essential for their careers.

More generally, the extension of the postdoctoral period contributes to the accumulation of biases and may act as an exclusionary factor for socioeconomically disadvantaged populations.

Despite postdocs' passion and drive for producing meaningful research, the competitive system can dampen their enthusiasm, as they perceive that survival in academia requires prioritizing speed and networking over research quality. Indeed, the research community's growth and the increased pressure for productivity make it difficult for researchers to thoroughly evaluate their peers' work. As a result, the review and faculty selection processes often fail to assess research quality accurately, leading to researchers who prioritize networking and advertising over quality research securing faculty positions. This can create a work environment that does not always reward quality over greed, causing frustration for more scrupulous researchers. Note that this is not a statement from somebody leaving academia—I want to pursue research and have earned a competitive award to help transition to a faculty job.

Existing NIH policies, programs, or resources

1. To better support the growing number of foreign researchers, expanding the range of grants they can apply for is necessary. Accounting for the shorter duration of Ph.D. training in foreign countries when evaluating grant proposals and defining eligibility periods would also be beneficial. More options to request adjustments to eligibility periods based on circumstances and life events should be provided.
2. Redirecting funding from absentee faculty members, who focus on alternative ventures like startups, to postdoctoral scientists leading the research can help mitigate harm. This would protect postdocs and graduate students from suffering due to poor management decisions made by disconnected faculty members. Though faculty must report their efforts, there is often little oversight.
3. Grant proposal evaluations could include measuring the satisfaction levels of a PI's postdoctoral researchers and graduate students, using a non-academic third party to avoid retaliation. Receiving faculty-level NIH grants could also be contingent upon PI training in the current assistant professor job market to ensure they have a comprehensive understanding of the situation.
4. Studies suggest that federal funding is becoming more concentrated among fewer faculty members, who then attract most postdocs and can quasi-automatically secure further funding (Cantwell et al, Higher Education Quarterly, 2012, https://doi.org/10.1111/j.1468-2273.2012.00522.x; Noble et al., Plos One 2020, https://doi.org/10.1371/journal.pone.0233367). To prevent this, funding for each faculty member could be capped or evaluated by considering their performance relative to their previous funding. This would free up extra funds to create a variety of permanent positions.
5. Using federal funds to establish stable research scientist positions could eliminate the instability of postdoc positions. These positions could serve as a preliminary step before considering an upgrade to a group leader role. Securing extra funding to manage other junior scientists could depend on a comprehensive report from trainees co-mentored by the research scientist and an experienced manager.

Proven or promising external resources or approaches

Research suggests that more distributed research funding—the converse of the current trends—would generally improve research performance (e.g. Aagaard et al., Concentration or dispersal of research funding?, Quantitative Science Studies, 2019, https://doi.org/10.1162/qss_a_00002).

Response 3154

Perspectives on the postdoc roles and responsibilities

An academic postdoc these days is only if you want a faculty position. It is wasted time and money if you want to go into any other career.

Fundamental issues and challenges

Pay is insulting, when PhDs can earn 2 times the salary right away in industry and 3 times as much with just a few years of experience. It is not enough for people with families, unless they have a wealthy

partner. Inflation, housing prices, and childcare have soared, and the pay is not enough to live off of, let alone save money for retirement.

There is no work-life balance, with postdocs expected to slave away even on nights and weekends. There are no checks and balances on the PIs.

Their work is exploited by their PIs, who abuse them and steal their grant ideas, limiting what they can take with them for their own labs.

There are not enough faculty positions, and even if you get lucky enough to get one, it could be at a university in the middle of nowhere. You can't really pick where you want to live, and could end up in a state with politics that actively endanger women's lives (abortion policies, etc).

Postdocs slave away for 10+ years, making their PIs famous, but can't get their own labs. In the process they give up their lives, dreams, future earnings, and retirements. This all adds up to make doing a postdoc very, very undesirable because it just exploitative.

Existing NIH policies, programs, or resources

Increase the NIH postdoc minimum to at least $70k, with much more substantial raises every year, and make it raise up for cost of living.

Make PIs accountable for how they treat their lab.

Let postdocs be PIs on NIH grants.

Response 3155

Perspectives on the postdoc roles and responsibilities

Additional training and especially cross—training in a lab you did not do your PHD in to refine skills and practice team management. With a substantially increased salary. Postdoc can set you up for academic OR non-academic job in science.

Fundamental issues and challenges

Family wealth. Salaries are still too low and people start dealing with aging parents, having a family, etc. You are no longer a student. You should definitely have a parental leave policy that is made clear to you without you asking for it. I stayed and watched brilliant women leave academia because of the pay and not being able to rely on other sources of funds. We didn't get paid on time for a month and they were sleeping on mattresses on the floor with no couch—people have no savings after grad school.

Existing NIH policies, programs, or resources

Salaries and benefits. People are so willing to work for less than they deserve, but now it's below the lower limit.

Proven or promising external resources or approaches

The gender pay gap; the concept of underrepresented minorities.

Response 3156

Perspectives on the postdoc roles and responsibilities

My perspective is that a postdoctoral position is a position in which highly trained scientists can substantially move science forward while also receiving mentorship to prepare them for future roles. Postdocs are arguably the most productive entities in the academic scientific reserach enterprise, yet are some of the least compensated, in terms of salary, benefits, and professional development. This has to

change, otherwise we will continue to see a drop in postdoc participation, which will have the consequence of slowing overall scientific productivity.

Fundamental issues and challenges

1. Postdocs need to be paid more.
2. Postdoc roles need to be more defined. Perhaps after a reasonable period (3-5 years) postdocs should move on to more permanent titles, or to alternative tracks. Paying "postdocs" that have 5+ years of post-PhD experiment at the same scale as fresh-out-of-PhD scientists renders it nearly impossible for postdocs to become parents in high cost-of-living areas.

Existing NIH policies, programs, or resources

I'm not familiar with NIH's existing policies.

Proven or promising external resources or approaches

The Pershing Square Foundation could fund a lot of postdocs with $5 million/year.

Response 3157

Perspectives on the postdoc roles and responsibilities

As a step towards starting a lab of our own. Postdoc position includes learning how to be a good mentor, coming up with new ideas, writing grants. All of these serve as essential experience in order to run a successful lab.

Fundamental issues and challenges

The pay scale is pathetic and the opportunities are very limited for someone that wants to be a tenure track professor. Inexcusably low pay scale is the reason why almost all of my PhD cohort (30 individuals) have moved on from academia. Only 2-3 of us have decided to stay in academia ONLY because of our privilege as our partners are able to earn enough to bridge the gap. So, this is making academic postdoctoral positions unattractive.

Existing NIH policies, programs, or resources

There are fewer opportunities to transition to tenure track positions. There is systemic racism and very limited opportunities for people of color!

Proven or promising external resources or approaches

More and more PIs are interested in their research and do not provide enough mentoring for the postdocs. Postdocs are seen as data churning machines that are not mentored and paid well!!

Response 3158

Perspectives on the postdoc roles and responsibilities

I view it as a trainee position, where a person holding a P.h.D. obtains the necessary skills to become an independent investigator (either in academia or industry). However, there is a lack of training programs for postdocs at the current institutions. More and more, postdocs are expected to have numerous responsibilities that do not correlate with the salary or compensation that we get. Our schedule is expected to be very flexible as well: working hours go beyond the signed 40 hours per week, and we are expected to work on the weekends or late nights.

Fundamental issues and challenges

There are a number of issues that challenge the recruitment, retention, and quality of life of postdoctoral trainees, especially for those who are international. First, low salary and lack of relocation expenses cover. While the starting salary of a person holding a P.h.D. can easily surpass $80k in industry, postdoc salaries start from $50k, and increase in very low rate over time. If the person is international, relocation results in a especially high expense, due to fees resulting from lack of credit score, visa fees, plus starting a new life in a new country (new furniture, car, etc). Second, lack of clear expectations and training. As I mentioned above, there rarely exist training programs at the academic institutions that provide postdocs

with the necessary skills to advance in their careers, and it is expected that the principal investigator provides them with these skills. In reality, the principal investigator is normally too busy to provide proper mentorship, especially if the postdoc is not interested in pursuing an academic career, and, moreover, this results in not a clear path for development for the postdoc. Third, lack of stability. Contracts are normally just for a year, with the possibility of renewing it each year for as long as funding is available. This is especially hard for internationals, who can only get one-year-long visas, preventing partners to get rights to work, and from attending conferences, as they need to renew the visa stamp every time they exit the United States (which also adds up to costs that the postdoc trainee needs to cover). Fourth, lack of funding sources. International postdocs can hardly apply to any NIH funding opportunity, with the exception of the very competitive K99.

Existing NIH policies, programs, or resources

Removing citizenship restrictions in NIH programs. International postdocs (who amount to the majority of the postdoctoral body in the country) should be allowed the same founding resources as national postdocs.

Proven or promising external resources or approaches

Postdoctoral training at University of Texas Health in Houston.

Response 3160

Perspectives on the postdoc roles and responsibilities

During my PhD, I developed the ambition to become an independent investigator. Therefore, my perspective from a postdoc was that it would provide myself a buffer zone between PhD and independent PI, to fully formulate my original ideas and acquire new skills for executing these ideas in my own lab. However, the conflict between my viewpoint and the current postdoc program is length of time. While my own goals were achieved by 4th year, I am however still a postdoc in my 7th year. The sole reason being working towards a high-impact paper, which has been critical to become competitive for a tenure-track position. I understand that preprints are beginning to be recognized, but from conversations with senior PI's, the community is still very far from evaluating postdocs based on preprints.

So, what can be a possible solution? I envision a structured postdoc program in two phases:

Phase 1 (3-4 years): At the end of Phase I, postdoc and PI mentor will decide based on progress to either continue to Phase 2 or move to alternative career options outside of tenure-track faculty.

Phase 2 (4-6 years): Only for postdocs aiming for tenure-track positions. Postdocs will be provided technical support personnel funded by their PI to finish projects initiated in Phase I (note this criterion makes Phase 2 different from F32 and K99 postdocs). This will provide time to instead initiate independent investigations in Phase 2. This will be in parallel with managing publications from projects initiated in Phase I. Therefore, Phase 2 ensures that any time >4 years that current postdocs are putting into gathering data for high-impact publications, this time can be outsourced to technical support and instead utilized to set up their own research programs. Additionally, this will also provide mentoring opportunities for the postdoc towards their technical support personnel.

Fundamental issues and challenges

While there are several, the most critical issue is money. Currently, PhD and postdoc is >10 years, occurring mostly between 25-35 years of age. Therefore, it is impossible to sustain an acceptable lifestyle with current salaries. For example, due to financial support from my husband I was able to pursue a postdoc and still maintain my living standards. This means that the postdoc position unfortunately is favorable towards financially privileged. This represents a major drawback against NIH initiatives to promote diversity and underprivileged trainees in academia.

While one possible solution to increase salary is having smaller labs, I am not convinced this will help. Instead, it would make the postdoc position extremely competitive by catering to candidates from renowned labs. This in turn will only lengthen the time required for PhD completion since candidates will then have to be competitive enough for postdoc. So, how do we maintain size of labs and still increase salary? My thoughts arise from a recent realization. I was awarded the NIH K99 funding and was surprised to learn that 'fringe benefits' are paid for by the NIH! I realized then that previously, my benefits were coming from my PI's NIH grants. This was hard to accept, I am employed by my institute, and my benefits as an employee should be paid by my employer: my institute. For example, if my institute did provide my benefits, that would lead to re-allocating NIH funds of ~$15000 from my benefits towards my salary. I think this can reduce the burden on NIH to acquire increased funding, and still help to retain current lab sizes. Therefore, I envision that the NIH and academic institutes will restructure their agreements wherein not only NIH, but academic institutes too need to come on board to help with postdoc salary.

Existing NIH policies, programs, or resources

Existing NIH policies need to be improved to promote good mentorship. Postdocs having toxic mentors are at an alarmingly high percentage. I think we have failed as a scientific community to provide good mentorship simply because there are no real incentives to being a good mentor. Indeed, many postdocs have achieved success despite their toxic mentors, yet such mentors will list their postdoc achievements as evidence of their own mentoring achievements. So, a possible solution is to incentivize good mentorship. While postdoc funding applications (F32, K99, etc.) require letters of recommendation from mentors, the same mentors applying for R01 grants are not evaluated based on their mentorship, even though it would be their mentees like students and postdocs executing the proposed research. Therefore, I propose a "mentorship score" provided by trainees that will be considered by NIH. A few suggestions:

1. PI's must provide contact of all their senior PhD and postdocs, and any 3 will be contacted by NIH with a scoring system.
2. Scores will be provided anonymously on a 1-10 scale evaluating different aspects of mentorship: support in research initiation; research development; manuscript preparation; networking; recognition of trainees' original ideas; culture of rigor and reproducibility; mental health support; and support towards diversity.
3. Average of scores from different criteria will be considered by NIH grant reviewers to inform on the final impact score given to R01 applications, and this score will also be considered at study sections.

An objective scoring system as above will not add excessive additional burden on NIH reviewers. It also ensures that the final mentorship score is an average of different criteria, and the mentor does not fare poorly due to one aspect alone. In summary, I envision such a system will ensure that there are NIH funded incentives for being a good mentor.

Proven or promising external resources or approaches

With regard to incentivizing good mentorship, the possible practice of postdoc (and student) trainees evaluating their PI mentors is analogous to "upward feedback" practices in industry wherein employees evaluate their managers. A good write up on this method is the following Forbes article:

https://www.forbes.com/sites/forbescoachescouncil/2021/05/28/why-everyone-should-be-down-with-upward-feedback/?sh=1a2bac73f787

Response 3163

Perspectives on the postdoc roles and responsibilities

The postdoc is cheap labor for established PIs who don’t actually care about scientific training/development. These PIs are not providing space for trainees to step into their own. The system is broken.

Fundamental issues and challenges

First and foremost is abysmal wages in areas with very expensive cost of living. Second, the prospects of actually conducting value-add science in those areas when venturing out as an independent investigator. Third, lack of training, mentoring, management experience from PIs. Fourth, overall toxicity in many academic departments makes the cost and sacrifice simply too much to be worth the scientific joy of independent research.

Existing NIH policies, programs, or resources

Globally, salaries that keep up with cost of living and revisit incentive systems.

Proven or promising external resources or approaches

Honestly everything is so broken I’m not even sure where to start.

Existing NIH policies, programs, or resources

INCREASE MODULAR BUDGET CAP. [redacted for anonymity] recent letter addresses the limitations of the modular budget cap, and we recommend raising the current modular cap ($250,000) or eliminating the direct costs cap altogether (allowing for all applications to utilize the modular budget format). The number of modular applications significantly declined since implementation (90% in 1998 compared to 29% in 2021), and have limited ability to fully support all research activities (i.e., mentoring activities and funding multiple trainees). This is of particular concern within the context of other recommendations being considered by NIH. Modular budgets are steadily squeezed in absorbing increased activities (i.e., DMS**) and the cost to support personnel and trainees critical to individual projects.

INCREASE NRSA STIPEND LEVELS. We support comments shared by the community and postdoctoral trainees recommending the National Research Service Award (NRSA) stipend levels be increased. Increasing stipends would improve recruitment and retention and provide a living wage for trainees. Current stipend levels are insufficient in the current market and fail to account for inflation and the cost of living.

CONSIDER MORE EQUITABLE BENEFITS. NRSA fellows are compensated through stipends rather than salary, which has numerous tax and benefit ramifications for post-docs. Stipend pay limits full recognition of their work at institutions and the research enterprise at-large. NIH should engage the community on postdoctoral classifications (e.g., stipend vs. salary) and impacts on recruitment and retention to consider policy clarifications or revisions.

REEVALUATE NRSA POLICIES. Laws governing the NRSA were established in 1974, and subsequent policies remain largely unchanged. NIH should engage with the community to identify specific policy areas that can be clarified or revised, including financial policies (i.e., see above) and areas to reduce administrative burden for trainees (i.e., payback obligations), mentors, and institutions.

Proven or promising external resources or approaches

No response

Response 3165

Perspectives on the postdoc roles and responsibilities

1. An independent researcher capable of developing their own research ideas and projects and writing grants.
2. A secondary mentor to the graduate and undergraduate students in the lab.

Fundamental issues and challenges

1. Fundamental issue is salary!! They are paid way below the average cost of living wage. The situation doesn’t get any better compared to graduate school life. Postdocs are already in their 30s, most of them with dependents/families. The financial stress adds to work pressure and academic competition. And this is just the plight of all post docs irrespective of their nationality. However, international post docs have it much worse.Within the same lab, with the same level of expertise and experience, post docs are paid differently, which in my opinion is unfair.
2. Postdocs are exploited as per convenience—at times treated like trainees.
3. Most NIH grants are designed for US citizens. But if more grants are designed to support internationals, academia will definitely be able to recruit more post docs.

Existing NIH policies, programs, or resources

1. Trainings on how to become a Principal investigator, budgeting lab resources, etc
2. Trainings on how to develop mentorship with students

Proven or promising external resources or approaches

Many postdocs struggle with inadequate mentorship during their training, which can hinder their professional development and job satisfaction. NIH could consider implementing formal training programs for mentors, providing them with resources and guidance on how to effectively mentor and support their postdocs.

NIH could consider expanding the availability of postdoctoral job opportunities, including creating more permanent positions in academia and industry.

NIH could consider implementing diversity and inclusion training programs for postdocs and mentors, as well as creating more diverse and inclusive recruitment and hiring practices.

NIH could consider integrating emerging technologies into postdoctoral training programs, providing postdocs with hands-on experience in cutting-edge research techniques and methodologies.

Response 3166

Perspectives on the postdoc roles and responsibilities

A postdoc is an early-career researcher with strong research skills and an interest in developing an independent program. In the best cases, these individuals identify a lab with overlapping interests and relevant resources to host them as they develop their new direction, and become valued colleagues of the PI. Both postdoc and PI benefit considerably from this relationship, and typically both see an expansion of their research options as a result. The United States has benefited tremendously from opening its doors to creative, intelligent individuals from all countries, and retaining the best of them in academia and industry. In most cases, a postdoctoral period is a de facto requisite next step to a career in research and biomedical science, especially in academia.

Too often, however, the structure of funding to postdocs fails to properly recognize the true value of a postdoc's independent contributions, resulting in their treatment as a junior contributor, thus diminishing their expertise. Postdocs are also fully dependent on the PI for salary, reference letters, and visa support, often without clear training criteria or expectations. This creates a potential for toxic research environments, especially as postdocs are also ineligible for many types of resources offered to employees. The definition of a postdoc as a trainee must therefore evolve, since postdocs often pay a heavy personal and financial price for their eagerness to contribute to research.

If the postdoc role is to survive in academia, we need new policies that recognize

1. the extraordinary value of postdocs to US research;
2. the need to reduce the costs of the postdoctoral period for individuals who are willing to invest their time and energy to advance our research; and
3. the need for institutions to provide appropriate safeguards and an equitable experience for their postdocs.

Fundamental issues and challenges

The quality of a postdoc's life largely depends on the lab they are in. Specific issues include:

1. Unlike medical and graduate students in biomedicine, there is no central governing body to establish consistent standards and required support infrastructure for postdocs. Sometimes there is confusion about who "counts" as a postdoc, and what policies apply to postdocs, including in recruitment. Such a governing body could provide tools to help institutions, PIs, and potential postdocs come to agreement about their planned relationship, define laboratory norms, and set expectations for research and career support.
2. At many institutions the postdoc recruitment cycle is typically managed directly by individual faculty, and may occur outside institutional HR processes. Sustained attention to formal recruitment systems and guidelines would enhance opportunities to improve diversity in recruitment.
3. Postdoc salaries are low relative to the level of expertise and energy a postdoc brings, and are typically not adjusted to the cost of living in a specific region. NIH has considerable power over postdoc salaries: NIH NRSA F32 stipend levels are used as the de facto national standard in biomedical research. Since the budget for a modular R01 has not changed for over a decade, PIs must make extremely hard choices if they wish to provide postdocs with a living wage. Solutions are needed to resolve salary inequities (e.g., those stemming from stipendee vs. non-stipendee postdoc designations), provide support for dependent care (especially given the increasing length of the postdoc period), and support moving/housing costs to improve recruitment and retention of postdocs who lack family wealth.

Existing NIH policies, programs, or resources

We strongly encourage the NIH to explore the following possibilities:

1. Change the designation of postdocs as "stipendees" and require them to be treated as employees. Note that this would require a change in NIH's fellowship model, since T/F32 recipients are not considered employees; this typically costs the individual T/F32 recipient thousands of dollars, making them ineligible for certain standard benefits while imposing significant inconvenience.
2. Restructure postdoc salary minima to take account of regional variances in cost of living.
3. Require all institutions that receive NIH funding to perform a review of postdoc satisfaction annually, and to publish the results. Such a review could be administered by a body such as the National Postdoc Association, taking a step in the direction of an "accreditation" body for postdocs.
4. Encourage institutions receiving NIH funds to adopt mentoring guidelines, individualized development plans, and career tracking required of T/F32 fellows.
5. Require EOO reports from institutions receiving NIH funds to demonstrate that postdoctoral hiring specifically is performed with appropriate attention to equality of opportunity.
6. 6. Create a grievance process, where such protections do not already exist, in which the postdoc in question is ensured protection from retaliation and provided resources to pursue their work elsewhere.
7. To decrease the dependency of postdocs on the PI, increasing the number of individual postdoc fellowships available would have far-reaching effects. Additionally, fellowships should be offered to international researchers as well as domestic researchers, to continue the extremely beneficial flow of talent into the US.

Proven or promising external resources or approaches

Many institutions have no dedicated office or department for sustained postdoctoral recruitment. This is especially problematic for prospective fellows from groups historically underrepresented in biomedicine. Recently, there was a pilot program that demonstrated the feasibility to diversify a postdoctoral applicant pool by creating a centralized recruiting process that was endorsed and enthusiastically supported by the departments and faculty.

In the pilot, there was an effort to recruit, from a national pool, late-stage graduate students from broader and more diverse backgrounds, many of whom do not ordinarily submit applications. So far, in just two recruitment cycles over 7 months, the pilot program offered over 60 postdoc opportunities, posted them on a central website, and received more than 60 applications from across the US and around the globe. To date, the program has generated 41 interviews and 12 fellowship offers, resulting in 6 new postdoc hires,

thus demonstrating that it is possible to diversify the postdoctoral applicant pool and centralize recruitment with a concerted, yet unfunded, effort. In an effort to improve postdoc recruitment, a comprehensive process that recruits, hires, and trains postdocs from a broader and more diverse pool can both enhance the experience of current fellows and allow institutions to build a stronger and more welcoming environment for all trainees.

Response 3167

Perspectives on the postdoc roles and responsibilities

While the postdoctoral position is ostensibly a training position, in reality it is a hybrid training/research scientist position with little stability. Principal investigators (PIs) view hiring a postdoc as hiring someone to be the leader or principal driver on a specific project; this indicates that we are essential to the research enterprise, and that our roles are viewed as research scientists first, mentees second. Good PIs make sure that postdocs also receive mentorship in both research techniques and, if desired, in other areas like running a lab; however, postdocs are dependent on PIs taking their mentorship responsibilities seriously to receive the training that is ostensibly a fundamental part of our roles.

Fundamental issues and challenges

Postdoctoral positions inherently come with little stability and less pay than could be obtained in other positions outside academia; in addition, they come with no clear exit strategy for many postdocs. While many rewarding non-academic positions exist, and should get more press, most postdocs take their positions because of a desire to do independent research, which leads naturally to considering tenure-track professor positions. The relative scarcity of these positions leads to long years of uncertainty, where postdocs give up stability and good pay, as well as many opportunities that require stability and good pay (for example, for many people, having children) to continue buying tickets for a future lottery.

Existing NIH policies, programs, or resources

The R50 grant offered by some institutes and centers could be greatly expanded to offer stability for more scientists wishing to continue research without becoming tenure-track professors. In addition, all NIH institutes and centers could implement specific policies for supporting research and staff scientist positions on grants, such that PIs don't get penalized for trying to support permanent staff over hiring trainees. In general, approaches that greatly expand research and staff scientist positions, and paths to those positions, will benefit both the PIs who are currently searching for postdocs as well as the scientists currently holding postdoc positions.

Response 3168

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

While the postdoc stipend is greater than the graduate student stipend it still does not allow one to live comfortably. It's still living paycheck to paycheck. The fundamental issue with the postdoc salary is that it does not account for the 5-7 years of training, which is experience. In any other field, 5-7 years of experience amounts to more than $60K. The reality is that sacrificing an additional 5 years of potentially good pay for the postdoc salary isn't worth it. It's frustrating to not be recognized for the experience being brought into an institute/lab. For an individual with a single income, this stipend is not enough to live on. A lot of graduate students finish graduate school with little savings if any, and accepting a postdoc position that pays only this much is financial suicide.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3169

Perspectives on the postdoc roles and responsibilities

Given the position of post-docs as a post-PhD training period to prepare for being a PI and the relative dearth of PI positions, post-docs should be better compensated, funded primarily through training grants, provided with more structured mentoring and limited in number. Training grant support should be limited to 2-3 years and transitions to independent funding mechanisms (K awards, etc.) should be encouraged after this time.

Fundamental issues and challenges

Fundamenta issues regarding recruitment and retention of post-docs are the lack of compensation, given the training they have already received and the degree they currently hold, the lack of structured and guided mentoring, the lack of community and the lack of a clear path of faculty positions.

Existing NIH policies, programs, or resources

post-doctoral training grant, more K grants

Proven or promising external resources or approaches

Response 3170

Perspectives on the postdoc roles and responsibilities

As the [redacted for anonymity] that is responsible for stewarding the health sciences education and training mission of the [redacted for anonymity], we recognize that there are varied opinions on our campus regarding the roles and responsibilities of postdocs. That said, as a community of researchers we acknowledge the critical role that postdocs play in moving the research enterprise forward. Without the contributions of postdocs, it would be nearly impossible to complete the work proposed in research grants from the NIH and other federal agencies and foundations.

As a community we grapple with the reality that postdocs are often viewed as both a workforce and a trainee population and that these two roles can be mutually exclusive. It may be of value to embrace the idea that postdocs exist on a continuum that includes both workforce and trainee. However, there must be an understanding between the individual postdoc and their faculty mentor about where an individual postdoc falls on that continuum. New postdocs that recently finished PhD training may benefit from a more trainee-focused approach, while more senior postdocs would benefit from more autonomy and may function more in a workforce role. For new postdocs and any senior postdoc looking to advance to their next role, we as an institution and NIH as a federal agency need to do more to ensure that they have access to career discernment and professional development resources. Independent of where an individual falls on the continuum of trainee vs workforce, the postdoc should be a short-term position that leads to an intentional career path.

Fundamental issues and challenges

Salary and access to benefits are core challenges that inhibit recruitment, retention, quality of life for postdoctoral trainees. The cost of living in [redacted for anonymity] has been rising exponentially in recent years. This rapid change has put pressure on our faculty to increase support for current postdocs and offer more competitive salaries for new recruits. Benefits, including access to affordable childcare, present pinch points in recruitment and retention. We would suggest the following changes,

1. Increase the minimum postdoc stipend levels to $70,000/year;
2. Implement a regional cost-of-living adjustment to compensate for differences across the country;
3. Increase the Childcare subsidy to $5,000/year and increase availability to all postdocs supported by an NIH grant;
4. Allow T32s to budget for moving expenses;
5. Mandate paid family leave programs for postdocs that are supported by the institution, rather than the PI. Effective mentoring is an additional issue that impacts all these issues and challenges and that we believe can be addressed by NIH. It was clear in the sponsored listening sessions that many postdocs do not feel that they are receiving adequate mentoring. We have similar issues at the [redacted for anonymity]. T

here are fantastic mentors on our campus, but many of them will acknowledge that they were never trained on how to mentor and do not always have the tools needed to meet the needs of their postdocs. We would suggest the following changes be considered by NIH,

1. Require Research Mentor training for PIs holding any NIH sponsored grant that support postdocs;
2. Require PIs to submit Individual Development Plans (IDPs) for all trainees supported by NIH funds as part of the annual RPPR (R, T, U, and F mechanisms);
3. Provide grant mechanisms that support the development of research mentor training infrastructure.

Existing NIH policies, programs, or resources

Modify the F32 to a grant rather than a fellowship. Postdocs would have autonomy to move with the funds allowing individuals to move on from toxic/unproductive mentoring relationships. This would also allow universities to keep postdocs on payroll and maintain their access to benefits and consistent tax collection resulting in annual W2 forms. By placing postdocs on fellowships, we have issues related to lost access to parking, childcare resources, and retirement benefits. Postdocs are also unable to apply for loans or mortgages due to the inability to provide banks with W2s. As a grant, postdocs could pursue a faculty position mid-appointment, creating a negotiating item, rather than simply a line on the "Honors and Awards" section of their CV.

Allow international postdocs to apply for fellowships and training grants. This change could have multiple benefits,

1. Increased recruitment of top talent from outside the US;
2. Increase to probability that top international postdocs stay in the US academic system;
3. Increase the diversity of our T32 cohorts by adding postdocs with different cultural experiences and approaches to science;
4. Provide international postdocs more autonomy and freedom to do independent science;
5. Provide international postdocs with more security in their labs and careers.

Modify what is considered an allowable use of indirect funds. Postdocs could directly benefit from changes that would allow indirect funds to cover institutional benefits and infrastructure such as paid leave programs, subsidized childcare tuition, development of new childcare centers, or expanding the capacity of existing childcare centers. If these types of costs were allowed, then institutions could account for them in the negotiation of their indirect rate.

Consider increasing the current Modular Cap approach and incorporating reasonable Cost of Living Adjustments into multi-year grants limits the ability to adequately fund postdoctoral training for a stable number of years.

Proven or promising external resources or approaches

The U of Utah has developed a series of Rising Stars Symposia that serve as a recruiting tool to bring senior postdocs and graduate students from diverse backgrounds to campus. These symposia include opportunities to interface with departments and labs looking to hire faculty and postdocs. Each symposium is built around a research topic that may cross multiple departments. Symposia focused on senior postdocs, the topic area matches the interests of ongoing faculty recruitments. Our Diabetes and

Metabolism Research Center has organized Rising Stars symposia focused on research related to diabetes supporting faculty recruitment in Biochemistry, Population Health Sciences and Nutrition and Integrative Physiology. Symposia for senior graduate students focus on departments that have multiple open postdoctoral positions. The Department of Neurobiology sponsored a symposium where students met with prospective mentors, attend a workshop, and give a public talk. Both mechanisms benefit the broader postdoctoral training environment by creating opportunities at the early and late stage of an individual's postdoc career.

We have also recently implemented a Postdoctoral Fellow Parental Leave Policy that is managed by the Office of Postdoctoral Affairs and Professional Programs. With this policy eligible postdoctoral fellows may receive full pay for a period of up to eight (8) weeks to care for a child born, adopted, or fostered. The Postdoc may work part-time during some or all the parental leave of absence. The Postdoctoral Fellow and the Postdoctoral Fellow's faculty advisor enter into a written agreement that describes the Postdoctoral Fellow's responsibilities.

Finally, we would encourage NIH to utilize the Center for Improvement of Mentored Experiences in Research (CIMER)-developed curriculum as a tool for broadly improving the postdoc mentoring experience. A common core curriculum implemented over multiple institutions could help standardize the national approach to research mentoring and limit the variability experiences by individuals at different institutions.

Response 3171

Perspectives on the postdoc roles and responsibilities

I view postdoctoral position as a means to train or acquire skills that I was initially not trained or given the opportunity as a graduate student. For instance, I was trained as in a lab that focused on pharmacologically targeting targets by performing basic assays of dose or concentration responses and measuring in vitro outputs while I was a graduate student. Eventually after attending seminars, I grew to earn to learn bioinformatics or computational skills that I perceive as relevant in my future career. Therefore in order to grow as a scientist, I pursued a postdoctoral position that was in a entirely field focusing on both computational and wet bench lab work.

Fundamental issues and challenges

A major challenge in staying in academia is seeing young or junior faculty/PI who are struggling to push their research forward along with getting data to get published and grants. This is a very vicious cycle that is set on junior faculty within the department of the institutes, especially when there is no help or postdoctoral researchers to push the projects forward. Academic institutes care about NIH indirect funds that are funneled into their departments. If junior faculty struggle to get their projects forwards, I see many of them (junior faculty) working as PI, lab manager, lecturers, postdocs, and lab technician all in one. This is unhealthy and I don't see any glimmer of hope if there is no mention of skilled researchers in academia. While graduate students exist, junior faculty cannot solely depend on them to push the projects forward at an accelerated pace in order to get and publish and simultaneously apply for grants. Thus, I am discouraged from applying to become a PI. A major issue inhibiting postdocs in staying academia is the salary.

Existing NIH policies, programs, or resources

Increase the salary of postdocs like HHMI has recently done! Increase NIH funds per year and prolong the grants from 5-7 years—also increase the amounts!!! Also open NRSA fellowship grants to non-citizens.

Proven or promising external resources or approaches

I think NIH could provide incentives to ALL graduate students who will complete their PhDs to do a short-term postdoc 2-3 years in academia to enhance skills that can be transferrable to industry. For instance, communication and presentation are vital in industry or consulting—manuscript writing and creativity could be further endorsed in academic labs.

Response 3172

Perspectives on the postdoc roles and responsibilities

[Redacted for anonymity] has nearly 2500 postdoctoral scholars, and a dedicated office, the Office of Postdoctoral Affairs (OPA) to support the administrative, medical, and professional development needs of those scholars. Fourteen staff members serve these needs, and interact closely with individual scholars, advocacy groups, and faculty mentors. These interactions provide deep insight into the training environment, and the pressures on both the scholars and the faculty. OPA is in a unique position to experiment with recruitment, fellowships, professional development, and benefits in an ongoing effort to support the needs of all postdocs, and to develop a diverse, equitable, accessible, and inclusive training environment. These efforts underlie the comments below.

The NIH definition of a postdoctoral scholar reflects the transient nature of the position, the critical role of PI as mentor, and the breadth of training necessary to fully prepare people for future careers as productive scientists in a variety of settings. It seems appropriate to refer to postdoctoral scholars as scholars pursuing advanced training, rather than trainees. Further, the "acquisition of professional skills" should clearly extend beyond a specific program of research; that is, at the same time as scholars are developing independence, they should be acquiring skills in mentoring and managing people, project management and budgeting, communication, career education, and other pertinent areas. We recommend NIH be more explicit in its expectations around professional development of ALL postdoctoral scholars, regardless of their source of support (i.e., including those funded off research grants, like R01s).

Fundamental issues and challenges

1. Training time depends on factors outside of a postdoc's control, including time to publication. We recommend against any move that extends postdoc training because such would further discourage individuals, especially those from disadvantaged backgrounds, from pursuing postdoctoral training.
2. Low pay and lengthy training precludes many from pursuing postdoctoral training. Low pay reduces lifetime income, makes starting a family financially difficult, forcing choices between family and training; delayed child-bearing can have potential significant health consequences. These factors especially impact women. We recommend substantial increases in NIH stipend rates to reduce or remove these very negative impacts.
3. PIs can be excellent mentors with the interest of the postdoc front and center. Too often, the pressure on a PI to produce data as quickly as possible causes the PI to push the postdoc; and the postdoc has little ability to push back. The result is less-than-optimal training. We recommend NIH implement a formal requirement for a secondary mentor for all postdocs to act as a buffer against the extreme power-imbalance. We also recommend NIH-funded PIs be required to document active participation in mentoring as evidenced by, for example, mandatory annual IDP conversations.
4. Most postdocs do not go into faculty positions, and do not need prolonged training. We recommend a formal review of progress at two years, to identify those for whom continued postdoctoral training is the best use of their time vs. those for whom departure sooner would be optimal.
5. A lack of diversity amidst the senior faculty impacts innovation, and the broad thinking fundamental to the academic pursuit. Progress in supporting diversity in the undergraduate and graduate populations has not yet impacted the diversity of the postdoc and faculty populations. We recommend expansion of programming to incentivize recruitment and retention of a diverse postdoc population.

Existing NIH policies, programs, or resources

Centralize recruitment: Institutions can provide potential postdocs with a broader understanding of science and resources, and a better sense of the culture. Our own experience with such programs has been positive; we recommend NIH fund new initiatives in recruitment, with robust data acquisition to quantify the most effective practices.

Develop new strategies for optimizing mentor-mentee pairing: NIH could develop a more robust assessment for mentor-mentee matching and change its award structure to reflect the great value of getting this right. Institutions can broaden their training, and support mentor-mentee pairs through ongoing skills and conversation development.

Develop staff scientist career paths: There are few options for talented researchers to continue in academia beyond their postdoctoral fellowship except faculty roles. Yet for many, their own aspirations and

skill-sets best fit a different role, one where they are operating as a staff scientist who provides the breadth and depth of knowledge crucial to an ongoing research program. We recommend NIH direct extramural funding to career paths that make varied careers as a research scientist more viable through grant mechanisms such as the NCI Research Specialist Award (R50).

Change postdoc pay policies: NIH's current postdoc pay policies are inequitable. In addition to overall higher pay levels, policies should recognize differences in cost-of-living in different regions. Additional inequities stem from the policy that federal funds cannot be used to supplement the stipend of a postdoc on a NIH fellowship, even to meet an institution's minimum. This forces such fellows to work with PIs who have access to non-federal funds, thereby funneling fellows into the labs of those with the greatest resources,. We recommend, that NIH reduce these inequities by factoring in the local cost-of-living in its compensation, and removing the restriction on supplementing NIH fellowships with federal funds.

Proven or promising external resources or approaches

Increase recruitment and retention of postdocs from historically excluded populations: Currently, faculty use personal networks to recruit, reinforcing exclusion. Ineffective mentoring leads to early attrition. Improved mentoring focuses on faculty training, a necessary but insufficient step. NIH should mandate training in culturally aware mentoring for all PIs of grants with postdoctoral scholars as contributors.

Centralize recruitment: Stanford PRISM recruitment has attracted nearly 100 scholars from under-represented backgrounds. Virtual recruitment programs have arisen elsewhere. NIH should fund new initiatives in recruitment, with robust data acquisition to quantify the most effective practices.

Develop new strategies for optimizing mentor-mentee pairing: NIH should encourage institutions to implement recommendations in the AAMC Appropriate Treatment of Research Trainees.

Students choose postdoc positions based on factors that may minimize their own mentoring needs. Similarly, faculty may choose postdocs without considering postdoc needs and their own limitations. [Redacted for anonymity] is directing internal fellowships to faculty-postdoc pairs who show clear communication and culturally aware mentoring in their relationship. We recommend NIH develop a more robust assessment for mentor-mentee matching and change its award/reward structure to reflect the real importance and value of outstanding mentoring.

Shorten term limit for first phase of two-tier training: The term limit of 5 years has not accelerated the time between receipt of a doctorate and acquisition of a faculty position and could be considered somewhat arbitrary. We recommend consideration of an evaluation for postdoctoral scholars after 2-3 years; those on track for faculty positions should be transitioned to a new role with a salary increase, while others might adjust their training and time-frame to allow an early exit into a non-faculty career path.

The University of Michigan piloted a second-year review for postdocs, which could support an exit strategy for those leaving academia, and focused mentoring for those staying.

Response 3173

Perspectives on the postdoc roles and responsibilities

Postdocs are vital to academic labs. They help PIs bring their ideas to life and help train the next generation of scientists (grad students, undergrads).

Fundamental issues and challenges

Postdoc pay scale is a significant barrier to recruitment, retention , and overall quality of life for postdocs. As the age of the average postdoc has increased and many are starting families, the current salary scale does not provide the support need for retaining their talent in the academic space

Existing NIH policies, programs, or resources

Increase the modular budget pay scale.

Proven or promising external resources or approaches

Pressure institutions to support professional development that allows PIs to produce mentoring plans similar to the independent development plans that postdocs are encouraged to create. This would allow for accountability by both the postdoc and the PI. https://arxiv.org/pdf/2302.13691.pdf

Response 3174

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] Office of Research formed a working group to provide input to the NIH RFA. The working group consisted of the vice provost for research, associate vice provosts for research, associate dean of student and postdoctoral affairs, vice deans for research, training grant directors, and other professors from schools and colleges with high numbers of postdocs. This group generally viewed the academic postdoctoral fellowship as preparation for an independent research-oriented position in academic, government and other research institutes. The position is viewed as a period of mentored, advanced training to enhance professional skills and research independence. In this position, postdocs perform primarily research and scholarship under the direction and supervision of university faculty mentors.

Fundamental issues and challenges

The [redacted for anonymity] working group agreed that current recruitment efforts are yielding fewer qualified applicants than in the past. The reasons for this are complex, including compensation and benefits, future job availability, work/life balance, and other factors. Industry jobs not only pay more, but also are increasingly viewed as providing more opportunities for making a real difference. Furthermore, fewer fellows aspire to faculty jobs due to a shrinking percent of tenured faculty and the perception that faculty job offers are increasingly rare. Wages are increasing slowly in response to a variety of forces; however, the cost of living is higher in some parts of the country. A challenge is how to pay for wage increases in excess of NIH limits from allowable sources.

Regarding overall quality of life issues, the working group agreed that these are likely to be idiosyncratic to specific labs and types of research. However, several factors were recognized to affect quality of life:

- Power differentials in mentor-mentee relationships.
- Challenges in building a sense of community for postdoctoral fellows due to most training and mentoring being specific to individual labs.
- Career and personal uncertainty for international postdocs due to issues around periodic visa renewals.
- Anxiety associated with a position that is not permanent.

Existing NIH policies, programs, or resources

The [redacted for anonymity] working group identified several issues surrounding NIH policy, programs/training, and resources that could be improved to enhance the postdoctoral ecosystem as follows:

Policy:

- Salaries, rather than stipends, should be used for training grant compensation, potentially making use of the existing GS scale.
- Greater flexibility in postdoctoral training grant funds for use outside of compensation.
- Expand NIH's family-friendly policies to all postdocs, including paid parental leave and childcare subsidies with realistic allocations.
- Offer opportunities for PIs to apply for supplements to cover re-location costs for postdocs.
- Funds to support mentorship training for both the PIs and postdocs should be included on training grants.
- Encourage policies that allows institutions to use direct costs from NIH grants to supplement postdoc compensation and benefits.
- Allow application for NIH supplements that provide cost of living (COL) adjustments for geographic regions with high COL.

Programs and Training:

- Develop NIH programs that allow customization of training experiences to meet the career needs/goals of each specific trainee. Funds on training grants should be more flexible and should allow carry forward
- Extending LRP program to postdocs and expanding the pool of money available to this program.
- New programs or expansion that allow T32-like programs for non-US citizens who are committed to staying in the US for an academic career.
- Extend term limits on a training grant to greater than 3 yrs, given the long times to publish and secure permanent positions.

Resources:

- Develop local and national data collection and dissemination resources to collect metrics of job satisfaction, career outcomes, etc.
- Make NIH funding available for Center for Improvement of Mentored Experience (CIMER) and other professional development training

Proven or promising external resources or approaches

The [redacted for anonymity] working group identified the following resources and approaches for further consideration:

- Resources provided by the National Postdoctoral Association (NPA) and Graduate Career Consortium (GCC)
- Center for Improvement of Mentored Experience (CIMER) Mentor Training
- NASEM report from 2017: The Next Generation of Biomedical and Behavioral Science Researchers
- Resources provided by NIH OITE—virtual offerings have been a huge asset over the past 4 years.
- Regular engagement of NIH with PIs, postdocs, and university leaders to assess, re-evaluate policies, and pivot as needed.
- Set up an NIH program that matches postdocs with PIs, similar to the NSF-funded Research University Alliance, which includes a Research Exchange and a match-maker website, the Postdoc Portal.

Response 3175

Perspectives on the postdoc roles and responsibilities

Postdoctoral fellows are primarily trainees, but they also represent a major part of the academic work force. They are highly trained professionals who already have an advanced degree, and should be treated accordingly.

Fundamental issues and challenges

It is extremely difficult to survive on a typical postdoctoral salary, especially in HCOL areas and/or with children. This makes the academic environment significantly less attractive then the pharmaceutical industry and other private sector employers, especially for US-

Existing NIH policies, programs, or resources

It would not be enough to increase the NIH postdoc pay scale. Without significantly increasing NIH grant budgets, including modular budgets, that would only disadvantage junior and mid-career PIs with small or medium labs. There would need to be fewer cuts to NIH grant budgets to allow for higher trainee salaries.

Proven or promising external resources or approaches

No response

Response 3176

Perspectives on the postdoc roles and responsibilities

The academic postdoc is, both historically and in practice, a time of mentored career development on a path towards an independent career. It should be a balance of work in service of larger projects and personal growth and discovery. It should always be seen as a dual role, both of a highly skilled employee and with opportunities for focus on self-interests. Ideally, a postdoc will have opportunities to experience tasks and roles that will be expected of them in their desired career. The position should be assessed with mutual goals in mind, and evaluated based on certain skills and activities that will move the postdoc closer to the next step of their career. Too often, postdocs are reduced to a labor force, focusing exclusively on the interests of the supervisor that provides salary and resources, all in the name of "training". While it is possible for a postdoc to produce high impact publications and fill an impressive CV, it is not always in the context of honing skills, but sometimes as proxy for an advisor's ambitions. There are enormous power imbalances that prevent postdocs from truly developing independence, sometimes even after leaving a supervising PI's oversight. The exception is when a postdoc obtains a K99-R00 award, when a project is developed and brought to an independent career under the guidance of a mentor, without the interference of financial burdens to a PI. Other types of individual fellowships (such as the NRSA Kirschtein F32's) are frequently worse than being paid on a PI's research grant, because there is never a true connection with an institution or PI, and the mentoring can be very unpredictable.but more on that later.

Fundamental issues and challenges

The structure and history of postdoctoral training is both a strength and a weakness. When postdocs can advocate for themselves and obtain positive mentoring relationships, it can be a period of incredible growth and intellectual stimulation. However, there is very little that outside forces can do to control the quality of those relationships, and due to the high pressure of academic research, there are frequent areas where disputes and bad feelings can arise (relationships are hard.see the national divorce rate). When you add in the very meager opportunities to truly vet a potential mentor-mentee match, it can lead to problems. PI's sometimes have a difficult time finding highly qualified people to work on their projects, especially if their institution is viewed as a somewhat remote or undesirable location, or if facilities or salary are not adequate. With the very high percentage of international scholars coming to the US on visas, it is even more difficult to properly screen a prospective postdoc. Even with such a difficult conditions finding a match, there is still an expectation that things will work out quickly (because most projects can't afford to have people in training for many months). If things do not go very well from early on, a PI can quickly decide to "not waste time" trying to train someone who is lacking in the qualities that are required to move a project forward. Those relationships, especially when immigration is involved, can be very fragile and stressful. A great deal of blame can be attributed to the way that research projects are funded by the NIH. It puts a great deal of pressure on PI's to produce high quality products in a short time, so it incentivizes internal competition and unreasonable expectations. Regarding retention and quality of life, see the next section.

Existing NIH policies, programs, or resources

The NIH individual fellowship system (F32) is nice in theory (trying to make a fellow independent and protect them from any abuses), but it is awful in practice. Host institutions are not able to take the money from the NIH and pay fellows as employees, and this causes enormous INEQUITIES and additional stress on postdocs. Benefits that the fellows are not able to receive include health care, retirement plans, parking, daycare, and many other aspects. It creates a two-tiered system for postdocs, and it is overall quite cruel. The K99 system does not suffer from this defect, as employment is one of the required criteria for the award. Other funding institutions (NASA, NSF, others) have found ways around the problem, but NIH is lagging severely behind, and severely hurting both research institutions and a generation of promising scholars.

Retention and Quality of Life, continued.

When postdocs realize that their career prospects are limited and their earnings in academia will severely hurt their future wealth, prudent individuals will strongly consider leaving academia for other career paths, many of which can offer significantly more money and equal levels of benefits and job security. Many graduate students in the US forgo postdocs completely after the pressure-cooker of graduate school and the pragmatic evaluation of job markets. Unless academic careers are incentivized in some way, the best and brightest will find other paths with less resistance.

Proven or promising external resources or approaches

There are so many good programs, but it would require a major re-working of the national funding of scientific research to try and rebalance the distribution of resources across the country, and it would require a major commitment by individual faculty to buy into a trainee-first mentoring mindset. I'm far too cynical to think that NIH could actually make the world a better place. I just wish that we could either kill the F32 system completely, replacing it with more K awards, or rework it so that it functions more like the K awards, and the postdocs can be employees of host institutions. That's all I am asking for.

Response 3177

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

Science is getting more expensive but NIH budgets are not expanding. In order to meet the benchmarks of the academic system (high-impact publishing), faculty need to spend more money on technology, large-scale experiments, and increasingly sophisticated equipment. This creates a conflict-of-interest with the goal of paying postdocs better wages and employing more of them. It also creates perverse incentives to do sloppy science that is not reproducible and/or misrepresents the significance of research outcomes. With bigger budgets, more qualified staff can be hired (i.e., postdocs), paid living wages and ensure stability so that they have time to do diligent and quality science.

Science is also getting increasingly quantitative, computational and driven by AI. This means that we need to be able to at least remotely compete with big tech and other industry sectors that currently brain drain a near total majority of PhD graduates with these core competencies. Better training will not solve this — the demand for these skills across the private sector is only increasing. The reality is that PhD graduates who can do AI research (even if they're coming from the natural and life sciences!) have the option to make $250k+ salaries if they forego an academic postdoc in favor of research positions in industry. This is a sufficient gap with current postdoc salaries that it makes it incredibly difficult for these trainees to rationalize a decision to stay in academia —especially when combined with aforementioned factors.

Existing NIH policies, programs, or resources

The situation in California is different than in other states due to our much higher minimum wage. But it is still the same basic problem everywhere. Postdocs are not paid enough. In California, even though the required pay rate that is much higher than the NRSA level, it is still not competitive because of the higher cost of living here. The NRSA stipend level is ridiculously low and needs to be increased. That single thing would make a huge difference in every state. If the NRSA level were higher then everybody would have to put higher postdoc salary levels on their R01s and other grant proposals, which would increase all of the requested budgets. This would normalize the higher budget requests in the study sections. Right now you are penalized with a bad score if your budget is too high, so if your institution (or State) requires a higher postdoc salary you are faced with either asking for fewer personnel to support the work or risking not getting any money at all because you get a low score.

Caregiving support is needed. Grants should be provided to institutions so that they can develop childcare facilities in house. Supplements should be provided to R level grants for extra child care costs for postdocs who need access to child care.

If NIH refuses to increase T32 and F32 stipends, they need to reduce their effort on these grants accordingly. If the F32 stipend will only cover 70% of their salary, then only 70% of their effort should be on the grant. This allows us to put the remainder of their salary on other grants.

Perspectives on the postdoc roles and responsibilities

A transition to an independent position, whether in company or in academia should be part of the postdoc training. Postdoc responsibilities must include a commitment to becoming independent in the research cycle (plan-execute-analyze and again). They are supposed to already have developed a work ethic during their grad training (work-hard play-hard is a must in this career). They are responsible for identifying and developing the skills necessary for their career (eg. grantsmanship for academia and networking for industry).

Fundamental issues and challenges

Academic research has a fundamental issue: peer review. As it is now, PR is defined by too much competition and not enough cooperation. This situation is even more extreme than in industry, and creates a vicious circle of stress, poor mentorship, unfair PR activity, unconscious bias and burnout that is propagated from mentor to mentee at all levels. To exit the cycle, those postdocs who cannot find a balance end up in company. Many grad students are already trained like employees thanks to widespread unionization and come unprepared to deal with this stressful environment.

Existing NIH policies, programs, or resources

It does NOT require more NIH funding to address the issue of hyper competition in peer-review, which can be solved by a better coordination between peer review and funding, and by developing a novel publishing platform. Regarding the former, NIH funding mechanisms must abandon study sections (that is, where established investigators anonymously maintain the status quo and stifle innovation), which are universally considered a lottery. It is crucial to insert more elements of cooperation in the competitive process of peer review: for example, if a reviewer criticizes a grant approach, they must be excited enough about their proposed alternative to be willing to collaborate with the PI on it. Otherwise, the reviewer criticism must be dismissed as subjective opinion. Maybe the NIH should have a platform to collect all junior faculty and postdoc research directions so that to facilitate new faculty hiring (for postdocs) and collaboration with senior faculties. Once a balance between competition and cooperation is reached, it will decrease the root cause of the problem with academic research careers.

Regarding publishing, peer review is currently upside down: first editors evaluate impact, then reviewers "evaluate" methods. Novel or existing pre-print platforms should be peer reviewed for methodology by both postdocs (who more experienced than them in a specific technique!) and junior faculty. Exclude senior faculties who likely have lost track of new technologies. This layer of publication should be used for promotion and funding. Current commercial publishing companies would then source the impact they aim for from this pre-print platform, adding value by summarizing multiple studies and delineating where a field is going.

Response 3179

Perspectives on the postdoc roles and responsibilities

The post-doc position is a fundamentally exploitative role whereby senior people get an independent scientist to work for them for low wages, justified by the senior-scientist-serving myth that people need 10-15 years of training before they are independent. It is a position designed to benefit senior scientists at the expense of junior scientists—at the expense of thier mental, physical, social, and financial health. Under the guise of "training" , senior people can get a talented collaborator that they might not otherwise be able to attract and who does not have the freedom to walk away from a toxic or simply non-beneficial relationship. Post-docs' dependency on "mentors" is a completely artificial relic of a broken system—there is no reason people should not be able to move into independent permanent positions earlier.

To the argument that post-docs are "trainees" , learning should be rewarded not penalized with low wages and precarious employment. Are post-docs learning new things? Sure, as any good scientist, at any career stage, should. To the argument that post-docs are simply carrying out the PI's ideas—that has not been my experience—personally, I have had to guide my work theoretically, conceptually, and methodologically,

while mostly relying on mentors for resources/data—resources that could be made directly available to junior people.

Why is there so much concern about the independence/ abilities of junior scientists and virtually no concern about the independence/ abilities of senior scientists? How many senior scientists are capable of doing high-quality science without the system of indentured servitude that supplies a stream of fresh capable minds to their research group? If I had the power to build a dream team comprised of actual scientists I know, it would include primarily junior people—because junior people do the work and too many senior people free-ride.

Fundamental issues and challenges

I'm fed up with systemic abuse of junior people. I experienced neglect, exclusion from opportunities, and bullying in my PhD—I know many others who experienced similar/worse. I came out of my PhD in deep financial dept and on psych meds (neither debt nor meds before my PhD). I love academic research, but the low wages, the lack of seniority/independence after so many years, and the abuse I've experienced is taking a toll.

The balance of being mentored vs. being exploited is heavily tipped toward exploitation. In my post-doc, I independently wrote a grant, designing studies with new methods my PI doesn't know. Then, I helped the PI write an additional similar grant—I helped them far more than they helped me. Both grants were successful. My PI then informs me they will give the projects I independently developed to a new trainee. I eventually convinced the PI the projects are rightfully mine, but I want freedom from senior people who I have to be on guard against.

And there is the social class element. Academia is a pyramid scheme where people who attended Ivies (or similar) move up the ladder more quickly, and those of us from less privileged/ marginalized backgrounds comprise an underclass of indentured servants beholden to the professoriate class. Junior people put off having children, put off going to the dentist, live far away from partners for years, while senior people (who disproportionately rode the privilege wave to their TT position) buy second homes, take multiple vacations per year, all while demanding more and more from junior scientists (especially those from less privilege who can't advocate for themselves as well).

It is demoralizing to work long hours with low pay, be infantilized, see senior people contribute little for maximum credit, while getting very little career support.

Existing NIH policies, programs, or resources

ACTUALLY COMBAT ACADEMIC BULLYING/HARASSMENT. The worst part of my academic experience has been the neglect, active exclusion from opportunities, and outright bullying. I know many others who have left academia due to bullying and harassment. The NIH could track trainee experiences anonymously, cut off access to funding for PIs who are repeat offenders, and have grant 'environment' scores informed by department-level bullying and harassment metrics—thus incentivizing departments to actually police PI behavior even a little bit. I see bullying and harassment as a major reason junior people leave academia.

There should be some attempt to formally measure academic privilege/ adversity and adjust for its undue influence on career success. How prestigious was the applicant's undergrad/grad/post-doctoral institution/lab/PI? If applicants come from the most prestigious institutions—particularly early on in their training—they already have an enormous advantage over those who went to smaller, less prestigious schools. If a great application emerges from a lab that has never had a successful fellowship before, that is an indicator that THE TRAINEE THEMSELVES may be the driving force behind the science—THAT is something that should be celebrated and formally supported (not penalized)! One way the NIH could better support marginalized scientists is to have fellowship schemes that specifically support trainees coming from less productive/less prestigious schools/labs. Another way the NIH could better support junior scientists coming from less productive/less prestigious labs is by giving them extra time for fellowship and early career grant timescales—maybe an extra year to submit a K99 for applicants who came from less productive PhD labs. I know trainees working in great labs who get rounds and rounds of edits on their papers and applications, and I know I wrote mine myself. Competing on such an uneven playing field is exhausting and makes industry positions very tempting.

Proven or promising external resources or approaches

Pay post-docs like the professionals that they are—65K should be a bare minimum with increases for high cost-of-living areas. Create more permanent positions, enable earlier transition to independence, including

non-TT permanent positions. Actually penalize PIs accused of harassment and bullying, and use formal assessment to quantify whether senior people are contributing or free-riding. Build formal funding/support mechanisms that facilitate trainees in safely transitioning away from toxic and non-contributing senior people.

Response 3180

Perspectives on the postdoc roles and responsibilities

The impact of COVID on graduate student training is leading to degree carrying postdocs that are incapable of meeting expectations. Although a postdoc came with a strong reference, was totally unprepared for this environment and expectations and was not able to be productive.

Funding is very scarce, which makes many postdocs feel that even if they get a job, they will not be able to sustain funding for their research. Seeing their Profs struggle to get and maintain funding breeds a cycle of doom.

Shift in attitude of postdocs that has been extenuated by covid. New sentiment is that this career is too hard, & not being able to compete in it.

It’s almost impossible to get paper out in 2-3 years; now more like 5-6 years. Is it fear that they don’t have enough for a high impact paper?

As long as the NRSA postdoc stipend level is low then NIH funded efforts will have decreased productivity. Fewer prospective postdocs will choose an academic career route and the quality and productivity of those that remain will be lower. Paying more will assure that the best and most productive are retained.

Fundamental issues and challenges

Retention:

- Many local biotechs and pharma offer very attractive startup packages and signing bonuses for well-trained postdocs, especially those with bioinformatics expertise.
- Postdocs need to be paid competitive wages commensurate with their life stage. A postdoc is typically in their mid-20s to mid-30s, a time when they are transitioning into starting new families or supporting their aging family members. The latter is particularly salient for postdocs from underrepresented minority and disadvantaged backgrounds, who in many cases simply cannot afford to pursue an academic career since they do not have access to generational wealth.
- Postdocs see very few jobs available in Academia. They may have to apply for several years before getting an offer, and this may be in a place they do not want to live or work. Therefore, Academic jobs seem unapproachable, causing them to choose alternatives.

Recruitment:

- Few domestic applicants, many more recent applicants have been international and seeking VISAs—particularly H1B which risks applicants using us to facilitate relocation without return on investment as they are able to leave within a year for more money.
- Few postdoc applicants, and fewer quality postdocs
- Competition with industry positions, including perceived quality of life for having a family.
- Generational differences. Younger postdocs more reliant on social media and older PIs aren’t leveraging those tools.

Existing NIH policies, programs, or resources

Postdoc pay cannot keep pace with industry careers and opportunities; especially in cities with high cost of living like San Diego. Given current NIH budget structures, we cannot compete. Increase the size of grants so pay can be improved.

NIH needs to increased amount of grants, fellowships and salaries in order to retain top talent and remain competitive globally in science

Adjust the pay scale so that it reflections regional costs of living.

Additionally, given the rarity of assistant professor positions, there is little incentive to take on the highly stressful and underpaid position of postdoc.

Because of low number of high quality US applicants, many labs are now recruiting more candidates from international labs as quality of candidates is better. Develop fellowship mechanisms to support international applicants training in US labs.

Response 3181

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The difficulty in postdoc recruitment and retention is mainly caused by aggressive recruitment in the biotech industry in recent years. The excessive investments in the biotech industry created a lot of positions that need to be filled with PhDs. This led to the lowering of the requirement for a typical scientist position in a biotech company from 4-5 years of postdoctoral experience to 1-2 years of postdoc experience or freshly graduated PhDs. Since the industry pays a lot more than academia for these positions, the red-hot job market lured a lot of PhD students into joining the industry directly without any postdoc training in an academic lab. I think this situation is not sustainable. Things will change when excessive investments in biotech cool down and postdoc salaries in academia start to rise. Both trends are already started.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Could there be more partnerships with industry where they contribute to the salaries of postdoctoral trainees so that the postdocs are trained within the labs that feed into industry positions? This would be more about training experience and research skills from specific labs in which the industry partner invests in and that refined training that would benefit the industry position.

Response 3182

Perspectives on the postdoc roles and responsibilities

A postdoc is a highly trained person conducting research on the highest level largely independently (i.e. NOT a trainee). Postdocs often take on a wide range of responsibilities including project management, grant writing and mentorship/supervision for junior researchers. Although a postdoc position is a transitional role (traditionally with the goal to move on to a permanent academic PI position) the acamdemic research system in the US is largely dependent on postocs and most likely could not exist as is without them.

Fundamental issues and challenges

Although an integral part of the academic system postdocs are often treated as supplicants by their academic institutions rather than valued employees. The attitude, especially in prestigious universities, seems to be that postdocs should be glad to have a position at all, that they are nothing but trainees and if they don’t like it there is someone else who will want their job. As a highly educated person who spent many years being trained and making low wages as a phd student a postdoc, no matter where in the US, should be able to afford to live on their own. With the current NIH salary scale there are many places in the US, such as NYC, Boston, Seattle or California, where this is only a far off dream and people need to share apartments in order to afford rent. Furthermore, postdocs tend to be in their 30s which is a time when for many people family planning, home ownership and retirement savings become important topics. However, many academic insitutions are not doing enough to support postdocs either by increasing wages to meet cost of living in the area or by improving benefits or both. This results in postdocs putting off

those milestones of adult life until they "have a permanent position" (which is not clear when or if it will happen). It should come as no surprise to any academic institution or the NIH that given the lack of appreciation, the often inadequate financial compensation and lacking benefits many PhDs now choose to not do a postdoc at all or leave academia for industry after only a few years of postdoc.

Existing NIH policies, programs, or resources

NIH needs to change their postdoc salary scale to account for cost of living in the area they live in. The salary a postdoc receives needs to reflect the qualification and expertise they have aquired during their PhD and needs to be comparable to what they would make outside of academia.

Response 3185

Perspectives on the postdoc roles and responsibilities

Postdoctoral researchers are responsible for various research and training activities and are crucial in advancing scientific projects. More specifically, they develop and carry out research projects. Their activities include designing and implementing experiments, collecting and analyzing data, and interpreting results. Additionally, postdocs may also be responsible for developing their research projects within the scope of their mentor's research program. As part of research activities, postdocs often collaborate with other researchers, including graduate students, technicians, and other postdoctoral researchers, to complete research projects. In many instances, they informally mentor undergraduate or graduate students. Some postdocs may be involved in writing grant proposals to secure funding for their research

projects. Postdocs also contribute to the daily operations of laboratories by managing lab resources, including ordering supplies, maintaining equipment, and ensuring that the laboratory complies with safety regulations.

Fundamental issues and challenges

Particularly after the pandemic, there is a global and nationwide shortage of postdoctoral candidates. This is fueled by the worsening economy (inadequate income), decreased desirability of prospects in academia (limited career advancement opportunities, low funding, issues related to publishing), work-life imbalance, lack of adequate mentorship, limited training opportunities to improve professional and scientific knowledge, limited equity and inclusion, and visa issues for international scholars. Junior and senior investigators have difficulty recruiting competent candidates despite the available funding. Overall, this issue decreases the scientific output of our labs and increases the need and workload for other trainees, particularly graduate students, in the laboratories. This increased pressure on graduate students creates a vicious cycle that detracts potential future PD candidates from considering academic careers.

Existing NIH policies, programs, or resources

1. Expanding eligibility criteria for postdoctoral fellowships (International applicants).
2. Developing programs to train PIs on effective mentoring (and holding PIs accountable??)
3. Encouraging training on other aspects of academic responsibilities (teaching, service leadership)
4. Collaborate with different professional societies to increase the representation of postdoctoral fellows from underrepresented fields
5. Include postdoctoral fellows in early career reviewer programs.

Proven or promising external resources or approaches

1. The National Academies of Sciences, Engineering, and Medicine (NASEM): NASEM has published several reports on the state of the biomedical research workforce and postdoctoral training. These reports provide evidence-based recommendations for improving the training, mentoring, and career development of postdoctoral researchers.
2. The National Postdoctoral Association (NPA): The NPA is a professional organization that provides advocacy, education, and resources to support postdoctoral researchers. The NPA has developed a number of resources and guidelines to promote best practices in postdoctoral training, including mentoring, professional development, and job search strategies.
3. The Center for the Improvement of Mentored Experiences in Research (CIMER): CIMER is a resource center that provides training and resources to improve mentorship in research. CIMER offers workshops, coaching, and online resources to help mentors and mentees build effective mentoring relationships.
4. The Future of Research (FoR) Coalition: FoR is a grassroots organization that advocates for improvements in the research enterprise, including postdoctoral training. FoR has developed a number of resources and initiatives to address issues such as diversity and inclusion, career development, and mental health and wellbeing.
5. The Howard Hughes Medical Institute (HHMI) Postdoctoral Fellowship Program: This program provides funding to support postdoctoral researchers in their research and professional development. The program emphasizes mentorship, networking, and career development, and has been shown to enhance the training and career trajectories of postdoctoral researchers.
6. The Consortium of Social Science Associations (COSSA): COSSA is a non-profit organization that advocates for social and behavioral science research. COSSA has developed resources and tools to help social and behavioral scientists navigate the postdoctoral training and academic career pathways.

Response 3187

Perspectives on the postdoc roles and responsibilities

The mantra of our postdoc office has always been that 'The point of being a postdoc is to no longer be a postdoc.' This is because the postdoc is a transitional career phase, not a destination, and the goal is to gain the training needed for a postdoc's next career step. But is it really needed? In some academic disciplines, this is not the case, and PhDs still go straight into the professoriate. But in the biomedical sciences, the existence of the postdoctoral career phase has effectively and permanently inflated the CV accomplishments required to obtain a tenure-track or PI position. So if the postdoc is here to stay, the community needs to ensure that the experience provides additional value.

The growth in the number of postdoc offices in the past decade has helped create more accountability for the postdoctoral experience. Nevertheless, more work needs to be done to foster a respectful and effective training environment and most postdoc offices are one person offices with few resources. Real culture change needs to start with faculty PIs, and PIs respond to funding incentives. NIH has taken helpful steps to start to address the abuse and harassment concerns of postdocs. An additional helpful step would be to look at funding deliverables on research grants and ensure that positive training experiences are also an expectation instead of a conflict of interest.

Fundamental issues and challenges

As a postdoctoral community, we need to reexamine the longstanding view that postdoc salaries and benefits can be low because they are scholars in training. Firstly, postdoc supervisors are often not held accountable to provide such training. Secondly, with industry as an increasingly viable post-PhD career alternative, postdoc salaries should reflect the level of training and expertise they already possess and should become more commensurate with the broader research job market beyond the academy. Appropriate salaries would make the postdoc position more liveable for scholars who are often in their thirties with families and other financial obligations. In addition, if postdocs become more expensive on research grants, then they may be treated more often as valued colleagues instead of as "cheap labor."

The NIH NRSA stipend level is a major driver of the postdoc salary landscape, but salaries are still set at the local institutional level for non-NRSA postdocs. The NIH might consider extending salary expectations to research grants that include postdocs as well. This would ensure that a majority of grant-funded postdocs in the U.S. are receiving appropriate compensation, and provide leverage for institutions to continue to set equitable salary scales for postdocs funded through different mechanisms.

Existing NIH policies, programs, or resources

The relative share of individual fellowship funding to research grant funding from NIH and other funders has decreased over time. Yet a fellowship is an opportunity to provide a true "transition to independence" for a postdoc. The fellow must take ownership of crafting and implementing research goals, managing a budget, and typically, engaging in training and career development. The fellow identifies a faculty sponsor for mentorship, but retains the autonomy for their science direction. This process prioritizes the fellow's training needs and cultivates innovation and creativity skills through the fellow's intellectual leadership of their project. While these experiences can be garnered through a PI-led R01 grant-funded project, a grant-funded postdoc's professional education and growth will never be the top priority—and in some cases can be neglected altogether. Increasing the relative balance between individual fellowships and grants could help address this issue.

An alternative to an individual fellowship could be to treat postdoc funding for research grants as a separate educational supplement that requires training goals to be established in advance--and reported upon--for any postdoc hired. The proposal could include, for example, a postdoctoral mentoring plan like

that required by NSF. In this way, the supplement could adopt some of the advantages of the fellowship proposal process while still supporting the goals of individual investigator research grants.

Proven or promising external resources or approaches

Fellowships are an important marker of excellence for early career scientists, and yet the potential loss of benefits upon fellow appointment remains a disincentive. The federal government and NIH in particular have worked for many years to maintain fellowships as a prestigious appointment that allows greater intellectual freedom and some financial benefit by avoiding the quid-pro-quo, pay-for-work model of an employee appointment. Any advantages to this type of appointment, however, are dwarfed by the disadvantages of lacking proper institutional status and access to resources, and appropriate employee-level benefits, such as paid time off, retirement, and affordable health insurance.

The 2021 NPA Institutional Policy report shows significant inequities in benefits access for fellows versus other postdocs—but this is a longstanding problem. Stony Brook University and the SUNY system developed a solution in 2019, establishing "seamless benefits" where grant-funded postdocs and fellowship-funded postdocs had access to the same health plans. While this a major success, challenges remain, as our fellows still do not qualify for the insurance premium subsidies enjoyed by employee postdocs. Our unsubsidized health plan premiums for fellows are over four times more expensive with costs than can exceed fellowship benefits allocations, particularly for family coverage.

One model the NIH might consider is a recent change to the NASA Hubble Fellowship Program (NHFP), a prestigious postdoctoral fellowships in Astrophysics. NHFP requires any sponsoring institution to offer awarded fellows the option of being appointed with employee benefits. In this case, NASA would provide the fellowship funds to the institution as a grant, with the faculty sponsor as PI, and will provide benefits funds at the appropriate fringe rate. Adopting a similar model for NIH fellows could be one way to ensure benefits equity between fellows and grant-funded postdocs and to incentivize the pursuit of prestigious external fellowships.

Response 3188

Perspectives on the postdoc roles and responsibilities

At many academic institutions, postdoctoral scholars are the lifeblood of biomedical research. They lead independent projects at the cutting edge of their fields, provide mentorship and support to their peers and graduate students, and help to shape the research programs of the PIs that employ them. In the best case, postdocs have an opportunity to train in new skills, expand their knowledge base, explore new fields, and build interdisciplinary bridges between their previous training and their current work. In the worst case, postdocs are overworked and undercompensated expert labor for PIs whose publications and grants depend on the material and intellectual contributions of these highly skilled scientists.

There is considerable diversity in the types of scientists who pursue postdocs. Some postdocs are seeking training beyond their graduate training, for example those who are switching research fields or who are seeking to learn new methods in the same field they did their graduate work in. Other postdocs are seeking intellectual diversity, staying within the same research field but looking for training in a new perspective on that field. Because prestige, an arbitrary metric, is often used in hiring decisions, some scientists use postdoctoral training as an opportunity to acquire prestige conferred by their postdoctoral institution or their postdoctoral adviser. This last option is particularly true for postdocs from marginalized backgrounds who, due to bias in what types of institutions and PIs are viewed as prestigious, might have been limited in their access to prestige as a function of the previous academic opportunities.

Fundamental issues and challenges

Insufficient salaries, high potential for abuse, short term contracts, and the dependence on singular mentors for career progression, as well as limited academic prospects as either staff scientists or principal investigators are all major issues in postdoc quality of life. These issues are exacerbated for international scholars, a major population of researchers at many R1 research institutions, with the added precariousness of their ability to live in the US being dependent on fickle bosses, having to navigate complex immigration bureaucracy with little to no support from their employer, and fewer opportunities for funding while in the US. These issues coexist with many scientists navigating racist, sexist, homophobic, transphobic, and xenophobic environments with limited recourse either through their universities or their funding agencies. Further, because of the temporary nature of the postdoc position, scientists who are

looking for long term research positions in academia where they do not lead their own laboratories may decide against postdoctoral training in favor of a higher paying more permanent position as a staff scientist outside of academia.

Existing NIH policies, programs, or resources

F32s, T32s, K12s, K01s, K22s and K99s all serve to fund postdoctoral training, but funding levels across these awards are stagnant. Further, many postdocs who do not receive these awards are funded off of their PIs R01-level research grants, which furthers the precarity of the postdoctoral position. For many, these awards are difficult to obtain due to biases against age, time from PhD, and the relative prestige of their institution or PI.

The NIH can improve postdoctoral training by expanding all of these funding opportunities. Stipends should be increased significantly commensurate with the applicant's cost of living. Citizenship requirements for T32s and F32s should be dropped. Time-since-PhD criteria for career development awards should be dropped. All NIH postdoctoral funding mechanisms should have cohort-based duplicates targeted toward marginalized postdocs similar to the MOSAIC K99 mechanism that has proven incredibly successful.

The NIH should establish strict mentoring criteria for PIs who administer R01, T32, or K12 awards the fund postdocs. The NIH should establish clear consequences for bullying and abusive PIs.

Finally, the NIH has a role to play in removing the need for postdoctoral training in the first place. This should take two forms:

For scientists who do not need additional training, the NIH should expand its DP5 program targeted to graduate researchers looking for jobs at minority-serving institutions or other institutions that do not receive significant NIH funding.

For scientists who want to stay in academic research as staff scientists, the NIH can obviate the need for doing a postdoc by expanding the R50 mechanism to fund staff scientist positions.

In summary, through increasing salaries, increasing the presence of cohort-based career development programs, increasing oversight over mentorship, holding abusive PIs accountable, and providing direct routes from the PhD to both PI and staff scientist positions, the NIH is well positioned to considerably improve postdocs experience.

Proven or promising external resources or approaches

A litany of public complaints from universities and principal investigators indicate there is a lack of postdoc applicants. Anecdotal reports suggest that PhD students are looking to the biotechnology arm of the private sector after receiving their training. These industry jobs offer high compensation, impressive benefits, ample time off, and some assurance of career progression. Additionally, due to the threat of liability and the existence of litigation-conscious HR departments, working in industry is often accompanied with greater perceived protections from abuse compared to academia. All of these features of the biotech industry could be replicated for academic science should the NIH choose to implement the suggestions above.

Response 3189

Perspectives on the postdoc roles and responsibilities

I view a postdoctoral position as an opportunity for further specialization of your skill set and to demonstrate research independence, ideally more efficiently than during a PhD. Generally speaking, I view a postdoc as necessary to a career in our current academic system.

Fundamental issues and challenges

The largest fundamental issue to doing a traditional postdoc, in my view, is the sacrifice of years and financial opportunity at this specific stage of life. Most postdocs must spend 4-5 years to produce publications, after having spent 5-7 years in PhD training. Many people, including myself, have spent 1-2 years prior to that to become competitive for graduate programs. That is between 9-14 years of "training", without a guarantee or limit on this timeline, and all the while we and our families sacrifice financially. As a first generation college student, I pursued each stage of education as one "should", quite successfulIy, but have reached the postdoc stage at the age of 31. I am in the challenging position to choose how to

support my family in the long term and I will no longer sacrifice time and money towards this system despite my passion for science and huge empathy for the people behind it. I will likely pursue a career in industry research that values my skills and respects me as a person, while pursuing translational research. It also doesn't appear that a postdoc is strictly required to pursue independent industry roles in our current climate.

Existing NIH policies, programs, or resources

I do not have knowledge of all the specified programs above, but ultimately support and protections for trainees could be improved through paying a livable wage, supporting PIs to do so, and ultimately changing the landscape of our academic system so people do not have to sacrifice family and longterm wellbeing. Training stages (including the PhD) should aim to be as efficient as possible and to enforce or at least justify extended timeframes. For example, PIs who are funded to be mentors of PhD and postdoc trainees should be held accountable for training times. This is often at odds with the publication goals of the PI, which likely requires a larger solution if this is the metric careers are measured by.

Proven or promising external resources or approaches

Pay people livable wages. See the recent HHMI initiative that increased postdoc salaries to $70,000 or more.

Response 3190

Perspectives on the postdoc roles and responsibilities

In Neuroscience, a postdoc is a time to focus on research (away from classes or other demands), gain further skills, and, make a name for yourself by doing excellent science to slingshot yourself into a faculty position. A successful postdoc sets the stage for a bright career as a scientist.

Fundamental issues and challenges

1. All but the most overt abuse by PIs is easy to cover up, and the power dynamic is stacked against trainees. PIs who create unrealistic demands, overly-competitive workplaces, avoid their duties, etc. need to be held accountable. This is particularly insidious when no legal law has been broken, but life is made miserable by working in a given lab, because there's no clear path for affected individuals to report problems. Even if problems are reported, it is easy for universities to ignore or sweep them under the rug, especially when abusive PIs are powerful or bring in lots of NIH dollars. NIH NEEDS A SPECIFIC WAY INDEPENDENT OF UNIVERSITIES TO VET THE HEALTH OF LABS IN AN OBJECTIVE WAY. Trainees in abusive situations don't want to speak up out of fear of retribution. Any reports or reviews sent to NIH about negligent or abusive PIs should not be reviewed by other academics, which risks getting back to the PI.
2. Pay is low. It does not keep up with inflation, post-docs are already coming from low pay during grad school, and are far behind their age-matched counterparts in quality of life, retirement, etc. Academic scientists do not need to be rich, but worrying about having enough money for medical treatment, adequate housing, and all the things money pays for is a detriment to science, because it plagues the mental acuity of the scientist. This impacts trainees form under-represented backgrounds even more.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

PIs respond best to grants. The demand for jobs in academia, even now, means that postdoc positions are more in demand than there are postdocs. Even worse for faculty. There should be some mechanism, tied to grant funding, that attempts to vet PIs quality as a mentor, not just a scientist. Quality as a mentor means willingness to spend time on students, cultivating healthy lab environments, etc.

Response 3191

Perspectives on the postdoc roles and responsibilities

The role of research postdocs is less valuable and higher inequality of opportunity/ career growth than clinical postdoc/fellow. This gives higher impacts on international postdocs, including US citizen international postdocs. This also ties to the role of mentor/PI as well as the NIH regulation. It seems the NIH strongly supports only academic tenure, but not research tenure (most institutes offered staff scientists/project managers), as after training, postdocs do not always gain better opportunities after training. The more time you spent as postdocs, the more undervalue you become, not value as an expert, though they had been trained. NIH should make it clear who their targets (only academic tenure tracks) as well as other career options are for career growth, then postdocs will understand the future career paths and expectation. However, staff scientists are equal to assistant professors, but their role is like a technician with a PhD degree, not to mention, with other responsibility of mentor-mentee, teaching-training the lab members, writing grants, but no future career (except higher salary levels than postdoc position), reflecting undervalue and disrespect of staff scientist position. Not surprisingly, there are more international postdocs than US citizen postdocs, who know the system better and choose better career growth and security in industrial (or other types) jobs.

NIH should mandatorily hold institutions and mentors/PIs for supporting postdocs to get professional development training in management (personnel, budget, administrative), leadership, teaching, science communication, grant-writing, new experimental techniques, career exploration, and other transferable skills. This will be reported as the IDP and independent (from mentor) yearly evaluation back to NIH as well. Poor qualified institutes/mentors/PIs should not continue getting postdocs and research funding.

Fundamental issues and challenges

Salary is not standard; however, the NIH provides the guideline, the final decision of salary depends on the institute and the PI. As the 4th year postdoc, my salary is $56,736, not even reaching the step 0 of GS-10 federal pay schedule with minimum $62,898, and no adjustment for the cost of living or inflation.

NIH should provide early career scientists with actionable information and transparent data to make informed career choices before and during their

postdoc periods, establish a minimum percentage of postdoc time to be devoted to service, mentoring and professional development activities, including increased awareness of career options (e.g.,academia, industry, government). Mentors need to be selected well enough to devote their time for mentoring and training postdocs. Here are my bad experience:

1. 80% of my postdoc period worked as a research coordinator, not gain any research training that much,
2. one postdoc in the same year and T32 program were quited (in Mar-Apr) before the program (in June) ended as his project was failed and his mentor could not support him with anything; he ended up as a sale representative job.

Since postdocs is still under mentors/PIs, NIH should expand its DEIA initiatives and instate rigorous, impactful at least annual mandatory DEIA training for all those impacting postdocs (mentors/peers/PIs/PDOs) similar to research ethics. NIH should hold institutions accountable for fostering inclusive and supportive training environments, including the mandatory requirement for institutional commitment to preventing discrimination and harassment.

NIH should create or expand programs to support staff scientist positions in academic labs, providing additional career options for postdocs, and supporting stable and valuable position of staff scientists who do not just work as lab technicians.

Existing NIH policies, programs, or resources

Limitation of two years causes higher risk of study failure or incompleteness. The flexibility of hiring should depend on the project and/or fields.

The role of postdocs for grants is limited and unfair. For example, the study is originally proposed by me, I can only be a project leader but cannot be a co-PI, just because I am a postdoc. I am talking about the reality and fair contribution that should occur in the scientific community. I think this produce an unfair and unethical contribution.

No offend to support the international postdocs as I am. However, I consider the fairness to everyone and every job. If some regulation of visa can be exempted for postdocs, then they should apply to every job for international citizen as well, as they will face the similar problems. In reality, undergraduate/graduate international students who choose to come to study in the U.S. have to follow the university regulations as well as the U.S. immigration regulations, when they are in the U.S. This is the same situation. The basic regulation of vacations and supports have been provided before hiring; postdocs can choose to accept/decline the position.

NIH should mandate mentorship training for NIH-funded PIs, menteeship training for postdocs, and mentoring committees at all institutions receiving NIH funding, should be continue regularly such as every 2-3 years, especially if they get grant funding. NIH should mandate that all postdocs develop an IDP and that PIs support and submit documentation of progress. The institutes should get levels of penalties if there are a failure of training postdocs. NIH should create or expand programs to support staff scientist positions in academic labs. This would benefit academia by maintaining continuity of lab knowledge, providing additional career options for postdocs, while providing clear differentiation between these positions and postdocs.

Proven or promising external resources or approaches

NIH should maintain comprehensive and support professional development resources, work closely with institutions that host postdocs and NPA

on an ongoing basis to consult on institutional policy adjustments and tool development that are needed to complement public policy change, collect metrics on postdoc satisfaction on an annual basis and allow postdocs to provide honest, anonymous feedback without retaliation.

Thanks to NIH for the platform to share my opinion for postdoctoral training in the biomedical sciences. I hope all responses could help the system to maintain scientific research and prepare the next generation, especially U.S. citizen, of scientists.

Response 3192

Perspectives on the postdoc roles and responsibilities

The PD role is a senior scientific position for those who have completed the highest degree available (PhD). The science done by PDs requires skill and knowledge gained over many years and is necessary for the advancement of human knowledge in the public domain.

Fundamental issues and challenges

PAY. It is as simple as that—it's almost insulting to even have this survey when this basic fact is obvious to anyone with half a brain—let along a PhD. I am at one of the world's leading institutions doing research that is at the cutting edge of my field in medical genomics and I am making less than some people earn with a Bachelor's degree, I'm sharing with three roommates, I can't afford to fly home to visit my family, I don't have the money to even think about buying a house. It's a disgrace.

Existing NIH policies, programs, or resources

We don't want [redacted] programs like "postdoc appreciation day" or whatever that do NOTHING to improve the material conditions for the actual workforce. We want direct intervention into the pay for our time worked and the calibre of our work. This means a MINIMUM 20% rise in the current NIH pay scale.

Proven or promising external resources or approaches

No response

Response 3193

Perspectives on the postdoc roles and responsibilities

An academic postdoc is a research fellow or scholar who devotes significant time to research and professional development. Due to the lack of a consistent definition across various institutions, they are treated poorly due to a lack of proper representations or established culture. The transient nature of the position makes it difficult the passing the institutional knowledge built over time. It makes it easier for the

university to take advantage of the work they have done without proper compensation in the form of more resources or opportunities.

Fundamental issues and challenges

The postdoctoral position used to be the path toward building a career in academia and building the expertise required to conduct independent research. However, the lack of opportunities in the job market and the current financial crisis (inflation and lack of adequate, sustainable income) has incentivized a path away from academia and toward other industries. The pandemic has severely affected my trajectory. It delayed my progress in research due to lack of access during the acute crisis while also slowing down the one-to-one training once the barriers were lifted. The isolation experienced and the lack of support also soured my personal experiences.

Existing NIH policies, programs, or resources

I was negatively affected by the earning of an NIH fellowship. My university stopped treating me as a full employee, and I lost some of the benefits typically given to employees. The NIH should issue guidance explaining to the institutions that earning a fellowship is not grounds to lose the categorization as an employee. Furthermore, they should have a yearly or bi-yearly inquiry into the national postdoc situation so that the policies, programs, and resources reflect the current times.

Proven or promising external resources or approaches

Consolidation of professional development resources could be highly beneficial. They should be a central hub where postdocs nationwide can connect and take advantage of the resources that could help them advance in their career.

Engaging with Universities and postdocs associations for policy adjustments that could help retain postdocs.

Thank you for the opportunity to share my current experiences as a postdoc.

Response 3194

Perspectives on the postdoc roles and responsibilities

The [redacted for anonymity] has conducted a survey amongst the postdoctoral community, and we provide a summary of the results and appropriate responses to the questions below. A total of 17 people answered the survey, including 10 International postdocs (59%), 6 United States citizen postdocs (35%), and one permanent resident.

More than half the postdocs (53%, n=9) felt a lack of clarity in their career path to the next position, while 40% (n=7) felt there was a lack of professional skills development opportunities, including teaching.

Requiring formal performance reviews as part of an NIH award will help PIs identify these issues, and work towards developing these skills.

Additionally, requiring a minimum percentage of postdoc time to be dedicated to service, mentoring, and/ or professional development opportunities will provide us with tools for success both inside and outside academia. Postdocs should have protected time and funds to attend at least one scientific or professional development conference annually to explore new concepts, share knowledge and perspectives, and network.

Provide a safety net for postdocs pursuing non-academic careers: While the [redacted for anonymity] has resources dedicated to career services, the NIH should also require that PIs foster a supportive environment for postdocs who decide to pursue non-academic jobs. Some steps could include the use of NIH funds to attend meetings that develop these specific skills, such as a career in science policy, or repercussions towards NIH-funded PIs who mistreat or manipulate postdocs deciding to pursue non-academic career paths.

Finally, we support the NPA recommendation that NIH replace the inappropriate term “Trainee” and replace it with “Postdoc/ Postdoctoral Scholar/ Postdoctoral Fellow” in all communications.

Fundamental issues and challenges

Salary: Almost all postdocs surveyed (94%, n=16) felt at least some impact of salary on their postdoctoral experience and quality of life, with 70% (n=12) feeling a significant impact. Many complaints include not having enough income to cover childcare costs, or salary levels not being competitive enough with industry standards, especially given our skill level, workload, and responsibilities. Higher postdoc salaries, such as the NPA recommended starting minimum salary of $62,898, would be a good start to help address this very crucial issue.

Issues facing international postdocs: As outlined in the NPA's 2023 Postdoctoral Barriers to Success report, international postdocs face a multitude of challenges.

Many postdocs and their spouses/ dependents face unnecessary stress when it comes to renewing contracts and visas, with ~75% of postdocs from our survey feeling an impact from visa requirements. The current requirement of having to renew visas annually exacerbates this issue and serves as a needless distraction from an already demanding job. The NIH should encourage contracts with lengths commensurate with the intended postdoc periods, longer termination notices, and ties to institutions not PIs.

The NIH should also expand funding opportunities to visa holders through K99/R00 and new programs.

Harassment/ Abuse: Many international postdocs also face harassment and abuse from their PIs, particularly due to their vulnerability of being an international postdoc. Our survey reports that 47% (n=8) postdocs feel at least some impact from harassment by PIs, with ~35% (n=6) experiencing a significant impact. Additionally, some postdocs report that they do not get paid even the minimum salary stipulated by the NIH. We believe that the NIH has a tremendous responsibility to combat this abuse, with harsh action again PIs/ mentors creating an unhealthy and unprofessional work environment for any postdoc, and even more specifically, for international postdocs.

Existing NIH policies, programs, or resources

Postdocs in the [redacted for anonymity] system are the sole group singled out as not eligible to receive any employer contributions towards retirement. Consequently, more than 82% (n=14) postdocs surveyed felt at least some impact of lack of such benefits towards their postdoc experience, with ~70% (n=12) stating that this issue had a significant negative impact on their postdoc experience. The lack of this benefit means a delay or reduction in long-term retirement planning, forcing us to consider a transition to industry.

Additionally, clinical postdoctoral fellows on this campus do not receive paid parental leave available to other postdocs on the same campus.

We request that the NIH mandate that NIH-funded universities and institutes:

1. Make contributions towards postdoctoral retirement matching levels provided by other employers.
2. Provide the same benefits to all postdocs at a particular NIH-funded institute regardless of department.

The NIH should expand its childcare subsidy program for intramural postdocs to all NIH-supported postdocs to a $10,000 annual maximum, adjusted for household size and income.

The NIH should mandate that all NIH-funded postdocs develop an IDP (Individual Development Plan) and that PIs support and submit documentation of progress.

Also, as requested by the NPA, collecting metrics on postdoc satisfaction on an annual basis will position NIH to be nimble in its response and adjust policy accordingly based on the needs of postdoctoral researchers. These data will not only provide key insights that will determine if new policy changes are effective, but will allow postdocs to provide honest, anonymous feedback without retaliation.

Finally, the [redacted for anonymity] requests the NIH to continue expanding its DEIA initiatives, including mandatory training for all postdoc mentors, with clear measures for accountability.

Proven or promising external resources or approaches

The [redacted for anonymity] supports the answers provided to this particular question by the NPA, including using NPA resources, consolidating professional development resources, and engaging with key stakeholders involved with postdoc well-being.

We would like to thank the NIH for providing a platform to share our concerns in this unstable academic market, and for the progress made thus far in providing support to postdocs.

Response 3195

Perspectives on the postdoc roles and responsibilities

I see it as a bery low paid traineeship

Fundamental issues and challenges

Low wages. The starting pay of a postdoc is lower than that of someone with a bachelor's degree

Existing NIH policies, programs, or resources

Unsure

Proven or promising external resources or approaches

Unsure

Response 3196

Perspectives on the postdoc roles and responsibilities

We are submitting the comment on behalf of [redacted for anonymity]. Thousands of our members work in biomedical research and affiliated enterprises, including 11,000 Postdocs and Academic Researchers at [redacted for anonymity].

As a powerful funding agency, the NIH has a unique ability to help ensure that the academic Postdoc experience is sustainable and inclusive now and for the future. Postdocs are foundational to carrying out much of the work funded in academia by the NIH—and bring in billions of dollars in NIH grant money. They write grants, keep labs running, perform cutting-edge research, mentor students, and more. Yet Fundamental issues and challenges like low pay and benefits, a lack of basic workplace rights, and a failure to promote career pathways for early career researchers threaten the sustainability of the research system.

Fundamental issues and challenges

Lack of support for Postdocs and other early-career researchers threatens the sustainability of the research system. Low pay has meant that Postdocs are increasingly unable to make ends meet due to high cost of living; parental leave is extremely limited or non-existent; Postdocs with disabilities receive inadequate services; and too many Postdocs experience harassment or abuse at the hands of their supervisors. Ensuring diversity in the scientific community reduces bias and creates better research outcomes, but too often, systemic problems hold people back and force them out of academia—in particular, women, people of color, international scholars, and other marginalized communities.

These issues are of vital importance as fair compensation and equitable treatment means stronger research institutions. Multiple studies have found that Postdocs in more supportive environments (more job security, more structure, better salary and benefits) publish significantly more papers, produce more patents, and win more academic awards. Better working conditions for researchers means more successful and productive researchers.

These are not new problems—they have been reported by a series of committees organized by the National Academies, NIH, and other organizations over the past 30 years. While there is no lack of reports and data on these issues, there has been a clear lack of progress on implementing the recommendations of the reports. In our experience, the most progress has been achieved when Postdocs and early-career researchers take agency over their working conditions by forming unions. Through their unions, Postdocs at UC, UW and across the country have won significant improvements via collective bargaining. But more progress is necessary to make academic research an equitable and sustainable system—to do this, workers and federal agencies like NIH should collaborate on improving researcher working conditions, which will in turn improve the quality of research in the U.S.

Existing NIH policies, programs, or resources

These recommendations are based on feedback from [redacted for anonymity] and our experience with negotiating contracts and enforcing rights over the past two decades.

Compensation: Postdoctoral researchers bring in billions of dollars to universities, yet almost 95% (per a national survey) report that low pay affects their personal and professional lives. Low pay disproportionately impacts members of historically marginalized groups and drives inequitable research workplaces. To address this, NIH should significantly increase Postdoc pay on all NIH funding mechanisms to at least $70,000 and should implement regional-based pay adjustments (such as the GS-11 scale for federal employees).

Parent and caregiver support: Insufficient paid parental leave, childcare support and dependent healthcare coverage have been shown to drive parents (and especially women) out of academic science. Paid parental leave of at least 16 weeks should be included in all NIH funding mechanisms, all NIH grants and fellowships should include funds to fully cover childcare costs, and NIH should require grants to fully cover dependent health care.

Equity for international scholars: International scholars comprise a majority of Postdocs at many institutions but are excluded from eligibility for certain types of support include Kirschstein NRSA fellowships. To ensure fairness and equity for all researchers, NIH should eliminate all eligibility restrictions based on immigration status.

Job Security: Most Postdocs lack basic job security and could be dismissed at any time without reason, and are appointed on short contracts. To improve research outcomes and increase retention, we urge the NIH to require grantees to have just cause protections in place for Postdocs and to ensure adequate contract lengths.

Protecting the right to form a union: NIH should require grantees to remain neutral when workers are deciding to form a union so they can make their choice free from intimidation or fear.

Proven or promising external resources or approaches

A recent study in Nature found that 65% of Postdocs have experienced bullying and a National Academy of Sciences report found that academia was second to only the US military in rates of sexual harassment. These issues disproportionately impact women, trans and non-binary researchers, international scholars and people of color. A tested approach to addressing these issues is enforceable protections against harassment and bullying through a grievance procedure that includes third-party arbitration, which postdocs at both the [redacted for anonymity] have won through collective bargaining. We have seen over and over again that forming a union and collective bargaining is a key factor in changing the power dynamics that leads to abuses of power.

The 2020-2021 annual equity survey at the [redacted for anonymity] reports after experiencing harassment, 81% of early career researchers who accessed resources through their union were very or somewhat satisfied, compared to their department (60%) or other institutional resources like Title IX (22%). To ensure Postdocs can work in a safe and supportive environment, NIH must require that grantees have a grievance process with a neutral third party arbitrator to ensure protections against harassment and bullying are upheld for everyone.

Additionally, through collective bargaining, University of Washington Postdocs have won an innovative, peer-to-peer training program, Empowering Prevention & Inclusive Communities (EPIC). [redacted for anonymity], EPIC is tailored to the unique environment of academic research and trains Postdocs on preventing harassment and promoting inclusive work environments. Post-training evaluations show 98% of respondents said they were likely to intervene if they witnessed harassment and a significant increase in respondents' confidence in identifying sexual harassment. The NIH must look to these types of solutions that go beyond standard legal definitions of harassment to address underlying cultural issues inside academic science.

Response 3197

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is a temporary research position that is typically taken up by PhD, MD, DVM holders who wish to gain additional research experience before pursuing a permanent academic or

research position. Postdocs are expected to conduct independent research, contribute to ongoing research projects, and collaborate with other researchers. They may also be responsible for training graduate students and other junior researchers, writing papers and grant proposals, and presenting research findings at conferences.

The specific roles and responsibilities of a postdoc may vary depending on the discipline and the specific research project they are working on. In general, however, postdocs are expected to be self-motivated, independent thinkers who can make significant contributions to their field of study. They are also expected to be able to work well with others, communicate effectively, and manage their time and resources effectively.

In addition to their research and academic responsibilities, postdocs are also expected to develop their professional skills and knowledge. This may be accomplished by attending workshops and seminars, participating in professional societies and organizations, and seeking out mentoring and networking opportunities.

Overall, the postdoctoral position is an important and challenging stage in an academic or research career.

Postdocs have the opportunity to conduct independent research, develop new skills, and make significant contributions to their field of study. At the same time, they are also responsible for managing their own career development, building their professional networks, and preparing for their next career move.

Fundamental issues and challenges

Postdoctoral researchers play a critical role in academic research, but there are several issues and challenges that can inhibit their recruitment, retention, and overall quality of life. Some of the Fundamental issues and challenges include:

1. Inadequate compensation: Postdocs are typically paid less than other professionals with similar levels of education, and many live in high-cost areas. This can create financial stress and make it difficult to maintain a reasonable quality of life.
2. Lack of mentoring and professional development: Without adequate support and guidance, postdocs may struggle to develop the skills and knowledge they need to succeed in their careers. This can lead to dissatisfaction and hinder recruitment and retention efforts.
3. Limited career prospects: The lack of clear career paths and limited job opportunities can create uncertainty and stress for postdocs, particularly for those who are nearing the end of their appointments. This can make it difficult to recruit and retain top talent.
4. Poor work-life balance: The demanding nature of academic research can make it challenging to balance work and personal responsibilities. This can lead to burnout, stress, and a lack of job satisfaction.
5. Limited access to resources and benefits: Postdocs may not have access to the same resources and benefits as other employees, such as health insurance, retirement plans, and access to affordable childcare.
6. Dependency on faculty: Postdocs are hired by a faculty and not a program which makes the department/program/institute less accountable to support them.

Existing NIH policies, programs, or resources

To enhance the postdoctoral training ecosystem and academic research career pathways, the NIH could:

1. Increase the number and size of postdoctoral fellowships and training grants to support more postdoctoral researchers.
2. Expand the scope of the K Awards to include funding for mentoring and professional development.
3. Increase the stipend level to close the gap between academic research and industry job salaries.
4. Make Career & Professional Development a mandatory part of postdoctoral training by allocating set-aside time for these activities.
5. Provide additional resources and services to support the mental health and well-being of postdoctoral researchers.
6. Increase outreach and recruitment efforts to attract more diverse candidates to postdoctoral positions.
7. Create more opportunities for postdoctoral researchers to engage with industry partners and gain experience in commercialization and entrepreneurship.

Proven or promising external resources or approaches

1. The myIDP tool: myIDP (Individual Development Plan) helps postdocs plan their career paths and set goals for professional development. The tool provides assessments, career advice, and personalized development plans to support postdocs in achieving their career goals.
2. The National Postdoctoral Association (NPA): NPA provides resources and support for postdocs. It offers training and professional development opportunities, as well as advocacy and policy initiatives to improve the postdoctoral experience.
3. The Center for the Integration of Research, Teaching, and Learning (CIRTL): CIRTL is a network of universities and colleges that provides training and resources for postdocs in teaching, mentoring, and career development. The program is designed to enhance the quality of postdoctoral training and provide more opportunities for career advancement.
4. The Science Careers website: The Science Careers website provides a variety of resources and job listings for postdoctoral researchers. The website also features articles and advice on career development, job searching, and networking.
5. The Consortium of Academic Research Training (CART): CART is a collaborative program designed to provide training and resources for postdocs in biomedical research. The program offers training in areas such as research ethics, career development, and grant writing.
6. The Future of Research (FoR): FoR advocates for better working conditions and career opportunities for postdocs. It provides resources and support for postdocs, as well as policy and advocacy initiatives to improve the postdoctoral experience.

NIH could use these external resources and approaches to inform and enhance its efforts to support postdoctoral researchers and improve the postdoctoral training ecosystem. NIH could collaborate with these organizations to share best practices, resources, and knowledge to improve postdoctoral training and enhance career pathways for postdoctoral researchers. Lastly, NIH could expand resources to support additional similar programs.

Response 3198

Perspectives on the postdoc roles and responsibilities

As a postdoc my main goal is to prepare for a faculty position. This involves developing a distinct scientific skill set from my graduate advisor/ experience and discovering my independent research interests. It also involves mentoring students and staff in the lab; writing papers and grants; presenting at conferences and seminars; networking with other postdocs, faculty, and scientists; etc. In an ideal world, the position is full of learning and freedom, but in reality, a large portion of my time is spent struggling to understand why we are not classified as employees by our employer; surveying other postdocs on the challenges they face as a consequence of our strange employment; and advocating and organizing my colleagues for better worker protections, higher pay, equitable benefits, and more.

Fundamental issues and challenges

Low salary, no annual raises, no retirement benefits, no other employee benefits (transit, childcare, HSA, FSA), termination without cause, toxic advisors, low quality mentorship, inadequate support of international postdocs, among others

Existing NIH policies, programs, or resources

PLEASE allow NRSA fellows to receive health insurance, retirement, etc similar to other institutionally funded postdocs (with tax withholding)!!!!! No one wants to apply for the F32 because they'll lose all their benefits (and probably have a lower salary)! Also expand the K mechanism and other career transition awards.

Proven or promising external resources or approaches

Postdoc to faculty bridge programs seem very promising. Create new/ extra awards for women, people of color, first generation, low SES, etc postdocs to retain diversity in academic science. Pay postdocs a living wage (hint: not 56k in NYC) and push their institutions to provide normal employee benefits.

Response 3199

Perspectives on the postdoc roles and responsibilities

This response was assembled by the [redacted for anonymity].

Although postgraduate training in the plant sciences covers a wide range of subdisciplines, the roles **and responsibilities** associated with a postdoctoral appointment are largely universal. Postdoctoral scholars are experts in their area of study. A postdoctoral appointment provides opportunities for career development, further technical training, and the capacity to explore research paths towards one's career in academia, industry, or government. The role of a postdoc demands the things learned as a graduate student: formulating and testing hypotheses in the context of existing bodies of literature and prior data. Extending beyond the typical scope of graduate researchers, the work of postdoctoral scholars also entails progressively increasing levels of mentorship, people and project management, and formal writing—all of which runs parallel with increased expectations of agency and disciplinary expertise. The intersection of these expanding day-to-day responsibilities and increasing professional expectations is a postdoctoral scholar's ability to identify research niches within their area of expertise that can be explored not only during their time in their current research group, but also as they potentially transition to managing research groups of their own. Postdoctoral appointments are often a necessary bridge between graduate training and a more permanent research position in the sciences. Effective postdoctoral training is therefore critical to the vitality and longevity of any scientific discipline, plant biology included.

Fundamental issues and challenges

As with any field, there is a wide breadth of postdoctoral experiences in the plant sciences; however, many of the challenges facing postdocs are ubiquitous. Some challenges are unique to this moment and this generation of researchers, while others are issues that have plagued postgraduate training for decades. The most immediate challenge for many postdocs is cost of living. Postdocs are subject matter experts with 10+ years of post secondary education, and should earn a wage commensurate with that experience. As the cost of living continues to rise, paying postdocs a comfortable wage will be critical to recruitment and retention across disciplines moving forward.

Many of the issues faced by postdocs pertain to training "beyond the lab" . Postdocs are often saddled with heavy research responsibilities, leaving little time to learn and develop skills such as mentoring, grant writing, and project management. The sudden need to acquire a unique and personal set of professional skills is further complicated by the ever pressing need to keep up with and contribute to the steadily evolving body of scientific literature. Little room is left after these duties are considered for other areas in which advanced doctoral training is expected, including teaching and science outreach and advocacy. This collectively stifles the transition to independence in an independent scientist role, often closing the door on opportunities outside of experimental research altogether. Although research should indeed be the focus of a postdoctoral appointment, development of those other skills should not be considered dispensable.

Please see our email for our full response to this prompt.

Existing NIH policies, programs, or resources

Postdoc stipends (according to the NRSA standards) are below the costs of living in many parts of the US. Considering recent increases in housing and many necessities including food, these stipends should be raised considerably to allow postdocs to attain a standard of living that provides security for them and their families. In high-cost-of-living areas of the country like the Northeast and California, which are also locations with high postdoc density, the

NIH postdoc stipend minima are woefully inadequate for attracting and retaining postdocs.

The criteria used to select fellowship recipients need to be revised to promote diversity in recipients. All candidates should have an equal chance at receiving awards based on their abilities and potential and not those of their mentors or institution. The current system is biased towards candidates from labs that are well-resourced and therefore deemed highly productive, labs led by experienced (often NIH-funded) mentors, labs from Institutions that already have high success rates in other NIH award programs and receive high levels of NIH funding, and labs that have produced successful recipients. By revising selection criteria to eliminate preference for candidates from already-successful environments, a more equitable selection process would open opportunities for a broader diversity of fellowship recipients.

Fellowship support should include benefits like health insurance and parental leave. The absence of these benefits represents another way in which the NIH is skewing the award of fellowships towards candidates whose labs or institutions have access to alternative means of providing these benefits.

Proven or promising external resources or approaches

The Plant Science Research Network (PSRN) comprises scientific societies and organizations with a mission to build and communicate a consensus vision of the future of plant science research, education, and training. In 2016 and 2017, the PSRN held workshops to discuss the future of postgraduate training in the plant sciences. The findings were compiled into a document titled "Reinventing Postgraduate training in the Plant Sciences" , which identifies six actions to improve the postgraduate training ecosystem in the plant sciences:

1. Increase number of grants available to trainees
2. Assemble mentoring teams to emphasize individual development
3. Establish institutional support for life-work transitions
4. Create a system of customizable modular experiences
5. Implement policies that promote individual well-being
6. Provide practical training in science communications and public engagement

In particular, funding and implementing policies focused on well-being may help to rebrand postdoctoral appointments as more positive life experiences, which may help with postdoc recruitment and retention.

In addition to the recommendations, the document also outlines the results from a number of pilot programs that were assembled under the ideals outlined therein. The report would serve as a valuable resource as the NIH considers the future of postdoctoral training. The report can be found here: https://plantae.org/wp-content/uploads/2019/09/PSRN-2018-Reinventing-Postgrad-Training-Plant-Sciences.pdf

Response 3200

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The linear STEM career pipeline is no longer the most common career path for scientists entering STEM.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Recognizing this and supporting scientists throughout their varied career paths will help attract and retain a more diverse STEM workforce. Leverage points that can help support scientists throughout their career path include:

- Longitudinal career path programs such as accessible career and skill training programming, creation of peer & mentoring networks, collaboration opportunities and open access resources, databases and scientific literature.
- Professional Societies are well positioned to support scientists throughout their careers with reforms such as improving conference accessibility, programming that supports junior scientists in transition, reconsidering membership due structures, and reassessing award programs.
- STEM Culture Change could include examination of hiring, admission and review practices, prioritizing career preparation as an integral component of professional training, and valuation of non-normative behavior, thinking, research and career paths.

Response 3201

Perspectives on the postdoc roles and responsibilities

Academic postdoctoral researchers are highly skilled and specialized workers, filling positions that require years of training in specific subject matter. They are responsible for making a principal investigator's research program happen, acting as a project lead and subject matter expert often for at least one aim of a large grant. Postdocs are also responsible for assisting in training junior members of the lab in the technical and soft skills necessary to perform well in their current position. At the same time, postdocs develop their own research programs, independent of their PI's program, and apply for grants to transition into an independent role. Often postdocs will complete a portion of a PI's grant and then get money for a research program that is somewhere in between what their PI does and what the postdoc plans to do in their own lab. The postdoc will complete at least part of this proposed research in the PI's lab.

Fundamental issues and challenges

The biggest issue for recruitment, retention and overall quality of life is salary. Most postdocs know someone from their Ph.D. program who went to industry instead of a postdoctoral position. This person makes 2-3x a postdoc salary and receives health care, dental and retirement benefits. This person works fewer hours than the postdoc and takes vacation more often. Friends that the postdoc went to undergraduate with are also now making more money than the postdoc. They have started families and own homes and boats. They all seem more comfortable in life than the postdoc. Depending on the lab the postdoc is in and the industry job the other person is in, the person in industry may have similar or less flexibility in what they work on than the postdoc. Granted, the postdoc usually has more flexibility in their projects. So, with the only benefit as flexibility in what the postdoc works on, the postdoc job seems less appealing each year. This is compounded by the fact that most postdocs eventually go to industry anyway, leading to what is in effect years of lost salary for no gain other than knowledge and maybe a prestigious paper or two. This is what academia banks on: postdocs want knowledge and publications more than a comfortable life. There is no opportunity for career advancement during postdoc position.

Postdoctoral experience is largely determined on a per-lab basis since academia operates on feudalism. There are limited protections for a postdoc, and limited options if their lab turns out to be a poor environment. There is a social punishment for complaining too loudly about poor lab environments, evidenced by the many women who have been forced out of academia entirely by sexually harassing PIs.

Existing NIH policies, programs, or resources

It would be nice if the NIH fellowships provided more money.

Pressure from the NIH to apply for grants within 1 (F32) and 4 (K99) years should be combined with pressure on universities to get their postdocs out quickly. The current duration of a postdoc is much too long.

It would be nice if grants could move in between institutions. Postdocs are eligible for most grants only within the first year or two after receiving a Ph.D. As such, they must apply for research grants immediately. If it turns out I they not like their institution or lab and move after a year, they are ineligible for many grants. This is problematic not only for the postdoc, but for the new PI who must now find even more funding.

Proven or promising external resources or approaches

PIs should have mandatory training in management and mentorship. See universities that offer such coursework, such as UNC Chapel Hill.

Response 3202

Perspectives on the postdoc roles and responsibilities

A postdoc's responsibilities are to use their expertise to help the PI accomplish their research goals, and to find their next job.

I may be an outlier, but I view this postdoctoral position as an opportunity to get some science done while I figure out which "real job" will be least miserable.

Fundamental issues and challenges

- Salary. My engineer friends make at least twice the NIH scale, straight out of grad school. As a postdoc I am above the scale but am still rent burdened in a substandard 1BR apartment. Granted, there are places a postdoc can live comfortably, but the salary is not competitive with industry STEM offerings.
- Employment in the US is transactional now. When companies stopped investing in their employees--stopped offering a stable career with a retirement to work toward--people responded with a contractor culture. The most successful money makers hop between companies every 2-4 years, with a raise at each hop, in order to afford retirement. Here's a symptom of the new culture: https://cheekyscientist.com/phds-stop-applying-postdocs-start-applying-research-scientist-positions/
- I think postdoc positions used to be primarily about the chance at a tenure track position, but the prestige of academia has been diminished by the replicability crisis, among other factors. Additionally, on my campus at least, it seems tenured positions are becoming more scarce. The chance at landing a rewarding career is no longer worth the reduced pay and risk associated with a postdoctoral position.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

https://www.federalpay.org/gs/2023 (Tie academic STEM salaries to the cost of living and/or industry salaries for STEM PhD work. Consider adding location-based allowances.)

Response 3203

Perspectives on the postdoc roles and responsibilities

To perform independent research, learn new skills, and collaborate with other internal and external researchers. A postdoc can contribute and help with other lab work which is not related to her/his project. However, I notice that some laboratories use their postdocs as technicians, preventing them from working on their own projects and forcing them to do a lot of irrelevant technical lab work instead of hiring a technician.

Fundamental issues and challenges

We receive the lowest postdoctoral salary among all postdoctoral fellows in the US. Wages are not even equal between different ICs at NIH. We all work equally, so we should earn equally. That is one of the most significant issues that my colleagues and I have. This is a huge reason for many postdoctoral fellows to leave academic research.

Independence for postdocs is not encouraged enough. This might be because there are only a few graduate students at NIH, and mentors may treat postdoctoral trainees as master students and technicians.

Existing NIH policies, programs, or resources

Postdoctoral salaries should have improved and should be equal in all NIH centers.

Proven or promising external resources or approaches

No response

Response 3204

Perspectives on the postdoc roles and responsibilities

In my perspective, it's a training position which trains you to generate new ideas, get funding and prepares to lead your own research independently.

Fundamental issues and challenges

1. Research Grants for immigrants are rare and needs to be increased. PostPHD limit for K99 should be increased to 5 years instead of 4 years.
2. NIH Salaries for early career positions after postdoc like instructors/ research scientist needs to fixed and left up to PI.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

No response

Response 3205

Perspectives on the postdoc roles and responsibilities

Maximally productive researchers in training for PI status

Fundamental issues and challenges

Salary relative to cost of living

Existing NIH policies, programs, or resources

Increased postdoc pay

No response

Response 3206

Perspectives on the postdoc roles and responsibilities

Fundamental issues and challenges

salary support, this is single-handedly the reason we lose individuals from low socioeconomic (and often minoritized) backgrounds.

Existing NIH policies, programs, or resources

individuals who identify as native american and southeast asian (laotian, cambodian, hmong, etc) have no voice and are severely underrepresented in science

Proven or promising external resources or approaches

No response

Response 3207

Perspectives on the postdoc roles and responsibilities

Stepping stone to a position as a professor at a university or small liberal arts college. (I could easily get an industry job without a postdoc.)

Fundamental issues and challenges

As a disabled trainee, my primary concerns are financial and medical. I badly injured myself at the start of my F99 fellowship and had to continue working though constant severe pain, because there was no reasonable disability leave option to take a break from my research and focus on physical therapy and rehabilitation.

What if I need to take a medical leave during my postdoc on an R00 fellowship? Again, I won’t have any disability leave options beyond the state-mandated minimum. I won’t have the financial stability to

accumulate savings to support me through a medical leave. How am I supposed to afford complex medical care on a postdoc salary, let alone save for retirement?

PIs are poorly equipped to mentor trainees from diverse backgrounds —especially disabled trainees. I've experienced rampant ableism and abuse as a post-bacc and a PhD student. Every day I think about transitioning to a postdoc, I feel a deep sense of terror and despair that I'll be abused again.

To be very clear —if not for my R00 fellowship, I would not do a postdoc. I would transition to an industry job that would allow me to support myself.

The postdoc system is broken. The bubble needs to burst. We need more staff scientist positions in academia.

Existing NIH policies, programs, or resources

Higher salary minimums

Disability and/or medical leave for trainees on fellowships

Option for trainees on fellowships to take advantage of tax advantaged retirement options (401K, 403b, etc).

Funding penalties for investigators found guilty of gross misconduct.

Proven or promising external resources or approaches

Better promotion of supplemental funding for accommodations for disabled trainees.

Additional professional development funds associated with fellowships.

Perspectives on the postdoc roles and responsibilities

Having a chance to expand or slightly switch your expertise field (very important function in my view).

Getting more training to write grants, papers, and lead projects before becoming an independent PI.

A buffer stage before making a decision to stay in academia (either as an independent PI or a staff scientist under another PI), or move to industry.

Fundamental issues and challenges

Low pay compared to peers in industrial positions.

Limited job opportunities if you are only pursuing a conventional professor position in school.

Existing NIH policies, programs, or resources

More postdoc grants needed to support postdocs with families or those living in high-cost areas. Especially for those who are not US citizens or permanent residents, who have even more limited funding opportunities.

Proven or promising external resources or approaches

Not sure.

Response 3208

Perspectives on the postdoc roles and responsibilities

Academic postdocs bring expertise and perspective to their host laboratories and in return should gain the opportunity to define a research program, execute it, receiving coaching and mentoring in how to supervise and train others, disseminate research results in writing and by speaking, and to seek independent funding with support from a committed mentor. Many of the professional development elements of this role have traditionally been fulfilled via an apprentice model, which is quite literally a medieval approach to training. Postdocs could, instead, receive explicit training in management and talent development as well as in grant writing. This could be done in classes as part of the role (say 10%). Such a change in tradition would improve operations in the research labs as well as connect postdocs to one another and across laboratories, reducing isolation.

Fundamental issues and challenges

Much is written and worried about regarding postdoctoral salaries. It would be transformative if funding for salaries considered local cost of living and if institutions were required to provide childcare subsidies. These are important issues that policy and funding can solve. Another significant challenge is that the postdoc is a temporary appointment filled with uncertainty about its duration and what kinds of more permanent positions each postdoc can reasonably hope to secure. Many of today's PhD students wish to avoid committing to a second training term of uncertain duration and value.

Existing NIH policies, programs, or resources

Proven or promising external resources or approaches

Our institution's Grant Writing Academy is a proven method for improving trainees' success rate in seeking independent fellowships. Postdocs also gain training as 'grant coaches' for graduate students and this paid position improves their skills in talent development. Programs that link postdocs together into communities within an academic institution or across them foster peer support networks that can improve job satisfaction.

Response 3209

Perspectives on the postdoc roles and responsibilities

As the Associate Dean, I submitted our response on behalf of the Biomedical Postdoctoral Program. This "individual" response includes important points which were submitted without the review of the entire advisory committee.

In our view, postdoctoral training is critical to prepare junior scientists for both academic and biotech/pharma career paths. Although there are many positions that newly minted PhDs can consider without postdoctoral experience, for recent graduates on either academic or industry/pharma tracks, postdoctoral training provides the necessary experience for attaining independence. After getting their PhD, postdocs often change fields or experimental systems. Starting a completely new project can be challenging, but mentored training will provide the necessary advanced experience. For industry/biotech/pharma, 2-3 years of postdoc experience may be sufficient, as a high profile 1st author publication is not critical for obtaining this type of a position. However, for postdocs on an academic track, in addition to a solid set of papers, years 3 to 5 of postdoctoral training provide an opportunity to transition to independence by:

a) Developing a K99 or similar transition project/awards or assisting with the preparation of R01/R21 grants.

b) Preparing not only a strong draft of their 1st author or collaborative paper, but leading or co-leading the publication efforts from inception to final acceptance.

c) Leading or co-leading interdisciplinary collaborations, which provides postdocs with an opportunity to work closely with a wider group of investigators and develop leadership skills.

d) Receiving invitations (facilitated by their mentors and collaborators) to participate in peer review and share their fundamental discoveries with their national and international research communities.

e) Providing postdocs with mentorship training to establish better mentee-mentor relationship and to develop mentorship skills, as well as additional skills needed to successfully lead a research group in academia or industry.

f) Exploring teaching opportunities and mentoring undergraduate students.

Fundamental issues and challenges

No response

There are several major issues and challenges.

a) Undercompensation in comparison to biotech/pharma career options.

b) The "costs" of dependent health coverage and parental leave/child care are challenging, which may preclude postdoc training, especially for those with families.

c) Low number of URM mentors and mentors trained in Diversity Equity and Inclusion who can properly support the needs of URM postdocs.

d) Many PhDs, especially first-generation and historically excluded based on race and ethnicity, often support other family members from their salaries (e.g., parents & younger siblings) and cannot elect or accept to stay in a postdoc position when other positions offer better compensation and benefits, diminishing retention and diversity in research

e) Postdocs are concerned about the uncertainty of their future or next career step and they seek a reasonable level of expectation regarding their next step in the career advancement. To reduce a sense of uncertainty, particularly for international postdocs, schools should consider multi-year appointment letters.

f) Even at schools with established postdoctoral programs, postdocs are not well integrated within their departments/centers/institutes. Too many PIs are recruiting postdocs to perform routine laboratory tasks and do not actively support postdoc training, which could be mitigated by establishing guidelines for mentorship expectations and postdoctoral trainee committees.

g) Finally, there is a disturbing concern among international postdocs who are particularly worried that they will be targeted or fired due to the pay increase burden on faculty mentors.

Existing NIH policies, programs, or resources

a) Funds provided by NIH for postdoctoral training should be increased;

b) Eliminate disparity between post-docs paid from different sources and the restrictions of using NIH dollars to supplement stipends;

c) Need to ensure that NRSA-funded postdocs have the same access to benefits as employee-classified postdocs;

d) Need for increased support for K99/R00 grants with more flexibility on the timeline;

e) Need for increased support for T32, IRACDA grants and F32 fellowships (note that the funding for F32 and K99 at some institutes is minimal, NIAID for example;

f) Need for more support for URM trainees and trainers at every level (undergraduate, graduate students, postdocs and faculty);

g) A large population of postdocs are international. Therefore, NIH should consider opening up eligibility criteria for F32 fellowships—similar to the K99/R00 awards;

h) Need to support meetings and conferences that bring together trainees at different stages of their career (at Penn, we call it "vertical integration");

i) NIH should require that PIs report on the mentorship plan and activities related to post-doc training in annual reports. The section on mentorship in the RPPR should be expanded or emphasized.

j) Need to support efforts of the Coalition for Life Sciences to collect and analyze outcome data on postdocs. Currently, these data are presented at the national level. However, analyses at the level of a specific university, school or a department will be important to fully understand outcomes and trends.

k) The recent trend of PhD students immediately going into high salary positions in Biopharma means that the NIH is now funding workforce training for for-profit companies. One approach to have such companies contribute to the training would be for the NIH to enforce the "pay-back" of T32/R-grant funding of training for students going immediately to for-profit positions.

Proven or promising external resources or approaches

We would be glad to share how we at the [redacted for anonymity] attempt to enhance the postdoctoral training ecosystem.

Response 3210

Perspectives on the postdoc roles and responsibilities

A postdoc is an opportunity to learn new techniques or fields and to grow your skills as a researcher. Ideally this is a chance to increase publications and get experience at grant writing and training junior lab members. A postdoc should not be a treadmill and PIs should not treat it as an opportunity to trap skilled individuals in their lab long term.

Fundamental issues and challenges

Postdocs lack basic amenities given to most workers. For instance, if a post doc were to have an extremely premature baby they would be expected back at work the next day (this happened to me). Furthermore, postdocs are not guaranteed parental leave when they have children and yet this is the best time biologically speaking to have a child. This is a serious oversight. It has been extremely eye opening to work in industry—I am not sure why anyone is willing to stay long term in postdoctoral positions given the lack of pay, lack of FMLA, and being at the whim of a PI who may or may not have their best interests in mind.

Existing NIH policies, programs, or resources

Uncertain.

Proven or promising external resources or approaches

Try reverse mentorship where postdocs mentor PIs on what they need but are lacking from their training experience. This has worked extremely well in the industry I work in and has helped a group of older scientists to better understand, support, and retain younger generations.

Response 3211

Perspectives on the postdoc roles and responsibilities

The postdoc is supposed to be a period of training where you learn new skills that are pertinent to the independent research program that you want to run. It SHOULD be for a designated time period (3 years max) and should expose postdocs not only to academic career paths but also other science bases positions given the tenure track market it unpredictable and there simply are not enough positions as it currently stands.

Postdocs can get experience in what it is like to run the lab but they should not take the position or roles of a lab manager.

Fundamental issues and challenges

The fundamental challenges all revolve around stability. Current salaries, benefits and contract terms vary from department, institution and even PI. Most universities wont pay postdocs above the NIH minimum for their experience and unfortunately, that salary has not kept up with cost of living, especially in high cost areas like NYC and San Francisco. Additionally, it is next to impossible to have children on the current salaries, especially if you are doing it without a partner. Childcare costs are exorbitant and can easily eat through most of the salary and that's before basic necessities like food and rent. If my spouse was a higher in the technology industry I would have had to have forgone a postdoc once my first child was born. As it stands I had to leave my most recent postdoc because I had twins and my salary could not cover the childcare costs let alone the gas, tolls and other expenses I would incur during my time working as a postdoc. So, despite wanting to remain in academic science i have essentially been pushed out because I have children who need care.

In addition to salary, benefits vary in almost the same way. Some universities, typically ones with unionized staff, offer some type of retirement, vacation, sick days and parental leave while other place don't or have really ambiguous policies that are often left open to interpretation, which means abusive PI's get a lot of leeway in determining what is or is not acceptable. The same goes for benefits like health insurance which can vary depending on whether or not you have a fellowship.

Existing NIH policies, programs, or resources

Increase in programs like the career transition grants and also raising the minimum salaries attached to those and postdoc fellowships. Increasing the modular R01 budget so that PIs have the option to pay more without foregoing some of the science goals that they have. Enhancing or adding to the policies about abuse and discrimination for NIH funded PIs AND Institutions. There need to be real consequences for people who abuse their trainees.

Cap the time period for a postdoc and make funding available for more permanent staff scientist type positions

Proven or promising external resources or approaches

HHMI, St. Judes, Princeton and the UC have recently made some policy changes around postdoc salary.

Response 3212

Perspectives on the postdoc roles and responsibilities

I see the postdoc position as an intermediate step between graduate student and faculty member where highly technical skills acquired in graduate research can be applied and new skills in research, lab management, and grant writing can be acquired. I also see a postdoc as a way to expand one's academic lineage and reputation, which seems necessary to procuring a faculty position.

Fundamental issues and challenges

Graduate students overworked are underpaid. Postdocs are overworked and underpaid. Without familial wealth, many graduate students are financially exhausted by the time they graduate. The thought of enduring a few more years with close to zero net income and no promise of a faculty position on the other end is extremely discouraging. We love science and we love seeing our science have an impact on human health, but it can be hard to stay optimistic and altruistic when a single unexpected event can send us into financial collapse. Additionally, postdocs are often at a life stage where they are considering having children, but this feels like a near impossible task under the current funding and incentives structures.

Existing NIH policies, programs, or resources

Increased minimum salary. Extended family leave time with guaranteed pay and insurance on family leave.

Proven or promising external resources or approaches

No response

Response 3213

Perspectives on the postdoc roles and responsibilities

A postdoctoral position is an important step after finishing graduate school providing researchers with an opportunity to further expand their knowledge and skills in the field of their doctoral degree or apply their expertise and develop an interest and gain experience in new specialized areas. Postdoctoral position is also an important phase of the training to help researchers to identify the career path that is best for them, in particular for the academia career path. At the same time with current known barriers and challenges for postdocs, including limited opportunities in academia and increased opportunities in Pharma/Biotech, it is reasonable that number of graduates are deciding to apply for postdoctoral positions in industry. Importantly, well trained scientists are needed in all segments of our society.

Fundamental issues and challenges

The financial model and the salary that directly affects the quality of life; Lengthening time to have successful postdoctoral fellowship, including obtaining an independent grant, publishing in high profile journals; Limited tenured faculty positions in academia; Limited research track faculty positions and opportunities for supporting this career path.

Existing NIH policies, programs, or resources

Allowing international postdoctoral fellows to apply and be eligible for the T32 training programs; Requiring Individual Development Plan and mentorship plan to be part of the RPPR for the postdoctoral fellows who are funded through R01 grants; Increasing the funding opportunities for research track faculty in academia.

Proven or promising external resources or approaches

The training of the postdocs and their professional carrier development should be in alignment with the diverse job markets; enhance mentoring; promote work life balance and wellness; introducing policies that will increase and broader the support for postdocs such as attending on meetings, networking and etc.

Response 3214

Perspectives on the postdoc roles and responsibilities

A postdoc should be a training opportunity where the trainee gets an opportunity to do independent research to a greater or lesser extent depending on the trainees wishes, and is not solely based on the Principal Investigators wants/needs.

Importantly, technical skills training should be easily accessible in a fair way.

Work should be dedicated to research activities, not maintenance duties such as cleaning, cleaning labware, excessive establishing of Principal Investigators Lab.

Fundamental issues and challenges

-TOO LOW SALARY—get it!!!! It is not that difficult to see. You don’t need a survey to answer that question.

Quote from previous PI: “I know it’s called a training position[the postdoc position], but it is really just cheap labor”, “I don’t think it is fair that I should be paying for your training”—the latter refers to PI letting postdoc use/work on a particular technique for research/training purposes to gain experience there.

Postdoc are effectively paying 50,000-60,000 USD per year in missed salary—one should get the opportunity to get high quality training with no questions asked.

Toxic work environment across the board with people fighting more or less openly for resources.

- Tenure of professors is a part of the problem, causing PI to be virtually immune to any sort of cases of work misconduct.
- subsidized high quality housing should be mandatory—It is missing at the [redacted for anonymity], unlike the other quality research universities in NYC.

Existing NIH policies, programs, or resources

Higher salary 85,000

Pension

Job contract, ensuring rights, job security.

Housing mandatory, or alternatively rent supplements mandatory.

This survey is Missing the Point by asking “**Fundamental issues and challenges** inhibiting recruitment, retention,.”

Treating postdoctoral workers decently should be the primary goal, which hasn’t been the case for decades at this point. It is clear from this question that better treatment of postdocs and their well-being is only now an issue because it is difficult to recruit them. come on NIH.

When I first came to the US for a research project it struck me as curious that no american postdoc in the department at Mount Sinai school of medicine was to be found out of 30 postdocs or so. It quickly became clear that the reason was that american don’t want to put up with postdoc working conditions.

The system is based on exploitation of foreign academic labor.

No real possibility to complain about PI and bad behavior

Proven or promising external resources or approaches

Recognize that you have been exploiting postdocs blatantly and improve!

Response 3215

Perspectives on the postdoc roles and responsibilities

The roles and responsibilities of an academic postdoc involve conducting research, intellectual and professional development, teaching and mentoring, grant writing and funding acquisition, professional ethics and integrity, collaboration and teamwork, dissemination of research, and career development. Postdocs play a critical role in advancing research and contributing to the academic community while also preparing for their own future careers.

It is the next step in one's academic career after obtaining a doctoral degree. Postdocs are very involved positions, much more so than a doctoral candidate and often the responsibilities and roles mirror that of a principal investigator. However, at present there is a dichotomy: sometimes the academic postdoc is primarily an experienced set of hands and labor.

Conversely, Industry equivalent research track after obtaining a doctoral degree ("Senior Scientist") is often not saddled with such an extensive list of roles **and responsibilities**. Yet, Senior Scientists are rarely employed as an experienced set of hands and labor (that's what technicians and research associates are commonly hired as).

The academic postdoc experience greatly varies but is often an intensive 3-6 year experience without guarantee of further advancement into higher academic positions. Pursuing an academic postdoc is a daunting endeavor given that the postdoc experience varies substantially from lab to lab—it is challenging to appreciate the stress and rigors involved for a specific lab until one is already deeply committed to their postdoctoral work.

Fundamental issues and challenges

Postdocs would benefit from being treated more like human beings. Many postdoctoral positions are temporary with fixed terms, leaving postdocs in a constant state of uncertainty regarding their future career prospects. The lack of job security can inhibit recruitment and retention of talented postdocs who may seek more stable employment opportunities. Postdocs often receive VASTLY lower salaries compared to other academic and industry positions, despite their level of education and expertise. Limited benefits such as health insurance, retirement plans, and paid time off can also negatively impact the quality of life for postdocs, affecting their overall well-being. Postdoctoral research can be demanding, with long working hours, including evenings, weekends, and holidays. This can result in a poor work-life balance, impacting postdocs' personal relationships, mental health, and overall quality of life. Extended periods of low quality of life can quickly diminish a postdoc's motivation (burnout) to further pursue academia or even a career in science. This causes the exit of a highly trained (10+ years) technical professional from the field, usually at a loss from funding agencies that have invested significant money into funding the individuals scientific pursuits over the entire length of their education and career.

Lastly, postdocs are often expected to be incredibly productive, including conducting research, publishing papers, securing funding, and teaching. This heavy workload can impact the quality of life of postdocs and may hinder their ability to focus on their own career development.

The recruitment, retention, and overall quality of life of postdoctoral trainees in academic research are impacted by challenges such as limited job security, low pay and benefits, long working hours, work-life imbalance, and lack of career development opportunities. Addressing these fundamental issues is essential to creating a supportive and inclusive environment for postdocs to thrive and contribute to the advancement of research and academia.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Basically in the USA, an academic post doc is becoming a class luxury. One is greatly benefited by having the support of a financially advanced spouse (to compensate for lack of post doc pay) or family financial assistance. Without outside financial help, it's almost always more worthwhile to pursue an advanced career outside of academia. Why settle for a 50K/year salary for 3-6 years without guarrantee of advancement when you can get a job with a fresh PhD that yields 110-130K? And you are infinitely more mobile in the latter case. The market already prices advanced individuals at around that rate. In other words, areas that generally need more post docs have a VERY high cost of living that is incredibly difficult to manage on a post doc salary.

Response 3216

Perspectives on the postdoc roles and responsibilities

Postdocs are currently de facto staging grounds for tenure track academic jobs or the switch to industry. They have some utility in furthering development as a research, though are far less necessary for preparation for the next career stage as, e.g., a medical residency. Due to bottlenecks in the academic job market, the postdoc position has proliferated in a manner only paralleled by the growth of academic administration.

Fundamental issues and challenges

The role of postdoc must be greatly streamlined for the field of physics. Moreover, significant disparities in credentials at the subgroup level for postdocs admitted at elite institutions indicate racial and gender preferences are commonly practiced though rarely disclosed.

Existing NIH policies, programs, or resources

Reduce the university administration to leave resources to hire more professors. Release subgroup data on the qualifications of admitted postdocs and assess whether systematic preferences are being employed for select racial and gender groups.

Proven or promising external resources or approaches

Increase postdoc salary, particularly in regions with high cost of living.

Response 3217

Perspectives on the postdoc roles and responsibilities

My role is to design and perform research, with some support from my PI, but at a faster pace than graduate students and with more independence. I am also responsible for modeling good professional behavior to students and mentoring them with research projects. I view it as more stressful and lonely than my PhD, but it also has the potential to give me more fulfillment.

Fundamental issues and challenges

While universities often do a good job of recruiting postdocs, including under-represented postdocs through fellowship programs, their efforts at retention are severely lacking in my experience. The price of housing and other living expenses have outpaced postdoctoral salaries, particularly in the past two years. Given how stressful and lonely an academic research career can be, these obstacles are serious, and cause the diversity of backgrounds to decrease dramatically as you go up the chain in academia. (For data on this, see the Stanford Latinx Postdocs' living expenses survey results: https://slpa.github.io/survey2022/)

Existing NIH policies, programs, or resources

Recipients of the F32 grant could be better engaged after receiving the grant. I did not know about many of the above linked programs and resources, but some such as the podcasts are a bit sparse. Invitations to (virtual?) events and to network with other trainees or receive career development training would be impactful. Additionally, advising universities on how to ensure success under the F32 is urgent. Many universities demote the status of grantees, removing benefits they previously received and not advising them on these changes. I had to hire an accountant to understand how my tax status had changed and pay a penalty because I was not warned. I also lost my retirement benefits and am now liable for my

health insurance being considered, all while my employer is saving money on me by not paying 7.5% of my salary to social security and medicare taxes.

Proven or promising external resources or approaches

Retention, retention, retention. My university is happy to boast about recruiting postdocs and their achievements, but does almost nothing to make their experience livable. Volunteer postdoc groups who advocate for the cause are treated with disdain. The NIH could fill this gap by forming a postdoc community across universities through specialized conferences, mailing lists, and local meet-ups, particularly for under-represented groups.

Response 3218

Perspectives on the postdoc roles and responsibilities

Postdoc position in my opinion should be viewed as a transition phase from PhD to next career stage (more independent) whether it be academia or industry or non-research job opportunities. It should be treated like a job and not a studentship and should take care of the financial and social circumstances including more stable work visas. Unfortunately, most of these are currently not taken care of to the best extent which add a lot of stress and prevents a postdoc from delivering their best at work.

Fundamental issues and challenges

1. Unstable work visas—J1 visa comes with 2-year home country boundary rule for most of the countries which creates a lot of uncertainty and instability
2. Very low income specially in cities like Boston
3. Support for immigrants
4. Childcare support
5. Housing support
6. Green card/permanent residency applications should have provisions for people who did their graduate studies in the USA/ have been living for more than 5 years in the country/ people who did PhD from top notch universities in the world like Cambridge, Oxford, ETH Zurich, UCL, ICL, NUS, Peiking University, Harvard, MIT, CMU, Stanford, Yale etc.
7. Subsidized health insurance, more support towards medical bills
8. Financial support/ subsidized lawyer support for green card applications

Fundamental issues and challenges

Postdocs are highly skilled professionals categorised as trainees, research fellows, research associates, research scholars, instructors, or staff, among others. This variation in title creates differences in salary, tax burden, access to benefits (such as health, pension, parental leave, vacations, childcare, etc.), appointment period, and job security, while the nature of work is the same. The root problems with varying appointment titles have been repeatedly emphasised by the National Research Council in 1969 report; surveys by the National Academies of Sciences, Engineering, and Medicine (NASEM), including the Committee on Science, Engineering, and Public Policy (COSEPUP—a joint committee of the National

Academies in 1999); surveys of individual institutions since the 1990s and more recently, surveys by the National Postdoc Association (NPA).

As per the latest NPA report, the inequality in postdoc benefits differs based on appointment. While most postdocs receive basic health insurance, access to childcare subsidy, housing support, retirement benefits, adoption assistance, and long-term disability remain poor, threatening family security and responsibilities. To make matters worse, the NRSA stipend guide, which serves as a de facto minimum salary ($56,484 for 2023-24) for postdocs across most US institutions, does not account for geographical cost-of-living. It is notable that the legal minimum salary is $23,660, and postdoc salary data collected from US institutions during 2016-2022 by Gary McDowell confirm that there are postdocs receiving this salary. Many case studies and analyses (more references herein) have highlighted how and why the current NRSA stipend rates are unsustainable for postdocs in high cost-of-living areas such as Boston and NYC. In our recently published article (already submitted to [redacted for anonymity]), we argue that such an unsustainable living burden on highly skilled researchers with negligible job security creates a selection pressure on postdocs, especially with families and those who are from historically marginalised backgrounds.

Existing NIH policies, programs, or resources

We urge the NIH to remove the exploitative title of 'trainees' for postdocs. The NIH should renounce other postdoc titles of fellows, scholars, instructors, staff, etc. We strongly recommend that the NIH use the term 'Postdoctoral Appointment', which emphasises an employee position guaranteeing equal benefits as other employees of the hiring institutions.

We also urge the NIH to make the same intramural and extramural postdoc appointments in all aspects of employee benefits and compensation. The postdoc salary and benefits must be compensated in accordance with the geographical cost-of-living and the US economy. In our recent publication, we proposed a salary scale for postdocs in the Boston area upon living wage analysis, consistent with the current General Services (GS) Scale 11. The GS scale is used for federal employees and automatically considers regional and inflation adjustments. The NIH already has built-in adjustments for the GS scale as per diem rates for conference or other work travel for investigators on NIH grants are calculated per the US GS Administration. We understand that implementing suggested increases in salaries and benefits policies may encounter logistical and financial issues and may reduce postdoc appointments in the country. We argue that a capped postdoctoral appointment may improve the quality of postdoctoral experience and lead to better job security and innovative science. The Janelia Research Campus of HHMI is an exemplary and successful model with capping in the research teams.

In summary, we propose a 'compensation package' for all postdoc appointees (NRSA, intramural, extramural without any bias towards marginalised identities/visa status) that includes:

1. GS11 salaries
2. Institutional employee status
3. Benefits package-GS11 adjusted
4. Healthcare, including dependents
5. Childcare
6. Matched retirement
7. Adoption assistance and IVF coverage
8. Minimum 16 weeks of paid leave for childbirth and adoption
9. Relocation costs
10. Flexible spending account
11. Minimum 3 weeks of annual leave

Response 3220

Perspectives on the postdoc roles and responsibilities

A postdoc is a critical member of a lab. They are highly trained and are often the one actually processing and analyzing data, along with writing up the results. Without a postdoc, this task is often split between junior faculty and grad students or research assistants. Postdocs really are the perfect in between to keep things moving.

Fundamental issues and challenges

Two main issues—salary and career options. The salary we can offer is way too low to retain the best postdocs. PhDs can make 5-10x as a data scientist in tech as they can in academia. Academia can never match tech, but the comparison shouldn't be so stark. It means that postdocs either need to make major compromises or that only those with extra resources or spouses who make more can stay in academia. Career options are also limited—a postdoctoral position is supposed to be a time-limited step before a faculty or career scientist position.

Existing NIH policies, programs, or resources

Honestly the main NIH policy to update would be the modular R01 budget. It's absolutely ridiculous that it has not increased from $500,000 without special permission. The salary cap for PIs just went up considerably but with a static budget cap our options are limited—we can't decrease the PI FTE too much without reviewers questioning it, research costs still exist and are increasing, so often this means fewer postdoc positions.

Response 3221

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

1. Salary is not competitive compared to other jobs with similar qualifications. We are disillusioned to accept the current pay status as normal, while others outside of this bubble have noted the shocking salary range for someone having earned a PhD.
2. Permanent or long term scientist positions or non-PI academic positions are rare and/or lacking. For the ones that exist, such as positions in a core/center, there is a stigma of inferiority. There is not appropriate appreciation for these positions.
3. A future with total dependency on grant writing (at least at research intensive institutions) is not attractive. The process of submitting and being reviewed is highly competitive and stressful. There is a negative feedback loop between insufficient funding and low productivity.
4. For those that have restricted living areas (ie. not able to move because of family situations), acquiring a PI position in the geographical region of interest after postdoc may be unlikely. Thus, why even pursue a postdoc? More long term positions (as in point 2) would help.

Existing NIH policies, programs, or resources

By the time one obtains and is funded by a K99, one has been in the postdoc position for longer than 5 years, which seems to be the upper length of postdoc positions. It has essentially become a second PhD. Yet at the same time, 4 years to acquire enough data and create a research plan for the next five years seems short, especially with the pandemic hit. Further, the argument for a K99 is a paradox—having to prove that the candidate can be independent yet also argue that the candidate lacks a certain strength and needs further training.

Proven or promising external resources or approaches

Response 3222

Perspectives on the postdoc roles and responsibilities

I think the main idea I want to stress here is that, if a position is going to be filled by someone with a PhD, then the PI should be prepared to allow that individual the autonomy to take advantage of their training and abilities to take an active, significant role in the decisions that come up in the course of a research project. This seems like it should be something that goes without saying, but I have seen instances of individuals serving in doctoral-level positions who appear to be expected to assume roles similar to research assistants, in that they largely execute the PI's decisions, and are not often given the opportunity to meaningfully shape the direction of research themselves. If a lab needs a staff member to implement decisions that have already been made, an RA should be hired for that purpose. To have a postdoc in such a position is a missed opportunity —the postdoc's training is not being fully utilized —and also puts the postdoc in the awkward position of presenting/writing up research that is based on implementation decisions in which they might not feel they had adequate say.

Fundamental issues and challenges

I am a graduate student. Due to a chronic health condition, I do my best work when I am allowed flexibility with respect to when and where I work. I don't need to work 100% remotely, but having the option to choose to work at odd hours/locations is critical, and compatible with the computational/quantitative nature of my work. However, as I seek postdocs, a major challenge I face is in identifying those PIs/labs that will be receptive to my need to take advantage of this kind of flexibility. This is not information that is posted in job advertisements. It can also be a difficult subject to bring up when interviewing with a PI, or even when conversing with other members of labs, for two reasons. First, the request for flexibility might raise the question of why this is being requested. To answer this would require describing personal health background that I might not be eager to disclose, and others might not be eager to hear. Second, I would be concerned that asking about this would be misunderstood as a lack of commitment or work ethic. As a potential solution to this problem, I think it would be extremely helpful if PIs/labs could provide information in job announcements and/or on their websites that provide some insight into openness to flexible work arrangements for those postdocs whose roles are compatible with this, or at least make it clear that prospective postdocs are welcome to discuss this without risk of being expected to disclose sensitive personal information or being viewed as a likely unproductive lab member. NIH could also take a lead on this by making clear the kinds of flexible work arrangements that might be considered for various intramural postdoc positions.

Existing NIH policies, programs, or resources

Coming from a grad student perspective, I am not terribly knowledgeable about all the details of the relevant programs, but I will try to offer a few thoughts. First, with respect to individual awards (e.g., F32, K), it would be helpful to better understand how I can get some insight into how competitive an application I submit is likely to be. That will help me best judge whether it is worth my time to try to submit now, or whether my time is better spent on other objectives, such as publication. Second, I wonder if it might be interesting/useful to consider a funding mechanism to support those who have just finished their dissertation, but could use a little more time to take care of various useful tasks (e.g., wrapping up thesis-related publications, pursuing job search-related activities, developing skills) before committing to a postdoc position that is very likely in a different lab and possibly in a different institution and city. This could almost be understood as a sort of "gap year" type of funding. Third, I wonder whether it might be helpful to increase the number of years for which a person might be categorized as a postdoctoral trainee.

Proven or promising external resources or approaches

I'll defer to others' insights on this question. In general, though: Thank you for soliciting feedback on this topic!

Response 3223

Perspectives on the postdoc roles and responsibilities

Postdocs are the workhorses of academic research. We do the experiments. We often train the grad students and other research staff. We also come up with many of the ideas that lead to funding for the lab.

Fundamental issues and challenges

Low pay. Limited academic job prospects. Awkward fellowship eligibility timelines and expectations of productivity that don't adequately account for the time needed to transition to a new area of study, etc. Lack of inter-lab mentorship structures that give postdocs resources other than their PI's, who often have conflicts of interest I associated with the postdoc's advancement

Existing NIH policies, programs, or resources

Relaxed eligibility timelines for fellowships.

Proven or promising external resources or approaches

No response

Response 3224

Perspectives on the postdoc roles and responsibilities

To me, an academic postdoc should be viewed as an equal colleague with a tenured professor, who simply has not yet gained the experience to be self-sufficient in their own laboratory, but who has the skill and potential to do that in time. Currently, most postdocs are treated as trainees, often lumped together with undergraduates and graduate students, rather than faculty with Ph.D.s.

Fundamental issues and challenges

The most fundamental issue is money. I imagine most responses will say this, because it is true.

Depending on the source, your average postdoc is 30-35 years old. Most won't finish until they are 35+. For reference, most industries consider this "middle career". For pregnancy, this is considered "geriatric". Yet most postdocs are seen as students who should be content to work 60+ hours per week, rather than seen as skilled experts in a desired field. Many postdocs forgo families, forgo hobbies, forgo "starting their life" until their 40's, and in return are paid less than half what the average Ph.D. makes in industry.

Further, the opportunities presented to academic postdocs are limited, with less than 1/3 of postdocs eventually achieving a tenured faculty position. The current "pathway to independence" is to apply for a K99 and hope you are one of the lucky 20% to receive funding to start a lab, otherwise the chances of getting a tenure-track position fall dramatically.

The biggest challenge is uncertainty, making little money with just the hope of one day having a decent job. If one compares the life of an M.D. to a Ph.D., we can see a dramatic difference in the life path. Med school takes 4 years, always, if you pass your classes/exams. Grad school can take up to 7 years, even for someone that has done everything right. Residency pays ~$60k/yr to give training required to bridge the gap between school and your first "real job", in the same way a postdoc is designed to, but is extremely rigid in the scope of what is learned, and a $200k+/yr attending position is GUARANTEED after completing the 3-6 years of training. Conversely, postdocs have no set path to guide them toward independence, and no guarantee of ever seeing a well-paying job.

Existing NIH policies, programs, or resources

Unfortunately the NIH budget is set by congress. So while more money will solve the current financial problems most postdocs face, I appreciate that the "resources may not be there". Additionally, I realize there are not enough tenure-track positions to go around to guarantee a postdoc an academic job the same way a resident is guaranteed an attending position. Yet I still believe there are things the NIH can do to help with money and a path to a job.

However, the NIH should work to prevent the "perpetual postdoc", by enforcing the standard set by many institutions that postdocs should never be more than 5 year positions. Institute a ban on NIH funds being

used to fund postdocs after 60 months, unless they are the recipient of a K99. This could free up funds to increase the salaries of postdocs years 0-5.

However, and this is incredibly crucial, you must create a resource that fosters a path to independence plan for postdocs that will not get a tenure-track position. This resource could provide mentorship, disseminate job opportunities outside of academia, or even act as a headhunting service for industry, given to 4th and 5th year postdocs who did not receive a K99 and/or are looking to transition out of academia. If a K99 is unfunded on final attempt, immediately direct them to this resource. Do not leave postdocs out to dry. It would make a world of difference for a postdoc to at least know there is an institutional "plan b" they can turn to if they realize they will not become a tenure-track professor and need to find an alternative. Even a program like the "Supplemental Offer and Acceptance Program (SOAP)" for med students that don't match to residency, but designed to help match postdocs into non-academic positions.

Response 3225

Perspectives on the postdoc roles and responsibilities

Much of the scientific progress in the US rides on the backs of academic postdocs. In my day-to-day responsibilities, I critically analyze the literature, design and run experiments, present at key scientific meetings, train students, junior postdocs, and technicians, write grants, and also establish and build collaborations. These are all of the pillars of modern science and is the result of years of predoctoral training. Despite being classified as training period itself, postdocs are already highly trained and perform the instrumental roles in science.

Fundamental issues and challenges

Postdoctoral fellows are underpaid. Postdocs are a highly skilled workforce that is instrumental to biomedical sciences in the US. Academia has been hemorrhaging talent to industry due to the low compensation, lack of recognition, and high demands in productivity. Over time, this will lead to the stagnation of creative and innovative science. Higher compensation will communicate that postdocs are a valued group, and will lead to more recruitment of talent over time.

Postdocs often work more than a standard 40 hour week, often times exceeding 60 or even 70 hours. There is also no overtime and in many cases, poor work benefits. There is no reason why highly skilled individuals persuing a noble career in developing new therapies to diseases should struggle to make ends meet or delay raising a family due to unmanageable costs of living.

For any industry job, there is a period of training in the beginning. However they are not compensated less for requiring training. Therefore, the training nature of the academic postdoc position is not a reason to keep the compensation low.

Existing NIH policies, programs, or resources

Adding diverse merit-based funding mechanisms would be helpful. Many foundations are able to fund more cutting-edge science, however the vast majority of NIH funding mechanisms require way too much preliminary data. Postdoc is a time to try daring high risk/high reward work, and also to develop tools for one's future lab. Prioritizing these developments are instrumental for postdocs.

It would also be beneficial to reconsider what is necessary to be promoted in science. For example, if a postdoc is a highly skilled scientist and a fantastic mentor but is not keen on writing grants, this individual cannot be promoted to a professorship role in the current academic climate. Allowing for wider professorship roles with appropropriate (higher) compensation for the diverse skillsets required in science would be instrumental for the diversity of skills in the postdoc population.

Proven or promising external resources or approaches

No response

Response 3226

Perspectives on the postdoc roles and responsibilities

A postdoc should be able to learn something new in their role rather than continue doing just what they learned in their doctoral program. The position should provide opportunities to learn skills relevant in academia and outside of it. It seems that the academy in the US simply does not have enough investigator positions or staff scientist positions to accommodate all of the people graduating from doctoral programs. They design and perform research, analyze data, contribute peer review, write grants that generate money for their institutions, publish papers that contribute to the prestige and reputation of their institutions, and teach undergraduates, graduate students, and new staff. Their roles and their PIs expectations are very rarely well-defined, which can lead to a very uneven experience from PI-to-PI and institution-to-institution.

Fundamental issues and challenges

Our system is the opposite of inclusive. A crucial area to address is compensation. Many people love academia, but they are leaving for industry because they simply cannot afford to stay. I'm a first-generation college student and PhD, but I will not be able to stay a postdoc for as long as I had planned. I cannot afford to. To be competitive for academic positions, postdocs are expected to move from their doctoral institution or face punishment in NIH grant reviews. I have already experienced this as a postdoc. Relocation makes having a family or support system challenging. It is costly to relocate, and unaffordable on a graduate student or postdoc salary. The largest/most prestigious institutions that help people land academic positions are in higher cost areas of the US. Postdocs in these areas are paid less relative to their counterparts in affordable parts of the country because a much higher percentage of their income goes to housing. Despite the multifaceted skill-set postdocs bring to their laboratories, and the significant amount of unpaid labor they do to better their filed and institutions, I personally know postdocs that must go to food banks to get enough to eat. Most have roommates into their 30's, have no emergency fund, and cannot save anything for retirement. When I've asked colleagues how they afford living in the area on our pay, the universal answers are "my partner makes money", "my family helps me", or "I'm in debt" . This makes beginning in and continuing in academic research more difficult if you are not partnered with someone wealthy, or have family wealth. This leads people to delay medical care and other important life events. This does not encourage diversity. Finally, the role of a postdoc needs to be more clearly defined by the NIH.

Existing NIH policies, programs, or resources

Postdocs need to be paid commensurately with their experience. We are called trainees, but we do have significant skills and expertise that are not accounted for in our compensation. The NIH minimum wage should scale to cost of living, and years of experience as a postdoc. Postdocs should not be punished for receiving external funding outside of their PI's budgets. Despite the training and prestige provided in T32 and or F awards, these postdocs lose benefits provided by their university and are often paid less than colleagues who have not pursued outside funding and are covered by their PIs. This simply doesn't compute—we are punishing the trainees who are working to become better scientists by applying for funding as would be a requirement of a principal investigator. NIH needs to allow PIs to supplement their postdocs income using NIH funds. The current regulations limiting PIs ability to increase salaries are helping keeping postdocs in poverty.

NIH needs to provide more concrete guidance for what the role entails, and how universities can better support postdocs in moving to an independent position. If a postdoc writes and R01 and will be performing the majority of the research, they are not included as a Co-PI on the grant. This leaves them with undocumented experience that, if considered by NIH and other funding organizations, could help establish a track record of funding applications and acquisition when they move to their next position.

Proven or promising external resources or approaches

Giving postdocs a minimum contract of two years would significantly boost morale and give them some stability. More clear expectations and better avenues to establish their own independent work (Including them as PIs on grants, for example) could improve environment, training, and satisfaction. Increased pay would improve recruitment, retention, job satisfaction, and their ability to train, as less attention would be focused on finding a meal and scrounging to afford rent and more on their work.

Response 3227

Perspectives on the postdoc roles and responsibilities

The postdoctoral training period should be an opportunity to expand technical skills, develop independence and obtain mentorship from experienced investigators. The postdoc should be responsible for leading a project, mentoring and training others in the lab and work to secure funding or fellowships.

Fundamental issues and challenges

Postdoctoral scholars are generally in their 30s or 40s and have spent substantial time obtaining advanced training. They are experts in their field. They should earn a salary commensurate with their training, they should have access to benefits (including retirement), and they should have access to support for childcare.

Challenges:

- NIH NRSA postdoc payscale is a benchmark for postdoc pay and it has not kept pace with inflation.
- Postdocs who earn more than this NRSA payscale are disincentivized to apply for training grant slots or fellowships since they risk a cut in pay.
- Postdocs on fellowship are not university employees and not eligible for re-tirement and some other benefits. That is a PENALTY for earning a fellowship.
- There are currently limited paths for advancement or support if postdocs wish to stay in academic setting but not pursue an independent faculty position.
- There is limited flexibility in eligibility for fellowships (eg. K99) which can negatively impact women who may not be able to advance as quickly from PhD to postdoc for family reasons. One year family leave extension is often not enough
- There is limited financial support for family leave or funds for childcare to enable postdocs to attend conferences
- There are very few resources available for international postdocs. They are valuable members of the scientific workforce.

Existing NIH policies, programs, or resources

- NIH NRSA payscale needs to increase ASAP. Most universities use this as a benchmark for postdoc pay. Postdocs are disincentivized to apply for fellowships or training grant slots due to the low NRSA payscale. PIs cannot supplement these salaries from grants, so options to increase salary are limited.
- Postdocs on fellowship (eg. F32, K99) should be structured so that they can be paid as university employees and receive full benefits including retirement
- Modular R01 grants have not increased in 25 years! Grant budgets cannot keep pace with the need to increase pay for personnel, including postdocs
- There should be mechanisms of support for post-PhD advancement in an academic setting
- MORE flexibility in eligibility for K99 and other awards, including for junior faculty early-stage investigator status. This has been a PENALTY for young women scientists. One year extension is often not enough.
- Post-doctoral re-entry grants for those (usually women) who take a leave for family or maternity reasons.
- Loan programs for postdocs to pay for housing and childcare in high cost areas

Response 3228

Perspectives on the postdoc roles and responsibilities

An academic postdoc was once thought to be a prestigious position on the path to becoming a faculty at an academic institution, however, the cons have now greatly outweighed the pros for almost all graduate students. This new generation is simply not willing to accept the sacrifices that were once seen as a rite of passage in the life of academia, so there has been a mass exodus to industry/pharma/biotech among my graduate student peers.

Biomedical research at academic research institutions is responsible for our nation's major scientific breakthroughs/medical advances because it is a system where the science and data drives decisions and the paths forward. Unlike most business operations, grant funded academic research projects and decisions are made by experts—the PIs most postdocs aspire to become. Academic research allows us to move forward and progress in technology and medicine. People were willing to accept unlivable wages and work overtime without compensation for the privilege of intellectual freedom and scientific rigor and excellence that academia provided. The pros no longer outweigh the cons, and the reputation of academia has been severely damaged by the unreasonable sacrifices that perceived as cruel and undesirable by younger generations. There are so many alternative career paths that very few people are interested in the excellence of what a postdoc position used to represent. I view the postdoc position and the career path in academia as the most impactful and astounding definition of what it means to be a true scientist, guided by data and curiosity towards groundbreaking scientific discoveries—but I am one of the only graduate students I know that feels this way. The NIH needs to improve the salary, working conditions, and prospects for faculty positions, or there will be no future for this nation's biomedical research legacy.

Fundamental issues and challenges

Graduate students are not seeking postdoc positions because all other entry level positions are offering DOUBLE the salary. The overwhelming majority of students are not even considering applying for postdocs because the choice is clear. Graduate students are not interested to work overtime (without compensation) to make unlivable wages any longer. It is a disgrace that scientists who have earned PhDs are still considered "trainees" that are working in exchange for their educational training, which has historically been used to justify the unlivable salaries. There is no prestige in not being able to afford rent. Traditionally it was disregarded that postdocs are adults in an economy they cannot participate in, unable to start families, and who are unable to support themselves financially. Most of society isn't even aware of the unlivable wages of experts who are basically, as they say, "curing cancer". The average American assumes that a scientists' salary would be proportional to their impact in society, and this is certainly not the case. The fixed budget that is allocated to a postdoc salary is revolting and shameful as a nation. If the salary of an academic postdoc is not comparable with industry/biotech/pharma, PhDs will certainly not consider a career as a postdoc, or in academia altogether. The reputation needs to be restored in order to reinstate a future for biomedical science.

Existing NIH policies, programs, or resources

The salaries of a postdoc must be comparable to the starting salaries for PhDs in industry/biotech/pharm. Small salary increases will change nothing.

NIH should instate a committee/department that reviews cases of abuse and exploitation in the academic workplace—The infractions to human rights and code of conduct in the workplace should be addressed, not tolerated by the NIH or the university any longer.

The small number of faculty positions in academic institutions must increase.

If postdocs are not offered competitive wages, healthy working conditions/environments, and there are very few prospects for faculty positions, there will be no future for academic science in the United States funded by the NIH.

Response 3229

Perspectives on the postdoc roles and responsibilities

Post docs are currently quite frankly too many things all at once. They should bring new expertise to a lab, but they are encouraged to learn something completely distinct from their PhD work. They should train others in the lab, and in fact some faculty rely entirely on this, but this time is also an important stage for their own career development. Most importantly, if they're learning something completely new in their post-doc, they're probably getting trained by grad students for the first few months and not being that helpful in the other direction. We have the blind-leading-the-blind and so we're all reinventing the wheel. I view the post-doc as a very stressful time of one's life. You're undervalued, under-appreciated, and you feel crippling imposter syndrome because you went from figuring out a problem and feeing amazing after graduating with a PhD to not knowing anything and feeling helpless as a post-doc (opinion synthesized from talking to many post-docs from many different labs).

Fundamental issues and challenges

Where to begin! The pay is awful. People coming straight out of undergrad make at least 2-3X the amount of money in the tech sector. Because PhD's and post-docs take an increasingly longer time, we not only lose the actual dollars of income but we lose years of money invested in the market because we don't have enough money to save and invest meaningful amounts. This is a lifelong handicap I was unaware of until well into grad school and my mid-late 20's. Financial prospects for academics? Bad.

Academic culture is toxic. It's a competitive environment where there are no real, enforced rules. There is no authority keeping PI's in check. Faculty encourage or behave in ways breaking the rules taught in our NIH mandated ethics courses without any repercussions. Until there is some criterion in science that cares for more than just the results someone produces or, more accurately, the journal someone publishes in, this will never change. One example is faculty who copy collaborator's data and rush to publish it before them. This behavior is routinely rewarded because "they were first" . Another is the stereotypical mistreatment and bullying of students/post-docs into producing results which I have not experienced but have witnessed. Also, labs suddenly having "funding-issues" when needing to renew a (coincidentally pregnant) employee's contract—while interviewing new candidates.

Stress, no security, low pay, and no promise of the job you actually wanted. Let's face it—no one wants to be underpayed until they're 40 years old while wondering if they'll maybe get that tenured faculty position or if they'll have to build a different career at that time, age, and likely with dependents. I think fewer people do post-docs because younger generations have developed enough self-respect and confidence to find a healthier and more stable way to live.

Existing NIH policies, programs, or resources

I would restructure the whole system. The reward for "winning" or "publishing first" is too high. In my opinion, the problem stems from the fact that faculty running labs were primarily trained to do research. There is no rigorous mentorship criterion in training these group leaders. Labs could be run by small groups of PI's working together, each being specialists in either science or mentorship. Rarely do people excel at both.

Get rid of tenure. Or dramatically redefine it, As an example: academic tenure is a one time 10 year position; maybe it can be renewed once. Or it can be maintained by passing an extensive re-certification/licensing/board exam that focuses on the accepted scientific practices of the day, mentorship, interviews with trainees from the elapsed period, etc.

There are too many trainees. Cut the number of students in half (or more) and double (or more) everyone's pay. Same for post docs. Academia as it is now worked when people could justify miserable

pay for a couple years to then upgrade to a tenured job. Projects/methods are more time consuming, the academic track takes longer, and the payout is extremely uncertain. I hope it's obvious that that is not a risk worth taking. The time equivalent spent in academia spent in industry straight out of undergrad gets you to nearly the same place, except you were making more money the whole time. People figure this out in grad school so they don't want to touch a repeat of this experience (post-doc) with a 10-ft pole.

Bottom line—there is no security in this line of work, neither financially nor career-wise—unless you're one of the few who get tenure. And that's just not a risk most people can afford anymore.

Proven or promising external resources or approaches

I cannot stress this enough—just pay people more! A post-doc is a highly skilled employee and they should be paid as such. $100k min and the post-doc shortage will be gone. Lower the number of post-docs but make it a higher quality job. Currently post-docs are being asked to do too much for too little money, too many hours (it's research, you'll often need to pull long hours, it's just reality for some projects), and a "we'll see what you produce" about their next career move. It's an *extremely* bad deal. I haven't had a single post-doc recommend the experience to me and I talk to many of them. The graduate and post-doc experiences are awful enough that I actually predicted the post-doc shortage back in 2016 just from listening to folks share their experiences. I say this to emphasize that these (any many other) problems have been around for a long time but no one was listening. This is itself part of the problem. The pervasive mentality that "you suffer and get through" breaks down when there is nothing solid on the other side.

Response 3230

Perspectives on the postdoc roles and responsibilities

The academic postdoc is a varied role that encompasses many different stages of the transition from training to independence. Each individual postdoc will have a different trajectory and timeline, with some doing significant independent work early on and others needing more supervision throughout their postdoc. Each postdoc's exit path will also look different depending on their plans and experiences, with some launching to write their own grants, others transitioning to industry, and any number of other pathways.

In all of those cases, postdocs do a significant amount of work to support the research enterprise. While the point of postdoctoral training is to gain skills and competencies in order to function as an independent scientist, a postdoc is still doing real and important work during their fellowship. At BWH they are considered full employees and receive benefits and rights accordingly.

Fundamental issues and challenges

The number one challenge with recruiting and retaining postdocs for our institution is the cost of living in Boston. This affects all roles, not just postdocs, but postdocs are in a particularly vulnerable position at academic medical centers like BWH because they are often completely reliant on the PI's NIH funding for their salary. Major academic centers in large urban centers where rents are very high are losing very qualified postdocs; when they do come, the financial struggle hugely impacts their quality of life.

Cost of living also presents an equity issue, with intergenerational wealth impacting a postdoc's ability to survive on low salary, rely on family assistance, or not be burdened with student loan debt in addition to rent and childcare.

The need to increase postdoc salaries also has a deleterious effect on the rest of the research ecosystem, particularly impacting small labs and junior faculty who can't afford to attract talented postdocs—or any postdoc at all. BWH, along with most institutions in Boston, is moving to increase minimum postdoc salaries to account for cost of living, but without the NIH's support in increasing the funds provided to PIs, this will be difficult or impossible for small labs to afford.

Existing NIH policies, programs, or resources

Expanding modular budgets to allow higher postdoc salaries with regional cost of living adjustments is necessary to protect not just the postdoc ecosystem, but the rest of the academic ladder and particularly junior faculty in small labs. Adjusting NRSA scale is particularly critical for NRSA Training Grants.

K99/R00 are in many ways the 'ideal' pathway for postdocs to transition to independence, but they are known to be highly competitive and elusive, particularly as one of the few mechanisms that are not limited by citizenship or permanent residency. If there is any way to expand this program or offer similar pathways in other programs, that would be significant for many postdocs.

The NIH Diversity Supplements are also an essential resource that needs to be protected and expanded. They are a key mechanism for PIs supporting multiple postdocs and a valuable tool for increasing the diversity of our scientists.

Proven or promising external resources or approaches

The General Schedule federal employee pay scale incorporates cost of living, and could be an example for the NIH to look to.

Response 3231

Perspectives on the postdoc roles and responsibilities

I decided to do a postdoc because I wanted to gain expertise in a different field from my graduate studies and gain the independence needed to become a PI. I feel my responsibilities are foremost to focus on experiments, grants, publications, and mentoring which will help me in my journey to being a PI.

Fundamental issues and challenges

I'm the president of our postdoc society and I have one key reason. Pay. The low salaries of both graduate students and postdocs impact all of these aspects, and critically so for those without generational wealth. I have several friends in grad school (paid through NIH grants) who had to take out over 80k in student loans to afford rent and food. Many had dreams of becoming a PI but cannot afford to gamble another 4+ years of low pay for the small chance of becoming a well-paid PI. The common denominator amongst them is that they lack generational wealth. You must understand that low pay excludes the diversity of people that you claim to want to attract.

I, fortunately, do have the privilege to take the financial risks of being a postdoc, but I am still having to make many sacrifices. The low pay means that I'm nowhere close to where my peers are to buy a house, and I'm at the whim of whatever renters want to charge. Rent increased by 25% amongst the postdoc community at my institute from the last leasing cycle to this one. Postdocs were barely holding on as it was and there was no increase in pay. This led to many postdocs quitting (we lost at least 15 out of 75 postdocs) academia and joining industry. I've heard from several PIs that the postdocs that they were in the process of recruiting rejected their offers due to the high rent. I had to move from a nice apartment near campus to one 150% smaller, in a neighborhood where shootings are common, with an added commute that is frankly terrifying to drive every day. In contrast to this, our neighboring institute increased their housing stipend and retained all their postdocs/ "graduated" some to PIs.

Existing NIH policies, programs, or resources

You need to massively change the language and policies associated with being an NRSA fellow. From the conversations I've had with HR and other fellows, it seems to be some interpretation of the language used which enables over 70% of public institutions to prevent us from being classified as employees. I've earned this fellowship but it's come with so many costs. Because I'm now a fellow I've lost the few benefits that I had as an employee of a state institute. These included good health care (dental and vision), a 3% matched retirement contribution, and access to travel grants. It has also come with over a solid week's worth of time spent doing administrative work to make sure I still get paid and I would get a significant pay cut if it weren't for supplementation by my PI's private foundation grants.

This loss of the institute's health insurance also meant that a PI at our institute told her postdoc who recently had a baby, and received an NRSA that it was a better choice for her future if she rescinded her F32 and went to work for industry instead (which she ended up doing).

From a tax standpoint, these kinds of fellowships need to be worded in a way that classifies them as earned income (as PIs grants are). Because of this discrepancy, fellowship recipients are not eligible for any earned income tax credit.

The postdoc position should also be relabeled as 'permanent' so visa holders are not in such a vulnerable state. Over 70% of the postdocs at our institute are visa holders and are critical to the discoveries and

progress we make every day. I realize that the postdoc position is supposed to be a stepping stone to something more permanent but so is any position.

Proven or promising external resources or approaches

The National Postdoctoral Association provides guidance on best practices, which are informed by the postdoctoral community, and the faculty and staff that support the postdoctoral community.

Response 3232

Perspectives on the postdoc roles and responsibilities

Postdoc is the bridge between grad student and independent scientist. Postdoc experience not only enrich the skills but also teach perspective of the field, which is essential to become an independent scientist.

So postdocs shouldn't be considered as MANUFACTURER OF DATA to get grants or publish papers. PIs should mentor rather than boss them. Postdocs will do experiments, generate data, teach grad students but alongside they need to edge their critical thinking pattern. They need to be mentored to understand the bigger picture and long-term goal of the project to learn to structure purposeful scientific questions for future.

Fundamental issues and challenges

1. Don't increase the NIH recommended salary for postdocs. MENTORS will give proper salary as per needs of the place, but BOSSES will pay salary as low as it can be given. So WHEN WE HEAR NIH RECOMMENDED SALARY INCREASES WE FEEL VICTIM AGAIN AND AGAIN. I am a 5TH YEAR POSTDOC and I get 45K PER YEAR, can you tell me what is the NIH recommended salary for a 5th year postdoc? And why I am not getting it? AND it's not only me, many many other postdocs also.
2. NIH should do an orientation for all the incoming postdocs directly and not through University/Institute, about research ethics, research integrity. Otherwise, fellows will learn to manipulate.
3. NIH should update and let every postdoc/grad student know (if there is any) about the WHISTLE BLOWER PROTECTION ACT of NIH and where to contact and whether the whistleblower's carrier will be at stake or not.
4. NIH could inform Federal Govt about VISA rules because J1 postdocs often get threats about terminating their employment and immigration status.

Not for postdocs but NIH should start scrutinizing data for all NIH grants for falsification and fabrication.

Existing NIH policies, programs, or resources

No policies/grants/rules/resources/programs/recommendations can protect postdocs from EVIL scientists. SO ALTHOUGH TEDIOUS BUT BETTER TO SEARCH FOR THE GHOST IN THE MUSTRAD.

Proven or promising external resources or approaches

Social Media.

Response 3233

Perspectives on the postdoc roles and responsibilities

The postdoctoral position is in my opinion a transition between being a grad student and officially in an academic position as a PI and teaching other students. An opportunity to get funded, develop your ideas and become independent.

Fundamental issues and challenges

The biggest issues in my opinion is toxic environments and lack of money. The number one issue in my opinion being LACK of MONEY. Post doctoral positions run in parallel with woman fertility and the stage of family building, and postdoc salaries just DO NOT cut it. I think in general there needs to be a big boost to salaries in the academic fields. Also medical residents salaries are higher for a similar education level. Not sure why such a difference between academic and clinical. Professors do not make enough these days to

make people want to put up with all that goes behind doors. You can make professor salaries this days with a BS and an MS. It almost doesnt even hold the same reputation as being a Dr. of medicine when they are two wings of the same bird. Passion can go a long way, but ultimately we all recognize our mental health and financial stability is first. Post docs feel like doing a PhD all over again, which is soooo exhausting and all for not a lot of reward. At least medicine you have big salaries to pay for the long hours and mental energy investment. Talking with students in california I heard they are paid below 40,000 in a state that is sooo expensive. Is like living poor after so much education and preparation. Also ultimately you can do research with medicine, with a fall back plan of clinical work. So there are few advantages to a PhD in general. I LOVE academia. I want to be a professor. But it does make you consider your options.

Existing NIH policies, programs, or resources

Increase managerial training for PIs to learn how to manage people and create healthy work environments and increase salaries for Post Docs and Professors.

Proven or promising external resources or approaches

No response

Response 3234

Perspectives on the postdoc roles and responsibilities

In the modern scientific ecosystem the postdoc should be viewed as a short-term position that facilitates the transition to a more sustainable career trajectory. There is limited upside to an extended postdoc unless the an individual is focused on a tenure track position at a R1 type institution. As a scientific community we should work to reduce the need for postdoctoral training by creating better career discernment for graduate students. Only those interested in long term, high level science careers should be taking on postdoctoral training.

Fundamental issues and challenges

The postdoc is a dead end position and without considerable philosophical changes there will likely be long-term issues with recruitment and retention of postdocs. Many postdocs will put off important milestones like home ownership and starting a family due to the social pressure of completing a postdoc in the hopes of reaching a long term position. The COVID pandemic has laid bare the reality that a postdoc is not required for success in the biomedical workforce and it will be hard to reverse course going forward. If it is the desire of NIH to maintain a sustainable model for postdoc recruitment and retention then salary needs to be competitive (>$70K/year), childcare must be subsidized and available, housing needs to be available, postdocs need access to retirement benefits, and the position needs to be respected within the academic hierarchy.

Existing NIH policies, programs, or resources

More training grants that are based on cohort models. IRACDA is a fantastic program that facilitated the training of postdocs for a specific career outcome. More funding for programs like this would be of high value and would attract more people to academic postdocs. Graduate students know that there are limited opportunities for tenure track faculty positions and are looking for alternative career paths. Programmatic grants that support postdocs to be in the lab 50-70% of the time while also receiving training in other spaces (e.g., teaching, entrepreneurship, industry, policy, science communication) would likely be of high interest to both postdocs and universities around the country.

Proven or promising external resources or approaches

No response

Response 3235

Perspectives on the postdoc roles and responsibilities

A postdoc is one who is responsible for generating ideas, read, think extraordinarily, stays updated with the progress in the field of study and conduct experiments in order to do good science. However, the roles and responsibilities of postdocs are not clearly defined. It is a general understanding that postdocs are expected to work beyond work hours and on weekends. Sometimes, it is the requirement of the

experiment to work in odd hours/weekends and this is indeed done voluntarily. However, this is visualised as a measure of sincerity in the scientific community. They are also expected to carry out functions of the lab technician like making media etc. inspite of having one or two in the laboratory. The distribution of duties should be clearly defined such that postdocs are not overwhelmed with side duties and not able to prioritize their research. Most importantly, it is very important to tabulate the weekly tasks done by technician (who work fixed hours per week, do not work on weekends and take all the holidays) in a formal format for assessing proper utilisation of time and work done. Interestingly, the pay difference between the technician and postdocs in current scenario is $10K/year.

Fundamental issues and challenges

The major issue in the retention of postdocs comes with the fractional hike in the salary (provisioned through unions etc.). Although this hike in the salary is important in the life of a postdoc for various reasons like living in an expensive city, expanding family, childcare expenses, but, this creates a burden on the Postdoc Advisor who is now not able to support the postdoc. This is because it is too expensive for them to afford a postdoc as the grant fund is limited and there is no increase in grant money from NIH. The only way to have a postdoc in the laboratory is to bring their own funding, which is difficult to get considering the competitive market and also time consuming in terms of grant writing that is initiated way before joining the lab and there is no guarantee of getting one. This in turn again puts a prospective postdoc in a vicious cycle of grant application whether you are applying with your PI currently working as a postdoc in a lab or thinking of joining a lab in the future.

Existing NIH policies, programs, or resources

1. If the reason for not retaining the deserving postdocs is the fixed salary dedicated to the postdoc in a lab, then increasing the salary bar for postdocs in the NIH grants provided to the Advisor should be brought into action, so that advisors are not cutting corners to retain one or let go one in order to carry out lab functions.
2. A clear demarcation of tasks done over time/day or week for the technicians would help in assessing transparent job functions/productivity and redistribution of work, if required.
3. The development of a stable funding and job security for international postdocs both in terms of job security and providing benefits like relocation assistance would be a boon.

Proven or promising external resources or approaches

A mandate/set of instructions in the form of orientation should be provided to the Advisors and Postdocs to understand and train the mindset of both for amicable work environment. This should include work ethics, mentoring, mandatory holidays to refresh mind, work life balance and enhance productivity.

Response 3236

Perspectives on the postdoc roles and responsibilities

I am still believing post doc job is to do great science, but non progressive research environment is negatively affecting our career.

Fundamental issues and challenges

Salary is very low below the average. especially in big cities it is very difficult to live with the family.

Delay in the publication is another big issue, which makes us stay in the same low salary job.

Because of the publication hold, we are unable to move to another job, even if we get good opportunities.

Existing NIH policies, programs, or resources

twitter

Response 3237

Perspectives on the postdoc roles and responsibilities

No response

Fundamental issues and challenges

The most critical predicament of a postdoc's life is that the salary—which is directly or indirectly based on NIH stipends—does not cover the cost of living in most U.S. metropolitan areas. For an analysis of the matter, see this paper in Research Policy 52:3 April 2023:

American postdoctoral salaries do not account for growing disparities in cost of living

https://www.sciencedirect.com/science/article/pii/S0048733322002360

Moreover, the annual salary increases do not pace with inflation, especially in the current high inflationary economy. The current salary levels become even less livable when the postdoc has a child too.

The NIH should set the salaries at levels that meet the actual cost of living in expensive cities and increase them annually with inflation.

Existing NIH policies, programs, or resources

No response

Proven or promising external resources or approaches

Not having to worry about sustenance will have the most impact on almost every aspect of the training ecosystem of a postdoc. Raising the salaries will achieve that.

Response 3238

Perspectives on the postdoc roles and responsibilities

As an international postdoc that have work in different labs and countries, I appreciate clear differences in the roles and responsibilities between places. The role of a postdoc should be to train and teach students and write grants to secure funding for their future career. Their responsibility is towards their project, but at the same time towards the scientific community, and to collaborate with their peers.

However, many times and due to the system as it is, we are involved in lab manager tasks, and we spend much of our time performing tasks that a technician could do.

At the moment, what should be a postdoc for me, it is far from the reality in the US. Due to the system, and since we are not faculty, we are the cheapest professional labor in academia, we are independent and can learn by ourselves because we have a PhD. This makes us more than capable to develop ideas and perform projects, not needing training in that area but mentorship to progress in our career.

A better understanding of the role of a postdoc, with indication of objectives and milestones to be accomplice by postdocs along each year, will clearly help in our career. Also, we should not be the only ones accountable for our progress, but the efficiency and performance of PIs should be check and evaluated. Also, the career of postdocs should be follow after they finish their postdoc, since this will be a reflection of leader and mentorship from the PI.

Fundamental issues and challenges

The main challenge is the salary, that in most cases do not reflect the experience of the postdoc and do not match the cost-of-living levels in the location. Housing provided is limited in number and time. In 6 months, I will see myself in a straggle due to having to move out of the housing and having to spend half of my salary, if no more, in rent. An adjustment of the NIH stipend scale should be adjusted for the actual prices in the US as well as for local prices not only of housing but of other basic needs, like food and heath. Purse

The job security, the immigration status and the environment in the workplace makes difficult asking for what we deserved. The lack of recognition and appreciation, together with the salary, does not encourage us to follow a career in academia. Besides, the support and the opportunities to pursue a career in academia are very reduced and difficult.

On top of this, postdocs have to postpone natural decisions in life, such as having a family, buying a house, making important decision. At the same time, and due to the pressure from some PI, our time dedicated to ourselves, to meet people, to follow with our hobbies, and to take care of our health, is limited and postponed. The competitivity in academia creates toxic environments at work which reflect in our work and in our mental health.

Existing NIH policies, programs, or resources

The first thing that need to change is the definition of postdocs as trainees, making them faculty, and getting the same benefits. In most cases, there is not much training or mentorship during these years. The follow up of postdocs progression in their career and the mentorship received should be performed to assure it is happening and to make sure postdocs are receiving a fair treatment at a professional and personal level.

Proven or promising external resources or approaches

Periodical surveys to check the satisfaction of postdocs with the working environment and the mentoring, making special enfaces in reporting mistreatment from PIs. More required professional development events and courses to assure the career advancement of postdocs. Direct contact with the postdoctoral associations and the postdocs in the institution in a safe environment in order to get all the information.

Response 3239

Perspectives on the postdoc roles and responsibilities

To me, the post-doc position appears to be an academic version of a medical residency. While it may sound nice in theory, it seems somewhat leftover at this point.

Most field are able to provide on the job training (including teaching positions) w/o requiring multiple years of mandatory continued training with lower pay.

Fundamental issues and challenges

It is far too easy to be exploited (as are grad students).

Post-docs and grad students do the bulk of the research, for half or less of the pay as other positions.

Often, trainees are expected to move (i.e., staying in the same place frowned upon), which removes their support systems, is expensive, and creates upheaval.

Pay seems arbitrarily lower than trainees. (I wld rather be paid less, and there to not be such large gaps btw stages.)

Power dynamics are a *huge* problem. Trainees often do not know they can push back, or say no.

As a field, we have normalized exploiting ourselves. Mandating that our trainees endure it is worse.

Adult trainees shld be paid such that they can live off the salary, supporting responsibilities in their life any adult might have. Expectations on their work shld, similarly, be reasonable.

Often, paying post-docs ~half of what a staff scientist makes is justifies by “they’re receiving training”, but the individual experience varies. The responsibility and expectation is, too often, placed on the PI, with little to no guidance or oversight that can guarantee a good experience.

Expecting individual PIs to “figure it out”, placing the responsibility on individual scientists, seems tantamount to me to putting the responsibility on the individual to “figure out” how to avoid Covid.

They can’t. Not only bc some individuals are less skilled at it than others. But also bc an individual, inspiring mentor doesn’t cancel out a toxic one.

Existing NIH policies, programs, or resources

My post-doc position was a nominal one. It was a post-doc position on paper (and by pay, respect, and lack-of-authority), but there was no “post-doc training” and no discernable difference btw my position and a non-postdoc one. (No one knew if I didn’t tell them, and they were generally surprised. And often had questions.)

So.

I do want to defer, in some ways, to people who are, currently, having valuable postdoc experiences and want to preserve the position. (I know I am biased, and I do want you to hear their voices, too.)

However, I hear poor experiences far more often.

I do think the position needs an overhaul. My personal opinion is that we should remove the requirement/expectation for doing a postdoc at all.

Or, we should at least consider it.

Again, other fields do not have this, and they all train their people just fine. (Even teachers and profs.)

If scientists with positive experiences to identify what it is about their postdoc that was so valuable and unique, then we can look at preserving that (and whether or not that value can be provided in something like entry-level staff positions, etc., or not).

Again, I know I'm biased, and I do want the positive experiences to be heard.

However. I think it may be extremely important to include, at the table, in the conversations, voices of people with less positive experiences, so that we can truly learn how to avoid them.

And I sincerely think we should *consider* whether.we still need to "require" or expect postdoc positions or not. And, if we continue to have postdoc positions, I ask that we be very certain that we need these positions, that they add value to the trainees in them.

Proven or promising external resources or approaches

Look at how other technical fields approach training as a whole.

NASA, in particular, has a very thorough, proven history in defining how to do a thing well (incl industrialization and systems engineering).

In response to Challenger, they reevaluated a *lot* about the workplace. They have strict rules abt 40 hr workweek, etc.

The scene in Hidden Figures, where he tells them to call their wives and tell them they'll miss supper.is how they *got* to Challenger. The overworking and burn-out.

Ironically, it appears that medicine and medical research are stuck behind, eith pre-Challenger work ethics.

And because the engineers at NASA do not have PhDs, we don't listen to them.

They have an expertise we could benefit from.

We should listen.

Response 3240

Perspectives on the postdoc roles and responsibilities

As an aspiring academic investigator, I initially viewed the position as a mean to enhance my research article publication record while learning how to identify gaps in knowledge, conceptualize and formulate research projects, write grants, manage a lab, and ultimately develop into an independent principal investigator (PI). However, the experience of my lab mates post-docs convinced me that I was wrong and my own post-doctoral experience confirmed that sentiment that post-docs are actually just laborers, some sort of instruments in the hands of labs' PIs to use to advance their own career ambition at the expense of the post-doc doing the work.

Fundamental issues and challenges

At the core of the issue post-docs face is that the biomedical research field has clearly morphed into some sort of business with PIs locked into a race of competition to make a name for themselves. As a result, PIs have turned to post-docs to run the experiments the PIs need to write more grants. Even PIs with at least 2 active R01 are not satisfied and are constantly behind post-docs' backs asking for data. At my past institution, I knew of labs with only post-docs; no graduate students. As a consequence of this greed of PIs, post-docs are being exploited, abused. In the lab I did my first post-doc in, all post-docs were subjected to a mandatory work hour of 8am-6pm, 6 days per week. Saturday after the 10 hours shift, I

spent the evening preparing my weekly report to be sent to the PI the next day. When I labored to complete the manuscript that I secretly planned to submit and leave the lab, the PI sat on it for months; he wanted to submit it himself but said he did not have the time. At the same time, I was expected to be in the lab Monday-Saturday. This showed that the PI did not care about my career but was only cruelly using me as a technician to meet his experiment needs. This quick recap of my first post-doctoral experience paints a picture of research labs that have turned into some kind of concentration camps where the life is being squeezed out of post-docs. My status of minority added another layer of complication to my post-doctoral experience.

Existing NIH policies, programs, or resources

Not every post-doc has this determination. Since institutions are not addressing these serious issues facing post-docs, in fact some do not even have relevant policies in place, NIH has all interest in making sure that taxpayer dollars are not being turned into some micro businesses run by greedy, abusive, racist and discriminatory PIs who are only in it for themselves.

As suggested above, I proposed that post-docs at every NIH-funded institutions be made aware of their rights and that a system be created to allow them to report abuses. When it comes to diversity supplement grants, the recipients should submit an exit survey or report that tells their experience, the project they work on and whether the PI delivers on their career development plan. NIH needs to, PLEASE, address racism and discrimination in biomedical field and make sure post-doc hiring is fair. Most PIs are going to their home countries to source post-docs, people they know they will easily use any way they want

Proven or promising external resources or approaches

No response

Response 3241

Perspectives on the postdoc roles and responsibilities

Postdocs are in effect indentured servants, lured into their postdoc with promises of resources to be productive, time to learn new techniques, and allegedly conducive environments to write their papers. Postdoc once recruited are at the mercy of their "mentors." problematic mentors are often shielded by their institutions because these mentors can bring in funding. The situation is worse for minority trainees, people with disabilities, people with families and/or dependents, and international postdocs on visas. Take away postdocs and grad students, and academia would collapse as national strikes have demonstrated.

Fundamental issues and challenges

Postdocs are treated like trainees and not given due benefits because of this culture of exploitation.

Postdocs lack ***industry parity,*** and have been historically exploited and abused.

Postdocs are often exploited by their mentors, expected to work twice what is reasonable while being paid half or less than what they could make in any other economic sector. The means to report abuse of postdocs is often biased towards helping the funded institute maintain their prestige at the expense of burnt out and/or abused postdocs/grad students/staff/faculty. Reporters are often retaliated against, and there is minimal protection for whistleblowers despite whistleblowing effectively being protected speech.

Existing NIH policies, programs, or resources

All postdocs should have their OWN independent funding. This should NOT be tied to lengthy "competitive" processes which select for candidates cherry-picked by schools "good apples" which have possibly been abused before and scared to perform (brainwashed into thinking exploitation is beneficial to them).

For international workforce members, postdocs should have a centralized process for their visas managed by the NIH with minimal red tape to prevent institutions from holding international postdocs hostage by their visas. These people should also have the same benefits as domestic postdocs.

Institutions receiving ANY federal funding must make clearly available their past and current institutional policies and change logs so that postdocs can know whether an institution's policies would be detrimental to the postdoc's safety and wellbeing.

Postdocs should be considered federal employees so that problematic institutions can't make decisions like arbitrarily punishing and firing postdocs without due process. Due process should also not be abused.

Postdocs should AUTOMATICALLY qualify for the NIH Loan Repayment Program and/or the Public Service Loan Repayment Program. Applying and not getting the LRP can be detrimental to postdocs and their families. It's needless gatekeeping.

Proven or promising external resources or approaches

GIVE. POSTDOCS. THEIR. OWN. FUNDING. Pay postdocs at least twice as much as what they are making now. Same for grad students. Health insurance should also be covered, as well as benefits standard for a similar position in industry.

High-performing faculty often jump from mid-tier institutions/unsupportive environments and may be recruited to "better" environments. If postdocs had their own power of the purse (so to speak), then they too could leave abusive environments.

Pay postdocs for their time filling out surveys and RFIs. None of the above is new. Do something to fix this mess.

Response 3242

Perspectives on the postdoc roles and responsibilities

At many academic institutions, postdoctoral scholars are the lifeblood of biomedical research. They lead independent projects at the cutting edge of their fields, provide mentorship and support to their peers and graduate students, and help to shape the research programs of the PIs that employ them. In the best case, postdocs have an opportunity to train in new skills, expand their knowledge base, explore new fields, and build interdisciplinary bridges between their previous training and their current work. In the worst case, postdocs are overworked and undercompensated expert labor for PIs whose publications and grants depend on the material and intellectual contributions of these highly skilled scientists.

There is considerable diversity in the types of scientists who pursue postdocs. Some postdocs are seeking training beyond their graduate training, for example those who are switching research fields or who are seeking to learn new methods in the same field they did their graduate work in. Other postdocs are seeking intellectual diversity, staying within the same research field but looking for training in a new perspective on that field. Because prestige, an arbitrary metric, is often used in hiring decisions, some scientists use postdoctoral training as an opportunity to acquire prestige conferred by their postdoctoral institution or their postdoctoral adviser. This last option is particularly true for postdocs from marginalized backgrounds who, due to bias in what types of institutions and PIs are viewed as prestigious, might have been limited in their access to prestige as a function of the previous academic opportunities.

Fundamental issues and challenges

Insufficient salaries, high potential for abuse, short term contracts, and the dependence on singular mentors for career progression, as well as limited academic prospects as either staff scientists or principal investigators are all major issues in postdoc quality of life. These issues are exacerbated for international scholars, a major population of researchers at many R1 research institutions, with the added precariousness of their ability to live in the US being dependent on fickle bosses, having to navigate complex immigration bureaucracy with little to no support from their employer, and fewer opportunities for funding while in the US. These issues coexist with many scientists navigating racist, sexist, homophobic, transphobic, and xenophobic environments with limited recourse either through their universities or their funding agencies. Further, because of the temporary nature of the postdoc position, scientists who are looking for long term research positions in academia where they do not lead their own laboratories may decide against postdoctoral training in favor of a higher paying more permanent position as a staff scientist outside of academia.

Existing NIH policies, programs, or resources

F32s, T32s, K12s, K01s, K22s and K99s all serve to fund postdoctoral training, but funding levels across these awards are stagnant. Further, many postdocs who do not receive these awards are funded off of their PIs R01-level research grants, which furthers the precarity of the postdoctoral position. For many, these awards are difficult to obtain due to biases against age, time from PhD, and the relative prestige of their institution or PI.

The NIH can improve postdoctoral training by expanding all of these funding opportunities. Stipends should be increased significantly commensurate with the applicant's cost of living. Citizenship requirements for T32s and F32s should be dropped. Time-since-PhD criteria for career development awards should be dropped. All NIH postdoctoral funding mechanisms should have cohort-based duplicates targeted toward marginalized postdocs similar to the MOSAIC K99 mechanism that has proven incredibly successful.

The NIH should establish strict mentoring criteria for PIs who administer R01, T32, or K12 awards the fund postdocs. The NIH should establish clear consequences for bullying and abusive PIs.

Finally, the NIH has a role to play in removing the need for postdoctoral training in the first place. This should take two forms:

For scientists who do not need additional training, the NIH should expand its DP5 program targeted to graduate researchers looking for jobs at minority-serving institutions or other institutions that do not receive significant NIH funding.

For scientists who want to stay in academic research as staff scientists, the NIH can obviate the need for doing a postdoc by expanding the R50 mechanism to fund staff scientist positions.

Proven or promising external resources or approaches

A litany of public complaints from universities and principal investigators indicate there is a lack of postdoc applicants. Anecdotal reports suggest that PhD students are looking to the biotechnology arm of the private sector after receiving their training. These industry jobs offer high compensation, impressive benefits, ample time off, and some assurance of career progression. Additionally, due to the threat of liability and the existence of litigation-conscious HR departments, working in industry is often accompanied with greater perceived protections from abuse compared to academia. All of these features of the biotech industry could be replicated for academic science should the NIH choose to implement the suggestions above.

Perspectives on the postdoc roles and responsibilities

A position where one further her scientific, people, managerial, organizational skills while figuring out the next step career wise. As a postdoc you share many of the PI responsibilities in term of mentoring and managing the lab and also in term of innovative ideas. You are involved in multiple projects, work with collaborators (develop collaborations), mentor junior staff and also perform your research.

Fundamental issues and challenges

Salary is the number one issue when it comes to postdoctoral fellowship. It is very hard to swallow that most people with Master or even bachelor are making more money than you while doing probably less work. After spending so much time getting your PhD, you may want to build a family (or already have one) and supporting a child with a postdoc salary is very challenging. It feels like if your main goal is academia, you have to give everything (including your personal life) into your postdoc without even being guaranteed you will the position you desire.

Perspectives on the postdoc roles and responsibilities

A post-graduate research position where you work on a project to either attenuate your skillset, work on related research, or bring your skillset to a new field. This means that you work under the PI to fine tune the research in that PI's lab. In some labs, this could mean also having mentorship opportunities. The roll,

to me, is like an employee under the management (PI) and you have supervisory, contributory, and training aspects in your position.

Fundamental issues and challenges

The fundamental issue, first and foremost, is the belief and the treatment that this position is purely another "training" position that entails a corresponding "training" salary. At this stage, a person has been training for this position already for 4-6 years. The salary should reflect that. Academia, although unique from the "traditional" job, is still a job. We should not have to chose between conducting research for the "good of science" and taking a massive pay-cut as a sacrifice or being a paid a livable, decent wage at a company that rewards hard work and profit.

Next, job insecurity. The post-doc positions are low-pay for only a year or two at a time. Third, it is unlikely you will receive a stipend for relocation costs and moving is not cheap. You are never expected to receive "bonuses" as would would in a "traditional" work setting. If the PI loses funding or does not receive the grant that they expected to, you can be out of a job. This creates a stressful and competitive work environment that rewards quantity and not quality.

Have PIs been trained on how to manage post-docs? Most PIs that move from a post-doc to a PI position are untrained in how to run a lab which includes interpersonal management and hiring. Post-docs should be trained on this.

Existing NIH policies, programs, or resources

I do not have much to contribute to this question.

Proven or promising external resources or approaches

Look at the jobs that you are losing post-docs to, the benefits that they provide should be a clear "promising" approach to how to recruit and retain post-docs. You can even look at companies that have post-docs. It's there.
